

Prefatory Note

The attached document represents the most complete and accurate version available based on original copies culled from the files of the FOMC Secretariat at the Board of Governors of the Federal Reserve System. This electronic document was created through a comprehensive digitization process which included identifying the best-preserved paper copies, scanning those copies,¹ and then making the scanned versions text-searchable.² Though a stringent quality assurance process was employed, some imperfections may remain.

Please note that some material may have been redacted from this document if that material was received on a confidential basis. Redacted material is indicated by occasional gaps in the text or by gray boxes around non-text content. All redacted passages are exempt from disclosure under applicable provisions of the Freedom of Information Act.

¹ In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).

² A two-step process was used. An advanced optical character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.

MONEY MARKET AND RESERVE RELATIONSHIPSRecent developments

Since the last meeting of the Committee, conditions in the money market have been alternately tight and relatively comfortable, with the swings importantly influenced by expectational factors. In the two auctions surrounding the mid-September tax date, the 3-month bill rate rose sharply to a peak of 5.59 per cent, partly as a result of the market's initial reaction to the changed Treasury financing picture and partly as a result of fears about a mid-September money market squeeze. The rate subsequently declined to around 5.35 per cent as demand for bills from the public strengthened markedly at the higher rate levels, as pressures associated with the tax date were quite moderate, and, in very recent days, as the System returned to the buying side of the market.

The recent decline in bill rates was accompanied by a general relaxation of the taut money market conditions that had emerged around mid-September. In particular, the Federal funds rate declined during the past two statement weeks, with trading frequently at rates below 5 per cent. As a result, average dealer financing costs were reduced, and dealers became more willing to bid aggressively for bills.

The recent more comfortable money market conditions could have been related to banks' having prepared for stronger loan demands and larger CD run-offs than actually materialized. Loan growth during September was partly held down by tight bank lending policies but demands

p - Preliminary.

September 30, 1966.

also appear to have weakened somewhat. In addition to a sharp drop in security loans, business loans by banks for the month of September are estimated to have increased by an 11 per cent annual rate, as compared with ^a19 per cent rate in the June-August period.

With respect to CD's, major reporting banks' net losses for the month are estimated at \$1.2 billion. Such a net loss is equivalent to one-fourth of maturities during the month, a smaller run-off than many bankers had thought likely. The better experience of banks partly reflects the almost \$500 million of 33-day CD's obtained in midmonth as a result of a corporate merger.

Under these circumstances, excess reserves of banks were considerably larger than usual in mid-September, when banks were also adjusting to higher reserve requirements on time deposits. With excess reserves enlarged, total reserves expanded in September at a 4 per cent annual rate, but both nonborrowed and required reserves showed declines. The bank credit proxy also showed a slight decline for the month (-.5 per cent annual rate, on the basis of preliminary figures and revised seasonal factors), but it would show about a 1.5 per cent increase when adjusted to include funds obtained from banks through their branches abroad. In the month, private demand deposits and the money supply rose 8 per cent and 7 per cent respectively.

Partly reflecting sharp fluctuations in excess reserves, net borrowed reserves varied widely over the past three weeks, averaging about \$380 million. Borrowings of member banks drifted down in the more

comfortable money market environment after mid-September and averaged \$710 million over the past two statement weeks.

Prospective developments

Treasury bill rates will be influenced in the days immediately ahead by relatively low dealer bill positions. It is not clear that these positions will lead to much further rate declines, however, since lower bill rates, especially on shorter maturities, will decrease incentives for switching out of CD's. Moreover, the Treasury will soon be announcing its October bill financing, which may be in the \$3-3.5 billion range.

All things considered, a range of fluctuation for the 3-month bill rate of 5.25-5.60 per cent seems most likely over the next four weeks. A sustained movement toward the upper end of the range is likely to depend on a strengthening of loan demands -- given current bank lending policies -- and a concomitant rise in the Federal funds rate back to the neighborhood of 6 per cent. The outlook for financing needs of both business and the Federal Government suggests that banks are likely to be more pressed to make loans in the period and therefore that they will tend to increase their demand for reserve funds both through the discount window and in the Federal funds market.

The availability to banks of funds from time and savings deposits is likely to be no greater in October than it was in September (when it rose by 1.5 per cent on average). In fact, taking into account the apparently slightly more favorable competitive position of nonbank savings institutions under the new structure of ceiling rates, the

competition from Treasury and other open market paper, and recent CD experience, banks' time and savings deposits might show a small decline on balance in October. In that month, we are assuming a further \$1.5 billion reduction in CD's outstanding, a rate of disintermediation that is equivalent to roughly one or two percentage points on the bank credit proxy.

Assuming that the existing FOMC directive language of "firm but orderly conditions in the money market" would comprehend some tightening from money market conditions of the moment but not beyond the bounds of recent experience, total and required reserves may rise by about 5 and 10 per cent annual rates respectively in October, assuming strengthened Federal and private credit demands. This reserve growth would be sufficient to accommodate a private demand deposit expansion of about 8 per cent on average during the month (and about 7 per cent for the money apply). Government deposits can also be expected to rise during the month on average as a result of the Treasury financing, but the continuing high level of Federal expenditures is expected to keep the rise to modest proportions. The bank credit proxy would, under these conditions, be projected to expand by about 5-6 per cent in October, largely reflecting the effect of the Treasury financing.

This assumed pattern of developments in October would mean a money supply increase of only about 1 per cent annual rate since midyear and of about 3 per cent for the year to date. Bank credit growth, as measured by the proxy, would be about 3 per cent and $5\frac{1}{2}$ per cent over

those respective periods (and 4.5 per cent and 6.5 per cent respectively when funds obtained through foreign branches are included).

The outlook for the coming month is consistent with a tendency not only for short-term markets to tighten but also for long-term rates to rise. Actual long-term rate movements, however, are likely to be dominated by such expectational factors as peace or tax prospects.

In the money markets a failure of rates to tend upward may mean that banks are under less loan pressure than we currently foresee and, therefore, that banks will have less of an inclination to borrow from the System. Such a development would be consistent with a constellation of relatively shallow net borrowed reserves, lower money market rates, and a less than anticipated expansion in aggregate reserves.
