## MONETARY POLICY ALTERNATIVES

## MONETARY POLICY ALTERNATIVES

## Recent develogments

(1) Ml increased at an 8.6 percent annual rate in November, offsetting the sharp October contraction; transactions deposits surged last month, but currency growth again was sluggish. Preliminary data for early December suggest at this point moderate growth for the month, leaving expansion of this aggregate over the september-to-December period a little under the 3 percent minimum rate specified by the FOMC. on a quarterly average basis, Ml in the fourth quarter will grow at only about a 1-1/2 percent annual rate, well below predictions of econametric models given estimates of income and the recent decline in interest rates, and velocity would increase at an annual rate of about 4 percent. For the year 1984, Ml likely will expand by about 5 percent on a fourth-quarter to fourth-quarter basis, in the lower half of its 4 to 8 percent longer-run range, as shown in the table below.

e/ Estimated.
(2) M2 surged in November at a 15 percent annual rate, reflecting strengthening of its nontransactions component as well as of Ml. The nontransactions camponent was swelled by very heavy inflows to MMDAs and money funds, whose yields lagged declines on market rates. M2 appears to be expanding in December at close to the November pace, and growth over the

| Adjustment and seasonal <br> borrowing | 960 | 781 | - | - | - |
| Excess reserves | 607 | 683 | - | - | - |

1. QIV to QIV growth rates incorporate staff projections for December. 2. Growth rates of reserve measures are adjusted to remove the effects of discontinuities resulting from phased changes in reserve ratios under the Monetary Control Act.
2. Includes "other extended credit" from the Federal Reserve. NOTE: Monthly reserve measures, including excess reserves and borrowing, are calculated by prorating averages for 2 -week reserve maintenance periods that overlap months.

September-to-December period is likely to be well in excess of the FONC's 7-1/2 percent short-run path. For the year as a whole, the staff estimates that M2 will have increased by about 7-1/2 percent, at the middle of its longer-run range.
(3) M3 grew at a 16 percent annual rate in November, spurred by expansion in its non-M2 as well as M2 camponents. The non-M2 component was dominated by flows into institution-only money funds. Issuance of new CDs by camercial banks virtually ceased, given the robust expansion in core deposits and a large inflow of Treasury deposits, but thrift institutions remained heavy issuers of large time deposits. Although partial data suggest some moderation in M3 growth in December, this aggregate is running considerably above its short-run September-to-December path of 9 percent, and for the year will grow around 10 percent, above its 6 to 9 percent range.
(4) Expansion in damestic nonfinancial sector debt is estimated (on the basis of partial data) to have accelerated to about a 14 percent annual rate in November, reflecting a pick-up in federal government borrowing and continued rapid growth in the debt of nonfederal sectors. Corporate bond offerings in the domestic and Euramarkets were at record levels, and business borrowing in short-term markets also was sizable, in part to finance new mergers; sales of municipal revenue bonds continued heavy as year-end approached. Borrowing by households is estimated to have remained near the substantial third-quarter volume, but down from the very rapid pace of the first half of the year. Total nonfinancial sector debt is expected to grow at about a 13-1/4 percent rate in 1984; perhaps about one percentage point of this growth can be attributed to financing of corporate mergers, share repurchases, and buyouts in excess of the usual volume of such activity.
(5) Nonborrowed reserves paths for the intermeeting period were initially constructed assuming $\$ 575$ million of adjustment and seasonal borrowing at the discount window; in view of the weakness in Ml, as well as further evidence of sluggish economic expansion, subdued price increases, and the continued strength of the dollar on exchange markets, the borrowing assumption was reduced to $\$ 500$ million, and then to $\$ 400$ million in the course of the intermeeting period. Actual borrowing came in somewhat above the amount assumed in the latter part of November, but free reserves increased about as implied by reserve paths, as excess reserves were higher than anticipated. The actual average level of borrowing fell $\$ 180$ million in November, contributing to an increase in nonborrowed reserves of $17-1 / 2$ percent at an annual rate; total reserves grew 11-1/4 percent in November. So far in the current reserve period borrowing has averaged under $\$ 300$ million.
(6) The decline in borrowing along with a reduction in the discount rate fram 9 to $8-1 / 2$ percent on November 21 led to a drop in the federal funds rate from about 9-3/4 percent at the time of the November foMC meeting to around $8-3 / 4$ percent recently, with trading in the last two days below $8-1 / 2$ percent. Other market interest rates also have continued to move down. Short-term interest rates have declined another 45 to 60 basis points. Declines were smaller in intermediate- and long-tem credit markets, which have been affected by uncertainties about future federal budget deficits and at times by econamic indicators that were stronger than expected. Since the November meeting, rates in the note and bond market are down only a little at the long end, while dropping about 50 basis points at the shorter end. The prime rate was trimmed by a total of 75 basis points during the period, but remained high relative to the cost of funds.
(7) The dollar has appreciated, on a weighted average basis, by about $4-1 / 2$ perœent since the last FOMC meeting and is currently only one in favor of dollar assets have narrowed.

Prospective developments
(8) The table below presents three alternative specifications for growth of the monetary aggregates fram November to March, along with associated federal funds rate ranges. A November base is suggested in view of the considerable uncertainties this early in the month about the December level. (More detailed data, including implied growth rates to March from projected December levels and from the estimated QIV '84 level, can be found on the charts and table on the following pages.)

|  | Alt. A | Alt. B | Alt. C |
| :--- | :--- | :--- | :--- | :--- |
| Growth from Nov.   <br> to March   | 8 | $6-3 / 4$ | $5-1 / 2$ |
| M1 | $9-1 / 2$ | $8-1 / 2$ | $7-1 / 2$ |
| M2 | 9 | $8-1 / 2$ | 8 |
| M3 |  |  |  |
| Federal funds <br> rate range | 6 to 10 | 7 to 11 | 8 to 12 |

(9) The aggregates specifications of alternative $B$, which are expected to be consistent with maintenance of about the current degree of pressure on reserve positions, would place all of the money supply measures in March close to the upper limits of their tentative longer-run ranges for 1985 established last July. Growth of Ml under this alternative from November to March would be expected to be at about a 6-3/4 percent annual rate. The acceleration of Ml growth from the slower pace that has prevailed on average since around mid-year reflects strengthened transactions demands, given the projected pickup in GNP growth, as well as the lagged effects of the sizable drop in short-term rates over recent months. The income velocity of Ml would be about unchanged in the first quarter. Some models, on the other hand, suggest a drop in income velocity, associated with higher money growth at current interest rates, because they embody greater responsiveness of Ml to earlier interest rate declines.

Growth Rates
Quarterly Average

## Actual and Targeted M1

Billions of dollars

## Actual and Targeted M2

Billions of dollars

## Actual and Targeted M3

Billions of dollars

We have assumed, however, a more moderate Ml growth partly because its recent behavior suggests the possibility that the demand for narrow money may have become a little less responsive to interest rate changes.
(10) Despite the pickup in M1 growth under this alternative during the first quarter, the broad monetary aggregates are expected to decelerate from their unusually rapid rate of late 1984 to a pace more nearly in keeping with growth rates prior to the fourth quarter of this year, and in the case of M3 samewhat below such rates. Inflows to MMDAs and MMMFs should drop off considerably as the first quarter progresses as yields on these instruments decline into more normal aligrment with market interest rates. As a partial offset to reduced growth in core deposits, $C D$ issuance by banks is expected to pick up, after showing virtually no growth late this year. We do not expect the broad aggregates to be affected to any significant extent by the reduction fram $\$ 2,500$ to $\$ 1,000$ in the minimum balance requirement for MMDAs and super-NOW accounts. Transfers into these accounts are likely to be relatively small, with the great bulk cơming from other camponents of M2. We have also assumed a minimal net effect on Ml as inflows fram non-Ml deposits into new superNoWs may be about offset by shifts out of smaller transactions accounts into new MMDAs.
(11) The growth of debt of nonfinancial sectors in the first quarter of next year, although slowing somewhat from the pace of late 1984, may also be around the top of its tentative 8 to 11 percent range. In part, the moderation in credit growth projected for early next year reflects a drop in tax-exempt borrowing by state and local governments and businesses, following a surge in the fourth quarter in advance of various legislative year-end deadlines. In addition, growth of Treasury
debt, while remaining large, is expected to moderate some from its recent advanced pace. Underlying business needs for credit are expected to continue at close to the level of the last half of 1984 , and recent announcements seem to indicate that borrowing to finance corporate mergers and share retirements will remain sizable in the months ahead. The pace of mortgage lending to households, which had been slowing since the spring of 1984 , is projected to stabilize in response to the easier conditions that have developed in that market.
(12) Discount window borrowing under alternative $B$ is expected to average around $\$ 400$ million. That level of borrowing appears to be somewhat in excess of the likely "frictional" level, which now is probably around $\$ 150$ to $\$ 250$ million. Seasonal borrowing has declined to close to $\$ 100$ million since the last FOMC meeting in accord with its nomal seasonal pattern and in response to the slimer spread between market and discount rates. Under these circumstances, federal funds might average mostly in a range around $8-3 / 4$ percent. Nonborrowed reserves would be expected to increase at a 16 percent annual rate, and total reserves at a 12-1/2 percent rate over the November-to-March period.
(13) Short-term rates are not likely to show much change on balance over the intermeeting period under alternative $B$, with the 3 -month Treasury bill rate generally in an $8-1 / 8$ to $8-3 / 8$ percent range; the prime rate may drop a little further, given current rate relationships. In long-term markets, yields could move samewhat higher should there be no real progress toward putting together a credible deficit reduction package, if there were signs of strengthened economic activity, and if Ml growth were sustained as expected under alternative B. Mortgage rates may stabilize in the period immediately ahead, and could begin to rise, particularly should bond rates turn up as the first quarter progresses.
(14) Alternative A involves growth in the aggregates that would bring them above the upper limits of their tentative longer-run ranges (the width of the ranges of course being narrow early in the year). This alternative may also be viewed as compensating in some degree for the recent shortfall in Ml growth. For instance, the 8 percent growth of M1 over November to March that is specified would bring it by March to a level that would be near the midpoint of the FOMC's tentative long-run growth range if that range were based not on the actual fourth-quarter average but on the fourth-quarter midpoint level of the 1984 long-run range. The more rapid growth of M2 under this alternative would reflect, in addition to faster expansion of its Ml component, continued strong inflows to MMDAs and money market mutual funds, given the further drop assumed in market rates and the lag in reduction of yields on these instruments.
(15) The money supply specifications of alternative A are expected to entail an increase in total reserves of about 15 percent at an annual rate fram November to March, accompanied by a drop in the funds rate to 8 perœnt or a little below. Absent a decline in the discount rate, discount window borrowing is likely to be at a bare minimum, and excess reserves perhaps samewhat higher than usual, with nonborrowed reserves rising at about a 21 percent annual rate through March. If the discount rate were reduced from the present $8-1 / 2$ percent level, reserve growth consistent with this alternative could be accomplished with somewhat less expansion in nonborrowed reserves than otherwise. Under this alternative, the 3 -month Treasury bill rate may drop to around 7-1/2 percent, but yield declines in long-tem markets may be more limited. The dollar probably would come under downward pressure in foreign exchange
markets, although any depreciation would be moderated if foreign monetary authorities allowed their domestic rates to fall as well under the circumstances.
(16) Alternative $C$ is designed to hold growth of M1 and M2 to rates close to the midpoints of their tentative long-run ranges and is expected to involve same tightening of reserve conditions. Borrowing might rise back toward $\$ 800$ million, with the federal funds rate returning to the $9-1 / 2$ to 10 percent area. Nonborrowed and total reserves would increase at rates of around 10 percent from November to March. Such a change in reserve conditions at this time would be quite unexpected by market participants, and both short- and long-term rates would back up considerably, with Treasury bill rates rising almost a percentage point to 9 percent or a bit higher. Rates on private instruments might increase by even more should investor concerns about creditworthiness be revived. The dollar would probably rise further on foreign exchange markets.

## Directive language

(17) Proposed language for the operational paragraph, with alternatives, is shown below. The language in brackets is proposed should the Committee wish to provide flexibility on the up side for growth in M1 in light of the currently estimated shortfall over the fourth quarter relative to the FOMC's original expectation for that period, as was done in the November directive. The bracketed language would seem to be more relevant to alternatives $B$ or $C$, since alternative A contains a growth rate for Ml from November to March that, as described in paragraph (14), already takes more account of the shortfall.

In the implementation of policy in the short run, the Camittee seeks to reduce samewhat (alt. A)/MAINTAIN (alt. B)/ INCREASE SOMEWHAT (alt. C) existing pressures on reserve positions. This action is expected to be consistent with growth of M1, M2, and M3 at annual rates of around $7-1 / 2-a n d-9 \quad$ _ ___, and ___ percent, RESPECTIVELY, during the period fram September-to-Đeeember NOVEMBER TO MARCH. MI-is-expeeted-te-grew-erer-the peried-at-an-anarak-rate

 MI-weuld-be-aeeeptabler [SOMEWHAT MORE RAPID GROWIH OF MI WOULD BE ACCEPTABLE IN LIGHT OF THE CURRENTLY ESTIMATED SHORTFALL IN GROWIH FOR THE FOURTH GUARTER RELATIVE TO THE COMMITTEE'S EXPECTATIONS AT THE BEGINNING OF THE PERIOD.] Lesser restraint on reserve positions would be sought in the event of significantly slower growth in the monetary aggregates, evaluated in relation to the strength of the business expansion and inflationary pressures, domestic and international financial market conditions, and the rate of credit growth.

Conversely, greater restraint might be acceptable in the event of substantially more rapid monetary growth and indications of significant strengthening of econamic activity and inflationary pressures. The Chairman may call for Committee consultation if it appears to the Manager for Domestic Operations that pursuit of the monetary objectives and related reserve paths during the period before the next meeting is likely to be associated with a federal funds rate persistently outside a range of $7-1 \pm$ _ $T O$ percent.

sury coupon issues.
6 Includes changes in RPs ( +1 , matched sale purchase transactions ( -1 ) and matched purchase sale transections (+).

[^0]:    ${ }^{1}$ In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).
    ${ }^{2}$ A two-step process was used. An advanced optimal character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.
