## **Background**

The international banking activities of U.S. banks are supervised by the three federal banking agencies: the Office of the Comptroller of the Currency (OCC), the Federal Deposit Insurance Corporation (FDIC), the Federal Reserve System; and by several state banking agencies. Among other things, the agencies evaluate the quality and liquidity of each bank's foreign exposures to determine their effect on the solvency and overall condition of the bank.

In 1979, the OCC, the FDIC, and the Federal Reserve Board established the Interagency Country Exposure Review Committee (ICERC, or the committee) to ensure consistent treatment of the transfer risk associated with banks' foreign exposures to both public and private sector entities. Transfer risk means the possibility that an asset cannot be serviced in the currency of payment because of a lack of, or restraints on the availability of, needed foreign exchange in the country of the obligor.

In subsequent years, a growing number of problem foreign loans led the U.S. Congress to pass the International Lending Supervision Act of 1983, which included provisions affecting both the international lending activities of U.S. banks and the federal banking agencies' supervision of those activities. The Act required banks, in certain circumstances, to set up an allocated reserve for assets subject to severe transfer risk, and in early 1984, the three federal banking agencies published regulations implementing the Allocated Transfer Risk Reserve (ATRR) requirement. The regulations require that each affected bank charge off or establish and maintain an ATRR for each asset with impaired value due to transfer risk. (See 12 CFR 28, Subpart C; 12 CFR 211, Subpart D; or 12 CFR 347.)

## **Transfer Risk, Country Risk, and Credit Risk**

Transfer risk is one facet of the more broadly defined concept of "country risk." Country risk, which has an overarching effect on the realization of an institution's foreign assets, encompasses all of the uncertainties arising from the economic, social, and political conditions in a country. Country risk includes the possibility of deteriorating economic conditions, political and social upheaval, nationalization and expropriation of assets, government repudiation of external indebtedness, exchange controls, and currency depreciation or devaluation. While ICERC-assigned transfer risk ratings focus rather narrowly on the availability of foreign exchange to service a country's external debt, an institution's own internal country risk management process should focus on the more broadly defined concept of country risk.

Country risk is also an important consideration when evaluating the level of credit risk associated with individual counterparties in a country. Regardless of the availability of foreign exchange, macroeconomic conditions and events that are beyond the control of individual borrowers can strain the financial capacity of otherwise good credit risks. Depreciation in a country's exchange rate, for example, increases the cost of servicing external debt and can adversely affect not only transfer risk for the country, but also the credit risk associated with even the strongest counterparties in the country.

## **Purpose of the Committee**

The ICERC is responsible for providing an assessment of the degree of transfer risk that is inherent in the cross-border and cross-currency exposures of U.S. banks. Although banks are advised of the results of the ICERC's evaluations, the ICERC's transfer risk ratings are primarily a supervisory tool and they should not replace a bank's own country risk analysis process.

## **Composition of the Committee**

The ICERC is composed of nine voting members (primarily experienced international bank examiners), with three representatives from each of the three federal banking agencies. In addition, a representative from the Conference of State Bank Supervisors attends the committee's meetings as an observer. Responsibility for chairing the meetings rotates among the three agencies annually. A staff member from the International Banking and Finance Department of the OCC serves as the committee's permanent secretary.

## **Frequency of Meetings**

The ICERC usually meets three times a year, in March, June, and October. At the March and October meetings, the committee generally has an agenda of 12 to 18 countries that it reviews for purposes of assigning a transfer risk rating to exposures. In recent years, the committee's June meetings have focused on supervisory and administrative issues related to carrying out its responsibilities.

## **Countries Reviewed by the ICERC**

The ICERC regularly reviews countries to which U.S. banks have had an aggregate exposure of \$1 billion or more for at least two consecutive quarters. In addition, countries to which aggregate exposure is between \$200 million and \$1 billion are reviewed by the ICERC if the exposure at five or more U.S. banks exceeds 25 percent of capital (Tier 1 capital + the allowance for loan and lease losses). For purposes of determining whether a country meets the threshold for review by the ICERC, aggregate exposure is based on the exposure reported in the most recent Country Exposure Lending Survey.<sup>1</sup> Specifically, aggregate exposure is the sum of "Transfer Risk Claims" from Table I and "Total Commitments After Adjustments for Guarantees" from Table IV.

If a country does not meet at least one of the exposure criteria for two consecutive quarters, the committee decides whether it should continue to be reviewed based on the number of banks with exposure, the severity of the rating, and the trend of conditions in the country. Normally, countries for which exposures are rated "Weak" or better are

---

<sup>1</sup> The Country Exposure Lending Survey report, which is published quarterly by the Federal Financial Institutions Examination Council (FFIEC), summarizes the aggregate, by-country exposures of U.S. banks, bank holding companies, and Edge and Agreement corporations filing the FFIEC 009 Country Exposure Report. The report is available to the public on the Internet at [www.ffiec.gov/e16/](http://www.ffiec.gov/e16/).

automatically dropped from the agenda if they do not meet at least one of the exposure criteria.

## Frequency of Country Reviews

Countries for which exposures are rated “Strong” (and certain countries where exposures are rated “Moderately Strong”) are not scheduled for review on a regular basis. However, the committee may decide to review such countries formally on an *ad hoc* basis. Otherwise, exposures to a country are reviewed on a regular basis, depending on the current rating and the aggregate exposure of U.S. banks as follows:

<u>Rating</u>	<u>Aggregate Exposure</u>	<u>Frequency of Review</u>
Value Impaired, Substandard, and OTRP	Any amount	Once a year
Weak	> \$3 billion	Once a year
Weak	< \$3 billion	Every 12 to 24 months <sup>2</sup>
Moderately Strong	> \$3 billion	Every 12 to 18 months <sup>2</sup>
Moderately Strong	< \$3 billion	Every 12 to 24 months <sup>2</sup>

## The ICERC Rating System

The ICERC’s assessment of transfer risk reflects the committee’s application of the following category definitions.

**Strong** — The country does not experience social, economic, or political problems that could interrupt repayment of external debt.

**Moderately Strong** — The country experiences a limited number of identifiable economic, social, or political problems that do not presently threaten orderly repayment of external debt.

**Weak** — The country experiences many economic, social, or political problems. If not reversed, these problems could threaten orderly repayment of external debt.

**Other Transfer Risk Problems (OTRP)** — This category applies when:

---

<sup>2</sup> Within this range, the ICERC will determine the timing of reviews based on current conditions and trends in the country.

1. A country is not complying with its external debt service obligations, as evidenced by arrearages, forced restructuring, or rollovers; however, the country is taking positive actions to restore debt service through economic adjustment measures, generally as part of an International Monetary Fund (IMF) program; or
2. A country is meeting its debt obligations, but noncompliance appears imminent; or
3. Exposures to a country have been classified previously, but recent debt service performance indicates classification no longer is warranted (e.g., the country is complying with the terms of IMF and rescheduling programs). However, sustained resumption of orderly debt service needs to be demonstrated.

**Substandard** — This category applies when:

1. A country is not complying with its external service obligations as evidenced by arrearages, forced restructuring, or rollovers; and
2. The country is not in the process of adopting an IMF or other suitable economic adjustment program, or is not adequately adhering to such a program; or
3. The country and its bank creditors have not negotiated a viable rescheduling and are unlikely to do so in the near future.

**Value Impaired** — This category applies when a country has protracted arrearages, as indicated by more than one of the following:

1. The country has not fully paid its interest for six months.
2. The country has not complied with IMF programs (and there is no immediate prospect for compliance).
3. The country has not met rescheduling terms for more than one year.
4. The country shows no definite prospects for an orderly restoration of debt service in the near future.

**Loss** — This category applies when the loan is considered uncollectible and of such little value that its continuance as a bankable asset is not warranted. An example would be an outright repudiation by a country of its obligations to banks, the IMF, or other lenders.

As discussed in more detail in a later section of this guide, exposures rated as “Value Impaired” are generally subject to an ATRR requirement. In addition, the volume of less severely rated foreign exposures, including those rated “Moderately Strong,” “Weak,” “OTRP,” and “Substandard” are relevant to any assessment of possible concentrations of risk, and should certainly be factored into the evaluation of the adequacy of the bank’s capital and allowance for loan and lease losses.

## **The ICERC Process**

The ICERC bases its assessments and ratings on information collected from a number of sources, including detailed country studies prepared by economists at the Federal Reserve Bank of New York. The studies focus on economic, social, and political risk factors in a country and provide statistical information about a country's external debt, balance of payments, and general economic conditions.

Prior to each meeting, examiners from the federal banking agencies visit U.S. banks with significant international exposures to review the banks' country files and to discuss country economic conditions and political developments with the banks' senior international officers. The examiners also inquire about the banks' lending terms and their strategic plans concerning the types of exposures and the desired mix and level of exposure in a country.

Finally, the ICERC draws on other U.S. government sources to supplement and confirm the information it has gathered on a country. Among other things, these sources can provide information on any bilateral or multilateral financial assistance that a country may be seeking or receiving.

## **Evaluating Transfer Risk**

The committee's evaluation of transfer risk is influenced by a country's anticipated current account performance and debt service in relation to such factors as available IMF facilities, international reserve levels, the existence (if any) of exchange controls, official and private loan commitments, foreign investment trends, and the attitude among bankers toward further lending to borrowers in that country.

The committee also evaluates the socio-political effects of prevailing economic trends and their impact on a country's prospective ability to sustain external debt service. The committee considers such factors as the country's total external debt size and structure in relation to revenues, projections of volume and price for a country's commodity exports, a country's ability to attract foreign investment, a country's natural and human resource potential, and the willingness and ability of the government to recognize economic or budgetary problems and implement appropriate remedial action.

## **Application of ICERC Ratings**

ICERC transfer risk ratings are applicable in:

- Every U.S. chartered insured commercial bank in the 50 states of the United States, the District of Columbia, Puerto Rico, and U.S. territories and possessions;
- Every U.S. bank holding company, including its Edge and Agreement corporations and other domestic and foreign nonbank subsidiaries; and

- The U.S. branches and agencies of foreign banks (however, the ATRR requirement does not apply to these entities).

In general, ICERC ratings are applicable to all types of foreign assets held by an institution, with the exception of premises, other real estate owned, and goodwill. For purposes of the ICERC rating, the determination of where the transfer risk for a particular exposure lies takes into consideration the existence of any guarantees, and is based on the country of residence of the ultimate obligor as determined in accordance with the instructions for the FFIEC 009 Country Exposure Report. (Relevant excerpts from these instructions can be found in Appendix A.)

Except as noted in the footnote, the ICERC transfer risk rating is the only rating applicable to sovereign exposures in a reviewed country (that is, direct or guaranteed obligations of the country's central government or government-owned entities).<sup>3</sup> Furthermore, except as noted in the next paragraph, the ICERC transfer risk rating is also the minimum risk rating applicable to **all other** cross-border and cross-currency exposures of U.S. banks in a reviewed country.

However, regardless of the currencies involved, to the extent that an institution's claims on local country residents are funded by liabilities to local country residents, the ICERC's transfer risk ratings **do not** apply. For example, to the extent that it has liabilities to local residents (such as sterling deposits), claims of the London branch of a U.S. bank on a public or private sector obligor in the United Kingdom (whether they be denominated in sterling, dollars, or marks) are not subject to the ICERC transfer risk rating.

The ICERC is not able to evaluate the credit risk associated with individual, private sector exposures in a country. Therefore, based on an evaluation of credit risk factors (including the effects of country risk), examiners may assign credit risk ratings to individual, private sector exposures that are more severe than the ICERC-assigned transfer risk rating for the country. For any given private sector exposure, the applicable rating is **the more severe** of either the ICERC-assigned transfer risk rating for the country or the examiner-assigned credit risk rating (including ratings assigned as a result of the Shared National Credit Program).

Questions sometimes arise concerning the consideration that examiners should give to informal expressions of support by the central government of a country for a particular borrower or sector of the economy (most often, banking). Unless they constitute a guarantee or other legally binding commitment, examiners should view such expressions of support as no more than a mitigating factor in their evaluation of the counterparty's credit risk. Informal expressions of support by the central government would not cause the counterparty's credit risk rating to revert to the ICERC-assigned transfer risk rating for the country.

---

<sup>3</sup> However, if they are carried on the institution's books as an investment, securities issued by a sovereign entity are also subject to the FFIEC's "Uniform Agreement on the Classification of Assets and Appraisal of Securities Held by Banks." The FFIEC agreement provides for specific, and possibly more severe, classification treatment of "sub-investment quality securities."

## Special Categories of Exposure

Although the ICERC may have rated ordinary short- and/or long-term exposures in a country as “OTRP,” “Substandard,” “Value Impaired,” or “Loss,” there are several special categories of exposure in a country that may receive a less severe transfer risk rating if certain conditions are met.

- **Performing short-term bank and performing short-term trade exposures.**<sup>4</sup> Short-term bank and trade exposures are generally considered to have a lower level of transfer risk because, historically, they have received priority in the allocation of a country’s foreign exchange resources. In recognition of their historical performance, the ICERC usually assigns a more favorable rating to these types of exposures.
- **Securities held in trading accounts.** Presuming that there is an active and liquid market for the securities and the bank has procedures in place to appropriately value them, the ICERC may, on a case-by-case basis, assign a less severe transfer risk rating to specific securities held in the bank’s trading account. In any case, because Financial Accounting Standard No. 115 requires that they be marked-to-market, trading account securities are not subject to an ATRR requirement.
- **Direct equity investments.** The ICERC may, on a case-by-case basis, assign a less severe transfer risk rating to specific direct equity investments where all of the following conditions are met:
  1. The investment has been marked-to-market or is valued using the equity accounting method;
  2. The institution has provided the ICERC with evidence that the foreign business is financially viable; and

---

<sup>4</sup> A **performing credit** is current and has not been restructured to avoid delinquency or because of a deterioration in the financial condition of the borrower. A credit is considered to be current if it would not be reported as "past due" or "nonaccrual" as those terms are defined in the instructions for schedule RC-N of the Call Report.

The definition of **banks** is the same as is used for column 1 of the FFIEC 009 Country Exposure Report and the Report of Condition. It includes commercial banks, savings banks, discount houses, and other similar institutions accepting short-term deposits. It also includes banking institutions owned by foreign governments unless such institutions function as central banks or banks of issue.

A **short-term credit** has a maturity of one year or less. Short-term credits are reported in column 5 of the FFIEC 009 Country Exposure Report.

**Trade credit** consists of credit extensions that are directly related to imports or exports and will be liquidated through the proceeds of international trade. Such credit extensions will include pre-export financing **only** where there is a firm export sales order and the proceeds of the order will pay off the indebtedness. Trade credits are reported in column 21 of the FFIEC 009 Country Exposure Report.

3. The institution has provided the ICERC with evidence of its ability to repatriate dividends, interest payments, and proceeds from the sale of assets on a timely basis.

### **Allocated Transfer Risk Reserve Requirement<sup>5</sup>**

For each country exposure rated “Value Impaired,” the ICERC recommends an appropriate percentage level for the ATRR. The ATRR is a specific reserve that is created by a charge to current income. The ATRR, which is not counted in the bank’s capital, is separate from the allowance for loan and lease losses (ALLL) and is deducted from gross loans and leases.

When approved by the principals of the three federal banking agencies, the amount of the ATRR requirement is communicated to each bank that has reported exposures to the subject country. A bank’s compliance with the ATRR requirement is measured on an asset-by-asset basis rather than a portfolio-wide basis. Except as noted in the next paragraph and in the section on ATRR Rulings and Interpretations, each exposure rated “Value Impaired” in a country must be specifically provided for in the required percentage.

The ATRR is required to be established by banks, bank holding companies, and Edge and Agreement corporations on a consolidated basis in accordance with the procedures and tests of significance set forth in the instructions for preparation of call reports or other federal regulatory record keeping requirements. As an alternative to establishing an ATRR, an institution may write down the value of the specified international assets in the requisite amount. Such assets may be written down by a charge to the ALLL or a reduction in the principal amount of the asset by applying interest payments or other collections on the asset. However, if this alternative accounting treatment is used, the institution may not write up the value of the assets if the ATRR requirement is later reduced or eliminated.

### **Reducing the ATRR Requirement**

An ICERC decision to reduce the ATRR requirement and upgrade exposures in a country from “Value Impaired” status will be based on the country meeting all of the following criteria:

- Orderly debt service has been restored for at least one year;
- Transfer-risk-related arrears to commercial banks have been eliminated and there is no expectation that the arrears will recur; and

---

<sup>5</sup> This section summarizes the most important aspects of the ATRR requirement. For further information, see the abridged preamble to the *Federal Register* publication of the ATRR regulation in Appendix B. Among other things, the preamble discusses: (1) assets to be covered by the ATRR, (2) applicability to nonbank and foreign subsidiaries, (3) criteria for requiring an ATRR, (4) percentage norms, and (5) treatment of ATRR accounting.

- The country has demonstrated sustainable, improved economic performance through successful implementation of an IMF program or other suitable economic adjustment program.

Generally, at the first ICERC meeting following the satisfaction of these conditions, the committee substantially reduces the level of the ATRR requirement. The next time the country is reviewed, the remaining ATRR requirement is eliminated, and the transfer risk rating for exposures to the country upgraded.

## ATRR Rulings and Interpretations

Although the general rule is that all exposures rated “Value Impaired” are subject to the ATRR requirement, over the years there have been a number of clarifications and refinements of this rule. These clarifications, which began with the explanatory preamble to the original ATRR regulation (included as Appendix B), include the following:

**An ATRR is required only for international assets that are subject to transfer risk.** The preamble to the regulation makes it clear that the following categories of exposures would normally **not be subject** to the ATRR requirement.

1. Assets where the performance of the direct obligor is guaranteed by a resident of another country — unless exposures to the guarantor are also rated as “Value Impaired.” (In this situation, the applicable transfer risk rating is determined by the country of the guarantor, who is the ultimate obligor.)
2. Certain collateralized assets, where full payment will come from proceeds that can be accessed outside the country of the direct obligor. (This situation generally arises in connection with loans to the exporter of a commodity, such as oil, where arrangements have been made for the buyer to deposit payments in another country.)
3. An ATRR is not required for off-balance sheet, potential exposures, such as unfunded commitments.

In addition, the preamble to the regulation indicates that the agencies would “. . . consider whether the performance characteristics of certain other categories of assets are such that no ATRR is warranted against those assets (for example, assets on which debt service has been maintained with little or no interruption).” As noted in the section on “Special Categories of Exposure,” for countries in which most other exposures are rated “Value Impaired,” the ICERC generally assigns a less severe transfer risk rating to performing short-term trade and bank credits, thereby eliminating the ATRR requirement for those assets.

**The ATRR requirement does not apply to U.S. branches, agencies, or commercial lending company subsidiaries of foreign banking organizations.** Nevertheless, each federal banking agency will determine the need, if any, for other special measures that may be warranted by conditions in the branch, including, for example, increased monitoring of due-from/due-to head office accounts, asset maintenance requirements, and/or specific reserves.

**Assets of an investment Edge corporation do not require an ATRR.** In a 1997 letter, the committee confirmed that an ATRR is only required on the assets of a “banking institution” as defined in 12 CFR Parts 28, 211, and 347 (including a domestic U.S. bank, Edge, or Agreement corporation *engaged in banking*). An Edge corporation that does not accept deposits in the United States from nonaffiliated persons (i.e., an investment Edge corporation) is not considered to be engaged in banking and is, therefore, not subject to the ATRR requirement.

**As long as they are performing, advances that originate after the ICERC’s initial assignment of a “Value Impaired” rating to exposures in a country (i.e., “net new lending”) are not subject to the ATRR requirement.** Relief from the ATRR requirement for such advances is based on the presumption that a bank will not increase its exposure in the country unless it has taken special measures to mitigate transfer risk. However, any such advances that fail to perform as originally agreed automatically become subject to the ATRR requirement. (See the definition of a “performing credit” in footnote 4 to the earlier discussion of “Special Categories of Credit.”)

In addition to relief from the ATRR requirement, if and when the ICERC determines that a country has initiated a suitable economic adjustment program, the committee establishes a “cut-off” date after which net new lending is eligible for more favorable rating treatment by the committee. Ratings for net new lending originating after the cut-off date are decided by the ICERC on a case-by-case basis, but are generally no better than “Weak.” Continuation of the more favorable rating treatment for net new lending is evaluated by the committee each time the country is reviewed. Net new lending that does not perform as originally agreed is automatically downgraded to “Value Impaired” and becomes subject to the ATRR requirement.

**Applicability of ATRRs to debt-for-equity or debt-for-debt exchanges.** Because transfer risk may continue to exist for an exposure converted to (or exchanged for) assets in the form of equity or debt securities, the agencies issued an interagency policy statement in 1992 concerning the applicability of ATRRs to these types of exposure. The policy statement, which can be found in Appendix C, includes the following additional guidance concerning the ATRR requirement:

1. The initial recorded value of a security received in a debt conversion cannot exceed the carrying value of the converted loan exposure, net of any applicable ATRR.
2. Because they are required to be carried at market value, securities that are held in a bank’s trading account (i.e., for which there is an active and liquid market) and are actively traded by the bank in a dollar or other hard currency market are exempt from the ATRR.
3. In all other cases, including both securities held for investment purposes and those that are “available for sale,” the ATRR framework applies — **unless** the ICERC determines in its review of transfer risk for a particular country that grounds exist for

a more favorable treatment of securities obtained in officially sanctioned debt conversion programs in that country.

## Country Write-ups

### Production and Updating

ICERC generates country write-ups for all regularly reviewed countries with exposures that are rated “Moderately Strong” or worse. Write-ups are updated only when the country has been discussed and voted on by the ICERC. The date appearing just below the country name at the top of each write-up is the date of the last country review and update.

### Content

Each country write-up has four sections: a rating matrix, an introductory summary, a description of the current situation, and supporting comments for the assigned rating.

The *rating matrix* that appears at the top of each write-up summarizes ICERC ratings for the country by exposure type; typically these are performing short-term bank credits, performing short-term trade credits, and all other exposures. Rating categories used in the matrix are “Moderately Strong,” “Weak,” “Other Transfer Risk Problems,” “Substandard,” “Value Impaired,” and “Loss.” (In country write-ups distributed before October 1998, the rating categories of “Moderately Strong” and “Weak” were combined under the single heading of “Exposures Warranting Special Comment.”)

The *introductory summary* provides information on the aggregate amount and nature of U.S. bank exposures to the subject country. In addition to noting any trend in the overall level of aggregate exposure, this section provides information on the distribution of exposures, including the amount of direct outstandings, commitments, trade-related exposures, trading assets, net local country exposures, and net revaluation gains. Information is also provided on the by-sector and by-maturity distribution of U.S. bank exposures. Any available information on the existence/level of arrears is also included in this section. When drafting this section, the ICERC ensures that any information concerning arrears or bank attitudes toward lending comes from publicly available sources.

The *description of the current situation* summarizes current conditions in the country, notes any improvement or deterioration in conditions since the previous write-up, and identifies any specific issues of concern. Where appropriate, the section also includes specific comments on the country’s access to capital markets, as well as the condition of the banking system.

The *supporting comments* section includes the date of the previous rating and identifies the specific reasons and conditions justifying the assigned ICERC rating. When there has been an upgrade or a downgrade in the rating, the specific areas of improvement or deterioration are noted. This section also provides information on any ATRR

---

requirement and the reasons for any change in the requirement. Where applicable, the section includes the cut-off date and rating for new money advances.

## Distribution

Because the ICERC deliberations are a part of the examination process, the committee's transfer risk ratings can be communicated only to those institutions that have exposures to the reviewed country. Following each ICERC meeting, write-ups for countries where exposures have been rated OTRP or worse are routinely provided to banks, bank holding companies, and Edge and Agreement corporations that have reported exposure to the country on the most recent FFIEC 009 Country Exposure Report.<sup>6</sup> Write-ups for countries where exposures have been rated "Moderately Strong" or "Weak" are not routinely distributed; however, they may be provided by the institution's examiner-in-charge or supervising office if there are concerns about the level of exposure to the country.

Because they are not required to file a FFIEC 009 Country Exposure Report, some smaller U.S. banks and the U.S. branches and agencies of foreign banks do not receive country write-ups as a result of the routine distribution that follows each ICERC meeting. In addition, some institutions may have exposures that were not reported on the FFIEC 009 Country Exposure Report, either because they were booked after the quarterly reporting date or were less than the reporting threshold (all amounts on the report are rounded to the nearest million dollars). In these cases, the institution may make a request to its supervising office for the country write-ups applicable to its exposures.

## Discontinuing Country Write-ups

When no further write-ups are to be issued for a country where exposures had previously been rated OTRP or worse, the remaining banks with exposure to the country are provided with a written notification that the previous ICERC rating is no longer in effect and advising them of the reason that exposures to the country are no longer reviewed by the committee.

---

<sup>6</sup> Specific reporting requirements can be found in the instructions for the FFIEC 009 report. In general, the FFIEC 009 report is required to be filed quarterly:

- By every U.S.-chartered commercial bank that has aggregate foreign claims of more than \$30 million and a foreign branch, international banking facility, or majority-owned subsidiary.
  - Under certain conditions, by bank holding companies.
  - By Edge and Agreement corporations with claims on foreign residents exceeding \$30 million, except if they are majority-owned by a commercial bank that files on a consolidated basis.
-

### Excerpt From the Instructions for Preparation of the FFIEC 009 Country Exposure Report

#### PART III - Definitions of concepts used in the report

##### A. Claims

The term “claims” used in this report includes the following types of assets, as defined in the instructions for preparation of the FFIEC 031. Please note that all claims are not reported in all columns. Refer to specific instructions for each column.

- Deposit balances, both interest-bearing and non-interest-bearing, with:
    - banks in foreign countries
    - foreign branches of other U.S. banks
    - foreign branches of foreign banks
    - U.S. branches of foreign banks
  - Balances with foreign central banks and foreign official institutions
  - Foreign securities held for the respondent’s own account
  - Federal funds sold to foreigners, U.S. branches of foreign banks, or other U.S. entities that are branches of a foreign company or where repayment is guaranteed by a foreign entity
  - Loans to, or guaranteed by, non-U.S. addresses
  - Holdings of acceptances of foreign banks
  - Foreign direct lease financing
  - Investments in unconsolidated foreign subsidiaries and associated companies
  - Revaluation gains on interest rate, foreign exchange, equity, commodity and other off-balance-sheet contracts (Reported in schedule 2)
  - Customers’ liability on acceptances outstanding where the account party is foreign
  - Accrued income on credits extended to or guaranteed by non-U.S. addressees (including interest; commissions; and income earned or accrued and applicable to current or prior periods, but not yet collected)
  - Resale agreements
  - Asset sales with recourse
-

- Participations and syndications of loans

Securities held in the available-for-sale portfolio should be reported at amortized cost for the purposes of this report. The total claims on foreigners that must be reported cover cross-border claims as defined in paragraph B, and foreign office local country claims as defined in paragraph G. Premises, Other Real Estate Owned, and Goodwill should be excluded from claims for the purposes of this report.

## **B. Cross-border claims**

For purposes of this report, the cross-border claims of each reporting institution cover:

- All claims (as defined in Part III, definition A) of its U.S. offices (including IBFs, Edge and Agreement corporations, and offices in Puerto Rico and U.S. territories and possessions) with residents of foreign countries, regardless of the currency in which the claim is denominated; and,
- All claims of each of its offices in a foreign country with residents of other foreign countries, regardless of the currency in which denominated.

Since the reports are on a fully consolidated bank (or fully consolidated holding company) basis, cross-border claims exclude any claims against those foreign branches or foreign subsidiaries that are part of the consolidated bank (or consolidated holding company). However, claims on unconsolidated subsidiaries of the reporting institution would be reported. Thus, if a report is filed on a consolidated bank basis, claims on foreign subsidiaries of its parent holding company would be reported, since such companies would not be included in consolidated reports of the bank.

## **C. Guaranteed claims**

Columns 8 through 10 and 11 through 13 ask for information on the claims reported in columns 1 through 3 that are “guaranteed” by residents of other countries. For the purposes of this report, “guaranteed” claims are those cross-border claims, as defined above, which a third party located outside of the country of the obligor formally and legally obligates itself to repay if the direct obligor fails to do so. Exclude guarantees that do not cover transfer risk. For purposes of this report, claims on a branch (but not on a subsidiary) of a banking organization are considered guaranteed by the head office of the organization. Acceptances where the accepting bank has sold a risk participation are considered guaranteed by the purchaser of the participation for the amount of the participation sold.

Documents that do not establish firm legal obligations, such as “comfort” letters, letters of awareness, or letters of intent, are not considered guarantees for the purpose of this report. (As used here, “comfort” and other such letters are, by definition, not legally binding on the issuer. If the respondent’s legal counsel has determined that these documents are binding based upon relevant state and national laws, they should be treated not as “comfort” letters but, rather; as guarantees.) Insurance policies that cover

specific assets and that guarantee payment if the borrower defaults or if non-convertibility occurs for any reason should be treated as guarantees.

The term “guaranteed” also covers collateralized claims if the collateral is (a) tangible and liquid, including readily marketable shares of stocks or bonds **and** (b) is **both** held and realizable outside of the country of residence of the borrower. In cases involving collateral, the residence of the “guaranteeing” party, for purposes of the report, is the country in which the collateral is held, unless the collateral is stocks or bonds, in which case it is the country of residence of the party issuing the security. If the collateral consists of a basket of convertible currencies or investment grade securities of different countries, the exposure may be reported on the “Other” line (for example, “other Latin America”) that most closely represents the geographical composition of the basket. Assets such as real estate and accounts receivable are not liquid or tangible assets. Although only liquid, tangible, and readily realizable assets may be listed in columns 8 through 10 and columns 11 through 13, the federal banking agencies will consider the protection afforded by other assets to the reporting bank’s country exposure claims when appraising each bank’s country exposures.

#### **D. Shipping credits**

Shipping credits should be allocated in columns 1-3 to the country in which the primary source of repayment resides. In cases where there is no long-term charter, such as a vessel operating in the spot market or a liner vessel, the allocation should be to the country of residence of the ultimate shipowner.

Exceptions may be made where it is judged that the source of repayment of the credit may be other than in the country of residence of the ultimate shipowner.

Where a shipping credit is repayable principally from the proceeds of the charter assigned to the bank, the allocation should be to the domicile of the charter.

#### **E. Contingencies and commitments**

Report only those commitments for which the respondent has charged a commitment fee or other consideration, or otherwise has a legally binding commitment. Include cross-border underwriting commitments when the customer accepts the commitment offered by the banking institution. Exclude “best efforts” letters and letters in which the pricing is indicative and not determined until launch date because the banking institution does not become legally committed until launch date (i.e., after price is finally determined and agreed with the customer). The term “best efforts” refers to letters issued by the banking institution whereby it agrees to try to sell a certain volume of assets at a desired price. If the market rejects the desired price, the banking institution has no commitment to buy the assets for its own account.

In case of commitments for syndicated loans, report only the bank’s proportional share of the commitment. Similarly, contractual underwriting commitments (e.g., revolving underwriting facilities) and other bond underwriting agreements may be shown net of firm commitments from other parties to purchase the assets without recourse within a

short and specific period of time. Accordingly, the respondent should also include its obligations to participate in syndicated loans and underwritings managed by other institutions.

#### **F. Trade financing**

Report in column 21 total extensions of credit with maturities one year and under that are included in columns 4 and 15 **and** that: (1) are directly related to imports or exports and (2) will be liquidated through the proceeds of international trade. Provided these two conditions are met, such extensions of credit may include customers' liability on acceptances outstanding, own acceptances discounted, acceptances of other banks purchased, pre-export financing where there is a firm export sales order, commercial letters of credit, as well as other loans and advances whenever such extensions directly relate to international trade.

#### **G. Foreign-office local country activities**

For purposes of this report, "foreign-office local country activities" cover claims (column 18) on residents of the same country in which that office is domiciled and liabilities (column 19) of a foreign office that represent legal liabilities solely of that foreign office. For example, deposits received in a foreign branch are assumed to be the obligations solely of that branch. Other foreign office liabilities may require documentation to qualify as local country liabilities. Since the report is consolidated, local country assets exclude any claims on other offices of the consolidated reporting institution that are in the same country.

Allocated Transfer Risk Reserve

49 FR 5587

February 13, 1984

**ACTION:** Joint notice of final rules and request for additional comments.

**SUMMARY:** These regulations require banking institutions to establish special reserves against the risks presented in certain international assets when the Federal banking agencies (Board of Governors of the Federal Reserve System ("Board"), Comptroller of the Currency and Federal Deposit Insurance Corporation) determine that such reserves are necessary. In particular, they are intended to require banking institutions to recognize uniformly the transfer risk and diminished value of international assets which have not been serviced over a protracted period of time. These regulations implement one aspect of the joint program of the Federal banking agencies to strengthen the supervisory and regulatory framework relating to foreign lending by U.S. banking institutions, incorporated in section 905(a) of the International Lending Supervision Act of 1983.

It is important that this provision of law be implemented expeditiously for banking regulatory and supervisory purposes. Accordingly, the regulations will be effective upon publication.

Further regulations implementing other provisions of the International Lending Supervision Act of 1983 will be issued separately.

**EFFECTIVE DATE:** February 13, 1984.

Following are the major topics raised in the comments and the agencies' responses thereto:

### **(1) Assets to be covered by the Allocated Transfer Risk Reserve (ATRR)**

The proposed regulations required banking institutions to establish an ATRR for "specified international assets," and defined "international assets" to mean those assets included in Country Exposure Report forms (FFIEC No. 009). Numerous commenters suggested clarification of the definition of international assets or exemption for certain categories of assets or for specific assets.

The agencies intend that an ATRR will be required only for international assets subject to transfer risk. International assets subject to transfer risk associated with the country of residence of the obligor normally do not include, for example, (1) assets guaranteed by a resident of a foreign country different from that of the direct obligor; (2) certain collateralized assets; (3) commitments; and (4) assets of a foreign office of the banking institution payable in local currency for which the foreign office has equivalent local currency liabilities. (The foregoing examples are described in more detail in the Instructions to Country Exposure Report forms.)

The banking agencies also will consider whether the performance characteristics of certain categories of assets are such that no ATRR is warranted against those assets (e.g., assets on which debt service has been maintained with little or no interruption.)

In this connection, in line with the suggestions of several commenters on the treatment of new loans, an ATRR normally would not be required initially for net new lending when the additional loans are made in countries implementing economic adjustment programs, such as programs approved by the International Monetary Fund, designed to correct the countries' economic difficulties in an orderly manner. Such new lending under appropriate circumstances may strengthen the functioning of the adjustment process, help to improve the quality of outstanding credit, and thus be consistent with the objectives of the program of improved supervision of international lending. Whether an ATRR subsequently is required for those new loans would be determined by the agencies on the basis of performance and continued inapplicability generally of the criteria for establishment of an ATRR.

### **(2) Applicability to nonbank and foreign subsidiaries**

The proposed regulations would apply to a banking institution and its subsidiaries, and "subsidiary" was defined to mean an organization of which a banking institution has control or holds 25 percent or more of the voting shares. Two issues raised by the comments were (1) whether the provision should apply to minority-owned nonbank subsidiaries; and (2) whether it should apply to foreign bank subsidiaries of banking institutions.

On the issue of whether minority-owned subsidiaries should be covered, several of the commenters reasoned that a banking institution with a 25 percent interest in an entity may not be able to compel that entity to comply with the regulation and should not be

held responsible for the entity's accounting methods. Several commenters proposed that the regulations cover only those nonbank subsidiaries that are consolidated with the parent banking institution under Generally Accepted Accounting Principles (GAAP). Objections also were raised to applying the regulations to foreign subsidiaries.

In light of these comments, the agencies determined that each "banking institution" is subject to the regulations on a consolidated basis. "Banking institution" is defined in the regulations as a domestic bank, Edge or Agreement corporation engaged in banking, and bank holding company. Other than the foregoing banking institutions, subsidiaries need not separately comply with these regulations. The effect of this rule for foreign bank subsidiaries is that specific reserves against, or write-downs of, international assets, taken from current earnings of the foreign bank, will be incorporated in the parent banking institution's consolidated financial statement.

For banks, consolidation should be in accordance with the procedures and tests of significance set forth in the instructions for preparation of Consolidated Reports of Condition and Income (currently, FFIEC Nos. 031, 032, 033, 034). For bank holding companies, the consolidation shall be in accordance with the principles set forth in the "Instructions to the Bank Holding Company Financial Supplement to Report F.R. Y-6" (Form F.R. Y-9). Edge and Agreement Corporations should file in accordance with the "Instructions for the Preparation of Report of Condition for Edge and Agreement Corporations" (Form F.R. 2886b).

In applying the foregoing rules to bank holding companies under section 910(a)(2) of the act, the Board has deemed such action appropriate to promote uniform application of section 905(a) of the Act and to prevent evasions thereof.

### **(3) Criteria for Requiring an ATRR**

In determining whether an ATRR is warranted for particular international assets, the agencies are directed by statute to apply the following factors: (1) Whether the quality of a banking institution's assets has been impaired by a protracted inability of public or private obligors to pay or (2) whether no definite prospects exist for the orderly restoration of debt service. Some commenters urged more specific criteria; others were concerned that the criteria were not flexible enough. Most of the commenters, however, generally agreed that the statutory criteria are reasonable. The agencies consider the statutory criteria to be appropriate because they provide guidance as to when an ATRR is required, while allowing the agencies to take into account a sufficient range of factors in making their determinations.

### **(4) Percentage Norms**

Under the proposed regulations, the initial year's provision for the ATRR would be ten percent of the principal amount of the specified international assets, or a greater or lesser percentage as determined by the banking agencies. In subsequent years, the agencies would review the assets concerned and determine whether additional reserves are required. The proposal provided for a reserve based on such review in the subsequent periods of 15 percent, or a higher or lower percentage as determined necessary by the

banking agencies. In the preamble to the proposed regulation, the agencies specifically asked for comment on these percentages.

Some commenters thought the percentages were too low, and some considered them too high. Several were opposed to the establishment of any percentage norms, primarily on the ground that the appropriate percentages should be determined by the agencies in each case and that agency flexibility in making this determination should be preserved. However, a substantial number of comments supported the proposed percentages as reasonable.

The agencies believe that the norms contained in the regulations provide reasonable guidance to banking institutions of the likely ATRR requirements, yet the regulations give the agencies discretion to modify these percentages on a case-by-case basis as factors warrant.

### **(5) Treatment of ATRR Accounting**

The provision in the proposed regulations eliciting most comment was the section allowing banking institutions to write down an asset in the same amount as required for the ATRR, instead of setting up the ATRR, but requiring the banking institution, in that case, to replenish the Allowance for Possible Loan Losses (APLL) out of current earnings by the amount written down. Commenters suggested that if a banking institution chooses to write down an asset instead of establishing an ATRR, the APLL should be replenished only to the extent necessary to restore it to a level adequate to reflect the remaining risks in the loan portfolio.

The commenters pointed out several problems they see with the replenishment provision as it was proposed: it could put banks that already have charged earnings at a disadvantage vis-a-vis those banks that have made no comparable provisions; it could thus discourage conservative practices; and, as a result of inconsistency with GAAP, it could distort financial statements and cause them to be qualified by accountants.

In light of these comments, the agencies have determined that, consistent with prudent banking practices and GAAP, replenishment of the APLL will be required to the extent necessary to restore it to a level which adequately provides for the estimated losses inherent in the loan portfolio. The agencies wish to emphasize, however, that it remains the responsibility of bank management and external auditors to recognize, and management to provide adequately for, any significant deterioration in the value of assets and this responsibility is in no way lessened as a result of the agencies' adoption of this recommendation.

Several commenters also sought further clarification of the alternative accounting treatment under which an ATRR would not be required if comparable amounts of the assets had been written down. Some comments stated that the regulations should clarify the treatment of interest payments which have been applied to the loan balance. They suggested that the regulations specify that such reductions of principal should be considered write-downs for purposes of the regulations. Another issue was the treatment of write-downs of assets in prior reporting periods. The final regulations clarify that

write-downs in prior periods, as well as reductions in principal as described above, which are tantamount to write-downs, are acceptable alternatives to establishment of an ATRR.

Another issue raised in connection with the alternative accounting treatment was whether a write-down of an asset for commercial risk will be treated the same as a write-down for transfer risk reasons. The final regulations have been clarified to state that an ATRR applies to the principal amount of each specified international asset in the percentage required. Accordingly, a write-down of any such asset for commercial risk can be included in the amount of a write-down which satisfies a required ATRR for that particular asset but not for specified assets in the aggregate.

One commenter suggested that the regulations be clarified to indicate that a banking institution may transfer to the ATRR any amount specifically allocated in the APLL for the assets subject to the ATRR. The agencies consider this approach an acceptable method of implementing the ATRR requirement, particularly since a banking institution could in any event write down an asset by a charge to its APLL rather than a charge to current earnings in the period the write-down is taken. However, in either instance, the APLL must be replenished to the extent necessary to restore it to a level that adequately provides for the estimated losses inherent in the loan portfolio.

Finally, clarification was sought, and the agencies have so provided in the final regulations, that a banking institution may reduce an established ATRR not only if the banking agencies determine it may be reduced, but also where the institution decides to write down the assets involved.

#### **(6) Timing of ATRR implementation**

Several commenters requested that notifications of ATRR requirements be made on a timely basis relative to banking institutions' reporting and filing dates for their financial statements. The banking agencies intend to make every effort, in providing notice of ATRR requirements, to accommodate these concerns, recognizing the importance, however, of prompt implementation of section 905(a) of the Act and initial establishment of the ATRR.

#### **(7) Consultation with banking institutions**

Several commenters stressed the importance of regular consultation with the affected banking institutions by the agencies before establishing the ATRR. One commenter suggested that concerns about a particular country should be discussed in the course of the normal bank examination process to evaluate all factors concerning the obligors' ability to pay. Discussions of foreign country exposure and transfer risk are a part of the ongoing examination process and efforts will be made by the agencies to strengthen consultations in this context.

#### **(8) Applicability of the Act to U.S. branches and agencies of foreign banks**

Comment was requested on whether and the extent to which foreign banks should be subject to this and other provisions of the Act. The period for comment on these general

issues remains open to permit foreign banks adequate time to respond, and the final regulations do not apply to U.S. branches, agencies or commercial lending company subsidiaries of foreign banking organizations.

**(9) Other comments**

Questions were raised concerning the confidentiality of the agencies' determinations of the international assets specified as subject to the ATRR and the applicable reserve percentages. As is customary, such notifications are conveyed as confidential examination information to each affected U.S. banking institution by its primary federal banking supervisor.

Several commenters stated that the regulation should not govern disclosures under the federal securities laws. In this connection, the federal banking agencies understand that the staff of the Securities and Exchange Commission will provide guidance to registrants concerning appropriate disclosure of ATRR requirements in filings with the SEC.

### OFFICE OF THE COMPTROLLER OF THE CURRENCY BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM FEDERAL DEPOSIT INSURANCE CORPORATION

October 30, 1992

#### TO THE CHIEF EXECUTIVE OFFICERS OF BANKS WITH INTERNATIONAL ASSETS

A question has arisen as to the appropriate Call Report treatment for debt-for-equity or debt-for-debt exchanges by banks that involve countries for which the Interagency Country Exposure Review Committee (ICERC) evaluation of transfer risk has led to the establishment of an Allocated Transfer Risk Reserve (ATRR) requirement. In such exchanges, banks swap developing country debt for equity securities or debt securities under government-sponsored programs. Specifically, does the ATRR requirement only apply to banks' existing loan exposures or does it also apply to those exposures that take the form of equity or debt securities obtained through such conversions?

In order to assure uniformity, the Office of the Comptroller of the Currency, the Federal Reserve and Federal Deposit Insurance Corporation are clarifying their policy. It is the position of the agencies that:

- Transfer risk may continue to exist for an exposure converted to (exchanged for) assets in the form of equity or debt securities. Under both generally accepted accounting principles (GAAP) and regulatory reporting requirements, a debt exchange must be reported at fair value. However, the initial recorded value of a security received in a debt conversion cannot exceed the carrying value of the converted loan exposure, net of any applicable ATRR.
- Securities that are held in a bank's trading account (i.e., that have an active and liquid market) and are actively traded by the bank in a dollar or other hard currency market would be (as at present) exempt from ATRR application. Such securities would be carried at market value. In all other cases, including both securities held for investment purposes and those held for eventual sale in a longer time frame (e.g., certain Debts Previously Contracted (DPC) and Regulation K holdings), the ATRR framework would apply — UNLESS the ICERC determines in its review of transfer risk for a particular country that grounds exist for a more favorable treatment of securities obtained in officially sanctioned debt conversion programs in that country.
- Specifically, the ICERC would consider relevant information on officially-sponsored debt conversion programs in a given country in order to reach a judgment as to whether transfer risk for the resulting securities may be sufficiently lower than for the

country's external financial obligations as a whole and whether this warrants a full or partial exemption from the ATRR requirements.

- In reaching its conclusions, the ICERC would consider, among other things,
    - the existence of a clearly different income and capital repatriation program for securities obtained through debt conversions relative to repatriation policies existing for sovereign debt service.
    - performance of the country under such programs to date, or more generally for debt or equity securities vs. loan obligations, in permitting the repatriation of income and capital.
    - other relevant evidence that transfer risk for the securities obtained under the exchange program is in fact lower than that for the country's external financial obligations as a whole.
  - When the ICERC has determined that debt conversion programs of a particular country can provide reduced transfer risk, examiners will verify that transactions conducted by individual banks qualify for exemption from the ATRR within the ICERC-established framework.
  - In addition to assessing transfer risk, examiners will also review each security holding to assure that the carrying value is recorded in accordance with GAAP and regulatory reporting requirements as well as normal examination procedures applied to bank investments in securities. In particular, in cases involving securities acquired through asset swaps rather than for cash, examiners will determine that the initial valuation is supported by evidence of fair value. In doing so, examiners will consider, among other things,
    - similar transactions for cash.
    - estimated cash flows from the security received. Any projections used to justify an initial valuation higher than the secondary market price of the debt exchanged must be supportable based on historic performance or other empirical grounds.
    - the initial valuation of the investment by other purchasers, participants, or shareholders.
    - the market value of similar debt or equity investments.
    - currency restrictions, if any, affecting dividends, the sale of the investment, or the repatriation of capital.
  - With respect to equity investments that are carried by the bank using the equity method of accounting, the ATRR is deemed to apply to the entire investment including any increases in carrying value reflecting equity income, unless ICERC determines that grounds exist for more favorable treatment of the equity securities and related equity income, as detailed above.
  - As with other assets, examiners will determine whether such investments should be classified or criticized for reasons of commercial risk and assigned the more severe of the commercial or country risk classifications in evaluating a bank's asset quality.
-
