Percent change

### INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production was unchanged in March for a second month but rose at an annual rate of 5.4 percent in the first quarter of 2012. Manufacturing output declined 0.2 percent in March but jumped 10.4 percent at an annual rate in the first quarter. The gain in manufacturing output in the first quarter was

r Revised. p Preliminary.

Note. The statistics in this release cover output, capacity, and capacity utilization in the U.S. industrial sector, which is defined by the Federal Reserve to comprise manufacturing, mining, and electric and gas utilities. Mining is defined as all industries in sector 21 of the North American Industry Classification System (NAICS); electric and gas utilities are those in NAICS sectors 2211 and 2212. Manufacturing comprises NAICS manufacturing industries (sector 31-33) plus the logging industry and the newspaper, periodical, book, and directory publishing industries. Logging and publishing are classified elsewhere in NAICS (under agriculture and information respectively), but historically they were considered to be manufacturing and were included in the industrial sector under the Standard Industrial Classification (SIC) system. In December 2002 the Federal Reserve reclassified all its industrial output data from the SIC system to NAICS.

broadly based: Even excluding motor vehicles and parts, which jumped at an annual rate of nearly 40 percent, manufacturing output moved up at an annual rate of 8.3 percent and output for all but a few major industries increased 5 percent or more. In March, production at mines rose 0.2 percent and the output of utilities gained 1.5 percent. For the quarter, however, the output of utilities dropped at an annual rate of 13.8 percent, largely as a result of unseasonably warm temperatures over the past several months, while the output of mining fell 5.4 percent. At 96.6 percent of its 2007 average, total industrial production for March was 3.8 percent above its year-earlier level. The rate of capacity utilization for total industry edged down to 78.6 percent, a rate 2.1 percentage points above its level from a year earlier but 1.7 percentage points below its long-run (1972–2011) average.

# Market Groups

The production of consumer goods fell 0.2 percent in March; for the first quarter, output moved up at an annual rate of 2.4 percent. In March, the index for durable consumer goods decreased 0.5 percent, primarily as a result of declines in automotive products and in appliances, furniture, and carpeting. Even so, the output of durable consumer goods increased at an annual rate of 17.6 percent in the first quarter. The production of nondurable consumer goods decreased 0.2 percent in March; the output of non-energy nondurable consumer goods edged down 0.1 percent—all of its major components except miscellaneous consumer nondurables decreased—while the index for consumer energy products declined 0.3 percent.

The production of business equipment moved up 0.2 percent in March, its smallest gain since June 2011; from July 2011 through February 2012, this index had advanced more than 1 percent per month on average. In March, gains in transit equipment and in industrial and other equipment more than offset a pullback of 0.9 percent in the production of information processing equipment. In the first quarter, the output of business equipment advanced at an annual rate of 15.9 percent.

The index for defense and space equipment declined 0.7 percent in March after having gained 2.0 percent in February. This category posted an increase of 5.1 percent at an annual rate in the first quarter.

The production of construction supplies fell 1.3 percent in March after having advanced 1.9 percent in February. For the first quarter, construction supplies recorded an increase of 11.5 percent at an annual rate, its largest gain in nearly two years; nevertheless, production remained about 20 percent below its pre-recession level. The index for business supplies moved up 0.2 percent in March after being unchanged in February.

The output of materials to be further processed in the industrial sector rose 0.2 percent in March and increased at an annual rate of 5.1 percent in the first quarter. The index for durable materials was down 0.3 percent in March, its first decrease since April 2011: The output of consumer parts was unchanged and the production of equipment parts moved up 0.4 percent, but the index for other durable materials fell 0.9 percent. Consumer parts posted an increase of 34.7 percent in the first quarter, its largest advance since the second quarter of 2010. The production of nondurable materials edged up 0.1 percent in March; a gain in chemical materials was mostly offset by a loss in paper materials. The output index for energy materials rose 0.8 percent after three months of declines.

# **Industry Groups**

Manufacturing output declined 0.2 percent in March but increased at an annual rate of 10.4 percent in the first quarter, the largest gain since the second quarter of 2010. Capacity utilization for manufacturing in March moved down 0.2 percentage point to 77.8 percent, a rate 14.0 percentage points above its trough in June 2009 but still 1.0 percentage point below its long-run average.

Within manufacturing, the output of durable goods declined 0.2 percent in March after having gained 1.2 percent in February. Among durables, the largest decreases in March were posted by nonmetallic mineral products, primary metals, and furniture and related products while moderate gains were recorded by wood products, machinery, motor vehicles and parts, and miscellaneous manufacturing. For the first quarter as a whole, durable goods manufacturing increased at an annual rate of 15.6 percent, with large gains for all of its major components.

The production of nondurable goods decreased 0.2 percent in March, but output increased at an annual rate of 5.7 percent in the first quarter, with increases for every major industry group. Among the major components of nondurables, only the indexes for textile and product mills and for chemical products moved up in March; the largest decreases were in apparel and leather, in printing and related support, and in petroleum and coal products.

Mining production edged up 0.2 percent in March after having dropped 4.0 percent in February. Capacity utilization in mining inched up to 87.5 percent in March and was 0.2 percentage point above its long-run average. The output of utilities increased 1.5 percent after having risen only 0.1 percent in February. The operating rate for utilities in March improved to 73.1 percent but still remained more than 4.5 percentage points below its average during 2011.

Capacity utilization rates in March at industries grouped by stage of process were as follows: At the crude stage, utilization increased 0.3 percentage point to 86.5 percent, a rate 0.2 percentage point above its long-run average; at the primary and semifinished stages, utilization was unchanged at 75.7 percent, a rate 5.4 percentage points below its long-run average; and at the finished stage, utilization slipped 0.3 percentage point, to 78.5 percent, a rate 1.3 percentage points above its long-run average.

### **Revision of Industrial Production and Capacity Utilization**

The Federal Reserve Board issued its annual revision to the index of industrial production (IP) and the related measures of capacity utilization at noon EDT on March 30, 2012. The revised IP indexes incorporated detailed data from the 2010 Annual Survey of Manufactures, conducted by the U.S. Census Bureau. Annual data from the U.S. Geological Survey regarding metallic and nonmetallic minerals (except fuels) for 2010 were also incorporated. The update included revisions to the monthly indicator and to seasonal factors for each industry. In addition, the estimation methods for some series have changed. Modifications to the methods for estimating the output of an industry did affect the index from 1972 to the present.

Capacity and capacity utilization were revised to incorporate data through the fourth quarter of 2011 from the Census Bureau's Quarterly Survey of Plant Capacity, which covers manufacturing, along with new data on capacity from the U.S. Geological Survey, the Department of Energy, and other organizations.

The revision is available on the Board's website at www.federalreserve.gov/releases/G17. Further information on the revision can be obtained from the Board's Industrial Output Section (telephone number 202-452-3197).

# 1. Industrial production, capacity, and utilization

Note: The shaded areas are periods of business recession as defined by the National Bureau of Economic Research (NBER).

# 2. Industrial production and capacity utilization

## 3. Industrial production and capacity utilization, high-technology industries

Notes: High-technology industries are defined as semiconductors and related electronic components (NAICS 334412-9), computers (NAICS 3341), and communications equipment (NAICS 3342).

The shaded areas are periods of business recession as defined by the NBER.

r Revised. p Preliminary.

NOTE. Under the industry groups, the figures to the right of the series descriptions are 2002 North American Industry Classification System (NAICS) codes. The abbreviation pt denotes part of a NAICS code. Additional industry detail is available on the Board's web site (www.federalreserve.gov/releases/G17). Under market groups, in the products category, miscellaneous consumer nondurables, oil and gas drilling, and manufactured homes are not shown separately; in the nondurable materials category, containers and miscellaneous nondurable materials are not shown

<sup>1.</sup> The proportion data are the relative weights for the rates of change for each series in the computation of the change in total industrial production in the following year.

2. Selected high-technology industries are computers, communications equipment, and semiconductors and related electronic components.
3. Quarterly changes are at annual rates. Annual changes are calculated from annual averages.

value added divided by the average annual IP index.

The Industrial Production and Capacity Utilization statistical release, which is published around the middle of the month, reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. More detailed descriptions of industrial production and capacity utilization are available on the Board's website at <a href="https://www.federalreserve.gov/releases/G17">www.federalreserve.gov/releases/G17</a>. In addition, the website includes files containing data shown in the release, more detailed series that are published in a monthly supplement to the G.17, and historical data. Instructions on searching for and downloading specific series are provided as well.

#### INDUSTRIAL PRODUCTION

**Coverage.** The industrial production (IP) index measures the real output of the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 2007. Manufacturing consists of those industries included in the North American Industry Classification System (NAICS) definition of manufacturing plus those industries— newspaper, periodical, book, and directory publishing plus logging—that have traditionally been considered to be manufacturing. For the period since 1997, the total IP index has been constructed from 312 individual series based on the 2002 NAICS codes. These individual series are classified in two ways: (1) market groups, and (2) industry groups. Market groups consist of products and materials. Total products are the aggregate of final products, such as consumer goods and equipment, and nonindustrial supplies (which are inputs to nonindustrial sectors). Materials are inputs in the manufacture of products. Major industry groups include three-digit NAICS industries and aggregates of these industries—for example, durable and nondurable manufacturing, mining, and utilities. A complete description of the market and industry structures, including details regarding series classification, relative importance weights, and data sources, is available on the Board's web site (www.federalreserve.gov/releases/G17/About.htm).

Source data. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations and from government agencies; data of this type are used to estimate monthly IP wherever possible and appropriate. Production indexes for a few industries are derived by dividing estimated nominal output (calculated using unit production and unit values or sales) by a corresponding Fisher price index; the most notable of these fall within the high-technology grouping and include computers, communications equipment, and semiconductors. When suitable direct measures of product are not available, estimates of output are based on production-worker hours by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive annual data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. The annual data used in benchmarking the individual IP indexes are constructed from a variety of source data, such as the quinquennial Censuses of Manufactures and Mineral Industries and the Annual Survey of Manufactures, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the United States Geological Survey of the Department of the Interior; and publications of the Department of Energy.

Aggregation Methodology and Weights. The aggregation method for the IP index is a version of the Fisher-ideal index formula. (For a detailed discussion of the aggregation method, see the Federal Reserve Bulletins of February 1997 and March 2001.) In the IP index, series that measure the output of an individual industry are combined using weights derived from their proportion in the total value-added output of all industries. The IP index, which extends back to 1919, is built as a chain-type index since 1972. The current formula for the growth in monthly IP (or any of the sub-aggregates) since 1972 is shown below. An output index for month m is denoted by  $I_m^A$  for aggregate A and  $I_m$  for each of its components. The monthly price measure in the formula  $(p_m)$  is interpolated from an annual series of

$$\frac{I_{m}^{A}}{I_{m-1}^{A}} = \sqrt{\frac{\sum I_{m}p_{m-1}}{\sum I_{m-1}p_{m-1}}} \times \frac{\sum I_{m}p_{m}}{\sum I_{m-1}p_{m}}$$

The IP proportions (typically shown in the first column of the relevant tables in the G.17 release) are estimates of the industries' relative contributions to overall growth in the following year. For example, the relative importance weight of the motor vehicles and parts industry is about 4 percent. If output in this industry increased 10 percent in a month, then this gain would boost growth in total IP by 4/10 percentage point  $(0.04 \times 10\% = 0.4\%)$ . To assist users with calculations, the Federal Reserve's web site provides supplemental monthly statistics that represent the exact proportionate contribution of a monthly change in a component index to the monthly change in the total index (www.federalreserve.gov/releases/G17/ipdisk/IPWeightsSa.txt).

**Timing.** The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in tables) and subject to revision in each of the subsequent five months as new source data become available. (Revised estimates are denoted by the superscript "r" in tables.) For the first estimate of output for a given month, about 67 percent of the source data (in value-added terms) are available; the fraction of available source data increases to 81 percent for estimates in the second month that the estimate is published, 93 percent in the third month, 96 percent in the fourth month, 99 percent in the fifth month, and 99 percent in the sixth month. Data availability by data type in early 2011 is summarized in the table below:

**Availability of Monthly IP Data in Publication Window** (Percent of value added in 2011)

	Month of estimate										
Type of data	1st	2nd	3rd	4th	5th	6th					
Physical product	27	41	53	55	58	58					
Production-worker hours	41	41	41	41	41	41					
IP data received	67	81	93	96	99	99					
IP data estimated	33	19	7	4	1	1					

The physical product group includes series based on either monthly or quarterly data. As can be seen in the first row of the table, in the first month, a physical product indicator is available for about half of the series (in terms of value added) that ultimately are based on physical product data (27 percent out of a total of 58 percent). Of the 27 percent, about two-thirds (19 percent of total IP) include series that are derived from weekly physical product data and for which actual monthly data may lag up to several months. On average, quarterly product data are received for the fourth estimate of industrial production. Specifically, quarterly data are available for the third estimate of the last month of a quarter, the fourth estimate of the second month of a quarter, and the fifth estimate of the first month of a quarter.

Seasonal adjustment. Individual series are seasonally adjusted using Census X-12 ARIMA. For series based on production-worker hours, the current seasonal factors were estimated with data through January 2011; for other series, the factors were estimated with data through at least December 2010. Series are pre-adjusted for the effects of holidays or business cycles when appropriate. For the data since 1972, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

**Reliability.** The average revision to the *level* of the total IP index, without regard to sign, between the first and the fourth estimates was 0.27 percent during the 1987–2010 period. The average revision to the *percent change* in total IP, without regard to sign, from the first to the fourth estimates was 0.21 percentage point during the 1987–2010

period. In most cases (about 85 percent), the direction of the change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

#### CAPACITY UTILIZATION

Overview. The Federal Reserve Board constructs estimates of capacity and capacity utilization for industries in manufacturing, mining, and electric and gas utilities. For a given industry, the capacity utilization rate is equal to an output index (seasonally adjusted) divided by a capacity index. The Federal Reserve Board's capacity indexes attempt to capture the concept of sustainable maximum output—the greatest level of output a plant can maintain within the framework of a realistic work schedule, after factoring in normal downtime and assuming sufficient availability of inputs to operate the capital in place.

**Coverage.** Capacity indexes are constructed for 89 detailed industries (71 in manufacturing, 16 in mining, and 2 in utilities), which mostly correspond to industries at the three- and four-digit NAICS level. Estimates of capacity and utilization are available for a variety of groups, including durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Manufacturing consists of those industries included in the North American Industry Classification System (NAICS) definition of manufacturing plus those industries— newspaper, periodical, book, and directory publishing plus logging—that have traditionally been considered to be manufacturing. Also, special aggregates are available, such as high-technology industries and manufacturing excluding high-technology industries.

Source Data. The monthly rates of capacity utilization are designed to be consistent with both the monthly data on production and the periodically available data on capacity and utilization. Because there is no direct monthly information on overall industrial capacity or utilization rates, the Federal Reserve first estimates annual capacity indexes from the source data. Capacity data reported in physical units from government sources (primarily from the U.S. Geological Survey and the Department of Energy's Energy Information Administration) and trade sources are available for portions of several industries in manufacturing (e.g., paper, industrial chemicals, petroleum refining, motor vehicles), as well as for electric utilities and mining; these industries represent about 25 percent of total industrial capacity. When physical product data are unavailable for manufacturing industries, capacity indexes are based on responses to the Bureau of the Census's Quarterly Survey of Plant Capacity (QSPC); these industries account for a bit less than 70 percent of total industry capacity. In the absence of utilization data for a few mining and petroleum series, capacity is based on trends through peaks in production (roughly 5 percent of total industry capacity). A detailed description of the methodology used to construct the capacity indexes is available on the Board's web site (www.federalreserve.gov/releases/G17/CapNotes.htm).

Aggregation Methodology. Monthly capacity aggregates are calculated in three steps: (1) utilization aggregates are calculated on an annual basis through the most recent full year as capacity-weighted aggregates of individual utilization rates; (2) the annual aggregate capacity is derived from the corresponding production and utilization aggregates; (3) the monthly capacity aggregate is obtained by interpolating the annual capacity aggregate with a Fisher index of its constituent monthly capacity series. Utilization rates for the individual series and aggregates are calculated by dividing the pertinent monthly production index by the related capacity index.

**Consistency.** A major aim is that the Federal Reserve utilization rates be consistent over time so that, for example, a rate of 85 percent means about the same degree of tightness that it meant in the past. A major task for the Federal Reserve in developing reasonable and consistent time series of capacity and utilization is dealing with inconsistencies between the movements of the industrial production index and the survey-based utilization rates. The McGraw-Hill/DRI Survey, now discontinued, was the primary source of manufacturing

utilization rates for many years. This was a survey of large companies that reported, on average, higher utilization rates than those reported by establishments covered by the Census Bureau's annual Survey of Plant Capacity (the predecessor to the QSPC) for the fourteen years they overlapped. Adjustments have been made to keep the industry utilization rates currently reported by the Federal Reserve roughly in line with rates formerly reported by McGraw-Hill. As a consequence, the rates reported by the Federal Reserve tend to be higher than the rates reported in the QSPC.

**Perspective.** Over the 1972–2010 period, the average total industry utilization rate is 80.4 percent; for manufacturing, the average factory operating rate has been 79.0 percent. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime. The highs and lows in capacity utilization shown in table 7 are specific to each series and do not all occur in the same month.

### REFERENCES AND RELEASE DATES

References. The release for the annual revision that was published on March 25, 2011 is available on the Board's website (www.federal  $reserve.gov/releases/g17/revisions/Current/DefaultRev.htm). \ A$ summary of the annual revision that incorporated back to 1972 production and capacity indexes reclassified according to the North American Industry Classification System is available in an article in the Federal Reserve Bulletin, vol. 89 (April 2003), pp. 151–176. A description of the aggregation methods for industrial production and capacity utilization is included in an article in the Federal Reserve Bulletin, vol. 83 (February 1997), pp. 67-92. The Federal Reserve methodology for constructing industry-level measures of capital is detailed in "Capital Stock Estimates for Manufacturing Industries: Methods and Data" by Mike Mohr and Charles Gilbert (1996), which can be obtained at:

www.federalreserve.gov/releases/g17/CapitalStockDocLatest.pdf.

Industrial Production—1986 Edition contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the Federal Reserve Bulletin (April 1990, June 1990, June 1993, March 1994, January 1995, January 1996, February 1997, February 1998, January 1999, March 2000, March 2001, March 2002, April 2003, Winter 2004, Winter 2005, March 2006, May 2007, August 2008, August 2009) or in an on-line staff study (www.federalreserve.gov/releases/g17/articles/rev2010/industrial10.pdf).

### Release Schedule

At 9:15 a.m. on

2012: January 18, February 15, March 16, April 17, May 16, June 15, July 17, August 15, September 14, October 16, November 16, and December 14.
