Proposal and Comment Information

Title: Regulatory Capital Rules: Regulatory Capital and Standardized Approach for Risk-weighted Assets, R-1888

Comment ID: FR-2026-0008-01-C141

Submitter Information

Name: Eric Robinson

Submitted Date: 05/09/2026

The Bitcoin Network is a protocol similar to the internet itself TCP/IP, and decentralized with substantial consensus much like the protocol for written language in the Western world, the alphabet.

It is a decentralized, immutable, trust-less, permission-less, global, rules based digital ledger for all of mankind. There is no owner, no single point of failure, no CEO/Marketing Team/HR or salesman. It is money, a commodity, and a digital barer asset protected by the 1st Amendment through code, backed by energy.

It came to be in 2008/2009 through many decades of other attempts along with small failures and successes that helped form Bitcoin. It is freedom money for all of humanity to conduct commerce in the pursuit of life, liberty, and happiness. Throughout all of humanity we’ve never had perfect money until now. The time is now.
