June 16, 1999

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production rose 0.2 percent in May after gains of 0.4 percent in April and 0.7 percent in March. Manufacturing output advanced 0.4 percent in May, about matching the pace of the previous three months. Production at utilities fell sharply, and mining activity was little changed. At 134.1 percent of its 1992 average, industrial production in May was 1.7 percent higher than in May 1998; capacity utilization for total industry—at 80.5 percent—was off more than 2 percentage points from a year earlier.

Market Groups

The production of consumer goods, which had accelerated in March and April, edged up. The growth in the output of durable consumer goods decreased to a still-strong 0.8 percent rate. The deceleration primarily reflected a large drop in the production of appliances after a strong advance in April; other major categories posted output gains. In particular, the production of automotive products increased sharply for a second consecutive month. The production of

| Utilities | 87.4 | 75.9 | 92.6 | 91.3 | 87.7 | 92.0 | 92.2 | 90.1 | .7 |

nondurable consumer goods edged down; a small increase in the production of non-energy goods was more than offset by a significant drop in the production of energy goods, mainly utility output for residential use. Among non-energy nondurable consumer goods, growth in the production of consumer chemicals, food, tobacco, and paper products was partially offset by a drop in the production of clothing.

The output of business equipment inched up after an upward-revised advance of 0.9 percent in April. A substantial further rise in the production of information processing equipment and in the assembly of business vehicles was counterbalanced by lackluster activity in farm machinery and equipment, another cutback in the production of civilian aircraft and a decline in the output of industrial equipment.

The production of construction supplies receded 0.2 percent but, on balance, has remained little changed from its high level earlier in the year: Over the past twelve months, output in this sector has increased 4.4 percent. The index for business supplies declined 0.3 percent after having increased substantially in March and April. The output of materials increased 0.5 percent. Among producers of durable goods materials, the output of semiconductors and computer parts continued to gain appreciably. The production of nondurable goods materials remained sluggish and was about 1 percent below the level of May 1998; the production of energy materials dropped.

Industry Groups

Production in manufacturing increased 0.4 percent. The factory operating rate inched up, to 79.7 percent, but was down from its May 1998 level of 81.6 percent. Durable goods production rose 0.6 percent—about the same pace as in the previous two months. In particular, the output of electrical machinery grew noticeably—albeit at a slower rate than in April—boosted by robust increases in the output of communications equipment and semiconductors. The production of motor vehicles and parts and of computers increased more than 2 percent. Excluding computers, the production of industrial machinery declined more than 1 percent. The production of fabricated metals also retreated in May, but the output of iron and steel rebounded. With gains in production matching gains in productive capacity, the rate of capacity utilization in durable manufacturing remained unchanged at 79.5 percent, a level identical to its 1967–98 average.

The output of nondurable manufactured goods advanced 0.2 percent; production has been advancing slowly since last autumn and has increased about 1 percent over the past four months. Furthermore, most major industries posted gains in May. The only major industries registering declines were textile and apparel products, both of which had posted substantial increases in April. The operating rate in nondurable manufacturing edged up 0.1 percentage point, to 80.4 percent: Utilization for these industries was more than 2 percentage points below its level of May 1998 and was 3 percentage points below its long-term average.

Mining production inched up. Reductions in the output of coal and stone and earth minerals partly offset advances in drilling for oil and gas wells and in metal mining. The rate of capacity utilization in mining stayed at 80.7 percent in May, down from 87.9 percent twelve months earlier. Most of the drop in capacity utilization over the past year reflects severe weakness in oil and gas drilling activity that has persisted throughout the period.

Output at utilities, which had rebounded 4.9 percent in March and posted a small increase in April, fell 2.2 percent, with declines in both gas and electric utilities. The operating rate at electric utilities remained above its historic average, while utilization at gas utilities was about 7 percentage points below the 1967–98 average.

Notice: This release contains revised estimates of capacity and capacity utilization for selected industries beginning with the data for January 1999. With the revision, the estimated growth of aggregate capacity between the fourth quarter of 1998 and the fourth quarter of 1999 increased 0.2 percentage point, to about 3-3/4 percent. In addition, beginning with the data for February 1999, the industrial production indexes were revised to reflect the semiannual revision to seasonal factors for motor vehicle assemblies and for series that use production-worker hours as their monthly indicator.

1. The IP proportion data are estimates of the industries' relative contributions to overall IP growth in the following year.

2. Semiconductors include related electronic components.

3. Millions of units at an annual rate.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

1. Series begins in 1977.

2. Semiconductors include related electronic components.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastic products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products.

Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

Table 4
INDUSTRIAL CAPACITY: MANUFACTURING, MINING, AND UTILITIES

| Item | SIC | Percent change | | | | | | | | | | Capacity indexes | | | | | | | |
|--|---------|-----------------------|-----------------------|-----------------------|----------------------------------|------|------|------|-------|-------------|--------------|---------------------------|-------------------|-------------------|-------------------|-------|-------|--|--|
| | | Annual rate | | | Fourth quarter to fourth quarter | | | | | | | Percent of 1992 output | | | | | | | |

p. Preliminary estimate for current year.

1. Series begins in 1977.

2. Semiconductors include related electronic components.

Table 8
DIFFUSION INDEXES OF INDUSTRIAL PRODUCTION

| Year | Jan. | Feb. | Mar. | Apr. | May | June | July | Aug. | Sept. | Oct. | Nov. | Dec. |
|-----------------------------|------|------|------|------|------|------|------|------|-------|------|------|------|
| One Month Earlier | | | | | | | | | | | | |
| 1997 | 53.4 | 65.7 | 53.7 | 51.3 | 53.7 | 56.3 | 58.8 | 49.8 | 55.6 | 55.8 | 61.4 | 50.9 |
| 1998 | 55.8 | 47.2 | 50.2 | 53.7 | 49.1 | 39.3 | 54.7 | 46.8 | 39.7 | 56.2 | 48.3 | 52.1 |
| 1999 | 49.6 | 52.8 | 53.6 | 60.1 | | | | | | | | |
| Three Months Earlier | | | | | | | | | | | | |
| 1997 | 58.2 | 65.7 | 59.0 | 62.7 | 54.9 | 55.6 | 60.2 | 60.9 | 59.0 | 58.1 | 65.5 | 63.7 |
| 1998 | 59.6 | 52.1 | 54.3 | 49.1 | 55.4 | 44.2 | 46.8 | 44.6 | 45.7 | 47.6 | 49.1 | 52.1 |
| 1999 | 49.4 | 48.7 | 50.9 | 59.6 | | | | | | | | |
| Six Months Earlier | | | | | | | | | | | | |
| 1997 | 65.3 | 65.7 | 63.8 | 61.6 | 58.4 | 62.7 | 67.3 | 62.8 | 63.5 | 66.9 | 68.8 | 65.0 |
| 1998 | 63.7 | 63.3 | 61.0 | 58.1 | 56.6 | 48.3 | 46.8 | 46.4 | 43.3 | 47.6 | 46.4 | 48.7 |
| 1999 | 52.8 | 51.3 | 55.4 | 61.4 | | | | | | | | |

Note—The diffusion indexes are calculated as the percentage of series that increased over the indicated span (one, three, or six months) plus one-half the percentage that were unchanged.

Explanatory Note

The statistical release of **Industrial Production and Capacity Utilization** reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. The release also includes monthly indexes on the use of electric power in manufacturing and mining. Files containing data in the release and historical data are available under statistical releases at <http://www.federalreserve.gov>, the Board's World Wide Web site. For paid access to these files through the Department of Commerce's Economic Bulletin Board or World Wide Web site, please call STAT-USA at 1-800-STAT-USA or (202) 452-1986. Diskettes containing historical data and the data published in this release are available from the Board of Governors of the Federal Reserve System, Publications Services, (202) 452-3245.

Industrial Production

Coverage. The industrial production (IP) index measures output in the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 1992. For the period since 1992, the total IP index has been constructed from 267 individual series based on the 1987 Standard Industrial Classification (SIC). These individual series are classified in two ways: (1) market groups (shown in table 1), such as consumer goods, equipment, intermediate products, and materials; and (2) industry groups (shown in tables 2 and 6), such as two-digit SIC industries and major aggregates of these industries—for example, durable and nondurable manufacturing, mining, and utilities.

Market groups. For purposes of analysis, the individual IP series are grouped into final products, intermediate products, and materials. Final products are assumed to be purchased by consumers, businesses, or government for final use. Intermediate products are expected to become inputs in nonindustrial sectors, such as construction, agriculture, and services. Materials are industrial output requiring further processing within the industrial sector. Total products comprise final and intermediate products, and final products are divided into consumer goods and equipment.

Timing. The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript "r" in tables.) After the fourth month, indexes are not revised further until the time of an annual revision or a benchmark revision. The last three benchmark revisions were published in 1990, 1985, and 1976.

Source data. In annual or benchmark revisions, the individual IP indexes are constructed from a variety of source data, such as the quinquennial *Censuses of Manufactures and Mineral Industries* and the *Annual Survey of Manufactures*, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the Department of the Interior; and publications of the Department of Energy. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations as well as from government agencies including those listed above; data of this type are used to estimate monthly IP where possible and appropriate. When suitable data on physical product are unavailable, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. Especially for the first and second estimates for a given month, the available source data are limited and subject to revision.

Weights. In the index, series that measure the output of an individual industry are weighted according to their proportion in the total value-added output of all industries. The industrial production index, which extends back to 1919, is built as an annually weighted chain-type index since 1977. The components of IP are combined using estimates of value added per unit of output. For months from January to June, the weights are drawn from the year containing the month being estimated and the preceding year; for months from July to December, the weights are drawn from the current and following year. The IP proportions shown in column 1 of tables 1A, 2A, and 6 are estimates of the industries' relative contributions to overall growth in the following year. For example, a 1 percent increase in durable goods manufacturing in 1997 would account for an increase in total IP of nearly 1/2 percent.

Seasonal adjustment. Individual series are seasonally adjusted by the X-11 ARIMA method, developed at Statistics Canada. For series based on production-worker hours, the current seasonal factors were estimated with data through October 1998; for other series, the factors were estimated with data through at least June 1998. Series are preadjusted for the effects of holidays or the business cycle where appropriate. For the data since 1977, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

Reliability. The average revision to the *level* of the total IP index, without regard to sign, between the first and the fourth estimates was 0.28 percent during the 1987–97 period. The average revision to the *percent change* in total IP, without regard to sign,

from the first to the fourth estimates was 0.21 percentage point during the 1987–97 period. In most cases (about 83 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

Capacity Utilization

Definition. Capacity utilization is calculated for the manufacturing, mining, and electric and gas utilities industries. For a given industry, the utilization rate is equal to an output index divided by a capacity index. Output is measured by seasonally adjusted indexes of industrial production. The capacity indexes attempt to capture the concept of sustainable practical capacity, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work schedule, taking account of normal downtime, and assuming sufficient availability of inputs to operate the machinery and equipment in place. The 76 individual capacity indexes are based on a variety of data, including capacity data measured in physical units compiled by trade associations, surveys of utilization rates and investment, and estimates of growth of the capital input.

Groups. Estimates of capacity and utilization are available for a variety of groups, including primary and advanced processing industries within manufacturing, durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Component industries of the primary and advanced processing groups within manufacturing are listed in the note on tables 2 and 3 of the release.

Weights. Although each utilization rate is the result of dividing an IP series by a corresponding capacity index, aggregate utilization rates are equivalent to combinations of individual utilization rates aggregated with proportions that reflect current capacity levels of output valued in current-period value added per unit of actual output. The implied proportions of individual industry operating rates in the rate for total industry for the most recent year are shown in the first column of table 3.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime.

Electric Power

Data on electric power (expressed in kilowatt hours) are collected by the Federal Reserve District Banks from electric utilities and also from manufacturing and mining establishments that generate electric power for their own use (cogenerators). The indexes of power use shown in table 9 are sums of kilowatt hours used by an industry or industry group expressed as a percentage of that industry's or group's usage in 1992. The first column of the table shows, for reference, electric power use in billions of kilowatt hours as reported by manufacturing and mining industries in the 1992 censuses of those industries. The supplementary group, "Total, less nuclear nondefense," is shown separately because the value-added proportion for the nondefense nuclear material series (part of SIC 2819) in total IP is considerably smaller than its share of total electric power use. Excluding this component from total power use facilitates comparisons with total IP.

References

The annual revision published on November 24, 1998 is described more completely in the *Federal Reserve Bulletin*, vol. 85 (January 1999).

A description of the aggregation methods for industrial production and capacity utilization is included in an article in the *Federal Reserve Bulletin*, vol. 83 (February 1997), pp. 67–92. *Industrial Production—1986 Edition* contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. To obtain *Industrial Production—1986 Edition* (\$9.00 per copy), write to Board of Governors of the Federal Reserve System, Publications Services, Washington, DC 20551. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the *Federal Reserve Bulletin* (April 1990, June 1990, June 1993, March 1994, January 1995, and January 1996, February 1997, February 1998, January 1999). The basic methodology used to estimate capacity and utilization is discussed in the June 1990 *Federal Reserve Bulletin*.

Release Schedule for 1999

At 9:15 a.m. on January 15, February 17, March 16, April 16, May 14, June 16, July 16, August 17, September 16, October 15, November 16, and December 15.
