Navigating Monetary Policy through the Fog of COVID

Remarks by

Lael Brainard

Member

Board of Governors of the Federal Reserve System

at the

Perspectives on the Pandemic Webinar Series, hosted by  
the National Association for Business Economics

Washington, D.C.

(via webcast)

July 14, 2020

The COVID-19 contraction is unprecedented in modern times for its severity and speed. Following the deepest plunge since the Great Depression, employment and activity rebounded faster and more sharply than anticipated. But the recent resurgence in COVID cases is a sober reminder that the pandemic remains the key driver of the economy's course. A thick fog of uncertainty still surrounds us, and downside risks predominate. The recovery is likely to face headwinds even if the downside risks do not materialize, and a second wave would magnify that challenge. Fiscal support will remain vital. Looking ahead, it likely will be appropriate to shift the focus of monetary policy from stabilization to accommodation by supporting a full recovery in employment and a sustained return of inflation to its 2 percent objective.<sup>1</sup>

A variety of data suggest the economy bottomed out in April and rebounded in May and June. Payroll employment rebounded strongly in May and June. Retail sales jumped 18 percent in May, exceeding market expectations, and real personal consumption expenditures (PCE) are estimated to have increased 8 percent. Consumer sentiment improved in May and June.<sup>2</sup> And both the manufacturing and nonmanufacturing Institute for Supply Management indexes jumped into expansionary territory last month. Financing conditions remain broadly accommodative on balance: They continued to ease over recent weeks for nonfinancial corporations and municipalities, although they remained stable or tightened slightly for small businesses and households.<sup>3</sup>

---

<sup>1</sup> I am grateful to Ivan Vidangos of the Federal Reserve Board for assistance in preparing this text. These remarks represent my own views, which do not necessarily represent those of the Federal Reserve Board or the Federal Open Market Committee.

<sup>2</sup> This is reflected in the University of Michigan Surveys of Consumers and the Conference Board.

<sup>3</sup> Nearly all of the financial conditions indexes that we track indicate only slightly less accommodative financial conditions currently than just before the onset of the COVID outbreak.

The earlier-than-anticipated resumption in activity has been accompanied by a sharp increase in the virus spread in many areas. Uncertainty will remain elevated as long as the pandemic hangs over the economy. Even if the virus spread flattens, the recovery is likely to face headwinds from diminished activity and costly adjustments in some sectors, along with impaired incomes among many consumers and businesses. On top of that, rolling flare-ups or a broad second wave of the virus may lead to widespread social distancing—whether mandatory or voluntary—which could weigh on the pace of the recovery and could even presage a second dip in activity. A broad second wave could re-ignite financial market volatility and market disruptions at a time of greater vulnerability. Nonbank financial institutions could again come under pressure, as they did in March, and some banks might pull back on lending if they face rising losses or weaker capital positions.

A closer look at the labor market data hints at the complexity. The improvement in the labor market started earlier, and has been stronger, than had been anticipated. Over May and June, payroll employment increased by 7.5 million, the unemployment rate fell 3.6 percentage points, and the labor force participation rate rose 1.3 percentage points.<sup>4</sup> The large bounceback is a sharp contrast to the Global Financial Crisis, when the initial employment decline was shallower and it took much longer before a similar share of the initial job losses was recouped.

---

<sup>4</sup> The Bureau of Labor Statistics (BLS) has indicated that the official unemployment rate has understated the extent of joblessness in recent months because many workers who lost their jobs were incorrectly reported as being employed but absent from work, rather than unemployed on temporary layoff. The BLS estimated that this misclassification held down the unemployment rate by about 5 percentage points in April and by about 1 percentage point in June, such that the reduction in the unemployment rate would be about 7½ percentage points if these job losses were classified correctly.

The job gains in the past two months were concentrated among workers who were on temporary layoff. They likely were driven by an earlier-than-expected rollback of COVID-related restrictions as businesses ramped up hiring and consumers exhibited more comfort engaging in commercial activities, as well as by a boost to employment from the Paycheck Protection Program. While nearly all industries experienced increases, the improvement was especially notable in the leisure and hospitality sector, which had been particularly hard hit by COVID-related closures in April.

It is unclear whether the rapid pace of labor market recovery will be sustained going forward, and risks are to the downside. The pace of improvement may slow if a large portion of the easiest gains from the lifting of mandated closures and easing of capacity constraints has already occurred. Moreover, weekly COVID case counts have been rising, and some states are ramping up restrictions. These developments mostly occurred after the reference period for the June employment report. After declining at a fast clip through early June, initial claims for unemployment insurance have moved roughly sideways in recent weeks and remained at a still elevated level of 1.3 million in the week ending July 4.<sup>5</sup> Some high-frequency indicators tracked by Federal Reserve

---

<sup>5</sup> The flattening out seen in recent weeks is even clearer when looking at nonseasonally adjusted claims numbers, which might be a slightly better measure than seasonally adjusted numbers in the current environment. The usual seasonal adjustment procedure, which relies on multiplicative seasonal factors, is not ideally suited to the current extraordinary circumstances. See Jason Bram and Fatih Karahan (2020), “Translating Weekly Jobless Claims into Monthly Net Job Losses,” Federal Reserve Bank of New York, *Liberty Street Economics* (blog), May 7, <https://libertystreeteconomics.newyorkfed.org/2020/05/translating-weekly-jobless-claims-into-monthly-net-job-losses.html>.

In addition, the Department of Labor stated that 49 states reported about 1 million initial claims for Pandemic Unemployment Assistance (PUA) in the week ending July 4. However, since most PUA applicants must first apply for, and be denied, regular state unemployment insurance (UI) benefits before they apply for PUA, initial PUA claims and initial claims for regular UI benefits will be strongly correlated (likely with some lag) and do not constitute independent measures of the number of unemployed persons seeking unemployment benefits.

Board staff (including mobility data and employment in small businesses) suggest that the strong pace of improvement in May and the first half of June may not be sustained.

The pandemic's harm to lives and livelihoods is falling disproportionately on black and Hispanic families. After finally seeing welcome progress narrowing the gaps in labor market outcomes by race and ethnicity in the late stage of the previous recovery, the COVID shock is inflicting a disproportionate share of job losses on African American and Hispanic workers. According to the Current Population Survey, the number of employed persons fell by 14.2 percent from February to June among African Americans and by 13.4 percent among Hispanics—significantly worse than the 10.4 percent decline for the population overall.<sup>6</sup>

Separately, on the other side of our dual mandate, inflation has receded further below its 2 percent objective—reflecting weaker demand along with lower oil prices in recent months. Both core and total PCE price inflation measures have weakened, with the 12-month percent changes through May standing at 1.0 percent and 0.5 percent, respectively.<sup>7</sup> Measures of inflation expectations are mixed; while market-based measures have moved below their typical ranges of recent years, survey measures have remained relatively stable within their recent historical ranges.<sup>8</sup> Nonetheless, with

---

<sup>6</sup> The Current Population Survey (or household survey) measures the number of employed *persons* and includes detailed demographic information, whereas the Current Employment Statistics survey (or establishment survey) measures the number of *jobs* in the payrolls of nonfarm establishments.

<sup>7</sup> That said, the trimmed mean PCE inflation rate calculated by the Federal Reserve Bank of Dallas over the 12 months ending in May remained stable at 2.0 percent; the data as of May 2020 are available on the Bank's website at <https://www.dallasfed.org/research/pce>. And this morning's Consumer Price Index (CPI) data for June showed some signs of stabilization, with both core and total CPI inflation increasing noticeably last month, driven by a partial rebound in price categories that seemed most affected by social distancing in prior months (such as apparel, accommodation, and transportation services).

<sup>8</sup> The median 5-to-10-year measure from the University of Michigan Surveys of Consumers and the median three-year-ahead expected inflation from the Federal Reserve Bank of New York's Survey of Consumer Expectations both came in at 2.5 percent in June—well within their ranges in recent years. Median long-run expectations from the Survey of Professional Forecasters ticked down 0.1 percentage point to 1.9 percent in the second quarter, which is historically low for this measure. Market-based measures of

inflation coming in below its 2 percent objective for many years, the risk that inflation expectations could drift lower complicates the task of monetary policy.

The strong early rebound in activity is due in no small part to rapid and sizable fiscal support. Several daily and weekly retail spending indicators tracked by Federal Reserve Board staff suggest that household spending increased quickly in response to stimulus payments and expanded unemployment insurance benefits. Household spending stepped up in mid-April, coinciding with the first disbursement of stimulus payments to households and a ramp-up in the payout of unemployment benefits, and showed the most pronounced increases in the states that received more benefits.<sup>9</sup> With some of the fiscal support measures either provided as one-off payments or slated to come to an end in July,

---

inflation compensation over the next few years have retraced much of their sharp declines in mid-March but remain below their typical ranges in recent years. The 5-to-10-year measure of longer-term inflation compensation derived from Treasury Inflation-Protected Securities, at around 1.4 percent, remains notably below pre-pandemic levels.

<sup>9</sup> This evidence is also consistent with recent research by Baker and others, who examine a panel of households using a financial planning app and show that these households responded quickly to CARES Act (Coronavirus Aid, Relief, and Economic Security Act) stimulus payments despite stay-at-home orders and social distancing; see Scott R. Baker, R.A. Farrokhnia, Steffen Meyer, Michaela Pagel, and Constantine Yannelis (2020), “Income, Liquidity, and the Consumption Response to the 2020 Economic Stimulus Payments,” NBER Working Paper Series 27097 (Cambridge, Mass.: National Bureau of Economic Research, May). Other recent studies, including Kargar and Rajan as well as Chetty and others, find similar responses to the CARES Act using different data. See Ezra Karger and Aastha Rajan (2020), “Heterogeneity in the Marginal Propensity to Consume: Evidence from Covid-19 Stimulus Payments,” Working Paper Series 2020-15 (Chicago: Federal Reserve Bank of Chicago, May), <https://www.chicagofed.org/publications/working-papers/2020/2020-15>; and Raj Chetty, John N. Friedman, Nathaniel Hendren, Michael Stepner, and the Opportunity Insights Team (2020), “How Did COVID-19 and Stabilization Policies Affect Spending and Employment? A New Real-Time Economic Tracker Based on Private Sector Data,” Opportunity Insights Working Paper (Cambridge, Mass.: Opportunity Insights, May), [https://opportunityinsights.org/wp-content/uploads/2020/05/tracker\\_paper.pdf](https://opportunityinsights.org/wp-content/uploads/2020/05/tracker_paper.pdf). Analysis by Bhutta and others uses data from the Survey of Consumer Finances to assess how the cash assistance (expanded unemployment insurance benefits and stimulus payments) under the CARES Act would help families cope with job loss and find that the CARES Act dramatically improves households’ financial security; see Neil Bhutta, Jacqueline Blair, Lisa J. Dettling, and Kevin B. Moore (2020), “COVID-19, the CARES Act, and Families’ Financial Security,” working paper, July. The act’s cash assistance, in addition to families’ liquid savings, would allow an estimated 94 percent of working families to cover their recurring nondiscretionary expenses if they were to lose all of their income for six months from April through September 2020. In contrast, in the absence of the CARES Act, only about half of working families would be able to cover six months of expenses by relying exclusively on their liquid savings and standard unemployment insurance benefits.

the strength of the recovery will depend importantly on the timing, magnitude, and distribution of additional fiscal support.

At the sectoral level, there is substantial heterogeneity in the effect of COVID. Recent data suggest that the recoveries in sectors such as manufacturing, residential construction, and consumer goods are likely to be relatively more resilient, while consumer services are more likely to remain hostage to social distancing. Manufacturing production jumped nearly 4 percent in May (following a historic drop in April), and forward-looking indicators point to another solid increase in June. Pending home sales and single-family permits rose more than anticipated in May. In the consumer sector, the rebound in spending has been concentrated in goods categories—especially those sold online—whereas most services categories have remained quite depressed. A similar concern may apply to the commercial real estate (CRE) sector and to equipment investment. Some parts of the CRE market—most notably, the lodging and retail segment—are experiencing significant distress and have seen sharp increases in delinquency rates along with tighter bank lending standards. For equipment investment, production and supply chain disruptions and high levels of uncertainty continue to weigh on expenditures.

In addition to the headwinds facing demand, there could be persistent effects on the supply side of the economy. The cross-border distancing associated with the virus raises the possibility of persistent changes to global supply chains. Within the U.S. economy, the virus may cause durable changes to business models in a variety of activities, resulting in greater reliance on remote work, reductions in nonessential travel, and changes to CRE usage and valuations.

In downside scenarios, there could be some persistent damage to the productive capacity of the economy from the loss of valuable employment relationships, depressed investment, and the destruction of intangible business capital. A wave of insolvencies is possible. As the Federal Reserve Board's May *Financial Stability Report* highlighted, the nonfinancial business sector started the year with historically elevated levels of debt.<sup>10</sup> Already this year, we have seen about \$800 billion in downgrades of investment-grade debt and \$55 billion in corporate defaults—a faster pace than in the initial months of the Global Financial Crisis. Several measures of default probabilities are somewhat elevated. It remains vitally important to make our emergency credit facilities as broadly accessible as we can in order to avoid the costly insolvencies of otherwise viable employers and the associated hardship from permanent layoffs.

Finally, in keeping with the global nature of the pandemic, foreign developments could impinge on the U.S. recovery. The International Monetary Fund estimates that real global gross domestic product dropped at an annual rate of about 18 percent in the second quarter after falling nearly 13 percent in the first quarter. While the potential for a fiscal response across the euro area is positive and important, there has been some renewal of tensions between the United States and China, and the outlook for many emerging markets remains fragile.

The Federal Reserve moved rapidly and aggressively to restore the normal functioning of markets and the flow of credit to households and businesses. The forceful response was appropriate in light of the extraordinary nature of the crisis and the

<sup>10</sup> See Board of Governors of the Federal Reserve System (2020), *Financial Stability Report* (Washington: Board of Governors, May), <https://www.federalreserve.gov/publications/files/financial-stability-report-20200515.pdf>.

importance of minimizing harm to the livelihoods of so many Americans. With the restoration of smooth market functioning and credit flows, our emergency facilities are appropriately moving into the background, providing confidence that they remain available as an insurance policy if storm clouds again move in.

While it is welcome news that 7.5 million jobs were added in the past two months, it is critical to stay the course in light of the remaining 14.7 million job losses that have not been restored since the COVID crisis started. The healing in the labor market is likely to take some time. Last month, a majority of Federal Open Market Committee (FOMC) participants indicated they expect economic activity to decline notably this year and recover only gradually over the following two years. A majority of FOMC participants indicated that they expect core inflation to remain below our 2 percent objective and employment to fall short of its maximum level at least through the end of 2022.

Looking ahead, it will be important for monetary policy to pivot from stabilization to accommodation by supporting a full recovery in employment and returning inflation to its 2 percent objective on a sustained basis. As we move to the next phase of monetary policy, we will be guided not only by the exigencies of the COVID crisis, but also by our evolving understanding of the key longer-run features of the economy, so as to avoid the premature withdrawal of necessary support. Because the long-run neutral rate of interest is quite low by historical standards, there is less room to cut the policy rate in order to cushion the economy from COVID and other shocks. The likelihood that the policy rate is at the lower bound more frequently risks eroding expected and actual inflation, which could further compress the room to cut nominal

interest rates in a downward spiral. With underlying inflation running below 2 percent for many years and COVID contributing to a further decline, it is important that monetary policy support inflation expectations that are consistent with inflation centered on 2 percent over time. And with inflation exhibiting low sensitivity to labor market tightness, policy should not preemptively withdraw support based on a historically steeper Phillips curve that is not currently in evidence. Instead, policy should seek to achieve employment outcomes with the kind of breadth and depth that were only achieved late in the previous recovery.<sup>11</sup>

With the policy rate constrained by the effective lower bound, forward guidance constitutes a vital way to provide the necessary accommodation. For instance, research suggests that refraining from liftoff until inflation reaches 2 percent could lead to some modest temporary overshooting, which would help offset the previous underperformance.<sup>12</sup> Balance sheet policies can help extend accommodation by more directly influencing the interest rates that are relevant for household and business borrowing and investment.

Forward guidance and asset purchases were road-tested in the previous crisis, so there is a high degree of familiarity with their use. Given the downside risks to the outlook, there may come a time when it is helpful to reinforce the credibility of forward guidance and lessen the burden on the balance sheet with the addition of targets on the

Butler Award New York Association for Business Economics, New York, New York, <https://www.federalreserve.gov/newsevents/speech/brainard20191126a.htm>.

<sup>12</sup> See Ben S. Bernanke, Michael T. Kiley, and John M. Roberts (2019), “Monetary Policy Strategies for a Low-Rate Environment,” Finance and Economics Discussion Series 2019-009 (Washington: Board of Governors of the Federal Reserve System, February), <https://dx.doi.org/10.17016/FEDS.2019.009>.

short-to-medium end of the yield curve.<sup>13</sup> Given the lack of familiarity with front-end yield curve targets in the United States, such an approach would likely come into focus only after additional analysis and discussion.

The Federal Reserve remains actively committed to supporting the flow of credit to households and businesses and providing a backstop if downside risks materialize. With a dense fog of COVID-related uncertainty shrouding the outlook, the recovery likely will face headwinds for some time, calling for a sustained commitment to accommodation, along with additional fiscal support.

---

<sup>13</sup> During the recovery from the previous financial crisis, there were several junctures when the expectations implied by market pricing and Committee communications got out of alignment, which proved costly.
