Secretary, Board of Governors of the Federal Reserve System
20th Street and Constitution Avenue, NW
Washington, DC 20551
Docket No. R-1442;
RIN No. 7100-AD87

Dear Sir or Madam,

The Conference of State Bank Supervisors (CSBS) appreciates the opportunity to comment on the Federal Deposit Insurance Corporation's (FDIC's), the Board of Governors of the Federal Reserve System's (FRB's), and the Office of the Comptroller of the Currency's (OCC's) (collectively, "the Agencies") joint Notice of Proposed Rulemaking (NPR, proposal, or proposed rule) to adjust the Agencies' general risk-based capital requirements for determining risk-weighted assets, entitled *Regulatory Capital Rules: Standardized Approach for Risk-Weighted Assets; Market Discipline and Disclosure Requirements.*

CSBS supports the Agencies' efforts to improve capital standards for the US banking system. We hope the Agencies will work to establish standards that are in the best interest of all financial institutions and the larger US economy. We have provided feedback on the Agencies' Basel III proposed rule in a separate comment letter. Our comments on the Standardized Approach proposed rule are organized in the sections below.

Summary of CSBS Position

CSBS is opposed to the proposed rule to revise the risk weights for risk-based capital. We come to this very clear position after extensive study of the proposal and dialogue with state supervisors. This position is based on the following concerns and beliefs:

1. The proposed rule is reactionary to the most recent crisis with a focus on housing and commercial real estate.

1129 20TH STREET, N.W. • NINTH FLOOR • WASHINGTON, DC • 20036
WWW.CSBS.ORG • 202-296-2840 • FAX 202-296-1928

2. The approach proposed by the Agencies will curtail bank lending in traditional mortgage products that they have generally managed well.
3. There is no empirical support for the proposed risk weights.
4. As we seek to address concerns that emerged from the financial crisis, greater appreciation must be paid to risk management and the supervisory process to address evolving risk concentrations rather than capital weightings of broad asset types based solely on imperfect correlations perceived from the last crisis.
5. The proposed framework is overly complex.
6. There is not sufficient understanding of the impact of the proposed rule on the industry, the potential change in business practices, and the impact on credit availability.

The approach taken by the Agencies is targeted at the major risk drivers for problem banks during this crisis. However, while over 450 institutions failed from 2008 through the present, we must remember that the majority of institutions did not fail. In fact, out of the nearly 2,300 banks with concentrations in commercial real estate loans in 2007, over 1,200 maintained a low level of problem assets and are profitable today.

As we seek to improve the quality and quantity of capital, we believe it is important to resist the temptation to address every financial weakness through capital. We must seek to apply lessons learned to improving risk management and the supervision process. If not, we will continuously seek to make the industry more risk averse, which will curtail access to credit and harm economic growth.

CSBS has supported prior agency efforts to enhance the risk sensitivity of the capital rules. We commented in January 2006:

> "a successful domestic capital framework will not only benefit individual financial institutions which effectively utilize risk management tools, but will also benefit the banking system as a whole by providing greater ability to effectively and efficiently manage capital."

The challenge before the Agencies is to do this while not adding complexity. We do not believe the rule as proposed meets these objectives. The proposed rule is not balanced in its treatment of exposures and will present undue complexity for the industry. Unfortunately, we must recognize that risk-based capital has limited utility for bank management. Bankers have clearly communicated to state commissioners that they view this as a regulatory exercise, not a tool for risk management. We must question the value of a proposed regulation which provides little or no value to the industry. As state and federal supervisors find value in the framework, we believe it would be worthwhile to enhance our collective understanding on a framework which would prove valuable for the industry and the regulators.

In order to truly improve the risk sensitivity of the capital rules, the categorization of exposures and risk weights need to be supported. The categorization of assets should be aligned with the variety of practices of banks for the origination of credit, while accepting that banks have different levels and areas of expertise and appetite for risk. The assigned risk weights must have a reasonable correlation with the risk and not be used as a tool for the allocation of credit and the creation of an overall more conservative industry.

In the implementation of Basel II, the Agencies went through a series of "Quantitative Impact Studies." This was important to understand the impact on banks and the ability to conform to the framework. From this, public policy makers and observers were able to judge and opine on the readiness of institutions, the impact on the banks, and the potential changes to the credit markets and availability. While a comprehensive impact study would create its own burdens, the system and the economy are ill-served by not having a better understanding of the desirable and undesirable ramifications of changing the risk weights in the manner proposed. Based on industry reactions, the proposal will clearly have a negative impact on credit allocation. Policy makers have a responsibility to understand these changes and evaluate the potential impact on the banking system and economy.

RESIDENTIAL MORTGAGE EXPOSURES

Current risk-based capital requirements generally prescribe a 50% risk-weighting for residential mortgage exposures. The proposed rule introduces a complex scheme for risk-weighting residential mortgage exposures. This process divides residential mortgage exposures into two categories: Category 1 and Category 2. The Agencies have proposed a detailed set of standards that mortgages must meet in order to achieve Category 1 status. Among other criteria, Category 1 mortgages must be fully amortizing, without a balloon payment, and meet strict underwriting criteria. Any mortgage that does not meet the Category 1 criteria would be deemed a Category 2 mortgage.

Once a mortgage is categorized, its risk-weighting would be assigned based on the Loan-to-Value (LTV) ratio of the loan within the eligible risk-weighting range of the category. Category 1 mortgages would be assigned a risk-weighting between 35% and 100% based on LTV. Category 2 mortgages would be assigned a risk-weighting between 100% and 200% based on LTV.

CSBS believes the proposed treatment of residential mortgage exposures will have a detrimental effect on access to mortgage credit. We strongly oppose the proposed scheme for risk-weighting residential mortgage exposures, and we urge the Agencies to re-work or abandon the proposed approach. Chief among our concerns is the excessively narrow criteria for Category 1 mortgages. In our estimation, traditional products such as adjustable-rate mortgages (ARMs) and other products with balloon features would not qualify as Category 1, subjecting them to the Category 2 risk weights. Many banks also offer second lien and Home Equity Lines of Credit (HELOCs). This is an important source of credit for consumers and small businesses. These loans would also be designated as Category 2. The highly punitive risk-weightings for all mortgages in Category 2 would effectively discourage institutions from engaging in such transactions. Thus, designation of these transactions as Category 2 loans will largely eliminate an important source of credit for consumers and small businesses and a reliable business line for the institutions, thereby restricting access to credit and negatively impacting the safety and soundness of banking institutions, and the overall economy.

We are concerned that the rule unnecessarily paints these products with a very broad brush. This could have an impact on the availability of certain loan products. There were certainly problems with some adjustable rate and balloon products in the financial crisis. However, these problems should be addressed in a manner that does not inhibit traditional products that banks have managed successfully and that have benefited consumers. The legitimate concerns generated from the poor underwriting and risk management practices of a few institutions should not be addressed through a capital rule applicable to the entire industry. If the proposal is adopted in its current form, the banking industry will enter a counterintuitive phase whereby unsecured loans, which receive a 100% risk-weighting under the proposal, will effectively be deemed safer than many loans secured by collateral, a concept that contradicts the basic principles of banking. Furthermore, the proposed risk-weighting framework will push more residential mortgage business into lines that receive government support, as most government sponsored mortgage programs receive a low risk-weighting under the proposal.

It is critical to acknowledge that while the residential mortgage industry is vast, and a large portion of mortgage activity takes place off banks' books, the volume of residential mortgage exposure held in portfolio at banking organizations is not at all insignificant. Indeed, the commercial banking industry holds over $2 trillion in residential mortgage exposure in portfolio. Notably, residential mortgage exposures comprise an average of 17% of a bank's assets. While the securitization market has become the dominant source of mortgage funding, the assumption that this is not an important exposure for banks is incorrect. A bank's ability to originate and hold residential mortgage product is an important part of its asset mix and allows for a customization of credit beneficial for the consumer. Public policy should not inhibit this activity.

In a period where a coherent plan for addressing broader housing finance reform has not emerged, we believe this proposal, which would limit residential mortgage activity at institutions that are willing to take on the risk associated with this important class of credit, is ill-advised.

HIGH VOLATILITY COMMERCIAL REAL ESTATE (HVCRE)

Current risk-based capital requirements prescribe a 100% risk-weighting for acquisition, development, and construction (ADC) loans. The Agencies have proposed a new risk-weighting for High Volatility Commercial Real Estate (HVCRE) loans. An HVCRE loan would be defined as a credit facility that finances or has financed the acquisition, development, or construction of real property, unless the facility finances one-to four-family residential properties or commercial real estate projects that demonstrate certain LTV or borrower contribution standards. HVCRE loans would receive a 150% risk weighting under the proposal.

The impact of the proposed treatment of HVCRE loans could have negative unintended consequences for banks and the broader economy. The proposed approach, with a highly punitive risk weight, fails to adequately account for an institution's experience and expertise in this type of lending, the adequacy of its policies and procedures, and the level of concentration. Issues with development and construction lending should be addressed at the risk management level and through the supervisory process. The proposed 150% risk weighting is effectively telling institutions not to engage in this type of lending.

Strikingly, under the proposed rule, sovereign debt that is in default receives the same risk-weighting treatment as the construction and development loans detailed above. Other sovereign debt in substantially struggling countries that are not in default receives a potentially more attractive risk-weighting than HVCRE loans. Considering these relative risk-weightings, the Agencies are effectively signaling to banking organizations that investing in struggling countries such as Greece is as sound as investing in real estate projects in their local communities. This implied direction will cause many banking institutions, particularly community banks, to re-evaluate their asset mix to the detriment of community focused business lending.

We recognize construction and development lending has posed significant risks for many community banks over the past few years. However, as discussed above, to the extent a construction and development loan poses safety and soundness issues for an institution, those issues should be addressed through the supervisory process. The Agencies should not feel compelled to penalize broad types of transactions through capital rules rather than addressing the concentrations that were problematic during the last crisis. Further, it is important to note that while many community banks struggled in their risk assessment of construction and development loans, many more were successful and prudent in construction and development lending. The successful banks frequently established loan concentration limits that forced them to engage in prudent risk selection which recognized the distinct differences within broad loan types. CSBS therefore urges the Agencies to re-contemplate the proposed framework for HVCRE loans.

PAST DUE EXPOSURES

Under current general risk-based capital rules, the risk weighting of an exposure does not change if it becomes past due, with the exception of residential mortgage loans. In the NPR, the Agencies have proposed to require banking organizations to assign a risk-weight of 150% to an exposure that is not guaranteed or not secured if it is 90 days or more past due or on nonaccrual.

This provision will introduce more volatility and potentially sudden shocks into the capital planning process. Additionally, we note that levels of past due exposures may change frequently from quarter to quarter. We should strive to establish provisions that will not cause frequent fluctuations in risk-weighted assets on a quarterly basis.

CSBS would also like to point out that increasing the risk-weighting for past due loans involves some measure of "double-counting." When an exposure becomes past due, there are generally allowance provisions that require institutions to reserve capital for those exposures in case they default, effectively lowering institutions' capital levels. Therefore, increasing the risk-weighting for past due loans will effectively adjust both the numerator and denominator in risk-based capital ratios, compounding the negative effect on the ratio.

Finally, it is important to note that there exist classes of past due loans that are designated as such for administrative reasons. For example, exposures may be past due while institutions are waiting on financial statements, appraisals, or other pertinent financial information. In these cases, institutions will refrain from renewing the loan until the technical issues are resolved. We do not believe institutions should have to hold additional capital against these types of past due exposures.

Off-Balance Sheet Exposures

Within the context of off-balance sheet exposures, the NPR states that if a banking organization provides a credit enhancing representation or warranty on assets it sold or otherwise transferred to third parties, including in cases of early default clauses or premium-refund clauses, the banking organization would treat such an arrangement as an off-balance sheet guarantee and apply a 100% credit conversion factor to the exposure amount. While it appears that standard representations and warranties for fraud, misrepresentation, & documentation deficiencies that have traditionally accompanied secondary market sales of mortgages to investors would be exempted from the risk-based capital requirements, we request the Agencies explicitly clarify whether these traditional representations and warranties are indeed exempt. We believe that requiring institutions to hold capital against these representations and warranties will have detrimental consequences for mortgage banking.

Securitizations

Dodd-Frank requires financial regulators to strip references to credit ratings from their regulations. This clearly has an implication for securitizations, as the risk-weighting framework in this area has traditionally referenced credit ratings. Under the proposal, a banking organization would generally calculate a risk-weighted asset amount for a securitization exposure by applying either: (1) the simplified supervisory formula approach (SSFA), or (2) for banking organizations not subject to the market risk rule, a gross-up approach similar to an approach provided under the general risk-based capital rules. Alternatively, a banking organization may choose to apply a 1,250% risk weight to any of its securitization exposures.

We acknowledge that the Agencies are required to adjust their regulations in this area to account for the Dodd-Frank mandate. We would like to note that the proposed approaches for measurement and due diligence requirements, which generally require complex methods of evaluating the underlying collateral in securitizations, may be difficult for community banks to administer, and the alternative proposed risk-weighting is punitive. CSBS encourages the Agencies to explore a simpler method for applying these standards to community banks. We are concerned the proposed approach will significantly impair an institution's ability to manage its balance sheet through the economic cycle. We believe that in order to have a vibrant and diverse banking system, banks of all sizes need the ability to manage the balance sheet with a variety of exposures.

Equity Exposures

Under the proposal, a banking organization would determine the risk-weighted asset amount for each equity exposure by multiplying the adjusted carrying value of the equity exposure by the applicable risk weight set out in the Agencies' proposed Simple Risk-weight Approach Table for equity exposures. The proposal also permits banking organizations to apply a 100% risk weighting to certain equity exposures deemed non-significant.

The Simple Risk-weight Approach Table is straightforward. However, we believe the scope of the 400% equity exposure category applied to non-publicly traded entities should be clarified. We would be particularly concerned if this risk-weighting is assigned to equity exposures such as stock ownership in bankers' banks. It seems that stock ownership in bankers' banks might qualify as a non-significant equity exposure if the ownership meets certain characteristics, thereby achieving a lower risk-weighting. Nevertheless, the industry would benefit from clarity in this area. The Agencies also inquire as to whether they should explore an alternative proposal to simplify the risk-based capital treatment of banking organizations' non-significant equity exposures. We support such an effort.

OTC DERIVATIVES

CSBS requests clarity on what is meant by "netting" within the context of OTC Derivatives in the proposed rule. Netting occurs in many forms. If the proposed rule is simply referring to netting within the context of various master netting agreements, we would like to note that the definition of netting within those agreements can vary widely. To the extent institutions comply with this provision, the Agencies should be aware of the variety of netting arrangements that exist under the master agreements.

MARKET DISCIPLINE AND DISCLOSURE REQUIREMENTS

The Basel Committee on Banking Supervision (BCBS) introduced additional capital disclosure requirements in its 2011 paper entitled, "Definition of Capital Disclosure Requirements." The Agencies are proposing to apply these disclosure requirements to banking organizations with assets greater than $50 billion. CSBS endorses the Agencies' proposed disclosure requirements for large institutions. However, it is important to ensure that these requirements will not flow down to community banks in the future. We generally do not believe that the specific disclosure requirements would be necessary for smaller banks or beneficial to community bank stakeholders.

REGULATORY FLEXIBILITY ACT ANALYSIS

The Regulatory Flexibility Act (RFA), 5 U.S.C. 601 requires an agency to provide an initial regulatory flexibility analysis with a proposed rule or to certify that the rule will not have a significant economic impact on a substantial number of small entities (defined for purposes of the RFA to include banking entities with assets less than or equal to $175 million).

We are troubled by the inconsistent and, in our view, inadequate approach the Agencies took in addressing this requirement. The FDIC and the OCC certify in their analyses that the Basel III and Standardized Approach NPRs, taken together, "appear to have a significant economic impact on a substantial number of small entities." The Federal Reserve's analysis is less conclusive.

Conclusion

The proposed rule provides an important opportunity for the industry and policy makers to debate how various rules should apply to a variety of institutions. The Agencies deserve credit for the extensive outreach they have conducted to ensure the industry understands the proposal. This process should yield the Agencies valuable information on the potential impact that this proposed rule will have on banking operations, access to credit and the broader economy. We believe this is an important opportunity for the Agencies to consider what is realistic and practical for a variety of institutions, appreciating the diversity of the system.

We believe it is important for the capital rules to take a long-term view of the industry and exposures. In this regard, broad risk weights have served regulators reasonably well, with specific information about risk exposures supplemented by supervision. While it can be tempting to attempt to fine tune the risk identification, there is a fine line between enhanced risk sensitivity and credit allocation.

Most importantly, we believe it is imperative to understand the potential impact not only on capital in the banks but also on their behavior in originating credit. An overly conservative industry will not be in the position to serve consumers or local economies. We appreciate that the Agencies must do certain things to comply with the Basel III international accord and the Dodd-Frank Act. The Agencies should pursue a rulemaking with the absolute minimum changes required to comply with the law. We strongly encourage the Agencies to undertake a larger study to evaluate long-term capital standards under a framework which meets the needs of regulators and is consistent with the variety of business models of our banking industry.

Best regards,

John W. Ryan

Docket No. R-1430;
RIN No. 7100-AD87

Dear Sir or Madam,

The Conference of State Bank Supervisors (CSBS) appreciates the opportunity to comment on the Federal Deposit Insurance Corporation's (FDIC's), the Board of Governors of the Federal Reserve System's (FRB's), and the Office of the Comptroller of the Currency's (OCC's) (collectively, "the Agencies") joint Notice of Proposed Rulemaking (NPR, proposal, or proposed rule) to implement the Basel III capital accords, entitled *Regulatory Capital Rules: Regulatory Capital, Implementation of Basel III, Minimum Regulatory Capital Ratios, Capital Adequacy, Transition Provisions, and Prompt Corrective Action.*

In our view, the proposed rule is one of the most significant public policy matters facing the financial sector. The appropriate level of capital should enhance the resiliency of the banking sector, allowing institutions to remain solvent through the economic cycle. However, too much capital can have undesirable effects on the industry. Too much capital can have the effect of increasing management's tolerance for risk as they strive to provide a return for stockholders. An overly restrictive capital requirement also serves as a barrier to entry, discouraging capital from entering the banking system and further driving industry consolidation. It is critical to strike the appropriate balance to achieve a stable banking system, which is attractive to capital, and can serve as the backbone to a vibrant and diverse economy. This comment period provides a critical opportunity for the public to express its views on the proposed rules and the potential impact they will have on banks, credit availability, and economic growth. We encourage the Agencies to consider not only the calibration of capital requirements to ensure a resilient banking system, but also what is in the best interest of both the national and local economies. Capital requirements must factor in the existence of an active supervisory function and a resolution regime, which works as designed for the vast majority of banks.

We have provided feedback on the Agencies' Standardized Approach proposed rule in a separate comment letter. Our comments on the Basel III proposed rule are organized in the sections below.

INTRODUCTION

We support the Agencies' efforts to increase the minimum required capital. However, we are concerned with the ability to achieve this under the Basel III umbrella. The international agreement clearly states it is intended to cover the same institutions covered under Basel II.[1] which targets only large, internationally active banks. The agreement was never intended to apply to all U.S. banks. We recommend the Agencies scale back this rulemaking to apply only to the intended institutions. We would support a separate rulemaking to address the minimum capital requirements for banks not covered by Basel II and Basel III. The proposed rule should be appropriately calibrated to enhance stability while serving to attract capital to the system. The proposed rule must be easy to understand and simple to manage. We believe the public comments to this rulemaking will provide the Agencies sufficient feedback to effectively structure a new proposal.

MINIMUM CAPITAL RATIOS

CSBS generally supports a higher level of high quality capital at banking organizations. The financial crisis clearly demonstrated that capital levels meeting minimum capital requirements for regulatory purposes are not adequate for practical purposes during stressful conditions. Considering the experience of the US financial crisis, the Agencies have proposed to introduce higher minimum capital requirements for banking organizations.

Specifically, the Agencies have proposed to eliminate the exception for CAMELS 1 rated institutions to maintain a Tier 1 Leverage Ratio of 3%. All institutions will now have to adhere to a Tier 1 Leverage Ratio of 4%. CSBS supports a higher minimum Tier 1 Leverage Ratio. Practically, 4% is not an adequate level of operating capital for all institutions. We support the Agencies' comments regarding the need for institutions to hold capital commensurate with the risks and complexity of their business activity, regardless of the regulatory capital ratios.

Additionally, the Agencies have proposed a new Tier 1 Common Equity Capital ratio. Institutions would have to maintain a minimum Tier 1 Common Equity ratio of 4.5% to meet minimum capital requirements. CSBS supports a renewed focus on common equity, as this is the strongest form of capital. Community banks typically hold a higher percentage of common equity than larger institutions. A new common equity ratio should contribute to a more level playing field between community banks and large banks. As discussed further below, we do not support the proposal to include unrealized gains and losses on available for sale securities

---

[1] Basel III: A global regulatory framework for more resilient banks and banking systems, December 2010, page 11.

in the definition of Tier 1 Common Equity. Nevertheless, we generally support the common equity ratio and believe it will enhance the quality of capital positions across the industry.

For Tier 1 Risk-Based Capital, the Agencies have proposed to increase the minimum ratio from 4% to 6%. We support the increase in Tier 1 Risk-Based Capital. The Agencies have not proposed to adjust the current Total Risk-Based Capital Ratio of 8%.

CAPITAL CONSERVATION BUFFER

The Agencies have proposed that institutions hold a capital conservation buffer comprising common equity tier 1 capital. The buffer represents an additional 2.5% of total risk-weighted assets. The buffer must be maintained to avoid restrictions on capital distributions and certain discretionary bonus payments. This has the effect of increasing the minimum risk based capital ratios by 250 basis points.

While we support requiring greater amounts of high quality capital, to the extent the capital conservation buffer introduces undue operational complexity for institutions, we believe regulators should work to clarify expectations. As discussed further in the Prompt Corrective Action (PCA) section of this letter, the number of consequential capital ratios detailed in the proposal to which institutions would have to adhere would introduce undue complexity to the capital planning process for banking organizations.

COUNTERCYCLICAL CAPITAL BUFFER AND SUPPLEMENTAL RATIO

The Agencies have proposed to implement the Basel III countercyclical capital buffer for advanced approaches institutions, which generally includes institutions with assets above $250 billion. The countercyclical capital buffer would be based on detailed market indicators and would require larger institutions to hold up to 2.5% of additional risk-based capital. CSBS supports the Agencies' proposal to apply the countercyclical capital buffer only to institutions with assets above $250 billion. Larger institutions have greater access to capital markets, which will allow them to more reasonably meet the requirements of the countercyclical buffer. We also support the theoretical structure of the countercyclical capital buffer as it applies to advanced approaches institutions.

Additionally, advanced approaches institutions would be required to maintain a supplementary leverage ratio of tier 1 capital to total leverage exposure of 3%. We support the supplementary leverage provision. However, the off-balance sheet exposures and repo style transactions the Agencies site in support of this requirement occur frequently at large institutions that do not meet the advanced approaches criteria. The Agencies may consider application of the supplementary leverage ratio to classes of institutions with assets below $250 billion but not less than $50 billion on a case by case basis.

PROMPT CORRECTIVE ACTION

The Agencies have proposed a method for incorporating changes to minimum capital ratios in the Prompt Corrective Action (PCA) framework. The proposed PCA framework includes new ratios corresponding to the various capitalization designations contained in PCA. Notably, the proposal does not factor the capital conservation buffer in the PCA ratios.

In our view, under the current proposal, institutions will have to manage their capital levels with too many consequential measures in mind. The proposals include new minimum capital requirements, new additional capital requirements for capital conservation buffer purposes, and new PCA requirements. The Agencies should work to streamline the PCA requirements to acknowledge the presence of the capital conservation buffer and clarify the implications associated with the various thresholds. We should work to minimize the operational complexity at institutions that can arise from numerous regulatory capital measures.

The currently proposed framework presents an awkward situation for institutions. For instance, the proposed measure of total risk-based capital to be considered "well-capitalized" for PCA purposes is 10%, yet the minimum total risk-based capital ratio including the 2.5% capital conservation buffer is 10.5%. Therefore, institutions may be "well-capitalized" but still have mandatory restrictions on dividend and bonus payouts. We encourage the Agencies to acknowledge and resolve such discrepancies that may result in confusion for bank management.

UNREALIZED GAINS AND LOSSES ON SECURITIES IN COMMON EQUITY TIER 1 CAPITAL

Under the Agencies' current general risk-based capital rules, unrealized gains and losses on Available For Sale (AFS) debt securities are not included in regulatory capital, unrealized losses on AFS equity securities are include in tier 1 capital, and unrealized gains on AFS equity securities are partially included in tier 2 capital. Under the proposal, unrealized gains and losses on all AFS securities would flow through to common equity tier 1 capital.

CSBS does not believe this provision is workable or meaningful for banking organizations. Including gains and losses on AFS securities in the common equity ratio would introduce significant volatility in capital ratios and potentially skew institutions' capital positions both in times of crisis and in periods of stability. The frequency and extent to which the proposed provision would adjust capital positions would be substantial. We believe capital measurements that are built on potentially significant volatility are not meaningful and may have detrimental consequences for the safety and soundness of our banking industry. We are concerned that this provision may cause banks to engage in transactions that they otherwise would not out of fear of the impact of potential future losses from changing market conditions. Incorporating this element of volatility into the capital framework is not in the long-term best interest of individual banks or the banking system.

The proposal offers possible alternatives, including excluding the impact solely from changes in interest rates and excluding U.S. government and agency securities. Firms that provide investment advisory services to the industry believe this will be nearly impossible to accurately quantify on a consistent basis. The Agencies should adequately research this perspective before finalizing any rule to ensure the option is workable and meaningful. To be clear, we believe the existing framework is more applicable to a traditional bank and provides for less complexity and greater stability.

TRUST PREFERRED SECURITIES

Basel III eliminates Trust Preferred Securities (TPS) as qualifying capital for all banks and bank holding companies above $500 million in assets. For bank holding companies with assets above $15 billion, the Basel III proposal maintains consistency with Dodd-Frank, retaining a phase-out period ending in 2016. For bank holding companies with assets between $500 million and $15 billion, the Agencies have proposed a phase-out schedule beginning at 10% in 2013 and increasing 10% a year for 10 years. No TPS would count beginning in 2022. The proposed treatment of TPS deviates from Dodd-Frank, which allows bank holding companies between $500 million and $15 billion to let the TPS roll-off.

CSBS strongly opposes the Agencies' proposed treatment of TPS for institutions between $500 million and $15 billion. The proposed rule represents a new and unnecessary extreme in the area of TPS. We are troubled by the Agencies' inclination to deviate from the Dodd-Frank standard. Implementing a sudden shift in policy related to TPS may have significantly negative consequences for institutions' capital planning strategies. Further, CSBS believes this matter was thoroughly reviewed in Congress during Dodd-Frank deliberations, and Congress elected to establish the framework detailed above for good reason. We therefore urge the Agencies to withdraw their proposed phase-out of TPS for institutions between $500 million and $15 billion and maintain the framework established by Congress.

CAPITAL TRANSITION PROVISIONS AND INFORMATION GAPS

CSBS generally believes the Agencies have proposed reasonable transition provisions for institutional compliance with the proposed capital requirements if the requirements are imposed.

We would also like to note that a number of information gaps exist in current financial reporting requirements that will make it difficult to assess the potential impact of various provisions of the proposal. Specifically, financial positions such as Deferred Tax Assets (DTAs) are not reflected in current regulatory reports in adequate detail, yet there are a number of proposed provisions affecting these assets. In order to adequately measure the impact of such requirements, we need to address reporting gaps in these areas.

CONCLUSION

We are supportive of the Agencies' efforts to improve the level and quality of minimum required capital. We strongly recommend the Agencies pursue a more simplistic and effective proposal appropriate for a diverse banking system which is largely dominated by less complex, community based institutions.

As the Agencies consider a revised and narrower proposal, it is important to be able to quantify the impact on the industry. We appreciate the Agencies' efforts to develop the capital estimation tool for banks to analyze the potential impact of this rule and the proposed rule for the Standardized Approach. We believe it is imperative for the Agencies to understand the impact on an aggregate basis and, more importantly, have a better sense of how changes in the capital rules will impact the bank's origination of credit.

Best regards,

John W. Ryan
