G.17 (419) Supplement

For release at 9:15 a.m. (EST)  
December 14, 2001

## INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production fell 0.3 percent in November. At 137.1 percent of its 1992 average, output was 5.9 percent below its level in November 2000. Manufacturing output declined 0.2 percent in November. Excluding a 6.4 percent increase in the production of motor vehicles and parts, manufacturing output dropped 0.7 percent, the third month of similarly sized declines. Utilities production fell 2.0 percent, and the output at mines rose 0.2 percent. The rate of capacity utilization for total industry declined 0.3 percentage point, to 74.7 percent, a level 6.0 percentage points below that of November 2000 and 7.4 percentage points below its 1967–2000 average.

### Market Groups

The output of consumer goods increased 0.4 percent in November. A 3.3 percent increase in the production of durables was led by a 6.4 percent increase in automotive products. Despite increasing 1.3 percent, the production of home electronics was more than 18 percent below its year-ago level. A 2.8 percent drop in energy products pulled down  
(over)

### INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION: SUMMARY

Seasonally adjusted

Industrial Production	Index, 1992=100				Percent change				Nov. 00 to Nov. 01

<b>Capacity Utilization</b>	Percent of capacity								Capacity growth
	Average 1967–00	1982 Low	1988–89 High	2000 Nov.	2001 Aug. <sup>r</sup>	Sept. <sup>r</sup>	Oct. <sup>r</sup>	Nov. <sup>p</sup>	Nov. 00 to Nov. 01
<b>Total industry</b>	82.1	71.1	85.4	80.7	76.4	75.7	75.0	74.7	1.7
Previous estimates					76.3	75.5	74.6		
Manufacturing	81.1	69.0	85.7	79.2	74.6	73.9	73.2	73.0	1.6
Advanced processing	80.5	71.0	84.2	78.0	74.5	73.5	72.8	72.8	.9
Primary processing	82.2	65.7	88.3	81.0	74.8	74.5	73.8	73.3	2.7
Mining	87.6	80.3	88.0	90.4	90.4	90.9	89.0	89.2	.4
Utilities	87.7	75.9	92.6	93.3	87.7	85.9	85.2	83.1	5.2

the nondurable consumer goods category, which slipped 0.4 percent. The production of nondurable non-energy products was flat; an increase in the output of chemical products offset declines in the production of foods and tobacco, clothing, and paper products.

The production of business equipment declined 0.6 percent in November. An increase in transit equipment was more than offset by further decreases in information-processing equipment and in industrial and other equipment. The output for each major category has fallen 13 percent to 14 percent in the past twelve months.

The output of defense and space equipment rose 0.4 percent, its third consecutive monthly increase. The output of construction supplies was unchanged as gains in plywood and flooring offset declines in gypsum and construction steel. The production of business supplies, which fell 1.2 percent, has declined 7.6 percent in the past twelve months.

The production of industrial materials fell 0.5 percent; both the durable and nondurable materials groups declined. Energy materials increased 0.1 percent as improvements in primary fuels more than offset declines in converted energy materials.

### Industry Groups

After consecutive decreases of 0.9 percent in September and October, manufacturing output declined 0.2 percent in November. The overall factory operating rate slipped 0.2 percentage point, to 73.0 percent, a level 6.2 percentage points below its year-ago level and 8.1 percentage points below its 1967–2000 average. The production of motor vehicles and parts jumped 6.4 percent; the production indexes both for autos and for light trucks registered large increases. Even so, the production of durable goods slipped 0.1 percent; widespread declines in the sector's remaining industries offset the large increase in motor vehicle output. Among durables, the output of primary metals and of aerospace and miscellaneous transportation equipment fell the most. Among nondurables, which declined 0.3 percent, only chemicals and products and textile mill products rose. A 2.0 percent decline in the output of petroleum products offset almost all of its October increase.

Production at mines ticked up 0.2 percent in November; the utilization rate rose 0.2 percentage point, to 89.2 percent, a level 1.6 percentage points above its 1967–2000 average. A warm November pushed down the output of utilities, which decreased 2.0 percent. The operating rate at utilities fell 2.1 percentage points; at 83.1 percent, it is more than 10 percentage points below its year-ago level and 4.6 percentage points below its 1967–2000 average.

## **Revision of Industrial Production and Capacity Utilization**

On November 27, the Federal Reserve Board published revisions to the index of industrial production (IP), to the related measures of capacity and capacity utilization, and to the index of industrial use of electric power. The updated measures reflected the incorporation of newly available, more comprehensive source data typical of annual revisions. The new source data were for recent years, primarily 1999 and 2000, although data from 1992 onward was subject to revision.

Industrial production and capacity utilization will continue to be based on the 1987 Standard Industrial Classification (SIC) until the 2002 annual revision, after which they will be constructed from the North American Industrial Classification System (NAICS). The new NAICS-related production indexes will be based on annual output measures that are constructed by reclassifying the establishments in historical Censuses of Manufactures and Mineral Industries under NAICS; annual output indexes constructed this way will maximize the reliability and historical consistency of the IP industry detail.

The updating of source data for IP in the 2001 annual revision included annual data from the 1999 Bureau of the Census Annual Survey of Manufactures and from selected editions of its 1999 and 2000 Current Industrial Reports. Annual data from the U.S. Geological Survey regarding metallic and nonmetallic minerals (except fuels) for 1999 and 2000 also were introduced. The updating included revisions to the monthly indicator for each industry (either physical product data, production-worker hours, or electric power usage) and to seasonal factors.

Capacity and capacity utilization were revised to incorporate preliminary data from the 2000 Survey of Plant Capacity of the Bureau of the Census, which covers manufacturing, along with other new data on capacity from the U.S. Geological Survey, the Department of Energy, and other organizations. The statistics on the industrial use of electric power incorporated additional information received from utilities for the past few years and included some data from the 1997 Census of Manufactures and the 1998 and 1999 Annual Survey of Manufactures.

The revision release and revised data are available on the Board's web site ([www.federalreserve.gov/releases/g17](http://www.federalreserve.gov/releases/g17)). The revised data also are available through the web site of the Department of Commerce. Further information on these revisions is available from the Board's Industrial Output Section (telephone 202-452-3197).

1. The IP proportion data are estimates of the industries' relative contributions to overall IP growth in the following year.

2. Semiconductors include related electronic components.

3. Millions of units at an annual rate.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, stone, clay, and glass products, semiconductors and related electronic components, and motor vehicle parts. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery except semiconductors and related electronic components, transportation equipment except motor vehicle parts, instruments, and miscellaneous manufactures.

1. Series begins in 1977.

2. Semiconductors include related electronic components.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, stone, clay, and glass products, semiconductors and related electronic components, and motor vehicle parts. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery except semiconductors and related electronic components, transportation equipment except motor vehicle parts, instruments, and miscellaneous manufactures.

## Explanatory Note

The statistical release of **Industrial Production and Capacity Utilization** reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. The release also includes monthly indexes on the use of electric power in manufacturing and mining. Files containing data in the release and historical data are available under “Research and Data” at [www.federalreserve.gov](http://www.federalreserve.gov), the Board’s World Wide Web site. For paid access to these files through the Department of Commerce’s Economic Bulletin Board or World Wide Web site, please call STAT-USA at 1-800-STAT-USA or (202) 452-1986. Diskettes containing historical data and the data published in this release are available from the Board of Governors of the Federal Reserve System, Publications Services, (202) 452-3245.

### Industrial Production

**Coverage.** The industrial production (IP) index measures output in the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 1992. For the period since 1997, the total IP index has been constructed from 276 individual series based on the 1987 Standard Industrial Classification (SIC). These individual series are classified in two ways: (1) market groups (shown in table 1), such as consumer goods, equipment, intermediate products, and materials; and (2) industry groups (shown in tables 2 and 6), such as two-digit SIC industries and major aggregates of these industries—for example, durable and nondurable manufacturing, mining, and utilities.

**Market groups.** For purposes of analysis, the individual IP series are grouped into final products, intermediate products, and materials. Final products are assumed to be purchased by consumers, businesses, or government for final use. Intermediate products are expected to become inputs in nonindustrial sectors, such as construction, agriculture, and services. Materials are industrial output requiring further processing within the industrial sector. Total products comprise final and intermediate products; final products are divided into consumer goods and equipment.

**Timing.** The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript “p” in tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript “r” in tables.) After the fourth month, indexes are not revised further until the time of an annual revision or a benchmark revision. The last three benchmark revisions were published in 1990, 1985, and 1976.

**Source data.** In annual or benchmark revisions, the individual IP indexes are constructed from a variety of source data, such as the quinquennial *Censuses of Manufactures and Mineral Industries* and the *Annual Survey of Manufactures*, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the U.S. Geological Survey; and publications of the Department of Energy. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations as well as from government agencies including those listed above; data of this type are used to estimate monthly IP where possible and appropriate. When suitable data on physical product are unavailable, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. Especially for the first and second estimates for a given month, the available source data are limited and subject to revision.

**Weights.** In the index, series that measure the output of an individual industry are weighted according to their proportion in the total value-added output of all industries. The industrial production index, which extends back to 1919, is built as a chain-type index since 1977. The components of IP are combined using annual estimates of value added per unit of output; for the data since 1992, the annual unit-value-added estimates are linearly interpolated to get monthly weights. The IP proportions shown in column 1 of tables 1A, 2A, and 6 are estimates of the industries’ relative contributions to overall growth in the following year. For example, a 1 percent increase in durable goods manufacturing in 1997 would account for an increase in total IP of nearly 1/2 percent.

**Seasonal adjustment.** Individual series are seasonally adjusted by the X–11 ARIMA method, developed at Statistics Canada. For series based on production-worker hours, the current seasonal factors were estimated with data through October 2000; for other series, the factors were estimated with data through at least June 2000. Series are preadjusted for the effects of holidays or the business cycle where appropriate. For the data since 1977, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

**Reliability.** The average revision to the *level* of the total IP index, without regard to sign, between the first and the fourth estimates was 0.27 percent during the 1987–99 period. The average revision to the *percent change* in total IP, without regard to sign, from the first to the fourth estimates was 0.21 percentage point during the 1987–99

period. In most cases (about 83 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

**Rounding.** The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

### Capacity Utilization

**Definition.** Capacity utilization is calculated for the manufacturing, mining, and electric and gas utilities industries. For a given industry, the utilization rate is equal to an output index divided by a capacity index. Output is measured by seasonally adjusted indexes of industrial production. The capacity indexes attempt to capture the concept of sustainable practical capacity, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work schedule, taking account of normal downtime, and assuming sufficient availability of inputs to operate the machinery and equipment in place. The 76 individual capacity indexes are based on a variety of data, including capacity data measured in physical units compiled by trade associations, surveys of utilization rates and investment, and estimates of growth of the capital input.

**Groups.** Estimates of capacity and utilization are available for a variety of groups, including primary and advanced processing industries within manufacturing, durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Component industries of the primary and advanced processing groups within manufacturing are listed in the note on tables 2 and 3 of the release.

**Weights.** Although each utilization rate is the result of dividing an IP series by a corresponding capacity index, aggregate utilization rates are equivalent to combinations of individual utilization rates aggregated with proportions that reflect current capacity levels of output valued in current-period value added per unit of actual output. The implied proportions of individual industry operating rates in the rate for total industry for the most recent year are shown in the first column of table 3.

**Perspective.** The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime.

### Electric Power

Data on electric power (expressed in kilowatt hours) are collected by the Federal Reserve District Banks from electric utilities and also from manufacturing and mining establishments that generate electric power for their own use (cogenerators). The indexes of power use shown in table 9 are sums of kilowatt hours used by an industry or industry group expressed as a percentage of that industry’s or group’s usage in 1992. The first column of the table shows, for reference, electric power use in billions of kilowatt hours as reported by manufacturing and mining industries in the 1992 censuses of those industries. The supplementary group, “Total, less nuclear nondefense,” is shown separately because the value-added proportion for the nondefense nuclear material series (part of SIC 2819) in total IP is considerably smaller than its share of total electric power use. Excluding this component from total power use facilitates comparisons with total IP.

### References

The annual revision published on December 5, 2000 was described more completely in the *Federal Reserve Bulletin*, vol. 87 (March 2001), pp. 132–148.

A description of the aggregation methods for industrial production and capacity utilization is included in an article in the *Federal Reserve Bulletin*, vol. 83 (February 1997), pp. 67–92. *Industrial Production—1986 Edition* contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. To obtain *Industrial Production—1986 Edition* (\$9.00 per copy), write to Board of Governors of the Federal Reserve System, Publications Services, Washington, DC 20551. The basic methodology used to estimate capacity and utilization was discussed in an article in the *Federal Reserve Bulletin*, vol. 86 (March 2000), pp. 188–205. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the *Federal Reserve Bulletin* (April 1990, June 1990, June 1993, March 1994, January 1995, January 1996, February 1997, February 1998, January 1999, and March 2000).

### Release Schedule

At 9:15 a.m. on:

**2001:** January 17, February 16, March 16, April 17, May 14, June 15, July 17, August 15, September 14, October 16, November 16, and December 14.  
**2002:** January 16, February 15, March 15, April 16, May 15, June 14, July 16, August 15, September 17, October 17, November 15, and December 17.
