# Meeting Between Federal Reserve Staff and a Representative of Inter-American Dialogue <br> October 13, 2010 

## Participants: Manuel Orozco (Inter-American Dialogue)

Dana Miller, Samantha Pelosi, Mandie Aubrey, Ky Tran-Trong, and Vivian Wong (Federal Reserve Board)

Summary: Staff from the Federal Reserve Board met with a representative of Inter-American Dialogue to discuss the remittance transfer provisions of the Dodd-Frank Wall Street Reform and Consumer Protection Act. The representative described the legislative evolution of several sections of the remittance transfer provisions. Specific topics of discussion included the posting of storefront disclosures containing information about model transfers, written initial disclosure of information regarding the transaction, foreign language disclosures, error resolution, and liability for agent actions. Participants also discussed the exceptions that permit the use of estimates in disclosing the amount of foreign currency to be paid to the recipient.

Prior to the meeting, the representative from Inter-American Dialogue sent some background documents to Federal Reserve Board staff for review. Copies of these materials are attached.

Source: ECO, March 2010. Transaction data from over 30 remittance companies.

Third, the draft shows a weak correspondence between the problem and the solution. The money transfer market has increasingly turned competitive, offering low-cost transfers (the unweighted cost is below $7 \%$ of the amount to remit US $\$ 200$ ), including significantly competitive exchange rates, where margins are significantly low, below $1.5 \%$ (meaning that less than $30 \%$ of the cost on a transfer is the commission on the exchange rate).

* Note: these are unweighted costs not controlled by market share. When market share is weighted in, the costs drop to 5\% for Latin America.

When the data is weighted to reflect market share, the costs drop significantly in all corridors for Latin America (see Table 3), where we have available information. What we see is that costs have remained relatively steady for the past four years. The reason is that competition and the prevailing agent-based business model have reached a relatively optimum cost line, and the only way to drop costs is by adding value to the remittance product ('bundling' services), or introducing technology methods that reduce intermediation (such as agents).

Data collected by the author. * Note: cost includes fee and exchange rate commission.

Increasingly, companies are depending less on forex commissions, partly because the market has turned competitive and exchange rate margins dropped, but also because immigrants are increasingly opting to send money in US dollars, being prepared to pay a fixed amount and not worry about the exchange rate. This situation includes the cases of Nicaragua, Costa Rica, and more recently the Dominican Republic, where people are choosing to send in US\$.

But even when we look at these forex commission margins and compare them to margins in other trades, such as forex conversion for tourists, the margins are pretty low: the forex commission at companies like Thomas Cook or Travelex are above $3 \%$ for a transaction to any destination.

Source: mystery shopping data collected by the author, February 2010
Public ratings of these businesses are quite strong. In a survey carried I carried out in 2008, I found that less than $1 \%$ of remittance senders believed companies are not transparent in the exchange rate, $65 \%$ believed they were transparent, and $34 \%$ were indifferent to the issue. In addition, problems of disclosure in the exchange rate are significantly restricted to very few cases or instances within the industry and can be solved without regulatory action or through financial education. A review in 2010 of 50 remittance companies that handle more than $70 \%$ of flows to Latin America showed that disclosure problems were found in fewer than two companies where mystery shopping was conducted. In these cases, solutions were encountered on the spot by contacting the company and presenting the problem.

Fourth, although these reporting requirements in this proposed legislation are mandated to a remitting company, they apply in practice to the agents, who in turn are not held directly accountable. Given that agents are not remittance service providers, nor employees of the company, it is unclear where the accountability will take place with agents. While contractual provisions could be amended to reflect proper accountability, the process as expected does not consider this practice.

The draft proposed piece also assumes a particular cash-to-cash business model and ignores many other prevailing practices of sending money: $75 \%$ of transfers are done through money transfer operators, but the rest are informal or via other means, such as the internet or banks. It remains unclear just how these provisions will apply to banks and Internet remittance service providers. For example, increasingly many U.S. banks are working as remittance service providers, and are making inroads in sending money and increasing financial access. But their transfers originate from an account, not at a retail store. Will the legislation expect banks to respond in a similar way and require all bank branches to post exchange rates? How will the printing of a receipt take place prior to an Internet transaction? For example, in Washington, D.C.'s Adams Morgan neighborhood, it is hard to identify which are the top three nationalities and they vary regularly, thus banks would face difficulties deciding which country info to post. How can disclosure be posted if the transfer is done via SWIFT or the Internet? And, as mobile technology is linking up with payment networks, how will disclosure be reflected in a transfer via PayPal, TwitPay or RegaloCard for example?

Fifth, the draft assumes a well balanced or distributed market that reflects arbitrary choice in requiring postings to three nationalities, but ignores the mixed composition of multiple migrant nationalities, who visit the same agent. Take New York City, Seattle, Los Angeles, Miami, Las Vegas, or Tampa, among other cities where there are immigrants from six or eight different nationalities visiting the same agent. In these cases, why post the top three and not the top ten?

Finally, I am concerned about the limited consultation process involved in drafting this proposed legislation. I became aware of the Act only recently in the past six weeks. As a matter of practice, is would be useful to obtain various versions of the proposed legislation, and garner the support of as many participants as possible.

Indeed, there are many loose ends to tie on this proposed draft. Disclosure of foreign exchange rates for money transfers are an essential feature of fair financial access for anyone, and particularly for low-income migrants who regularly transfer money to their relatives. But is physical posting the disclosure solution? Most likely not. The challenge lies in finding adequate policy procedures that can mitigate potential speculation and abuse against clients without producing adverse effects on both the industry and its market. Fairness is about commensurability, accountability, and judgment, which constitute the balance between norms and practice.

Warm regards,

Manuel Orozco

# A Scorecard in the Market for Money Transfers: Trends in Competition in Latin America and the Caribbean 

Manuel Orozco, Elisabeth Burgess and Landen Romei Inter-American Dialogue

June 18, 2010

FINAL DRAFT

## Introduction

This report presents fieldwork research and a review on remittance markets in 15 selected Latin America and Caribbean countries, ${ }^{1}$ with a focus on key indicators relating to competition in money transfers. ${ }^{2}$ We find that competition in money transfers among remittance service providers (RSPs) is relatively strong with most businesses offering more than one remittance product, operating in at least three remittance-payout countries, and relying on payment networks spanning over 50,000 payment points ${ }^{3}$ across these countries.

The results of this work show that remittance companies are turning more competitive. Increased competition brings costs down. We find that transfer costs in 2010, on average, have decreased slightly compared to 2009, to 5 percent of the value transferred. Additionally, RSPs have to compete for the satisfaction of the customer and have achieved an average of 70 percent satisfaction rate. Using four key indicators to measures company performance-scope, cost, distribution network, and consumer satisfaction-no company reached the highest grade, At. Thus, there is still room for improvement among RSPs.

We show that the majority of remittance service providers on the sending side are money transfer operators (MTOs), and on the payout side the majority of partner institutions are commercial banks. In fact, bank branches represent 76 percent of all payout locations, and the majority of payout points are represented by MTO and bank payer partnerships. Overall, 63 percent of all payout locations are in urban areas of at least 100,000 people, compared to only 46 percent of the population living in these areas, showing a divergence in the concentration of payout locations to population. We find that MTOs dominate the market for payout locations in Latin American and the Caribbean at 94 percent of locations, though banks that send remittances also play a significant role in many countries. Overall, MoneyGram has the largest share of locations, but despite the significant shares held by the largest five RSPs, the majority of all payout locations ( 59 percent) are held by other RSPs.

The report looks at the marketplace for transfers as performed by at least 39 leading companies, compared across 15 countries representing 90 percent of all remittance flows from the U.S. to Latin America and the Caribbean, as well as regulations in money transfers. The analysis looks into the main remittance service providers, the cost of remitting, the number, institutional type, and geographic concentration of payout locations in each country. ${ }^{4}$ Regulations on money transfers are examined in relationship to the institutions that authorize foreign currency payers, the limits and requirements on money transfers, anti-money laundering measures, the rules on foreign currency accounts and the roles of MFIs in remittance markets.

[^1]The first section presents the scorecard results and summarizes basic findings among companies. The second section looks into the various indicators characterizing the marketplace. It also includes an analysis of over 70 remittance service providers and 2,500 paying institutions working predominantly in the U.S.-Latin America and Caribbean corridors. ${ }^{5}$ The data provides information about transfers costs, presence in rural areas, partnership with banking and microfinance institutions, for example. The third section looks at regional trends across the various indicators. Section four reviews regulatory frameworks governing payment of remittances to Latin America. The appendix explains the data collection methodology as well as detailed scorecard results.

## 1. Intermediation in money transfers: measuring competition

In order to better understand the marketplace for money transfers, a set of variables were utilized to develop key indicators. These indicators are associated with features that characterize the money transfer industry in its competitive landscape, and are aspects of the marketplace that both consumers and development policy practitioners find important. Competition in the remittance transfer market typically refers to a situation where businesses play by the rules, offer a range of products across various regions, offer market prices, have accessible payment origin and distribution networks that offer various financial services, and satisfy consumers. ${ }^{6}$

The four key indicators utilized are scope, cost, distribution network, and consumer satisfaction. These indicators capture immigrant preferences on payment services as well as the link between remittances and financial asset building. The first indicator, scope, refers to the extent of product and geographic coverage that companies adopt. Businesses that offer more than one remittance product such as cash-to-cash or cash-to-bank account remittances, and transfer to more than one country make themselves more competitive. As the results below show, many businesses are increasingly offering various products and focus on fewer than three corridors. Transfer cost, the next indicator, is also a key feature defining competition and has been discussed in the literature as a policy issue. As more companies enter the market, lowering costs turns into a mechanism to attract consumers.

Transfer locations in the remittance origination and payment points in the destination are another feature distinguishing competitiveness. In the third indicator, we focus on the destination side to understand the types of payout institutions partnering with remittance service providers. The last indicator, consumer satisfaction, is reflected in consumers' appreciation of the services offered and is a key factor that illustrates a company's competitiveness. The table below presents the 16 variables utilized to create the four key indicators.

[^2]Table 2: RSP Scores (\%) and Grades***

| RSP | Grade 1* | Grade 2* |
| :---: | :---: | :---: |

*Includes consumer confidence data for a total of 64 points; ** Does not include consumer confidence data and counts 48 points; ${ }^{* * *}$ Based on average of scores across the four indicators.

In the following section, we analyze each of the key indicators scored above.

## 2. Remittance service providers: competition at work in the U.S.-Latin America corridor

The U.S.-Latin America remittances corridor covers 70 percent of all transfers to the region sent by over 15 million migrants. Here we show findings by company, which are increasingly diversifying their remittance product mix, and work mostly in one to three countries. The top six companies remitting to Latin America are among the largest in market share and have the largest operating presence in the region. The payment network from the United States to Latin America and the Caribbean involves partnerships with over 2,500 payout institutions and encompasses over 50,000 unique payment points, nearly half of which are in Mexico. RSPs are largely working with banking institutions as payout agents, and 60 percent of payout locations are in urban areas.

## a) Product and Geographic Scope

When looking at the type of remittance products ${ }^{9}$ RSPs offer, the majority of companies still center their services on C2C transfers, mostly working on the assumption that migrants are not switching or prepared to switch to other methods. However, there is increasing diversification in product offering: just under one-quarter ( 10 of 40 companies) still only offer C2C transfers, but the other three quarters (31 of 40 companies) offer transfers into bank accounts, six companies offer Internet transfers, and 17 offer additional financial services to consumers, such as money orders and check cashing services. In terms of geographic scope, the volume of money transfers continues to be an attractive financial proposition to companies in the business, but the large majority of companies work in fewer than three countries. There is a divide between a large group of businesses operating in a few countries and a small group of companies each operating in more than ten countries. These latter companies also have on aggregate the largest market share in transfers to the region. The companies that exhibit the largest share of payment points include MoneyGram, Western Union and Vigo, followed by Xoom and Viamericas. The latter two are emerging companies with less than ten years in operation.

Table 3: RSPs geographic scope

| Operates in | $\#$ | (\%) |
| :--- | ---: | ---: |
| 10 or more countries | 8 | 13 |
| Four to nine | 4 | 7 |
| Up to three | 47 | 80 |

Table 4: RSPs geographic scope (\%)

| RSP | Payout Distribution Share | Market share (est.) |
| :--- | ---: | ---: |
| MoneyGram | 13 | 10 |
| Western Union | 9 | 30 |
| Vigo | 9 | 8 |
| Xoom | 8 | 3 |
| Viamericas | 7 | 3 |
| Ria | 6 | 8 |
| Uniteller | 6 | 3 |
| Dolex | 6 | 3 |
| Other | 32 | 32 |

[^3]
## b) Transfer Costs.

Remittance transfer costs, typically measured by the fee and the commission on the exchange rate have been a topic of concern in public policy and international development circles. The average cost remitted in 2010 by these companies shows a slight decline compared to 2009, to 5.0 percent of a US $\$ 200$ transfer (see Table 11). The most important result in 2010 is that prices converge more closely around the mean, either in the fee or the foreign exchange commission: nearly 70 percent of costs are between 3.5 percent and 6.5 percent. These averages represent an important improvement in the marketplace because the range of prices fluctuates from a low of 1 percent to a high of 9 percent.

Table 5: Cost of sending US\$200 as percent of principal sent

| Measure | Fee | FX | Total |
| :--- | ---: | ---: | ---: |
| Average | 4.15 | 1.19 | 5.00 |
| Range | 8.43 | 3.36 | 7.92 |
| Standard deviation | 1.8 | 0.8 | 1.5 |

The companies offering the lowest cost are among those offering services in dollarized economies, where transfers are mostly paid out in U.S. dollars, or among RSPs paying to fewer countries. The cost slightly increases as the number of countries where an RSP operates increases. But for the most part these company costs are increasingly concentrated along mean values. The table below shows 15 out of 39 companies with total costs below the mean. At least one third of the revenue from most of these companies comes from one country corridor, which in many cases is paid in U.S. dollars.

Table 6: RSP average transfer costs

| RSP | Main country <br> it operates in | Total cost <br> $\mathbf{( \% )}$ |
| :--- | :--- | ---: |
| Bank of America (SafeSend) | Mexico | 1.58 |
| BHD | D. Republic | 2.01 |
| Delgado Travel | Ecuador | 3.00 |
| Girosol | Mexico | 3.00 |
| Dolex Dollar Express | Mexico | 3.04 |
| Alante Financial | El Salvador | 3.50 |
| Ficohsa Express | Honduras | 3.50 |
| Envios de Dinero G\&T Continental | Guatemala | 3.70 |
| Wells Fargo | Mexico | 3.73 |
| Banco Agricola | El Salvador | 4.50 |
| Bancuscatlan | El Salvador | 4.50 |
| Uniteller | Ecuador | 4.59 |
| Jamaica National Overseas | Jamaica | 4.83 |
| Viamericas | Mexico | 4.86 |
| Citibank | Mexico | 4.90 |

## c) Distribution network

Remittance service providers are working with more than 2,500 paying institutions in remittance receiving countries. The payers are distributed unevenly across regions, countries, and rural and urban areas. We find that Money Gram has the largest distribution of payment points. Nearly half (46 percent)
of all payment points are held by the five largest RSPs: Money Gram, Vigo, Xoom, Western Union, and Viamericas. Payers tend to be banks and tend to be located in urban areas.

## Marketplace trends among Remittance Service Providers and Payers

Although there are a number of new remittance service providers, competition is concentrated in about thirteen companies per country, most of which have been active in the market for many years. However, the range is high: Mexico has 21 RSPs while Haiti and Guyana have only seven. In some countries, new players hold significant shares of all payout locations; they may not have large remittance volumes yet, but they have built large payout networks. Country-specific RSPs, or an RSP whose presence is significant in only one country in the region, also represent an important segment of the market.

At the regional level, a select number of RSPs dominate. Of the 15 countries surveyed, MoneyGram has the largest number of locations in four countries, followed by Vigo, Viamericas, Xoom, Ria, and Western Union, with their largest number of locations in two countries each, while the other RSPs dominate in one country each: UnoMoneyTransfers in Brazil, Viamericas in Guatemala, and Ria in Nicaragua.

Despite the significant shares held by the largest five RSPs, the majority of all payout locations (59 percent) are held by other RSPs. Viamericas holds an important footprint of all payout locations, at 7 percent. Additionally, Uniteller, Dolex, and Intermex have between four and six percent of the total payout locations, due mostly to their prevalence in Mexico. In Mexico and Nicaragua, a large number of RSPs hold moderate shares in the market, in particular, Dolex and Viamericas (7 percent) in Mexico and Alante Financial ( 9 percent) in Nicaragua. In the Dominican Republic, six RSPs have 8 or 9 percent of the total number of payment points each: La Nacional, Mateo Express, Pronto Envio, Remesas Pujols, Uniteller and Viamericas.

Small countries with fewer payout locations, such as Jamaica and Guyana, have the greatest disparity in RSP participation, with Western Union and MoneyGram holding larger shares. Conversely, countries with the largest number of payout locations, particularly Mexico, Guatemala, and Ecuador, show greater parity among RSPs.

The nature of payer institutions has important implications for financial access and the geographic concentration of payment points. On the payer side, the trend remains that banks represent the primary institutions for money transfer into a country. Bank branches represent 70 percent of all payout locations, followed by retail at 10 percent. "Other" payers, which primarily reflect home delivery services, hold 5 percent of the payout locations, while credit unions and foreign exchange bureaus play a small role as payers in Latin America, with 7 and 3.5 percent of all payout locations, respectively. Post offices, which play a significant role in the payout side in other world regions such as Africa, play a small role in Latin America and the Caribbean, at one percent, and MFIs do not even reach one percent.

In terms of the intersection of RSP and payer institutions types, the partnership between MTO RSPs and bank payers represents 64 percent of all payment points. MTOs also have important partnerships with retail outlets and "other" RSPs. Bank RSPs partner nearly exclusively with bank payers, though retail and credit union payers have a very small presence. MFI RSPs play an insignificant role in the market and partner exclusively with banks, retail, and other payers, which do not include MFI payers.

Table 7: Types of RSPs and Types of Paying Institutions: Share of All Payout Locations (\%)

|  | Types of RSPs |  |  |
| :--- | :--- | :--- | :--- |
| Types of Paying <br> Institutions | MTO | Bank | Other |
| Bank | 64.0 | 5.4 | .2 |
| NBFI | 1.0 | .0 | .0 |
| MFI | 1.1 | .1 | .1 |
| Credit Union | 6.7 | .4 | .0 |
| Retail | 9.6 | .2 | .0 |
| Forex | 3.5 | .0 | .0 |
| Post | 2.5 | .0 | .0 |
| Other | 5.0 | .0 | .0 |

Note: 0 percent represents the presence of a partnership though the total share of all locations is less than 0.05 percent of all locations.

The prominence of each payer type also varies significantly by RSP. Western Union and MoneyGram have a large number of partner institutions across the region, at well over 1,000 each, compared to an average of less than one hundred for all of the other RSPs. As a result, Western Union and MoneyGram are the only RSPs to have a significant partnership with paying institutions besides banks. Intermex has the highest reliance on bank partner institutions with bank branches representing nearly 95 percent of all locations. Other than MoneyGram, Xoom has the highest number of credit union payout locations. By comparison, only about 60 percent of all Western Union and MoneyGram partner locations are represented by bank branches. Western Union has the highest level of partnership with retail outlets and NBFIs. MoneyGram also partners with retail outlets at significant levels, along with credit unions. MFI payers generally partner with Western Union, MoneyGram, and Viamericas.

Table 8: Top 10 MTOs and Payer Types in Latin America: Share of All MTO Payout Locations (\%)

|  | Bank | NBFI | MFI | Credit Union | Retail | Forex | Post | Other | Total No. of Partners* |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MoneyGram | 58.3 | 0.9 | 2.6 | 11.3 | 19.3 | 1.9 | 0.9 | 4.8 | 1,481 |
| Vigo | 73.3 | 1.3 | 0.0 | 4.6 | 5.4 | 2.6 | 0.2 | 12.6 | 92 |
| Xoom | 73.8 | 0.2 | 0.6 | 8.4 | 6.6 | 3.0 | 0.1 | 7.4 | 228 |
| Ria | 82.8 | 0.1 | 0.6 | 4.3 | 1.9 | 3.2 | 0.3 | 6.7 | 53 |
| Western Union | 59.7 | 3.7 | 1.9 | 4.7 | 19.6 | 2.1 | 0.1 | 8.4 | 1,247 |
| Viamericas | 79.8 | 0.2 | 1.5 | 1.9 | 5.7 | 2.5 |  | 8.4 | 60 |
| Uniteller | 63.2 | 0.4 | 0.8 | 5.7 | 10.8 | 2.0 | 9.6 | 7.4 | 55 |
| Dolex | 89.7 | 0.2 | 0.0 | 1.3 | 5.0 | 1.4 |  | 2.5 | 28 |
| Intermex | 94.8 |  |  | 0.4 | 4.8 |  |  |  | 10 |
| Wells Fargo | 81.8 |  |  |  |  |  | 18.2 |  | 16 |
| Other | 80.7 | 0.5 | 0.3 | 4.2 | 4.5 | 1.8 | 0.1 | 7.9 | 271 |

* Notes the total number of unique partner institutions which do not double count a payer if it works across more than one country in the region. Note: Blank entries signify the absence of payout locations between the MTO and a payer type, while a zero percent represents the presence of a partnership though the total share of all locations is less than 0.5 percent.

The diverging geographic concentrations of RSP partner payout locations also play an important role in determining access to remittance services. Of the largest RSPs, Ria has the largest concentration of its partners' payout locations in urban areas, with only 35 percent of its locations in rural areas overall, where 54 percent of the population lives. Viamericas, on the other hand, has the largest concentration of payout locations in rural areas.

Table 9: Geographic Concentration of Payout Locations and Population (\%)

|  | Rural | Urban |
| :--- | ---: | ---: |
| MoneyGram | 42 | 58 |
| Ria | 35 | 65 |
| Vigo | 36 | 64 |
| Western Union | 40 | 60 |
| Xoom | 40 | 60 |
| Viamericas | 69 | 31 |
| Other | $\mathbf{4 1}$ | 59 |
| All RSPs | 42 | 58 |
| Total Population | $\mathbf{5 4}$ | $\mathbf{4 6}$ |

## d) Consumer satisfaction

Consumer satisfaction is measured from surveys with immigrants who are asked whether they agree or strongly agree that they are satisfied with certain aspects of the RSP that they currently use. The five categories measured are the fee transparency, the foreign exchange transparency, the ease of use, overall inexpensiveness, and the value that the service has in comparison to other RSP's. The consumer satisfaction of these components is important because consumers will choose to frequent RSPs that they are most satisfied and content with. Therefore, it is in the interest of the RSP to understand and adapt to the consumer's satisfaction rating. ${ }^{10}$

The ease of use has the highest average satisfaction rating at 86.2 percent. The high average satisfaction with ease of use could be related to migrant tendencies to find one method of sending remittances and not exploring new options over time. Nearly three quarters of consumers are satisfied with the transparency of the fee, 60.1 percent were satisfied with the inexpensiveness of the service, 61.4 percent are satisfied with the transparency of foreign exchange, and only 46 percent of people responded that they are satisfied with the value of services available through their RSP. The value satisfaction rates may be low because consumers are unaware of the value of their services and products through their RSPs and of how to compare amongst them.

Among the five largest RSPs, Xoom has the highest consumer satisfaction ratings in transparency of the fee, transparency of the foreign exchange, and value. Xoom is tied for the highest satisfaction rating for inexpensiveness with Vigo, though Vigo is actually the least expensive. Finally, Xoom is only one percentage point below Vigo for ease of use. Among the lowest ratings are Viamericas for fee transparency and ease of use, Moneygram for foreign exchange transparency and inexpensiveness, and Vigo for value of service. In this case, Western Union is the most expensive.

[^4]Figure 1: Consumer satisfaction in the 5 largest RSPs in Latin America and the Caribbean

## 3. Corridor Competition in Remittance Markets in Latin America and the Caribbean

The market for remittance intermediation between the United States and Latin America and Caribbean countries continues to show significant dynamism, even in times of crisis. For example, market consolidation continues as a feature of competition. Currently, there are 13 remittance service providers in each given corridor on average, which are by and large money transfer operators. However, compared to previous years, the number of remittance service providers has declined, reflecting in part changes in the industry that may reflect consolidation of companies. ${ }^{11}$

The main data for fourteen countries shows a total of over 53,000 unique locations paying remittances in the countries researched. These locations are associated with 2,500 institutions authorized to perform money transfers. Not all companies with the largest volumes have the larger number of locations: there are new players with higher number of paying partners securing a bigger footprint in Latin America. This report uses payment locations as a measure of participation in the remittance market by RSPs and payers rather than market share by volume. One reason why payout location is important is that when RSPs control more payout locations, this ensures them a greater footprint and competitive advantage in the long term. Also, learning about the presence of payout locations allows studies on development finance in relationship to remittances to get a closer perspective about the potential to enable financial access to recipients.

[^5]
## a. General Features of Remittance Markets in Latin America and the Caribbean

We find a correspondence between the number of payout locations and aggregate volumes, suggesting that a larger number of transfers require a larger number of locations (see Figure 1 for example). When comparing payment points with costs, we also find that as a country's payment network expands, the cost of sending to that country decreases.

Table 10: Remittances to Latin America and the Caribbean: Basic Features

| Country | Annual <br> Remittance <br> (US\$ millions) | Remittances' <br> Share of GDP <br> (\%) | Remittances <br> Per Capita <br> (US\$) | RSPs (\#) <br> Payment <br> Points | Average Cost <br> of Remitting <br> (\%) |  |

| LAC | 9 | 8.6 | 8.2 | 7.1 | 6.3 | 6.5 | 6.1 | 5.2 | 5.3 | 6.1 |

Note: cost includes fee and commission.

The relative importance of payer types varies significantly by country. Of the fourteen countries surveyed, banks hold at least 70 percent of all payout locations in eight countries. Banks have the highest share of the market in Guatemala, at 95 percent, which reflects the restricted regulatory environment on authorized payers.

In Paraguay, by contrast, MFIs dominate as payers, with 50 percent of all locations. In Guyana, retail outlets hold significant shares at 43 percent. Banks in Guyana have their lowest share of locations in the region at only 7 percent. In the Dominican Republic, home delivery represents the largest payer type, at 84 percent. Still, other countries have a myriad of payer types with significant presences in the country. In Bolivia, for example, MFIs comprise 17 percent of all locations, followed by credit unions and banks at 16 and 28 percent respectively.

Table 12: Inbound payment of remittances by payer institutional type (\%)

|  | Bank | NBFI | MFI | Credit Union | Retail | Forex | Post | Other* | TOTAL |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |

| Paraguay | 23 | 0 | 50 | 0 | 0 | 23 | 1 | 2 | 100 |
| El Salvador | 75 | 1 | 2 | 12 | 4 | 0 | 0 | 6 | 100 |

* "Other" in the Dominican Republic and Haiti reflects the large share of home delivery services offered in the countries.

The prominence of each payer type varies significantly by sub-region. In the Caribbean, only 14 percent of payment points are bank branches. By contrast, 75 percent of all branches are "other" payers, which primarily reflect the large role home delivery services play in the Caribbean. The role of banks is particularly acute in Central America, where 89 percent of all payout locations are bank branches. Retail outlets and credit unions play a small role as payers in Central America. Credit unions have their greatest relative share of all locations in South America, at 6 percent of all locations. MFIs also play a relatively larger role in South America with 4 percent of all locations, equivalent to the share of retail outlets. Retail outlets have the largest relative presence in Mexico, at 11 percent, though banks dominate.

Table 13: Payer Institutional Type: Share of All Payout Locations

Note: * "Other" in the Caribbean primarily reflects the large presence of home delivery services.

## The presence of banks and their relationship to remittances

Banking sectors in Latin America and the Caribbean vary significantly not only in the number of banks, but in the concentration of bank branches in major cities. In general, smaller countries with smaller GDPs have fewer banks, though exceptions exist such as Paraguay with 16 licensed banks. Mexico has the largest number of banks and bank branches, at 41 and 9,332, respectively. Ecuador has a disproportionately high level of banks, at 25 , for its GDP. Colombia has a high number of branches per bank. Interestingly, the number of banks and branches per bank do not correlate with the concentration of bank branches in major cities. Bolivia has the highest concentration of bank branches in the major city, though its number of banks and branches per bank are not exceptional. Mexico has the largest banking system, yet the concentration of bank branches in the major cities is low, allowing the possibility that after a certain cluster point, banks expand into rural areas rather than crowding urban areas further. Colombia disproves such a concept, however, as its large banking system is only moderately concentrated in rural areas.

Table 14: Characteristics of Latin American Banking Institutions

|  | Banks | Branches | Branches <br> per bank | Branches in <br> major cities (\%) | Population in <br> major cities (\%) |
| :--- | ---: | ---: | ---: | ---: | ---: |

| Total | 215 | 20,784 | 97 | 41 | 21 |

Banks show varying participation levels with the major RSPs. On the one hand, 75 percent of all banks pay out with either Western Union or MoneyGram in El Salvador. On the other hand, only 12 percent of all banks pay out with Western Union or MoneyGram in Mexico. In a given country, banks also participate at significantly different levels between Western Union and MoneyGram. In the Dominican Republic, banks offer 315 payment points through MoneyGram and zero points through Western Union. In Haiti, Western Union partners with banks to offer 90 payment points in bank branches, while MoneyGram only offers 43 bank payout locations. In general, however, banks show significantly higher levels of payment points with MoneyGram than with Western Union.

Table 15: Banks' Partnership with Western Union and MoneyGram

## b. Geographic Concentration of Payout Locations

Competition also has important implications on service coverage in the areas where demand exists. In Latin America and the Caribbean, a significant divergence exists between the geographic concentration of the population and payout locations. Overall, 63 percent of all payout locations are located inside urban areas of at least 100,000 people, compared to only 46 percent of the population residing in those urban areas. In other words, those who live outside of urban areas, which constitute the majority, only have access to a little over a third of all payout locations. Only Paraguay has parity between its urban population and urban payout locations. The divergence is also significant among major cities, or metropolises in the region. Only 22 percent of the populace lives in major cities compared to 36 percent of all payout locations.

Figure 4: Urban Concentration of Payout Locations and Population in Latin America

The urban concentration of payout location varies significantly by country and sub-region. South America has the highest concentration of its payout locations in urban areas at 70 percent (excluding Brazil), though only 48 percent of the population lives in urban areas. This lack of correspondence in the geographic concentration of payout networks and population is similar in the Caribbean, but to a lesser degree. In the Caribbean countries of Jamaica, Haiti, and the Dominican Republic, 47 percent of all payout locations are located in urban areas compared to 39 percent of the population. In Central America, 47 percent of all locations are located in urban areas. Colombia has the highest divergence between the geographic concentration of the population and payment points, with 53 percent and 89 percent in urban areas, respectively. The Dominican Republic is the only country to have a higher share of payout locations outside of urban areas than the share of urban population respectively.

Figure 5: Urban concentration of payout locations by sub-region

In Latin America and the Caribbean, the payer institution types with the greatest concentrations outside of urban areas have the smallest shares of all payout locations. As Figure 6 shows, banks dominate as payers and are also the most concentrated in urban areas, along with NBFIs. The second largest payer type, retail, is also present in urban areas in particular. Post offices, by contrast, have the lowest concentration in urban areas and yet represent less than one percent of all payout locations. Credit unions and MFIs both have relatively greater presences in rural areas, but their market share is small as well.

Figure 6: Urban concentration of payment points by payer type

## 4. Remittance Market Regulations in Latin America and the Caribbean

Regulations on money transfers exist in order to facilitate payment systems for remittances and address an efficient and effective process that is safe but reliable. Five particular regulatory issues affecting remittance markets are examined here: rules on authorized payers that are able to deal in foreign exchange, limits and requirements on amounts transferred, anti-money laundering laws, foreigncurrency accounts, and the capabilities of MFIs in money transfers. Regulations affecting money transfers take several forms, many of which indirectly affect remittances in ways not often anticipated by the primary legislation.

Regulations that allow or restrict the types of paying institutions that are able to perform foreign currency transfers impact the extent of competition, geographic access to remittance services, and the ability to access additional financial services from the payout institution. One often cited example is the ability of MFIs to conduct foreign currency transfers. In countries where only banks are able to deal in foreign currency, access to remittance services is often restricted as the geographic reach of banks is limited in many countries. Other payer institutional types, such as retail outlets, may be permitted in a country, allowing greater reach into rural areas, though the ability to access additional financial products, such as microcredit, may be limited. Often, restrictive regulations may force remittance recipients to travel long, costly distances to urban areas to receive their money or otherwise encourage informal transfers, despite the existence of an extensive network of financial institutions capable of paying out remittances.

The regulatory environment varies significantly across Latin America and the Caribbean, though restrictions on authorized payers occur in a few countries. Of the fourteen countries surveyed, only two countries restrict authorized payers to banks and foreign exchange (forex) bureaus: Haiti and Guatemala. In both countries, MFIs may conduct foreign currency transactions, but only as subagents of banks, which decreases the incentives for MFIs to participate in the remittance markets as the bank agents earn a share of their profits. Ecuador, El Salvador, Colombia, Dominican Republic and Honduras permit banks, forex, MFIs, credit unions, and non-banking financial institutions (NBFIs), while other types of institutions may be prohibited or forced to receive Central Bank approval. Finally, the remaining six countries surveyed allow a broad spectrum of institutional types to participate as authorized payers in foreign currency transactions. In general, regulation regarding authorized payers falls under broader banking and financial system laws dating as far back as 1989 in Guyana and as recent as 2005 in Nicaragua. Haiti is the only country without a law that provides a direct framework for authorizing institutions to conduct money transfers.

Table 16: Authorized Payers in Latin America and the Caribbean

| Country | Law | Year | Authorized Payers |

| Jamaica | Requirements for License to Operate a Remittance Service in Jamaica | 2005 |  |
| Nicaragua | Ley General de Bancos, Instituciones Financieras No Bancarias y Grupos <br> Financieros |  |  |

Limits on the amount of transfers have generally been liberalized in Latin America and the Caribbean. Not one of the countries surveyed maintains limits on the amounts transferred, though three countries have reporting requirements for transactions under US $\$ 10,000$ : Haiti, Honduras, and Nicaragua.

Every country also has a law requiring proof of beneficiary for large transactions, in line with anti-money laundering (AML) legislation. Every country has passed AML legislation, with legislation in several countries dating back before 2001.

Most countries have established task forces to deal with AML issues. For many small financial institutions, the development of comprehensive anti-money laundering efforts often adds an additional cost of doing business, particularly as it regards cross-border transactions. The extent to which financial institutions must document and report even small transactions has important implications for the institutional capacity and funding needed to conduct remittance business.

## Appendix 3: Research Methodology

## a) Distribution network research

Data collection on the plethora of locations where money is retrieved (bank branches, post offices, foreign exchange bureaus, etc.) by recipients through authorized entities was obtained between September 2009 and June 2010 by using primary sources based on a review of all institutions authorized to carry out foreign currency payments. The process included three steps: a) identification of active remittance service providers (RSPs) in each country, b) data collection on the operational locations of each RSP, and c) identification of all authorized banks and data collection on their branch locations.

The types of RSPs were classified into the following groups: money transfer operators, banks, credit unions, microfinance institutions (MFIs), post offices, non-banking financial institutions (NBFIs), and "other" RSPs that do not fit any of the other categories. On the payout side, the types of institutions included are banks, retail outlets, MFIs, credit unions, NBFIs, retail stores, post offices, and "other" paying institutions who were not able to be classified or do not fit any of these categories (ex. home delivery services or private postal companies). Also, if the type of payer could not be determined (if it was the name of a geographic location, an acronym, etc. that could not be elucidated through further research) it was classified as "other."

When searching for payout locations for various RSPs, three main approaches were used to gather the necessary information. For many RSPs, the cities where services are offered are listed on the RSP website. By clicking on the name of the city, a list of payout locations appears. These locations were put into an excel file, noting the RSP, the city, the name of the payout location, the payout type (Bank, MFI, Forex, Other), and how many of each payer there are in each city. A second approach was used for RSPs that do not list payment points on their website, but do offer a search engine function to search for locations by city. That way, an extensive list of city names was developed for each country. A third approach was used for RSPs that do not list their branches online but only provide information on their paying institution partners. In this case, the branches of the paying institutions were collected and the locations that pay remittances were confirmed with the institution. The identification of institutions authorized to perform foreign currency transactions provided further information on the landscape of paying institutions. Each authorized institution was researched as to whether it pays transfers or not, who their RSP partner is, and where and which of their branch locations pay remittances.

Table 27: Variables in distribution network data set

| Variable | Label |
| :--- | :--- |
| CoID | Country Identification |
| Country | Country |
| City | Name of city |
| RSP | Remittance service provider name |
| RSP Type | Type of RSP (MTO, bank, NBFI, etc.) |
| Payer | Paying institution name |
| Payer Type | Payer type (bank, MFI, NBFI, post office, retail, etc.) |
| Number of branches | Number of payment points |
| Urban/rural | 1: Urban, over 100,000 people in city, 0: Rural, under 100,00 people |
| UrbanTotalPayoutPresence | Urban/Total Payout Presence |
| UrbanTotalPop | Urban/TotalPop |
| UrbanPop | Urban Pop |
| TotalPop | Total Pop |
| Urbpart | Number of locations in the capital |

The competition data also collected the concentration of the population and payout branches in urban and rural areas. Urban was defined as being located inside the city limits of the capital city and any city with more than 100,000 inhabitants. ${ }^{12}$ The report uses this urban definition for populations and remittance payout locations. Defining an "urban area" in a way that aligns with the available information on populations and payout locations is particularly challenging. Population data is available for cities with more than 100,000 people in nearly every country. ${ }^{13}$ Additional information is available for many major cities on the size of the population in the city proper and the suburban fringe. Data on remittance payout locations, by contrast, are only available by the name of the city where the paying institution is located. This report, therefore, used the definition of urban to maximize the allowance of the information available by both definitions: including cities of more than 100,000 people and limiting spatial boundaries to the city proper. To obtain the population information for each country, this report used the Gazetteer, ${ }^{14}$ a widely cited source of population data, which regularly updates information from recognized sources, including the UN Population Division and United States Bureau of International Program Center, along with official in-country sources and local survey data. The remittance payout location information was gathered from the respective websites of remittance service provider and their payout institutions.
b) Pricing research. Pricing data (remittance service providers' fees and foreign exchange margin above the Central Bank's reported rate) was collected in February 2010 based on a selection of countries created by and for the World Bank. Inter-American Dialogue staff conducted mystery shopping by posing as customers who wanted to send US\$200 to a certain Latin American country and asking RSP agents across the United States about their prices. Data was collected within each corridor on the same day, in order to control for fluctuations in exchange rates and other changes in fee structures.
c) Consumer satisfaction research. Consumer satisfaction data was obtained through a survey conducted by Hispanic Market Research and Services on behalf of the Inter-American Dialogue in April 2010. The survey was conducted in the metropolitan areas of New York-New Jersey (NY-NJ), DC (DC-VAMD), Los Angeles (LA), Boston-Lawrence-Providence (MA-RI), Chicago (CHI), and Miami (MIA) among 1000 immigrants over 18 years of age from Mexico, Dominican Republic, El Salvador, Guatemala, Jamaica, Haiti, Ecuador and Colombia.

Respondents were asked to state where they strongly agree, agree, were indifferent, disagree, or strongly disagree that they preferred money transfer sender is: a) transparent on its costs, b) transparent on its exchange rates, c) easy to use, d) inexpensive, and e) its service has more value than the others. In the scorecard, satisfaction was determined by adding those respondents who agreed or strongly agreed with each statement.

[^1]:    ${ }^{1}$ Mexico, Colombia, Guatemala, El Salvador, Dominican Republic, Peru, Ecuador, Honduras, Jamaica, Haiti, Bolivia, Nicaragua, Paraguay, Guyana, Brazil.
    ${ }^{2}$ Data collection was conducted by Guadalupe Ortigoza, Elisabeth Burgess, Tim Cheston, Jessica Brackett, Eugenia Garcia-Zanello, and Maite Hostetter between September 2009 and June 2010.
    ${ }^{3}$ A payout location includes bank and office branches, agencies, retail store locales, as well as 'mobile' payers, that is, individuals conducting home delivery, known in the Dominican Republic as 'motorizados'.
    ${ }^{4}$ Remittance service providers are identified from immigrant market surveys, interviews with competitors in the corridors, and previous country studies. Nevertheless, the list is not exhaustive and it is a work in progress. The data on payout locations are used as a way to capture the extent of payout coverage, but not necessarily the market share of the intermediaries.

[^2]:    ${ }^{5}$ For the purposes of protecting proprietary information, however, the numbers in our study were translated into ratios and percentages. These ratios and percentages serve for comparison.
    ${ }^{6}$ Legal compliance is not covered in this scorecard.

[^3]:    ${ }^{9}$ A remittance product is a transactional service that includes accepting the transfer in cash, through an account or providing additional financial services.

[^4]:    ${ }^{10}$ The results on consumer satisfaction are based on a nationwide survey to 1000 immigrants conducted between February and June, 2010.
