Re: Basel III Capital Proposals

Ladies and Gentlemen:

Thank you for the opportunity to provide comment on the Basel III proposals that were recently issued for public comment by the Federal Reserve Board, the Office of the Comptroller of the Currency, and the Federal Deposit Insurance Corporation.

Community banks should be allowed to continue using the current Basel I framework for computing their capital requirements. Basel III was designed to apply to the largest, internationally active, banks and not community banks. Community banks did not engage in the highly leveraged activities that severely depleted capital levels of the largest banks and created panic in the financial markets. Community banks operate on a relationship-based business model that is specifically designed to serve customers in their respective communities on a long-term basis. This model contributes to the success of community banks all over the United States through practical, common sense approaches to managing risk. The largest banks operate purely on transaction volume and pay little attention to the customer relationship. This difference in banking models demonstrates the need to place tougher capital standards exclusively on the largest banks to better manage the ability to absorb losses.

Inclusion of accumulated other comprehensive income (AOCI) in capital for community banks will result in increased volatility in regulatory capital balances and could rapidly deplete capital levels under certain economic conditions.

Interest rates have fallen to levels that are unsustainable long-term once an economic recovery accelerates. As interest rates rise, fair values will fall causing the balance of AOCI to decline and become negative. This decline will have a direct, immediate impact on common equity, tier 1, and total capital as the unrealized losses will reduce capital balances.

Large financial institutions have the ability to mitigate the risks of capital volatility by entering into qualifying hedge accounting relationships for financial accounting purposes with the use of interest rate derivatives like interest rate swap, option, and futures contracts. Community banks do not have the knowledge or expertise to engage in these transactions and manage their associated risks, costs, and barriers to entry. Community banks should continue to exclude AOCI from capital measures as they are currently required to do today.

Implementation of the capital conservation buffers for community banks will be difficult to achieve under the proposal and therefore should not be implemented. Many community banks will need to build additional capital balances to meet the minimum capital requirements with the buffers in place. Community banks do not have ready access to capital that the larger banks have through the capital markets. The only way for community banks to increase capital is through the accumulation of retained earnings over time. Due to the current ultra low interest rate environment, community bank profitability has diminished further hampering their ability to grow capital. If the regulators are unwilling to exempt community banks from the capital conservation buffers, additional time should be allotted (at least five years beyond 2019) in order for those banks that need the additional capital to retain and accumulate earnings accordingly.

The proposed risk weight framework under Basel III is too complicated and will be an onerous regulatory burden that will penalize community banks and jeopardize the housing recovery. Increasing the risk weights for residential balloon loans, interest-only loans, and second liens will penalize community banks who offer these loan products to their customers and deprive customers of many financing options for residential property. Additionally, higher risk weights for balloon loans will further penalize community banks for mitigating interest rate risk in their asset-liability management. Many community banks will either exit the residential loan market entirely or only originate those loans that can be sold to GSE. Second liens will either become more expensive for borrowers or disappear altogether as banks will choose not to allocate additional capital to these balance sheet exposures. Community banks should be allowed to stay with the current Basel I risk weight framework for residential loans. Furthermore, community banks will be forced to make significant software upgrades and incur other operational costs to track mortgage loan-to-value ratios in order to determine the proper risk weight categories for mortgages.

Imposing distribution prohibitions on community banks with a Subchapter S corporate structure conflicts with the requirement that shareholders pay income taxes on earned income. Those banks with a Subchapter S capital structure would need to be exempt from the capital conservation buffers to ensure that their shareholders do not violate the provisions of the Internal Revenue Code. It should be recommended that the capital conservation buffers be suspended during those periods where the bank generates taxable income for the shareholder.

At best, implementation and monitoring of the Basel III provisions would be onerous and confusing for small banks. Federal Reserve Chairman Ben Bernanke said during his September 13, 2012 press conference that "banks that are under \$500 million have special exemptions from [the Basel III] rules". This statement is confusing. The proposed Basel III applies to all banks regardless of size. Mr. Bernanke's statement is only one example of the confusion to be caused between the various regulatory agencies.

We recommend and urge you to exempt banks with assets less than \$500 million from the proposed requirements of Basel III.

Thank you for your consideration.
