- *responsibility for taxes and insurance*: the requirement to make payments for real estate taxes and insurance in addition to their loan payments, if not escrowed, and the fact that taxes and insurance costs can be substantial.

Control Systems

Institutions should develop strong control systems to monitor whether actual practices are consistent with their policies and procedures. Systems should address compliance and consumer information concerns, as well as safety and soundness, and encompass both institution personnel and applicable third parties, such as mortgage brokers or correspondents.

Important controls include establishing appropriate criteria for hiring and training loan personnel, entering into and maintaining relationships with third parties, and conducting initial and ongoing due diligence on third parties. Institutions also should design compensation programs that avoid providing incentives for originations inconsistent with sound underwriting and consumer protection principles, and that do not result in the steering of consumers to these products to the exclusion of other products for which the consumer may qualify.

Institutions should have procedures and systems in place to monitor compliance with applicable laws and regulations, third-party agreements, and internal policies. An institution's controls also should include appropriate corrective actions in the event of failure to comply with applicable laws, regulations, third-party agreements, or internal policies. In addition, institutions should initiate procedures to review consumer complaints to identify potential compliance problems or other negative trends.

Supervisory Review

The agencies will continue to carefully review risk-management and consumer compliance processes, policies, and procedures. The agen-

16. Institutions generally can address these concerns most directly by requiring borrowers to escrow funds for real estate taxes and insurance.

17. To illustrate: a borrower earning $42,000 per year obtains a $200,000 "2/28" mortgage loan. The loan's two-year introductory fixed interest rate of 7 percent requires a principal and interest payment of $1,331. Escrowing $200 per month for taxes and insurance results in a total monthly payment of $1,531 ($1,331 + $200), representing a 44 percent DTI ratio. A fully indexed interest rate of 11.5 percent (based on a six-month LIBOR index rate of 5.5 percent plus a 6 percent margin) would cause the borrower's principal and interest payment to increase to $1,956. The adjusted total monthly payment of $2,156 ($1,956 + $200 for taxes and insurance) represents a 41 percent increase in the payment amount and results in a 62 percent DTI ratio.

cies will take action against institutions that exhibit predatory lending practices, violate consumer protection laws or fair lending laws, engage in unfair or deceptive acts or practices, or otherwise engage in unsafe or unsound lending practices.

The Federal Reserve and the other federal banking and thrift regulatory agencies (the agencies)[1] issued the Interagency Guidance on Nontraditional Mortgage Product Risks on September 29, 2006. The guidance addresses both risk-management and consumer disclosure practices that institutions[2] should employ to effectively manage the risks associated with closed-end residential mortgage products that allow borrowers to defer repayment of principal and, sometimes, interest (referred to as nontraditional mortgage loans). (See SR-06-15.)

Residential mortgage lending has traditionally been a conservatively managed business with low delinquencies and losses and reasonably stable underwriting standards. However, during the past few years consumer demand has been growing, particularly in high-priced real estate markets, for nontraditional mortgage loans. These mortgage products include such products as ''interest-only'' mortgages, where a borrower pays no loan principal for the first few years of the loan, and ''payment-option'' adjustable-rate mortgages (ARMs), where a borrower has flexible payment options with the potential for negative amortization.[3]

While some institutions have offered nontraditional mortgages for many years with appropriate risk management and sound portfolio performance, the market for these products and the number of institutions offering them has expanded rapidly. Nontraditional mortgage loan products are now offered by more lenders to a wider spectrum of borrowers; these borrowers may not otherwise qualify for more traditional mortgage loans and may not fully understand the risks associated with nontraditional mortgage loans.

Many of these nontraditional mortgage loans are underwritten with less stringent income and asset verification requirements (reduced documentation) and are increasingly combined with simultaneous second-lien loans.[4] Such risk layering, combined with the broader marketing of nontraditional mortgage loans, exposes financial institutions to increased risk relative to traditional mortgage loans.

Given the potential for heightened risk levels, management should carefully consider and appropriately mitigate exposures created by these loans. To manage the risks associated with nontraditional mortgage loans, management should—

- ensure that loan terms and underwriting standards are consistent with prudent lending practices, including consideration of a borrower's repayment capacity;
- ensure that consumers have sufficient information to clearly understand loan terms and associated risks prior to making a product choice; and
- recognize that many nontraditional mortgage loans, particularly when they have risk-layering features, are untested in a stressed environment. As evidenced by experienced institutions, these products warrant strong risk-management standards, capital levels commensurate with the risk, and an allowance for loan and lease losses (ALLL) that reflects the collectibility of the portfolio. The Federal Reserve expects institutions to effectively assess and manage the risks associated with nontraditional mortgage loan products.[5]

Institutions should use the guidance to ensure that risk-management practices adequately address these risks. Risk-management processes, policies, and procedures in this area will be carefully scrutinized. Institutions that do not adequately manage these risks will be asked to take remedial action.

This guidance focuses on the higher risk elements of certain nontraditional mortgage products, not the product type itself. Institutions with sound underwriting, adequate risk management,

1. The Board of Governors of the Federal Reserve System, the Office of the Comptroller of the Currency, the Federal Deposit Insurance Corporation, the Office of Thrift Supervision, and the National Credit Union Administration.

2. The term *institution(s)* is used in the interagency guidance. As used in this section, *institutions* applies to Federal Reserve-supervised state member banks and their subsidiaries, and bank holding companies and their nonbank subsidiaries.

3. Interest-only and payment-option ARMs are variations of conventional ARMs, hybrid ARMs, and fixed-rate products. Refer to the appendix for additional information on interest-only and payment-option ARM loans. This guidance does not apply to reverse mortgages; home equity lines of credit (HELOCs), other than as discussed in the Simultaneous Second-Lien Loans section; or fully amortizing residential mortgage loan products.

4. Refer to the appendix for additional information on reduced documentation and simultaneous second-lien loans.

5. Refer to the Interagency Guidelines Establishing Standards for Safety and Soundness in 12 CFR 208, appendix D-1.

and acceptable portfolio performance will not be subject to criticism merely for offering such products.

NONTRADITIONAL MORTGAGE LOAN TERMS AND UNDERWRITING STANDARDS

When an institution offers nontraditional mortgage loan products, underwriting standards should address the effect of a substantial payment increase on the borrower's capacity to repay when loan amortization begins. Underwriting standards should also comply with the Federal Reserve's real estate lending standards and appraisal regulations and associated guidelines.[6]

Central to prudent lending is the internal discipline to maintain sound loan terms and underwriting standards despite competitive pressures. Institutions are strongly cautioned against ceding underwriting standards to third parties that have different business objectives, risk tolerances, and core competencies. Loan terms should be based on a disciplined analysis of potential exposures and compensating factors to ensure that risk levels remain manageable.

Qualifying Borrowers for Nontraditional Loans

Payments on nontraditional loans can increase significantly when the loans begin to amortize. Commonly referred to as *payment shock*, this increase is of particular concern for payment-option ARMs where the borrower makes minimum payments that may result in negative amortization. Some institutions manage the potential for excessive negative amortization and payment shock by structuring the initial terms to limit the spread between the introductory interest rate and the fully indexed rate. Nevertheless, an institution's qualifying standards should recognize the potential impact of payment shock, especially for borrowers with high loan-to-value (LTV) ratios, high debt-to-income (DTI) ratios, and low credit scores. Recognizing that an institution's underwriting criteria are based on multiple factors, an institution should consider these factors jointly in the qualification process and potentially it may develop a range of reasonable tolerances for each factor. However, the criteria should be based upon prudent and appropriate underwriting standards, considering both the borrower's characteristics and the product's attributes.

For all nontraditional mortgage loan products, an institution's analysis of a borrower's repayment capacity should include an evaluation of the borrower's ability to repay the debt by final maturity at the fully indexed rate,[7] assuming a fully amortizing repayment schedule.[8] In addition, for products that permit negative amortization, the repayment analysis should be based upon the initial loan amount plus any balance increase that may accrue from the negative amortization provision.[9]

Furthermore, the analysis of repayment capacity should avoid overreliance on credit scores as a substitute for income verification in the underwriting process. The higher a loan's credit risk, either from loan features or borrower characteristics, the more important it is to verify the

6. Refer to 12 CFR 208.51 subpart E and appendix C and 12 CFR 225 subpart G.

7. The fully indexed rate equals the index rate prevailing at origination plus the margin that will apply after the expiration of an introductory interest rate. The index rate is a published interest rate to which the interest rate on an ARM is tied. Some commonly used indices include the 1-Year Constant Maturity Treasury Rate (CMT), the 6-Month London Interbank Offered Rate (LIBOR), the 11th District Cost of Funds (COFI), and the Moving Treasury Average (MTA), a 12-month moving average of the monthly average yields of U.S. Treasury securities adjusted to a constant maturity of one year. The margin is the number of percentage points a lender adds to the index value to calculate the ARM interest rate at each adjustment period. In different interest-rate scenarios, the fully indexed rate for an ARM loan based on a lagging index (for example, the MTA rate) may be significantly different from the rate on a comparable 30-year fixed-rate product. In these cases, a credible market rate should be used to qualify the borrower and determine repayment capacity.

8. The fully amortizing payment schedule should be based on the term of the loan. For example, the amortizing payment for a loan with a 5-year interest-only period and a 30-year term would be calculated based on a 30-year amortization schedule. For balloon mortgages that contain a borrower option for an extended amortization period, the fully amortizing payment schedule can be based on the full term the borrower may choose.

9. The balance that may accrue from the negative amortization provision does not necessarily equate to the full negative amortization cap for a particular loan. The spread between the introductory or "teaser" rate and the accrual rate will determine whether a loan balance has the potential to reach the negative amortization cap before the end of the initial payment-option period (usually five years). For example, a loan with a 115 percent negative amortization cap but only a small spread between the introductory rate and the accrual rate may reach a 109 percent maximum loan balance before the end of the initial payment-option period, even if only minimum payments are made. The borrower could be qualified based on this lower maximum loan balance.

borrower's income, assets, and outstanding liabilities.

Collateral-Dependent Loans

Institutions should avoid the use of loan terms and underwriting practices that may heighten the need for a borrower to rely on the sale or refinancing of the property once amortization begins. Loans to individuals who do not demonstrate the capacity to repay, as structured, from sources other than the collateral pledged are generally considered unsafe and unsound.[10] Institutions that originate collateral-dependent mortgage loans may be subject to criticism, corrective action, and higher capital requirements.

Risk Layering

Institutions that originate or purchase mortgage loans that combine nontraditional features, such as interest-only loans with reduced documentation or a simultaneous second-lien loan, face increased risk. When features are layered, an institution should demonstrate that mitigating factors support the underwriting decision and the borrower's repayment capacity. Mitigating factors could include higher credit scores, lower LTV and DTI ratios, significant liquid assets, mortgage insurance, and other credit enhancements. While higher pricing is often used to address elevated risk levels, it does not replace the need for sound underwriting.

Reduced Documentation

Institutions increasingly rely on reduced documentation, particularly unverified income, to qualify borrowers for nontraditional mortgage loans. Because these practices essentially substitute assumptions and unverified information for analysis of a borrower's repayment capacity and general creditworthiness, they should be used with caution. As the level of credit risk increases, the Federal Reserve expects an institution to more diligently verify and document a borrower's income and debt-reduction capacity.

Clear policies should govern the use of reduced documentation. For example, stated income should be accepted only if there are mitigating factors that clearly minimize the need for direct verification of repayment capacity. For many borrowers, institutions generally should be able to readily document income using recent W-2 statements, pay stubs, or tax returns.

Simultaneous Second-Lien Loans

Simultaneous second-lien loans reduce owner equity and increase credit risk. Historically, as combined loan-to-value ratios rise, so do defaults. A delinquent borrower with minimal or no equity in a property may have little incentive to work with a lender to bring the loan current and avoid foreclosure. In addition, second-lien HELOCs typically increase borrower exposure to increasing interest rates and monthly payment burdens. Loans with minimal or no owner equity generally should not have a payment structure that allows for delayed or negative amortization without other significant risk-mitigating factors.

Introductory Interest Rates

As a marketing tool for payment-option ARM products, many institutions offer introductory interest rates set well below the fully indexed rate. When developing nontraditional mortgage product terms, an institution should consider the spread between the introductory rate and the fully indexed rate. Since initial and subsequent monthly payments are based on these low introductory rates, a wide initial spread means that borrowers are more likely to experience negative amortization, severe payment shock, and an earlier-than-scheduled recasting of monthly payments. Institutions should minimize the likelihood of disruptive early recastings and extraordinary payment shock when setting introductory rates.

Lending to Subprime Borrowers

Mortgage programs that target subprime borrowers through tailored marketing, underwriting standards, and risk selection should follow the applicable interagency guidance on subprime

10. A loan will not be determined to be "collateral-dependent" solely through the use of reduced documentation.

lending.[11] Among other things, the subprime guidance discusses circumstances under which subprime lending can become predatory or abusive. Institutions designing nontraditional mortgage loans for subprime borrowers should pay particular attention to this guidance. They should also recognize that risk-layering features in loans to subprime borrowers may significantly increase risks for the institution and the borrower.

Non-Owner-Occupied Investor Loans

Borrowers financing non-owner-occupied investment properties should qualify for loans based on their ability to service the debt over the life of the loan. Loan terms should reflect an appropriate combined LTV ratio that considers the potential for negative amortization and maintains sufficient borrower equity over the life of the loan. Further, underwriting standards should require evidence that the borrower has sufficient cash reserves to service the loan, considering the possibility of extended periods of property vacancy and the variability of debt service requirements associated with nontraditional mortgage loan products.

PORTFOLIO AND RISK-MANAGEMENT PRACTICES

Institutions should ensure that risk-management practices keep pace with the growth and changing risk profile of their nontraditional mortgage loan portfolios and changes in the market. Active portfolio management is especially important for institutions that project or have already experienced significant growth or concentration levels. Institutions that originate or invest in nontraditional mortgage loans should adopt more robust risk-management practices and manage these exposures in a thoughtful, systematic manner. To meet these expectations, institutions should—

- develop written policies that specify acceptable product attributes, production and portfolio limits, sales and securitization practices, and risk-management expectations;
- design enhanced performance measures and management reporting that provide early warning for increasing risk;
- establish appropriate ALLL levels that consider the credit quality of the portfolio and conditions that affect collectibility; and
- maintain capital at levels that reflect portfolio characteristics and the effect of stressed economic conditions on collectibility. Institutions should hold capital commensurate with the risk characteristics of their nontraditional mortgage loan portfolios.

Nontraditional Mortgage Loan Policies

An institution's policies for nontraditional mortgage lending activity should set acceptable levels of risk through its operating practices, accounting procedures, and policy exception tolerances. Policies should reflect appropriate limits on risk layering and should include risk-management tools for risk-mitigation purposes. Further, an institution should set growth and volume limits by loan type, with special attention for products and product combinations in need of heightened attention due to easing terms or rapid growth.

Concentrations in Nontraditional Mortgage Products

Institutions with concentrations in nontraditional mortgage products should have well-developed monitoring systems and risk-management practices. Monitoring systems should keep track of concentrations in key portfolio segments such as loan types, third-party originations, geographic area, and property occupancy status. Concentrations also should be monitored by key portfolio characteristics such as non-owner-occupied investor loans and loans with (1) high combined LTV ratios, (2) high DTI ratios, (3) the potential for negative amortization, (4) credit scores of borrowers below established thresholds, and (5) risk-layered features. Further, institutions should consider the effect of employee incentive programs that could produce higher concentrations of nontraditional mortgage loans. Concentrations

11. See SR-99-6, Subprime Lending and its attachment, Interagency Guidance on Subprime Lending, March 1, 1999, and SR-01-4, Subprime Lending and its attachment, interagency Expanded Guidance for Subprime Lending Programs, January 31, 2001.

that are not effectively managed will be subject to elevated supervisory attention and potential examiner criticism to ensure timely remedial action.

Controls

An institution's quality control, compliance, and audit procedures should focus on mortgage lending activities posing high risk. Controls to monitor compliance with underwriting standards and exceptions to those standards are especially important for nontraditional loan products. The quality control function should regularly review a sample of nontraditional mortgage loans from all origination channels and a representative sample of underwriters to confirm that policies are being followed. When control systems or operating practices are found deficient, business-line managers should be held accountable for correcting deficiencies in a timely manner.

Since many nontraditional mortgage loans permit a borrower to defer principal and, in some cases, interest payments for extended periods, institutions should have strong controls over accruals, customer service, and collections. Policy exceptions made by servicing and collections personnel should be carefully monitored to confirm that practices such as re-aging, payment deferrals, and loan modifications are not inadvertently increasing risk. Customer service and collections personnel should receive product-specific training on the features and potential customer issues with these products.

Third-Party Originations

Institutions often use third parties, such as mortgage brokers or correspondents, to originate nontraditional mortgage loans. Institutions should have strong systems and controls in place for establishing and maintaining relationships with third parties, including procedures for performing due diligence. Oversight of third parties should involve monitoring the quality of originations so that they reflect the institution's lending standards and compliance with applicable laws and regulations.

Monitoring procedures should track the quality of loans by both origination source and key borrower characteristics. This will help institutions identify problems such as early payment defaults, incomplete documentation, and fraud. If problems involving appraisals, loan documentation, credit, or consumer complaints are discovered, the institution should take immediate action. Remedial action could include more thorough application reviews, more frequent re-underwriting, and even termination of the third-party relationship.

Risk Management of Secondary-Market Activity

The sophistication of an institution's secondary-market risk-management practices should be commensurate with the nature and volume of activity. Institutions with significant secondary-market activities should have comprehensive, formal strategies for managing risks.[12] Contingency planning should include how the institution will respond to reduced demand in the secondary market.

While third-party loan sales can transfer a portion of the credit risk, an institution remains exposed to reputation risk when credit losses on sold mortgage loans or securitization transactions exceed expectations. As a result, an institution may determine that it is necessary to repurchase defaulted mortgages to protect its reputation and maintain access to the markets. In the Federal Reserve's view, the repurchase of mortgage loans beyond the selling institution's contractual obligation is implicit recourse. Under the risk-based capital rules, a repurchasing institution would be required to maintain risk-based capital against the entire pool or securitization.[13] Institutions should familiarize themselves with these guidelines before deciding to support mortgage loan pools or buying back loans in default.

Management Information and Reporting

Reporting systems should allow management to detect changes in the risk profile of its nontraditional mortgage loan portfolio. The structure

12. Refer to SR-02-16, dated May 23, 2002, Interagency Questions and Answers on Capital Treatment of Recourse, Direct Credit Substitutes, and Residual Interests in Asset Securitizations and its attachment.

13. Refer to 12 CFR 208 and 225, appendix A, III.B.3.

and content should allow the isolation of key loan products, risk-layering loan features, and borrower characteristics. Reporting should also allow management to recognize deteriorating performance in any of these areas before it has progressed too far. At a minimum, information should be available by (1) loan type (for example, interest-only mortgage loans and payment-option ARMs); (2) risk-layering features (for example, payment-option ARMs with stated income and interest-only mortgage loans with simultaneous second-lien mortgages); (3) underwriting characteristics (for example, LTV, DTI, and credit score); and (4) borrower performance (for example, payment patterns, delinquencies, interest accruals, and negative amortization).

Portfolio volume and performance should be tracked against expectations, internal lending standards, and policy limits. Volume and performance expectations should be established at the subportfolio and aggregate portfolio levels. Variance analyses should be performed regularly to identify exceptions to policies and prescribed thresholds. Qualitative analysis should occur when actual performance deviates from established policies and thresholds. Variance analysis is critical to the monitoring of a portfolio's risk characteristics and should be an integral part of establishing and adjusting risk-tolerance levels.

Stress Testing

Based on the size and complexity of their lending operations, institutions should perform sensitivity analysis on key portfolio segments to identify and quantify events that may increase risks in a segment or the entire portfolio. The scope of the analysis should generally include stress tests on key performance drivers such as interest rates, employment levels, economic growth, housing value fluctuations, and other factors beyond the institution's immediate control. Stress tests typically assume rapid deterioration in one or more factors and attempt to estimate the potential influence on default rates and loss severity. Stress testing should aid an institution in identifying, monitoring, and managing risk, as well as developing appropriate and cost-effective loss-mitigation strategies. The stress testing results should provide direct feedback in determining underwriting standards, product terms, portfolio concentration limits, and capital levels.

Capital and the Allowance for Loan and Lease Losses

Institutions should establish an appropriate ALLL for the estimated credit losses inherent in their nontraditional mortgage loan portfolios. They should also consider the higher risk of loss posed by layered risks when establishing their ALLL.

Moreover, institutions should recognize that their limited performance history with these products, particularly in a stressed environment, increases performance uncertainty. Capital levels should be commensurate with the risk characteristics of the nontraditional mortgage loan portfolios. Lax underwriting standards or poor portfolio performance may warrant higher capital levels.

When establishing an appropriate ALLL and considering the adequacy of capital, institutions should segment their nontraditional mortgage loan portfolios into pools with similar credit-risk characteristics. The basic segments typically include collateral and loan characteristics, geographic concentrations, and borrower qualifying attributes. Segments could also differentiate loans by payment and portfolio characteristics, such as loans on which borrowers usually make only minimum payments, mortgages with existing balances above original balances, and mortgages subject to sizable payment shock. The objective is to identify credit quality indicators that affect collectibility for ALLL measurement purposes. In addition, understanding characteristics that influence expected performance also provides meaningful information about future loss exposure that would aid in determining adequate capital levels.

Institutions with material mortgage banking activities and mortgage servicing assets should apply sound practices in valuing the mortgage servicing rights for nontraditional mortgages. The valuation process should follow generally accepted accounting principles and use reasonable and supportable assumptions.[14]

14. See SR-03-4, dated February 25, 2003, Interagency Advisory on Mortgage Banking and its attachment, which has the same title.

CONSUMER PROTECTION ISSUES

While nontraditional mortgage loans provide flexibility for consumers, the Federal Reserve is concerned that consumers may enter into these transactions without fully understanding the product terms. Nontraditional mortgage products have been advertised and promoted based on their affordability in the near term; that is, their lower initial monthly payments compared with traditional types of mortgages. In addition to apprising consumers of the benefits of nontraditional mortgage products, institutions should take appropriate steps to alert consumers to the risks of these products, including the likelihood of increased future payment obligations. This information should be provided in a timely manner—before disclosures may be required under the Truth in Lending Act or other laws—to assist the consumer in the product selection process.

Concerns and Objectives

More than traditional ARMs, mortgage products such as payment-option ARMs and interest-only mortgages can carry a significant risk of payment shock and negative amortization, neither of which may be fully understood by consumers. For example, consumer payment obligations may increase substantially at the end of an interest-only period or upon the "recast" of a payment-option ARM. The magnitude of these payment increases may be affected by factors such as the expiration of promotional interest rates, increases in the interest-rate index, and negative amortization. Negative amortization also results in lower levels of home equity as compared with a traditional amortizing mortgage product. When borrowers go to sell or refinance the property, they may find that negative amortization has substantially reduced or eliminated their equity in the property—even when the property has appreciated. The concern that consumers may not fully understand these products is exacerbated by marketing and promotional practices that emphasize potential benefits without also providing clear and balanced information about material risks.

In light of these considerations, communications with consumers, including advertisements, oral statements, promotional materials, and monthly statements, should provide clear and balanced information about the relative benefits and risks of these products, including the risks of payment shock and of negative amortization. Clear, balanced, and timely communication to consumers of the risks of these products will provide consumers with useful information at crucial decision-making points, such as when they are shopping for loans or deciding which monthly payment amount to make. Such communication should help minimize potential consumer confusion and complaints, foster good customer relations, and reduce legal and other risks to the institution.

Legal Risks

Institutions that offer nontraditional mortgage products must ensure that they do so in a manner that complies with all applicable laws and regulations. With respect to the disclosures and other information provided to consumers, applicable laws and regulations include the following:

- Truth in Lending Act (TILA) and its implementing regulation, Regulation Z
- Section 5 of the Federal Trade Commission Act (FTC Act)

TILA and Regulation Z contain rules governing disclosures that institutions must provide for closed-end mortgages (1) in advertisements, (2) with an application,[15] (3) before loan consummation, and (4) when interest rates change. Section 5 of the FTC Act prohibits unfair or deceptive acts or practices.[16]

Other federal laws, including the fair-lending laws and the Real Estate Settlement Procedures Act (RESPA), also apply to these transactions. Moreover, the Federal Reserve notes that the sale or securitization of a loan may not affect an institution's potential liability for violations of TILA, RESPA, the FTC Act, or other laws in connection with its origination of the loan. State laws, including laws regarding unfair or deceptive acts or practices, also may apply.

15. These program disclosures apply to ARM products and must be provided at the time an application is provided or before the consumer pays a nonrefundable fee, whichever is earlier.

16. The Board of Governors enforces this provision under the FTC Act and section 8 of the Federal Deposit Insurance Act. See the joint Board and FDIC guidance titled Unfair or Deceptive Acts or Practices by State-Chartered Banks, March 11, 2004.

Recommended Practices

Recommended practices for addressing the risks raised by nontraditional mortgage products include the following:[17]

Communications with Consumers

When promoting or describing nontraditional mortgage products, institutions should provide consumers with information that is designed to help them make informed decisions when selecting and using these products. Meeting this objective requires appropriate attention to the timing, content, and clarity of information presented to consumers. Thus, institutions should provide consumers with information at a time that will help consumers select products and choose among payment options. For example, institutions should offer clear and balanced product descriptions when (1) a consumer is shopping for a mortgages (such as when the consumer makes an inquiry to the institution about a mortgage product and receives information about nontraditional mortgage products) or (2) when marketing relating to nontraditional mortgage products is provided by the institution to the consumer. Clear and balanced information should not be offered by the institution only upon the submission of an application or at consummation.[18] The provision of such information would serve as an important supplement to the disclosures currently required under TILA and Regulation Z as well as other laws.[19]

17. Institutions should review the recommendations relating to mortgage lending practices set forth in other supervisory guidance from their respective primary regulators, as applicable, including guidance on abusive lending practices.

18. Institutions also should strive to (1) focus on information important to consumer decision making; (2) highlight key information to make it more prominent; (3) employ a user-friendly and readily navigable format for presenting the information; and (4) use plain language, with concrete and realistic examples. Comparative tables and information describing key features of available loan products, including reduced documentation programs, also may be useful for consumers who are considering the nontraditional mortgage products and other loan features described in this guidance.

19. Institutions may not be able to incorporate all of the practices recommended in this guidance when advertising nontraditional mortgages through certain forms of media, such as radio, television, or billboards. Nevertheless, institutions should provide clear and balanced information about the risks of these products in all forms of advertising.

Promotional Materials and Product Descriptions

To assist other consumers in their product selection decisions, promotional materials and other product descriptions should provide information about the costs, terms, features, and risks of nontraditional mortgages (including information about the matters discussed below).

Payment Shock. Institutions should apprise consumers of potential increases in payment obligations for these products, including circumstances in which interest rates or negative amortization reach a contractual limit. For example, product descriptions could state the maximum monthly payment a consumer would be required to pay under a hypothetical loan example once amortizing payments are required and the interest rate and negative amortization caps have been reached.[20] Such information also could describe when structural payment changes will occur (for example, when introductory rates expire or when amortizing payments are required) and what the new payment amount would be or how it would be calculated. As applicable, these descriptions could indicate that a higher payment may be required at other points in time due to factors such as negative amortization or increases in the interest-rate index.

Negative Amortization. When negative amortization is possible under the terms of a nontraditional mortgage product, consumers should be apprised of the potential for increasing principal balances and decreasing home equity, as well as other potential adverse consequences of negative amortization. For example, product descriptions should disclose the effect of negative amortization on loan balances and home equity, and could describe the potential consequences to the consumer of making minimum payments that cause the loan to negatively amortize. (One possible consequence is that it could be more difficult to refinance the loan or to obtain cash upon a sale of the home.)

Prepayment Penalties. If the institution may impose a penalty in the event that the consumer prepays the mortgage, consumers should be alerted to this fact and to the need to ask the

20. Consumers also should be apprised of other material changes in payment obligations, such as balloon payments.

lender about the amount of any such penalty.

Cost of Reduced Documentation Loans. If an institution offers both reduced and full documentation loan programs and there is a pricing premium attached to the reduced documentation program, consumers should be alerted to this fact.

Monthly Statements on Payment-Option ARMs. Monthly statements that are provided to consumers on payment-option ARMs should provide information that enables consumers to make informed payment choices, including an explanation of each payment option available and the impact of that choice on loan balances. For example, the monthly payment statement should contain an explanation, as applicable, next to the minimum payment amount that making this payment would result in an increase to the consumer's outstanding loan balance. Payment statements also could provide the consumer's current loan balance, what portion of the consumer's previous payment was allocated to principal and to interest, and, if applicable, the amount by which the principal balance increased. Institutions should avoid leading payment-option ARM borrowers to select a nonamortizing or negatively amortizing payment (for example, through the format or content of monthly statements).

Practices to Avoid. Institutions also should avoid practices that obscure significant risks to the consumer. For example, if an institution advertises or promotes a nontraditional mortgage by emphasizing the comparatively lower initial payments permitted for these loans, the institution also should provide clear and comparably prominent information alerting the consumer to the risks. Such information should explain, as relevant, that these payment amounts will increase, that a balloon payment may be due, and that the loan balance will not decrease and may even increase due to the deferral of interest or principal payments. Similarly, institutions should avoid promoting payment patterns that are structurally unlikely to occur.[21] Such practices could raise legal and other risks for institutions, as described more fully above.

Institutions also should avoid such practices as (1) giving consumers unwarranted assurances or predictions about the future direction of interest rates (and, consequently, the borrower's future obligations); (2) making one-sided representations about the cash savings or expanded buying power to be realized from nontraditional mortgage products in comparison with amortizing mortgages; (3) suggesting that initial minimum payments in a payment-option ARM will cover accrued interest (or principal and interest) charges; and (4) making misleading claims that interest rates or payment obligations for these products are "fixed."

Control Systems

Institutions should develop and use strong control systems to monitor whether actual practices are consistent with their policies and procedures relating to nontraditional mortgage products. Institutions should design control systems to address compliance and consumer information concerns as well as the safety and soundness considerations discussed in this guidance. Lending personnel should be trained so that they are able to convey information to consumers about product terms and risks in a timely, accurate, and balanced manner. As products evolve and new products are introduced, lending personnel should receive additional training, as necessary. Lending personnel should be monitored to determine whether they are following these policies and procedures. Institutions should review consumer complaints to identify potential compliance, reputation, and other risks. Attention should be paid to appropriate legal review and to using compensation programs that do not improperly encourage lending personnel to direct consumers to particular products.

With respect to nontraditional mortgage loans that an institution makes, purchases, or services using a third party, such as a mortgage broker, correspondent, or other intermediary, the institution should take appropriate steps to mitigate risks relating to compliance and consumer information concerns discussed in this guidance. These steps would ordinarily include, among other things, (1) conducting due diligence and establishing other criteria for entering into and maintaining relationships with such third par-

21. For example, marketing materials for payment-option ARMs may promote low predictable payments until the recast date. Such marketing should be avoided in circumstances in which the minimum payments are so low that negative amortization caps would be reached and higher payment obligations would be triggered before the scheduled recast, even if interest rates remain constant.

ties, (2) establishing criteria for third-party compensation designed to avoid providing incentives for originations inconsistent with this guidance, (3) setting requirements for agreements with such third parties, (4) establishing procedures and systems to monitor compliance with applicable agreements, bank policies, and laws, and (5) implementing appropriate corrective actions in the event that the third party fails to comply with applicable agreements, bank policies, or laws.

APPENDIX
(Terms Used in This Document)

Interest-Only Mortgage Loan. An interest-only mortgage loan refers to a nontraditional mortgage in which, for a specified number of years (for example, three or five years), the borrower is required to pay only the interest due on the loan, during which time the rate may fluctuate or may be fixed. After the interest-only period, the rate may be fixed or it may fluctuate based on the prescribed index and payments, including both principal and interest.

Payment-Option ARM. A payment-option ARM is a nontraditional adjustable-rate mortgage that allows the borrower to choose from a number of different payment options. For example, each month, the borrower may choose a minimum payment option based on a "start" or introductory interest rate, an interest-only payment option based on the fully indexed interest rate, or a fully amortizing principal and interest payment option based on a 15- or 30-year loan term, plus any required escrow payments. The minimum payment option can be less than the interest accruing on the loan, resulting in negative amortization. The interest-only option avoids negative amortization but does not provide for principal amortization. After a specified number of years, or if the loan reaches a certain negative amortization cap, the required monthly payment amount is recast to require payments that will fully amortize the outstanding balance over the remaining loan term.

Reduced Documentation. Reduced documentation is a loan feature that is commonly referred to as "low doc/no doc," "no income/no asset," "stated income," or "stated assets." For mortgage loans with this feature, an institution sets reduced or minimal documentation standards to substantiate the borrower's income and assets.

Simultaneous Second-Lien Loan. A simultaneous second-lien loan is a lending arrangement where either a closed-end second lien or a home equity line of credit is originated simultaneously with the first-lien mortgage loan, typically in lieu of a higher down payment.

Nontraditional Mortgages—Associated Risks Examination Objectives

Effective date May 2007

Section 2136.2

1. To ascertain if the bank has adequate risk-management processes, policies, and procedures to address the risk associated with its nontraditional mortgage loans.
2. To evaluate whether the bank's nontraditional mortgage loan terms are supported by a disciplined analysis of its potential exposures versus the mitigating factors that ensure that risk levels are adequately managed.
3. To determine if the underwriting standards for nontraditional mortgage loans comply with the Federal Reserve's real estate lending standards and appraisal regulations and associated guidelines.
4. To evaluate whether the bank's management carefully considers and appropriately assesses and mitigates the risk exposures created by the nontraditional mortgage loans by ensuring that—
   a. its loan terms and underwriting standards are consistent with prudent lending practices, including consideration of a borrower's repayment capacity;
   b. its nontraditional mortgage loan products have strong risk-management standards, capital levels commensurate with the risk, and an allowance for loan and lease losses that reflects the collectibility of the portfolio; and
   c. its consumers have sufficient information to clearly understand the loan terms and associated risks prior to making a nontraditional mortgage loan product choice.
5. To determine if the bank has borrower qualification criteria that include an evaluation of a borrower's repayment capacity and ability to repay the debt—the full amount of the credit extended, including any balance increase that may accrue from negative amortization—by the final maturity date at the fully indexed rate.

RISK MITIGATION

1. Assess the bank's management procedures to mitigate the risk created by nontraditional mortgage products. Determine that—
   a. underwriting standards and terms are consistent with prudent lending practices, including consideration of each borrower's repayment capacity;
   b. products are supported by strong risk-management standards, capital levels that are commensurate with their risk, and an allowance for loan and lease losses that reflects the collectiblity of the portfolio; and
   c. borrowers have sufficient information to clearly understand the terms of their loans and their associates risks.

UNDERWRITING STANDARDS

1. Determine if the bank's underwriting standards—
   a. address the effect of a substantial payment increase on the borrower's capacity to repay when loan amortization begins,
   b. comply with the Federal Reserve's real estate lending standards and appraisal regulations and associated guidelines, and
   c. require that loan terms are based on a disciplined analysis of potential exposures and mitigating factors, which will ensure that risk levels remain manageable.
2. Verify that the bank's nontraditional mortgage loan qualification standards recognize the potential impact of payment shock (particularly for borrowers with high loan-to-value (LTV) ratios, high debt-to-income (DTI) ratios, and low credit scores).
3. Ascertain that the analysis of a borrower's repayment capacity includes—
   a. an evaluation of the borrower's ability to repay the debt by final maturity at the fully indexed rate, assuming a fully amortizing repayment schedule,
   b. a repayment schedule that is based on the initial loan amount plus any balance increase that may accrue from a negative amortization provision, and
   c. avoiding an overreliance on credit scores as a substitute for income verification or a reliance on the sale or refinancing of the property (pledged as collateral) when amortization begins.
4. Determine whether originated or purchased mortgage loans that combine nontraditional features (such as interest-only loans with reduced documentation and second-lien loans) have mitigating factors (that is, higher credit scores, lower LTVs and DTI repayment ratios, significant liquid assets, mortgage insurance, or other credit enhancements) that support the underwriting decisions and the borrower's repayment capacities.
5. Verify that the bank has clear loan underwriting policies governing the use of—

   a. reduced documentation of the borrower's financial capacity (for example, non- verification of reported income when the borrower's income can be documented based on recent W-2 statements, pay stubs, or tax returns);

   b. minimal or no owner's equity for second-lien home equity lines of credit (such loans generally should not have a payment structure allowing for delayed or negative amortization without other significant risk-mitigating factors);

   c. introductory interest rates (banks should minimize the likelihood of disruptive early recastings and extraordinary payment shock when setting introductory rates);

   d. subprime lending (adherence to the interagency guidance on subprime lending);[1] and

   e. non-owner-occupied investor loans (qualifications should be based on the borrower's ability to service the debt over the life of the loan, which would include a combined LTV ratio that considers negative amortization and sufficient borrower equity, and continuing cash reserves).

1. See SR-01-4 and SR-99-6.

PORTFOLIO AND RISK-MANAGEMENT PRACTICES

1. If the bank originates or invests in nontraditional mortgage loans, determine if more robust risk-management practices have been adopted to manage the exposures.
   a. Verify that there are appropriate written lending policies that have been adopted and are being used and monitored, specifying acceptable product attributes, production and portfolio limits (growth and volume limits by loan type), sales and securitization practices, and risk-management expectations (acceptable levels of risk).
   b. Determine if enhanced performance measures have been designed and if there is management reporting that provides an early warning for increasing risk.
   c. Find out if the appropriate levels for the allowance for loan and lease losses (ALLL) have been established that consider the credit quality of the portfolio and the conditions that affect collectibility.
   d. Evaluate whether adequate capital is maintained at levels that reflect portfolio characteristics and the effect of stressed economic conditions on collectibility.
   e. Determine if capital is held commensurate with the risk characteristics of the bank's nontraditional mortgage loan portfolios.
2. If the bank has concentrations in nontraditional mortgage products, determine if there are—
   a. well-developed monitoring systems and risk-management practices that monitor and keep track of concentrations in key portfolio segments, such as by loan type, third-party originations, geographic area, and property occupancy status, and
   b. systems that also monitor key portfolio characteristics: non-owner-occupied investor loans and loans with (1) high combined LTV ratios, (2) high DTI ratios, (3) the potential for negative amortization, (4) credit scores of borrowers that are below established thresholds, and (5) risk-layered features.
3. Determine if the bank has adequate quality controls as well as compliance and audit procedures that focus on mortgage lending activities posing high risk.
   a. Determine if the bank has strong internal controls over accruals, customer service, and collections.
   b. Verify that policy exceptions made by servicing and collections personnel are carefully monitored and that practices such as re-aging, payment deferrals, and loan modifications are not inadvertently increasing risk.
   c. Find out if the quality control function regularly reviews (1) a sample of nontraditional mortgage loans from all origination channels and (2) a representative sample of underwriters confirming that underwriting policies are followed.
4. Bank oversight of third-party originators—
   a. determine if the bank has strong systems and controls in place for establishing and maintaining relationships with third-party nontraditional mortgage loan originators, including procedures for due diligence, and
   b. find out if the oversight of third- party mortgage loan origination lending practices includes monitoring the quality of originations (that is, the quality of origination sources, key borrower characteristics, appraisals, loan documentations, and credit repayment histories) so that they are reflective of the bank's lending standards and in compliance with applicable laws and regulations.
5. Determine if the bank's risk-management practices are commensurate with the nature, volume, and risk of its secondary-market activities.
   a. Find out if there are comprehensive formal strategies for managing the risks arising from significant secondary-market activities.
   b. Ascertain if contingency planning includes how the bank will respond to a decline in loan demand in the secondary market.
   c. Determine if there were any repurchases of defaulted mortgages and if the bank complies with its risk-based capital guidelines.
6. Evaluate the appropriateness of management information and reporting systems for the level and nature of the bank's mortgage lending activity.
   a. Verify that the reporting allows management to detect changes in the risk profile, or deteriorating performance, of its nontraditional mortgage loan portfolio.

b. Determine if management information is reported and available by loan type, risk-layering features, underwriting characteristics, and borrower performance.
c. Find out if—
   1) portfolio volume and performance are tracked against expectations, internal lending standards, and policy limits;
   2) volume and performance expectations are established at the subportfolio and aggregate portfolio levels;
   3) variance analyses are regularly performed to identify exceptions to policies and prescribed thresholds; and
   4) qualitative analyses are performed when actual performance deviates from established policies and thresholds.
d. Determine if the bank, based on the size and complexity of its lending operations, performs sensitivity analysis on its key portfolio segments to identify and quantify events that may increase its risks in a segment or the entire portfolio.
e. Verify that the scope of the sensitivity analysis includes stress tests on key performance drivers such as interest rates, employment levels, economic growth, housing value fluctuations, and other factors beyond the bank's immediate control.
f. Find out if the stress testing results provide direct feedback for determining underwriting standards, product terms, portfolio concentration limits, and capital levels.
g. Determine if the bank has established an appropriate ALLL for the estimated credit losses and commensurate capital levels for the risk inherent in its nontraditional mortgage loan portfolios (considering the higher risk of loss posed by the layered risks).
h. If the bank has material mortgage banking activities and mortgage servicing assets—
   a. evaluate whether sound practices were applied in valuing the mortgage servicing rights for its nontraditional mortgages and
   b. ascertain if the valuation process followed the nontraditional mortgage and other interagency guidance and generally accepted accounting principles, and whether reasonable and supportable assumptions were used.

Review the bank's internal controls, policies, procedures, and practices for making and servicing nontraditional mortgage loans. The bank's internal control system should be documented in a complete and concise manner and should include, where appropriate, narrative descriptions, flowcharts, copies of forms used, and other pertinent information.

RISK MANAGEMENT AND RISK MITIGATION

1. Are there procedures established to control, limit, and monitor the authorization of nontraditional mortgage loan transactions and to establish the appropriate supervision and preliminary review of nontraditional mortgage loan decisions?
2. For nontraditional mortgage loans, is there an appropriate separation of the employees' duties involving (1) the authorizing, executing, recording, and adjusting of loans, (2) receiving payments, (3) reconciling the accounts, and (4) maintaining clear title to, and custody of, pledged collateral—all to safeguard against the possible misappropriation of the bank's funds?
3. Has the bank's management developed risk-mitigation procedures for nontraditional mortgage products? If so, do the risk-mitigation procedures—
   a. set forth underwriting standards and terms that are consistent with prudent lending practices, including the consideration of each borrower's repayment capacity, third-party credit reports, pledged collateral valuations, and regularly timed follow-up reviews thereon?
   b. require that nontraditional mortgage products be supported by appropriate supervisory oversight and review, strong risk-management standards, capital levels that are commensurate with their risk, and an adequate allowance for loan and lease losses (ALLL) that reflects the collectibility of the portfolio?
   c. require that borrowers be provided with sufficient information so they can clearly understand the terms of their loans and their associated risks?

UNDERWRITING STANDARDS

1. Do the bank's underwriting standards—
   a. appropriately address and assess the effect of a substantial payment increase in the borrower's capacity to repay when loan amortization begins?
   b. establish practices consistent with the Federal Reserve's real estate lending standards and appraisal regulations and associated guidelines?
   c. require that loan terms be based on a disciplined analysis of potential exposures and mitigating factors, which will ensure that risk levels will remain manageable?
2. Does the bank's nontraditional mortgage loan qualification standards recognize the potential impact of payment shock, particularly for borrowers with high loan-to-value (LTV) ratios, high debt-to-income (DTI) ratios, and low credit scores?
3. Does the analysis of a borrower's repayment capacity include—
   a. an evaluation of the borrower's ability to repay the debt by final maturity at the fully indexed rate, assuming a fully amortizing repayment schedule?
   b. a repayment schedule that is based on the initial loan amount plus any balance increase that may accrue from a negative amortization provision?
   c. an avoidance of overreliance on credit scores as a substitute for income verification or reliance on the sale or refinancing of the property when amortization begins?
4. Do originated or purchased mortgage loans that combine nontraditional features (such as interest-only loans with reduced documentation and second-lien loans) have mitigating factors (that is, higher credit scores, lower LTVs and DTI repayment ratios, significant liquid assets, mortgage insurance, or other credit enhancements) that support the underwriting decisions and the borrower's repayment capacities?
5. Are there clear bank loan underwriting policies governing the use of—
   a. reduced documentation of the borrower's financial capacity (for example, non-

verification of reported income when the borrower's income can be documented based on recent W-2 statements, pay stubs, or tax returns)?
b. minimal or no owner's equity for second-lien home equity lines of credit (such loans generally should not have a payment structure allowing for delayed or negative amortization without other significant risk-mitigating factors)?
c. introductory interest rates (banks should minimize the likelihood of disruptive early recastings and extraordinary payment shock when setting introductory rates)?
d. subprime lending (including underwriting policies that are consistent with the interagency guidance on subprime lending)[1]?
e. non-owner-occupied investor loans (the qualifications should be based on the borrower's ability to service the debt over the life of the loan, which would include a combined LTV ratio that would consider negative amortization and sufficient borrower equity, and continuing cash reserves)?

PORTFOLIO AND RISK-MANAGEMENT PRACTICES

1. If the bank originates or invests in nontraditional mortgage loans—
   a. has the bank adopted risk-management practices to keep pace with the growth and changing risk profile of its nontraditional loan portfolio?
   b. are there appropriate bank-adopted (and monitored) written lending policies in use that specify—
      - acceptable product attributes?
      - production and portfolio limits (growth and volume limits by loan type)?
      - sales and securitization practices?
      - risk-management expectations (acceptable levels of risk)?
   c. have enhanced performance measures been designed and is there management reporting that will provide an early warning of increasing risk?
   d. are there appropriate ALLL levels established that consider the credit quality of the portfolio and the conditions that affect collectibility?
   e. is the bank's capital maintained at a level that is adequate and commensurate with the characteristics of its nontraditional mortgage loan portfolio, including the effect of stressed economic conditions on the collectibility of such loans?
2. If the bank has concentrations in nontraditional mortgage products, are there—
   a. well-developed monitoring systems and risk-management practices that monitor and keep track of concentrations in key portfolio segments, such as by loan type, third-party originations, geographic area, and property occupancy status?
   b. systems that also monitor key portfolio characteristics: non-owner-occupied investor loans and loans with (1) high combined LTV ratios, (2) high DTI ratios, (3) the potential for negative amortization, (4) credit scores of borrowers that are below established thresholds, and (5) risk-layered features?
3. Does the bank have adequate quality controls, including an independent internal loan review staff, that will consider and review loan documentation and other compliance and audit procedures that focus on mortgage lending activities posing high risk? Are there—
   a. strong internal controls over accruals, customer service, and collections?
   b. reviews of policy exceptions, conducted by servicing and collections personnel, which are carefully monitored, and are practices such as re-aging, payment deferrals, and loan modifications regularly reviewed to ensure that they are not inadvertently increasing risk?
   c. regular reviews conducted by the quality control function that focus on (1) a sample of nontraditional mortgage loans from all origination channels and (2) a representative sample of underwriters to confirm that underwriting policies are followed?
4. Bank oversight of third-party originators—
   a. Does the bank have strong internal systems and controls in place for establishing and maintaining relationships with third-party nontraditional mortgage loan

1. See SR-01-4 and SR-99-6.

originators, including procedures for due diligence?

b. Are there staff designated to provide bank oversight of third-party mortgage loan origination lending practices, which include the monitoring of the quality of originations (that is, the quality of origination sources, key borrower characteristics, appraisals, loan documentations, and credit repayment histories) to ensure that the originations (1) reflect adherence to the bank's lending standards and (2) compliance with applicable laws and regulations?

5. Are the bank's risk-management practices for nontraditional mortgage loans commensurate with the nature, volume, and risk of its secondary-market activities? If so, are there—
   a. comprehensive formal strategies for managing the risks arising from significant secondary-market activities?
   b. bank contingency plans that include how the bank will respond to a decline in loan demand in the secondary market?
   c. repurchases of defaulted mortgages and, if so, is the bank in compliance with its riskbased capital guidelines?

MANAGEMENT INFORMATION SYSTEM

1. Are the bank's management information system (MIS) and reports appropriate for the level and nature of the bank's nontraditional mortgage lending activity?
2. Do the systems and reports allow management to detect changes in the risk profile of, or deteriorating performance in, its nontraditional mortgage loan portfolio?
3. For the bank's nontraditional loan portfolio, is management information reported and available by loan type, risk-layering features, underwriting characteristics, and borrower performance?
4. Is the bank's nontraditional mortgage portfolio's—
   a. volume and performance tracked against expectations, internal lending standards, and policy limits?
   b. volume and performance expectations established at the sub portfolio and aggregate portfolio levels?
   c. variance analyses regularly performed to identify exceptions to policies and prescribed thresholds?
   d. qualitative analyses performed when actual performance deviates from established policies and thresholds?
5. Does the bank's MIS provide reports consisting of a trial balance of the borrower's loan balances, and an aged trial balance (based on the borrower's loan repayment terms), for the entire loan portfolio (the totals of which agree with the bank's respective general ledger balance[s]), but with nontraditional mortgage loan balances segregated and subtotaled (or totaled)?
6. Does the bank, based on the size and complexity of its lending operations, perform sensitivity analysis on its key portfolio segments to identify and quantify events that may increase its risks in a segment or the entire portfolio?
7. Does the scope of the sensitivity analysis include stress tests on key performance drivers such as interest rates, employment levels, economic growth, housing value fluctuations, and other factors beyond the bank's immediate control?
8. Do the stress testing results provide direct feedback for determining underwriting standards, product terms, portfolio concentration limits, and capital levels?
9. Has the bank established and maintained an appropriate ALLL for the estimated credit losses on nontraditional mortgage loans?
10. Do designated supervisory personnel periodically review adjustments to, and of, past due and charged-off nontraditional mortgage loans to confirm that appropriate actions have been taken, including collections and recoveries?
11. Does the bank have commensurate capital levels for the risk inherent in its nontraditional mortgage loan portfolios (considering the higher risk of loss posed by the layered risks)?
12. If the bank has material mortgage banking activities and mortgage servicing assets—
    a. has it evaluated whether sound practices were applied in valuing the mortgage servicing rights for its nontraditional mortgages?
    b. does the bank's valuation process follow the nontraditional mortgage and other interagency guidance and generally accepted accounting principles, and have

reasonable and supportable assumptions been used?

CONCLUSION

1. With respect to the bank's management of its nontraditional mortgage loan portfolio, is there adequate separation of duties, proper authorization of transactions and activities, adequate documents and records, physical control over assets and records, and independent checks on performance?
2. Have any responses to the forgoing information revealed any significant deficiencies and weaknesses in the bank management's system of internal controls over its nontraditional mortgage loan portfolio—weaknesses that effect controls over risk management and assessment, the reliability of financial reporting, the accounting information and communication system, efficiency and effectiveness of operations, compliance with laws and regulations, and monitoring of internal control performance?
3. Are there any internal control deficiencies in areas that are not covered within this questionnaire that impair any controls? Explain any additional examination procedures that are, or would be, necessary to draw conclusions about the adequacy of the internal controls over the bank's nontraditional mortgage loans.
4. Based on an overall evaluation, as evidenced by your answers to the foregoing questions, are internal controls over the bank's nontraditional mortgage loans adequate or inadequate?

LOAN-BROKERAGE AND -SERVICING ACTIVITIES

Loan-brokerage and -servicing activities are undertaken by mortgage banking enterprises and the mortgage banking operations of commercial banks. Mortgage banking activities consist primarily of two separate but related activities: (1) the origination or acquisition of mortgage loans and the sale of the loans to permanent investors and/or (2) the subsequent long-term servicing of the loans. A mortgage banking enterprise usually retains the right to service mortgage loans it sells to permanent investors. An enterprise's right to service mortgage loans other than its own is an intangible asset that may be acquired separately. The rights to service mortgage loans are purchased and sold frequently. Mortgage loans are acquired to sell to permanent investors from a variety of sources, including applications received directly from borrowers (in-house originations), purchases from brokers, purchases from investors, and conversions of various forms of interim financing to permanent financing. A service fee, usually based on a percentage of the outstanding principal balance of the mortgage loan, is received for performing loan-administration functions. When servicing fees exceed the cost of performing servicing functions, the existing contractual right to service mortgage loans has economic value.

A number of bank services may result in assets and liabilities that do not have to be entered on the general ledger. These services are considered off-balance-sheet activities and may include the origination, sale, and servicing of various loans. Servicing and accounting activities cover functions related initially to recording the loan, collecting and recording payments, and reporting loan transactions and balances (including reporting past due loans). Unlike the other activities in this section, servicing and accounting activities are not directly related to credit risk. However, some aspects of accounting and servicing activities, such as the accounting system's ability to produce accurate past due loan reports, indirectly contribute to controlling credit risk. Also, poorly designed or ineffective servicing and accounting activities can contribute to increased risk in areas besides credit, such as fraud and insider abuse.

The origination, sale, and servicing of various types of loans usually have been associated with mortgage loans. But increasingly, origination and servicing activities have also been observed in government-guaranteed loans (or portions thereof), consumer loans, and commercial loans. Improper management and control of these activities by the servicer presents certain supervisory concerns. If the bank servicer is continually originating additional loans to be serviced, the bank may find itself responsible for servicing more loans than it can prudently manage. Failure to properly administer loans may lead to legal or financial liabilities that could adversely affect the bank's capital.

ACCOUNTING GUIDANCE

The following accounting pronouncements issued by the Financial Accounting Standards Board (FASB) apply to mortgage banking activities:

- FAS 5, Accounting for Contingencies
- FAS 65, Accounting for Certain Mortgage Banking Activities
- FAS 91, Accounting for Nonrefundable Fees and Costs Associated with Originating or Acquiring Loans and Initial Direct Costs of Leases
- FAS 115, Accounting for Certain Investments in Debt and Equity Securities (paragraph 7 was amended by FAS 140)
- FAS 133, Accounting for Derivative Instruments and Hedging Activities (amended by FAS 140)
- FAS 134, Accounting for Mortgage-Backed Securities Retained After the Securitization of Mortgage Loans Held for Sale by a Mortgage Banking Enterprise
- FAS 138, Accounting for Certain Derivative Instruments and Certain Hedging Activities
- FAS 140, Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities
- FAS 149, Amendment of Statement 133 on Derivative Instruments and Hedging Activities
- FAS 154, Accounting Changes and Error Corrections

The accounting standards for nonrefundable fees and costs associated with lending, committing to lend, and purchasing a loan or group of loans are set forth in FASB Statement No. 91, “Accounting for Nonrefundable Fees and Costs Associated with Originating or Acquiring Loans and Initial Direct Costs of Leases,” (FAS 91). A summary of the statement follows. The statement applies to all types of loans as well as to debt securities (but not to loans or debt securities carried at market value if the changes in market value are included in earnings) and all types of lenders.

Nonrefundable loan fees paid by the borrower to the lender may have many different names, such as origination fees, points, placement fees, commitment fees, application fees, management fees, restructuring fees, and syndication fees. FAS 91 applies to both a lender and a purchaser and should be applied to individual loan contracts. Aggregation of similar loans for purposes of recognizing net fees or costs, purchase premiums, or discounts is permitted under certain circumstances specified in FAS 91, or if the result does not differ materially from the amount that would have been recognized on an individual loan-by-loan basis. In general, FAS 91 specifies the following:

- Loan-origination fees should be deferred and recognized over the life of the related loan as an adjustment of yield (interest income). Once a bank adopts FAS 91, recognizing a portion of loan fees as revenue to offset all or part of origination costs in the reporting period in which a loan is originated is no longer acceptable.
- Certain direct loan-origination costs specified in FAS 91 should be deferred and recognized over the life of the related loan as a reduction of the loan’s yield. Loan-origination fees and related direct loan-origination costs for a given loan should be offset and only the net amount deferred and amortized.
- Direct loan-origination costs should be offset against related commitment fees, and the net amounts should be deferred except for
  - — commitment fees (net of costs) when the likelihood that the commitment will be exercised is remote; in these cases, the fees should generally be recognized as service-fee income on a straight-line basis over the loan-commitment period, and
  - — retrospectively determined fees, which are recognized as service-fee income when the amount of the fees are determined.

All other commitment fees (net of costs) are to be deferred over the entire commitment period and recognized as an adjustment of yield over the related loan’s life or, if the commitment expires unexercised, recognized in income upon expiration of the commitment.

- Loan-syndication fees should be recognized by the bank managing a loan syndication (the syndicator) when the syndication is complete unless a portion of the syndication loan is retained. If the yield on the portion of the loan retained by the syndicator is less than the average yield to the other syndication participants after considering the fees passed through by the syndicator, the syndicator should defer a portion of the syndication fee to produce a yield on the portion of the loan retained that is not less than the average yield on the loans held by the other syndication participants.
- Loan fees, certain direct loan-origination costs, and purchase premiums and discounts on loans are to be recognized as an adjustment of yield generally by the interest method based on the contractual term of the loan. However, if the bank holds a large number of similar loans for which prepayments are probable and if the timing and amount of prepayments can be reasonably estimated, the bank may consider estimates of future principal prepayments in the calculation of the constant effective yield necessary to apply the interest method. Fees should not be recognized over the estimated average life of a group of loans.

Examiners should review the extent and nature of servicing activities to ensure that they are conducted in a safe and sound manner. Loan-origination fees and related direct loan-origination costs of loans held for sale should be accounted for in accordance with FAS 91, as discussed above. Improper practices should be criticized.

RISK MANAGEMENT AND THE VALUATION AND HEDGING OF MORTGAGE-SERVICING ASSETS ARISING FROM MORTGAGE BANKING ACTIVITIES

A bank's board of directors and senior management are expected to take into account the potential exposure of both earnings and capital to changes in a bank's mortgage banking assets and operations under expected and stressed market conditions. Banks are expected to have comprehensive documentation that adequately substantiates and validates the carrying values of its mortgage-servicing assets (MSAs) and the underlying assumptions used to derive those values. The analyses and processes should be fully documented to support the amortization and timely recognition of impairment of the bank's MSAs. (See SR-03-4.)

The guidance that follows focuses on the risks associated with these aspects of mortgage banking: valuation and modeling processes, hedging activities, management information systems, and internal audit processes. When banks originate mortgage loans, they often sell the loans into the secondary market. Yet banks often retain and recognize the servicing of those MSAs, which are complex and volatile assets that are subject to interest-rate risk. MSAs can become impaired as interest rates fall and borrowers refinance or prepay their mortgage loans. This impairment can lead to earnings volatility and the erosion of capital, if the risks inherent in the MSAs are not properly hedged.

When accounting for MSAs, banks are expected to follow FAS 140, which requires the following accounting treatment for servicing assets (including MSAs):[1]

- initially record servicing assets at fair value, presumably the price paid if purchased, or at their allocated carrying amount based on relative fair values if retained in a sale or securitization;[2]
- amortize servicing assets in proportion to, and over the period of, estimated net servicing income; and
- stratify servicing assets based on one or more of the predominant risk characteristics of the underlying financial assets, assess the strata for impairment based on fair value, and report them on the balance sheet at the lower of unamortized cost or fair value through the use of valuation allowances.

Fair value is defined in FAS 140 as the amount at which an asset could be bought or sold in a current transaction between willing parties, that is, other than in a forced or liquidation sale. Quoted market prices in active markets for similar assets provide the best evidence of fair value and must be used as the basis for the measurement, if available. If quoted market prices are not available, the estimate of fair value must be based on the best information available. The estimate of fair value must consider prices for similar assets and the results of valuation techniques to the extent available.

Examination Concerns on the Valuation of Mortgage-Servicing Assets

Banks involved in mortgage-servicing operations should use market-based assumptions that are reasonable and supportable in estimating the fair value of servicing assets. Specifically, bulk, flow, and daily MSA/loan pricing activities observed in the market should be evaluated to ensure that a bank's MSA valuation assumptions are reasonable and consistent with market activity for similar assets. Many banks also use models to estimate the fair value of their MSAs and substantiate their modeled estimate of MSA fair value by comparing the model output with general or high-level peer surveys. Such a comparison, however, is often performed without adequate consideration of the specific attributes of the bank's own MSAs.

Examiners should consider the following concerns as an indication that additional scrutiny is necessary:

1. Further guidance on the accounting for servicing assets and liabilities can be found in the instructions for the Reports of Condition and Income (Call Report); FAS 140 FASB Staff Implementation Guide; and the AICPA Statement on Auditing Standards 101, "Auditing Fair Value Measurements and Disclosures."

2. FAS 140 indicates, "Typically, the benefits of servicing are expected to be more than adequate compensation to a servicer for performing the servicing, and the contract results in a servicing asset. However, if the benefits of servicing are not expected to adequately compensate a servicer for performing the servicing, the contract results in a servicing liability."

- The use of unsupported prepayment speeds, discount rates, and other assumptions in MSA valuation models.
  - Assumptions are unsupported when they are not benchmarked to market participants' assumptions and the bank's actual portfolio performance across each product type.
- Questionable, inappropriate, or unsupported items in the valuation models (examples include retention benefits,[3] deferred tax benefits, captive reinsurance premiums, and income from cross-selling activities).
  - The inclusion of these items in the MSA valuation must be appropriate under generally accepted accounting principles (GAAP) and must also be consistent with what a willing buyer would pay for the mortgage-servicing contract. For example, when the inclusion of retention benefits as part of the MSA valuation is not adequately supported with market data, such inclusion will result in an overstatement of reported mortgage-servicing assets. Therefore, the inclusion will be deemed an unsafe and unsound practice.
- Disregard of comparable market data coupled with overreliance on peer-group surveys as a means of supporting assumptions and the fair value of MSAs.
  - Management may use survey data for comparative purposes; however, such data are not a measure of or substitute for fair value.
- Frequent changing of assumptions from period-to-period for no compelling reason, and undocumented policies and procedures relating to the MSA valuation process and oversight of that process.
- Inconsistencies in the MSA valuation assumptions used in valuation, bidding, pricing, and hedging activities as well as, where relevant, in mortgage-related activities in other aspects of a bank's business.
- Poor segregation of duties from an organizational perspective between the valuation, hedging, and accounting functions.
- Failure to properly stratify MSAs for impairment-testing purposes.
  - FAS 140 requires MSAs to be stratified based on one or more of the predominant risk characteristics of the underlying mortgage loans. Such characteristics may include financial asset type, size, interest rate, origination date, term, and geographic location. Banks are expected to identify a sufficient number of risk characteristics to adequately stratify each MSA and provide for a reasonable and valid impairment assessment. Stratification practices that ignore predominant risk characteristics are a supervisory concern.
- Inadequate amortization of the remaining cost basis of MSAs, particularly during periods of high prepayments.
  - Inadequate amortization often occurs because prepayment models are not adequately calibrated to periods of high prepayments. When these models underestimate runoff, the amount and period of estimated net servicing income are overstated.
- Continued use of a valuation allowance for the impairment of a stratum of MSAs when repayment of the underlying loans at a rate faster than originally projected indicates the existence of an impairment for which a direct write-down should be recorded.
- Failure to assess actual cash-flow performance. (The actual cash flows received from the serviced portfolio must be established in order to determine the benefit of MSAs to the bank.)
- Failure to validate or update models for new information.
  - Inaccuracies in valuation models can result in erroneous MSA values and affect future hedging performance. Models should be inventoried and periodically revalidated, including an independent assessment of all key assumptions.

RISK MANAGEMENT OF MORTGAGE BANKING ACTIVITIES

The Federal Reserve expects state member banks to perform mortgage banking operations in a safe and sound manner. Management should ensure that detailed policies and procedures are in place to monitor and control mortgage banking activities, including loan production, pipeline (unclosed loans) and warehouse (closed loans) administration, secondary-market transactions, servicing operations, and management

3. Retention benefits arise from the portion of the serviced portfolio that is expected to be refinanced with the bank in the future.

(including hedging) of mortgage-servicing assets. Reports and limits should focus on key risks, profitability, and proper accounting practices.

MSAs possess interest rate-related option characteristics that may weaken a bank's earnings and capital strength when interest rates change. Accordingly, banks engaged in mortgage banking activities should consider all aspects of the federal banking agencies' policy on interest-rate risk.[4] In addition, banks with significant mortgage banking operations or mortgage-servicing assets should incorporate these activities into their critical planning processes and risk-management oversight. The planning process should include careful consideration of how the mortgage banking activities affect the bank's overall strategic, business, and asset-liability plans. Risk-management considerations include the potential exposure of both earnings and capital to changes in the value and performance of mortgage banking assets under expected and stressed market conditions. Furthermore, a bank's board of directors should establish limits on investments in mortgage banking assets and evaluate and monitor such investment concentrations (on the basis of both asset and capital levels) on a regular basis.

During examinations of mortgage banking activities, examiners should review mortgage banking policies, procedures, and management information systems to ensure that the directors, managers, and auditors are adequately addressing the following matters.

Valuation and Modeling Processes

- Comprehensive documentation standards for all aspects of mortgage banking, including mortgage-servicing assets.
  - In particular, management should substantiate and validate the initial carrying amounts assigned to each pool of MSAs and the underlying assumptions as well as the results of periodic reviews of each asset's subsequent carrying amount and fair value. The validation process should compare actual performance with predicted performance. Management should ensure proper accounting treatment for MSAs on a continuing basis.

4. See SR-96-13, Joint Agency Policy Statement on Interest Rate Risk (June 26, 1996), and the Interest Rate Risk Management section.

- MSA impairment analyses that use reasonable and supportable assumptions.
  - Analyses should employ realistic estimates of adequate compensation,[5] future revenues, prepayment speeds, market-servicing costs, mortgage-default rates, and discount rates. Fair values should be based on market prices and underlying valuation assumptions for transactions in the marketplace involving similar MSAs. Management should avoid relying solely on peer-group surveys or the use of unsupportable assumptions. The Federal Reserve encourages banks to obtain periodic third-party valuations by qualified market professionals to support the fair values of their MSAs and to update internal models.
- Comparison of assumptions used in valuation models to the bank's actual experience in order to substantiate the value of MSAs.
  - Management should measure the actual performance of MSAs by analyzing gross monthly cash flows of servicing assets relative to the assumptions and projections used in each quarterly valuation. In addition, a comparison of the first month's actual cash received on new MSAs with the projected gross cash flows can help validate the reasonableness of initial MSA values prior to the impact of prepayments and discount rates. This analysis is a critical tool in understanding the profitability of mortgage servicing to a bank; however, it is not a substitute for the estimation of the fair value of MSAs under GAAP.
- Review and approval of results and assumptions by management.
  - Given the sensitivity of the MSA valuation to changes in assumptions and valuation policy, any such changes should be reviewed and approved by management and, where appropriate, by the board of directors.
- Comparison of models used throughout the company including valuation, hedging, pricing, and bulk acquisition.
  - Companies often use multiple models and assumption sets in determining the values

5. As defined in FAS 140, "adequate compensation" is "the amount of benefits of servicing (i.e., revenues from contractually specified servicing fees, late charges, and other ancillary sources) that would fairly compensate a substitute servicer should one be required, which includes the profit that would be demanded in the marketplace."

for MSAs depending on their purpose—pricing versus valuation. Any inconsistencies between these values should be identified, supported, and reconciled.
- Appropriate amortization practices.
  - — Amortization of the remaining cost basis of MSAs should reflect actual prepayment experience. Amortization speeds should correspond to and be adjusted to reflect changes in the estimated remaining net servicing income period.
- Timely recognition of impairment.
  - — Banks must evaluate MSAs for impairment at least quarterly to ensure amounts reported in the call report[6] are accurately stated. Banks will generally be expected to record a direct write-down of MSAs when, and for the amount by which, any portion of the unamortized cost of a mortgage-servicing asset is not likely to be recovered in the future.

Mortgage Banking Hedging Activities

- Systems to measure and control interest-rate risk.
  - — Hedging activities should be well developed and communicated to responsible personnel. Successful hedging systems will mitigate the impact of prepayments on MSA values and the effects of interest-rate risk in the mortgage pipeline and warehouse.
- Approved hedging products and strategies.
  - — Management should ensure appropriate systems and internal controls are in place to oversee hedging activities, including monitoring the effectiveness of hedging strategies and reviewing concentrations of hedge instruments and counterparties.
- Hedge accounting policies and procedures.
  - — Banks should ensure their hedge accounting methods are adequately documented and consistent with GAAP.

Management Information Systems

- Accurate financial reporting systems, controls, and limits.
  - — At a minimum, the board should receive information on hedged and unhedged positions, mark-to-market analyses, warehouse aging, the valuation of MSAs, various rate shock-scenario and risk exposures, the creation of economic value, and policy exceptions whenever material exposure to MSAs exists.
- Systems that track quality-control exceptions.
  - — Quality-control reports should be analyzed to determine credit quality, loan characteristics and demographics, trends, and sources of problems. Sound quality-control programs are also beneficial in the early detection of deteriorating production quality and salability as well as in the prevention and detection of fraudulent activities.
- Systems that track and collect required mortgage loan documents.
  - — Management should ensure adequate control processes are in place for both front-end-closing and post-closing loan documents. If mortgages are not properly documented, a bank may be forced to hold unsold mortgages for extended periods or repurchase mortgages that have been sold. Further, management should ensure that adequate analyses are performed and allowances are established for estimated probable losses arising from documentation deficiencies on closed loans.
- Systems that monitor and manage the risks associated with third-party originated loans.
  - — Banks often originate loans through broker and correspondent channels. Management should ensure that prudent risk-management systems are in place for broker and correspondent approvals and ongoing monitoring, including controls on the appraisal and credit-underwriting process of third-party originated loans. Adequate due diligence of third-party relationships is necessary to help prevent the origination of loans that are of poor credit quality or are fraudulent. Delegated underwriting to brokers or correspondents warrants close supervision from senior management.

Internal Audit

- Adequate internal audit coverage.
  - — Because of the variety of risks inherent in mortgage banking activities, internal audi-

6. Schedule RC-M, Memoranda, Item 2a.

tors should evaluate the risks of and controls over their bank's mortgage banking operations. They should report audit findings, including identified control weaknesses, directly to the audit committee of the board or to the board itself. Board and management should ensure that internal audit staff possess the necessary qualifications and expertise to review mortgage banking activities or obtain assistance from qualified external sources.

INTERAGENCY ADVISORY ON ACCOUNTING AND REPORTING FOR COMMITMENTS TO ORIGINATE AND SELL MORTGAGE LOANS

On May 3, 2005, the Federal Reserve, Federal Deposit Insurance Corporation, National Credit Union Administration, Office of the Comptroller of the Currency, and the former Office of Thrift Supervision issued an "Interagency Advisory on Accounting and Reporting for Commitments to Originate and Sell Mortgage Loans." The advisory provides guidance on the appropriate accounting and reporting for commitments to

- originate mortgage loans that will be *held for resale,* and
- sell mortgage loans under mandatory-delivery and best-efforts contracts.

The advisory discusses the characteristics that should be considered in determining whether mandatory-delivery and best-efforts contracts are derivatives and the accounting and regulatory reporting treatment for both commitments to originate mortgage loans that will be held for resale and those loan-sales agreements that meet the definition of a derivative. The advisory also addresses the guidance that should be considered in determining the fair value of derivatives.

A financial institution is expected to account for and report derivative loan commitments and forward loan-sales commitments as derivatives in accordance with GAAP, which includes the use of valuation techniques that are reasonable and supportable in the determination of fair value. An institution's failure to account for and report derivative loan commitments and forward loan-sales commitments in regulatory reports in accordance with GAAP may be an unsafe and unsound practice. To view the entire contents of the advisory, see SR-05-10, "Accounting and Reporting for Commitments to Originate and Sell Mortgage Loans."

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Mortgage Banking

INTRODUCTION

Agricultural loans can be broadly defined as loans made to agricultural producers to finance the production of crops or livestock. The term ‘‘crops’’ is meant to include any of the many types of plants that produce grains, fruits, vegetables, or fibers that can be harvested. Similarly, a variety of animals is produced for profit, although cattle, swine, sheep, and poultry are by far the most common. Production cycles vary with the type of crop or livestock, from a few weeks or months to several years; in the case of an orchard crop or timber, the time from planting to harvest (from cash outlay to the generation of income) is quite lengthy. The type of crop or livestock to be produced will determine the nature of the financing needed, including its timing, collateral considerations, and repayment terms.

Repayment terms for farm loans normally correspond to anticipated cash flows. Since repayment of agricultural-related loans usually comes from the sale of crops or livestock, annual repayment terms are not uncommon. Depending on the type of operation and timing of cash income, payments may be set to come due semiannually, quarterly, or on an irregular schedule. However, many smaller farm operators also receive income from nonfarm employment, which allows them to make monthly payments on some loans.

Agricultural producers need access to land (often with buildings and other improvements) and equipment, in addition to the shorter-term operating inputs directly involved in crop or livestock production. Not all producers own land; some are tenants who pay the landowners cash rent or a portion of the crop yield. Many producers both own and rent or lease land in an effort to maximize efficiency and income. Accordingly, individual producers may need a variety of types of loans, including—

- real estate loans,
- equipment loans,
- livestock loans, and
- operating (or production) loans.

Information on each of these types of agricultural loans follows, as well as general comments on agricultural lending and the examiner’s review of agricultural loans.

AGRICULTURAL REAL ESTATE LOANS

Real estate loans are not intended as a primary focus of this manual section. However, real estate loans are a significant portion of total debt for many agricultural producers, and the examiner should consider them when evaluating other types of loans to agricultural producers. For a more thorough discussion of real estate loans, refer to section 2090.1, ‘‘Real Estate Loans.’’ Loans to finance agricultural land, together with related improvements (frequently including the producer’s residence) comprise the most common type of real estate loan made by agricultural banks. These loans are subject to the same general lending principles and legal and regulatory requirements[1] as loans on other types of real estate. Even if a bank has not made a real estate loan to the agricultural borrower, any real estate debt owed elsewhere must be considered in analyzing the borrower’s creditworthiness, along with amounts due to the bank and any other creditors. Additionally, any state laws on homestead exemptions should be noted.

Agricultural real estate loans tend to have special characteristics, particularly with regard to valuation and repayment considerations. For instance, farmland appraisers need special knowledge of soil types, topography, data on rainfall or water tables, and crop production data, as well as a knowledge of area market conditions and other extenuating information. Prevailing market values for farmland tend not to permit as high a level of cash return as those for other types of income-producing property. Values always reflect supply and demand, and, probably due to a number of factors, the demand for farmland has traditionally been relatively strong from neighboring landowners, other area farmers, nonfarmers, and absentee owners who have a strong desire to own land. A lower level of return generally dictates a lower loan-to-value ratio, although a borrower may be able to

1. In connection with the supervisory loan-to-value limits set forth in the ‘‘Interagency Guidelines for Real Estate Lending Policies,’’ farmland, ranchland, or timberland committed to ongoing management and agricultural production is considered ‘‘improved property,’’ subject to a loan-to-value limit of 85 percent. However, a bank may set a lower limit for itself and, as a matter of policy, probably will loan less than 85 percent of appraised value on farmland in most cases.

service debt at a higher level from other income sources such as less-heavily encumbered land, rented land, or nonfarm income. For example, it would not be unusual for a bank to advance 100 percent of the purchase price of land if a lien on additional land is taken to lower the overall loan-to-value ratio.

There is generally a well-established market for agricultural land. Although values fluctuate based on a variety of factors (just as they do with other types of real estate), there is normally a recognized range of values at any given time for particular land types within a general area. The examiner should gain some knowledge of current area land prices and trends through published data from local universities or private organizations, interviews with bank management, and the review of appraisal reports. This knowledge will be vital in assessing collateral values and the borrower's overall financial condition and future prospects.

An amortization period of up to 20 years is not uncommon for agricultural real estate loans by banks. Longer-term loans (up to 30 years) on farm real estate are sometimes made by commercial banks, but are more common with other lenders such as Federal Land Banks. Many banks structure real estate loans so that required payments are based on a 20- to 30-year amortization, but they write the notes with a 5- to 10-year maturity, at which time a balloon payment is due. Major improvements, such as livestock-confinement buildings or grain-handling facilities, commonly have a shorter amortization period of 10 years or less.

AGRICULTURAL MACHINERY AND EQUIPMENT LOANS

Agricultural producers often need to finance the purchase of machinery, equipment, vehicles, and implements. Typically, these loans are secured by the durable goods being financed and are amortized over an intermediate term of up to seven years. As with any equipment loan, some borrower equity should be required, the amortization period should be no longer than the expected useful life of the equipment, and scheduled payments should correlate reasonably with the timing and amount of anticipated income. In some cases, equipment loan payments may be advanced under the borrower s operating line of credit.

Loans to farmers and ranchers may include individual notes to finance the purchase of specific pieces of equipment or vehicles. However, many agricultural borrowers provide the bank with a blanket lien on all equipment and vehicles to secure any and all debts owed the bank. Frequently, borrowers have both purchase money loans on specific equipment and other loans secured by a blanket equipment lien.

Under the Uniform Commercial Code, a security interest in equipment is created with a security agreement signed by the borrower and a bank officer, and the lien is perfected by a centrally filed financing statement. Many banks file the financing statement in both the county and state in which the borrower resides *and* in the county and state in which the equipment is located. The filing is a public record that notifies lenders or other interested parties that the assets identified have been pledged, as well as to whom and when they were pledged.

Since the filing record provides vital information for potential lenders, bank management must check it before extending credit to determine whether the collateral is already pledged to another lender. In many cases, a bank might approve a loan request only if it were to be in a first lien position, but there can be exceptions. For example, a bank may agree to advance on a second lien position in a large piece of equipment in which the borrower has substantial equity or take a blanket lien on all equipment, including one or a few items of equipment pledged elsewhere (such as a purchase money lien held by an equipment dealer). As a matter of prudent lending and sound loan administration, lien searches should be performed periodically on at least larger borrowers or on those borrowers known to be or suspected of having problems or of being involved with other lenders.

Sound bank lending policies should prescribe a maximum loan-to-value ratio for equipment, as well as maximum repayment terms. The same is true for vehicles, although the loan-to-value limits on vehicles for highway use (automobiles and trucks) tend to be higher because they have a less-specialized use and are more liquid. Maximum loan-to-value limits, particularly for loans to purchase specific pieces of farm equipment, may range to more than 80 percent or even to 100 percent for strong borrowers. However, many farm lines of credit are supported in part by blanket liens on all the borrower's equipment. Typically, overall loan-to-value ratios on a line of equipment do not exceed 60 percent.

LIVESTOCK LOANS

Livestock loans vary with the animal species and the nature of the individual producer's operation, but the same general lending principles apply to virtually all types of livestock loans. The borrower should have an equity position in the livestock financed, ample feed on hand, or another underlying financial strength that will protect the lender from risks such as losses from animal diseases and deaths, rising feed costs, or market fluctuations. The size of the livestock operation should be commensurate with the borrower's physical facilities and management capability. Total debt should not overburden the borrower, and the timing and source of repayment for loans should be understood when they are originated. The term of a livestock loan normally bears a close relationship to the length of time the animals are to be held.

Feed is a necessity for livestock producers and a major expense for those involved in finishing animals for slaughter, dairy herds, or egg-laying operations. On the other hand, stocker cattle feed mainly on pasture or silage, which reduces feed costs. Some livestock producers also raise feed crops, which may improve their overall efficiency. Many producers, however, need to buy feed. In any event, the loan officer should have a firm understanding of how much feed the borrower has on hand (or will be harvesting) and how much will have to be purchased. Still, even though both borrower and banker may be experienced and capable at projecting feed costs, variables beyond their control impose some risk of increased costs. These variables might include perils such as unfavorable weather or disease affecting feed crop yields or rising feed prices or shortages brought on by other unanticipated forces.

Many banks will advance up to 100 percent of the cost of livestock if the borrower has sufficient feed on hand and a sound overall financial position. Since the animals gain weight and value as feedstocks are consumed, the bank's collateral position normally strengthens as the livestock matures toward market weight. For borrowers without adequate feedstocks on hand, advance rates may be limited to 70 to 80 percent of the purchase price.

TYPES OF LIVESTOCK OPERATIONS AND LOAN CONSIDERATIONS

Livestock producers usually specialize in particular kinds or breeds of animals or in certain phases of an animal's life cycle. This specialization may vary depending on geographic area, climate, topography, soil type, or the availability of water and feed, or on the producer's preferences, experience, or physical facilities. A producer may change his specialization from time to time based on recurring market cycles or more fundamental shifts in economic factors, such as consumer demand. Some producers are involved in more than one type of livestock operation at any given time.

The following is a brief discussion of the most common types of livestock operations, as well as the lending and loan analysis considerations for each.

Cattle

Beef Breeds

- *Cow-calf operation.* A producer has breeding stock that produces calves, which are then sold as either feeder calves or future breeding stock or are kept until the animal reaches full maturity.

  The typical cow-calf loan is for financing the breeding stock (cows and bulls) of a herd. The loan term is usually three to five years, with annual payments of principal and interest to fully amortize the loan within that term. Often, loans for this type of operation are written with one-year maturities and no predetermined amount of principal reduction at maturity. However, this kind of loan structure is more suitable for borrowers who are not highly leveraged.

  Repayment is from the annual sale of calves and cull cows (older cows or those that fail to produce offspring). Approximately 10 to 15 percent of a cow herd is culled each year; most cows are retained for seven to as many as twelve years. Bulls are typically stocked at one for each 20 to 25 cows; pregnancy rates are generally 80 to 100 percent, depending on the age and health of the cows and on feed availability.

Most calves are born in late winter and early spring, weighing around 100 pounds. Cows may be winter-fed on hay, but cows and calves graze on pastureland from spring to around October when the calves weigh 500 to 550 pounds. At this time, the calves may be sold to another producer who specializes in raising stockers. (However, in some areas, herds are managed to produce fall calves. Also, depending on feed sources and market conditions, calves may be sold at lighter weights, around 300 to 400 pounds.)

- *Stocker or backgrounding operation.* A producer in a stocker operation acquires calves weighing from 300 to 550 pounds and feeds them, primarily on pasture, until they weigh around 700 to 750 pounds, when they are sold to a finisher. Since the growth gains of young cattle are generally the most efficient phase of beef production, some stock operators prefer to buy lighter weight calves, although the lighter weights require more care and supervision to minimize death losses. Stocker operations are relatively high-risk programs that require specialized knowledge, but they can also be quite profitable.

  Backgrounding requires approximately 100 days, during which time the cattle may be fed a daily ration of silage (the entire corn or grain sorghum plant chopped into feed and stored in a silo) and grain and feed supplements, including soybean meal, minerals, salt, and vitamins. The supplements usually need to be purchased. Steers gain approximately two pounds per day, and heifers slightly less. Sometimes stocker cattle are placed on pasture, which can include dormant wheat in the winter or grass during the summer.

  Stocker cattle are typically financed with a 90- to 120-day single-advance, single-maturity note. Funds for feed purchases may be provided as part of the note proceeds, but, more commonly, the feed is raised by the producer. Loan repayment comes from the sale of the cattle when they weigh around 700 to 750 pounds. Collateral for stocker loans is typically the cattle financed and the feed. Banks usually require around a 30 percent margin in the cattle, but may require as little as 20 percent or less for financially strong borrowers.

  The profitability of a backgrounding operation is sensitive to the average daily weight gain, feed costs, weather, and purchase and sale prices of the cattle.

- *Finishing operation.* A finishing operation acquires cattle weighing approximately 700 to 750 pounds and feeds them a high-protein grain ration until they are ready for slaughter at around 1,100 to 1,200 pounds.

  Finishing usually takes around 130 to 145 days. Most finishing cattle are now custom-fed in commercial feedlots, but the producer (not the feedlot owner) usually retains ownership of the cattle. Feeder steers usually gain approximately 3.2 pounds per day, and heifers around 2.8 pounds per day. However, average daily gains vary depending on the breed, type of ration, time of year, or weather conditions.

  Finishing cattle can be risky because of fluctuations in cattle prices between purchase and sale dates. Some producers use futures contracts to lock in prices and reduce the risk, or they enter into forward contracts with a packer. Larger producers may use a "moving hedge" to offset the risk imposed by market cycles.[2]

  Banks normally require 20 to 30 percent initial margin in financing the purchase of feeder cattle, but may advance up to 100 percent of the feed costs. As the cattle gain weight, the bank's collateral position tends to improve. Repayment comes from sale of the cattle, with loan maturity set near the anticipated sale date.

Dairy Operations

Cows are milked for ten months each year, then rested for two months and allowed to "dry up" (quit producing milk by not being milked). Three months after a female dairy cow gives birth, she is rebred and calves nine months later. Cows are commonly bred through artificial insemination, which allows the producer to improve the genetics of the herd. Each year approximately one-third of the cows are culled,

2. In this strategy, the producer periodically buys a given number of lightweight feeders and at the same time sells a similar number of fat cattle. When prices are down, lower revenues from sales of cattle are offset by the benefit of lower costs to purchase replacement lightweight feeders. By the same token, when prices are up, higher purchase costs are offset by higher revenues on the slaughter cattle sold. This strategy allows the producer to prevent or substantially minimize losses due to fluctuating market prices. Otherwise, the producer might too often be in the position of only buying at high prices and only selling at low prices.

with replacement heifers usually raised on the farm. An 80 percent calf crop is common, with the males either sold soon after birth or fed for slaughter.

Milk production is measured by pounds of milk produced per cow per year. Production in the range of 13,500 to 20,500 pounds is common. Milk production variables include the quality of the cows, number of days milked each year, and amount and quality of feed. Feeding cows a higher ratio of grain to dry hay will result in higher milk production, but the higher feed costs must be weighed against the returns of higher production.

Feed is a major expense for a dairy operation. Dairy cows consume a ration of corn or grain sorghum, soybean meal, high-quality hay, silage, vitamins, and minerals. Family-oriented dairy operations usually grow most of their own feed on the farm, while larger operations purchase most of their feed and confine the cows to a dry-lot facility.

A dairy operation is heavily capital intensive because of the investment in cows, buildings, and equipment. Dairying is also labor intensive, which further adds to the cost of production.

The efficiency of a dairy operation is measured on a "per-cow" basis. Gross income, expenses, and net income can be divided by the number of cows to analyze trends and compare them with other dairy operations. Several other key indicators of a dairy operation's productivity include the following:

- *Pounds of milk per cow per year.* Herds averaging less than 14,000 pounds may be struggling.
- *Calving interval.* Twelve to thirteen months is favorable; if the interval lengthens, milk production and the overall efficiency of the operation will decline.
- *Calf losses.* A 10 percent or less loss on live calves born is favorable and considered an indication of good management.
- *Culling rate.* Cows should start milking when they are about two years old and should average four to five lactation periods before they are culled; if cows have to be culled prematurely, efficiency declines.

Loans to dairy operators may include longer-term financing for land and improvements; intermediate financing for the cow herd, specialized equipment, and vehicles; and operating loans to help finance the production of feed crops. Established operations may not require herd financing unless the herd is being expanded. Financing replacement cows to maintain a herd, if necessary, should be included in a shorter-term operating loan. Generally, operating loans are not a major financing activity as the dairy farmer's regular income from the sale of milk can often accommodate operating needs.

Collateral for dairy loans, in addition to real estate, typically includes the livestock, crops and feed on hand, and equipment. The collateral is usually covered with a blanket security agreement. Often, milk sale proceeds are assigned to the bank, and the milk buyer sends a monthly check directly to the bank to meet scheduled loan repayments.

Clearly, the primary source of income for the dairy farmer is the sale of milk, which is produced daily. Additional income is produced from the annual sale of calves and culled cows.

Hogs

Hog production consists of a two-stage operation: (1) "farrowing" (breeding sows to produce feeder pigs) and (2) "finishing" (fattening feeder pigs to slaughter weight). Many producers combine both enterprises and are called farrow-to-finish operations.

Hog producers range from small operators to large corporate interests. The small producers can be considered those who market less than 2,500 head per year; they can be involved either in finishing hogs or in farrow-to-finish operations. Small producers also tend to be involved in grain farming (raising their own feed) and other kinds of livestock production. The profitability and financial strength of a small producer is generally tied to the ability to market hogs frequently throughout the year, which lessens the impact of adverse market fluctuations. If the producer cannot market frequently, he or she probably needs to be involved in hedging practices. A corporate hog farm is usually a farrow-to-finish operation, with the number of sows ranging from 500 to as many as 100,000 for the largest producers.

Farrowing Operations

Hog breeding normally requires one boar for approximately 20 sows. Sows typically have two litters per year, and litter size is one of the most crucial factors in determining the success of a farrowing operation. Eight hogs per litter is a goal for most producers. Up to 25 percent of the sows will be culled each year. Some producers raise their own replacement sows, while others purchase quality breeding stock in an attempt to improve herd quality.

Pigs are farrowed (born) in confinement buildings, and after three weeks, they are moved to a nursery facility where the pigs are weaned from the sow. The capital invested in farrowing facilities varies greatly, but the trend has been toward higher investments in facilities that require less labor. However, a large investment in a single-use, costly hog facility can pose a significant risk if the farrowing operation is not profitable.

Feed costs are the largest operating expense of a farrowing operation. The feed required consists of a feed grain (corn or milo), a protein supplement, vitamins and minerals, and a pig starter (a commercial feed used in the transition from nursing to eating solid food). In a feeder pig production operation, the young pigs are typically kept until they weigh 40 to 60 pounds, which takes around two months. Feed costs are continually changing because of fluctuating grain prices, so it may be difficult to project cash flow accurately. Historical cash flow may be more useful in demonstrating the borrower's overall management capabilities.

Loans to farrowing operations may include an intermediate- to mid-term loan on the facilities (usually not for more than ten years), breeding stock loans that should be amortized over no more than four years, and operating loans. Operating loans are often in the form of revolving lines of credit to purchase feed, with repayment normally coming from the sale of hogs. The operating line should be cleaned up periodically, or the bank should establish systems to monitor advances and repayments to ensure that stale debt is not accumulating.

Collateral for a farrowing operation could include the facilities and the hogs and feed on hand. For collateral purposes, the hogs should be valued at local market prices even though the producer might have paid a premium for breeding stock. Feed should be heavily margined, as the proceeds from feed sale during a foreclosure are likely to be limited.

Loan repayment comes primarily from the sale of young feeder pigs and culled sows. The timing of scheduled repayments will vary, depending largely on the producer's breeding schedule and the anticipated sale dates for feeder pigs. Usually, sows are bred at different times so they are not all having pigs at the same time. In the case of a farrow-to-finish operation, the cycle will be longer, and repayments will be scheduled according to anticipated sale dates of the fat hogs and culled breeding stock.

Finishing Operations

Hog finishing is the process of acquiring young pigs that weigh 40 to 60 pounds, and feeding them until they reach a slaughter market weight of 220 to 240 pounds. The process takes approximately four months. The average death loss for a finishing operation is generally 4 to 5 percent of the total number of hogs started on feed.

Loans for hog finishing are usually in the form of single-payment notes that mature in approximately four months. Loan proceeds are used to purchase young pigs and may also be used to purchase feed. A bank commonly advances up to 100 percent of the purchase price of the pigs. Usually, there is a blanket security agreement in place that gives the bank a security interest in all hogs, as well as in feed and other chattels to provide additional overall support for the credit. Margin in the collateral increases as the animals gain weight. Repayment comes from the sale of fat hogs to a packing plant.

The main factors in determining a finisher's profitability are (1) the cost of the feeder pigs, (2) the cost of feeding the pigs, and (3) revenues from the sale of hogs. Costs and revenues continually change because of fluctuations in market prices for young pigs, slaughter hogs, grain, and feed. Because of the relatively short cycle of hog finishing, a number of loans may be made during one year. In analyzing hog loans, reviewing the overall profitability of the operation (taking into account depreciation on facilities and equipment, interest, and insurance) is more meaningful than reviewing the results from each individual loan advance.

Sheep

Sheep are raised for the production of meat and wool. The most common sheep enterprise is the raising of ewe (female) flocks, which produces income from the sale of both wool and lambs. Larger flocks tend to be more efficient as they can take better advantage of investments in labor-saving equipment.

Ewes give birth once a year, usually during late fall or winter. They frequently have twins, resulting in an overall lamb production per ewe of approximately 140 percent. About 20 percent of the ewes are culled each year, with replacements usually being raised from lambs. There is typically one ram for each 30 ewes in a breeding flock. The sheep and lambs graze on pasture during the summer and are fed a ration of roughage and grain during the winter.

Loans to ewe flock operators are made to purchase breeding stock and to pay operating expenses. Breeding-stock loans should be amortized over no more than five years. Repayment comes primarily from the sale of lambs and wool.

Typically, lambs are finished in commercial feedlots until they reach slaughter weight, which involves purchasing 60-pound feeder lambs and feeding them a hay-grain ration for about 90 days until they weigh approximately 120 pounds. The loan term is usually 90 to 120 days, with the sale of fat lambs to a processor being the source of repayment. Collateral consists of the lambs, which should be valued at local market prices. Margin required in the lambs, if any, will depend on feedstocks owned or on the borrower's financial strength.

Poultry

Poultry production has become a very large and highly organized agribusiness. Large corporate producers dominate the industry. However, they depend to a large extent on individual growers, with whom they contract to raise the birds almost from the day they are hatched until they are ready for slaughter. The large company supplies an independent grower with the day-old chicks, feed, and medications and provides technical support. Under the contract, the company pays the grower at a rate designed to provide an acceptable return on the grower's investment in poultry houses, equipment, and labor.

Producing breeding stock, incubating eggs, hatching chicks, and producing pullets and eggs are other aspects of the poultry industry that are highly specialized and relatively concentrated within fairly large corporate producers. Most banks will not extend loans on these types of operations, and any that do should have substantial background information on the industry in their files. The examiner should review that information and discuss the industry and the borrower's operation with the officer originating or servicing the credit.

The typical grower owns 60 to 80 acres of land and has an average of three to four poultry houses. Most growers also have other jobs and earn supplemental income from their growing operations. Broiler (or fryer) chickens generally are grown to a live market weight of approximately 4.2 pounds at 42 days of age.

Most bank loans to contract poultry growers consist of construction loans to build poultry houses and permanent financing for the houses and equipment. The houses are large but of relatively simple construction. Permanent financing is typically amortized over 10 to 15 years.

Government guarantees (Farmers Home Administration, Small Business Administration, or various state agencies) are often available to mitigate the bank's risk by guaranteeing from 85 percent to as much as 100 percent of the permanent loan. Federal guarantees have not been available for construction financing of poultry houses, so the bank generally will have to assume the full risk of the loan during the construction period.

Construction loans are generally converted into long-term loans that are repaid with the contract income a grower receives from the large corporate producer. Since feed and other supplies are typically furnished by the large producer, individual growers do not normally require operating loans.

Egg production for consumption (rather than hatching) is another aspect of the poultry industry; it is also highly organized and controlled by large producers. Facilities, feed, and labor represent the primary costs for these operations, with repayment coming primarily from the sale of eggs. Some income is also derived from the sale of "spent" hens (older hens that are no longer efficient layers). These operations are capital intensive and highly specialized. Loans to egg producers need to be carefully analyzed to determine whether they are properly structured and adequately margined. Assessment of the borrower's overall management ability, and record of profitability, industry trends, and any special risk factors is particularly important in judging loan quality.

OPERATING (PRODUCTION) LOANS

Banks (and other lenders) commonly finance the operating expenses of agricultural producers with short-term operating loans. Expenses financed may include items such as cash rent; seed; fertilizer; chemicals; irrigation; fuel; taxes; hired labor; professional fees; and, for a livestock producer, feed, feed supplements, veterinary care and medicines, and other supplies. Operating loans may take the form of single-purpose financing or line-of-credit financing. The single-purpose loan is the simplest and most basic form of financing, as it does not attempt to address the borrower's total credit requirements, and the repayment source and timing are relatively certain.

Line-of-credit financing may accommodate most of a borrower's operating needs for the production cycle. Advances are made as needed to purchase inputs or pay various expenses, with all income usually remitted to the lender to reduce the line. Depending on the type of operation, the line may seldom be fully retired because funds are advanced for a new operating year before all inventories from prior years are marketed. An operating line of credit is generally established after cash-flow projections for the year are made to anticipate credit needs and repayment capacity. While this type of financing has the advantages of convenience and accurate cash-flow monitoring (which permits comparing actual cash flow with projections), it can also have some disadvantages. The lender may be inadvertently funding or subsidizing other creditors' payments with advances on the line and, because operating cycles overlap, it may be difficult for the lender to get out of an undesirable situation.

An operating line may be revolving or nonrevolving. A revolving line replenishes itself as repayments are made, so the outstanding balance can fluctuate up and down during the approved term. There is no limit on the total amount borrowed during the term of the line, as long as the amount outstanding never exceeds the established limit. A nonrevolving line is structured so that once the approved amount is used, even though payments are made to reduce the line, the borrower must reapply and receive approval for any further advances. Revolving lines afford flexibility but have no firm disbursement or repayment plan, so they are usually reserved for borrowers with strong financial positions, proven financial management, and a history of cooperation and performance. Bank management should continually monitor operating lines and clearly document the purpose for advances and source of repayments. A clean-up period may or may not be required after harvest or completion of the operating cycle, depending on the anticipated schedule for selling farm or ranch production.

The primary source of repayment for an agricultural operating loan is revenue from agricultural production. Many farmers also receive some form of government support payments, and they may have employment off the farm or do custom work (such as harvesting) for hire. In many cases, wages or salaries generated from the nonfarm employment of a farmer's spouse will cover a significant portion of the family's living expenses, relieving the financial pressure on the farming operation. To evaluate repayment capacity, the loan officer must determine how much revenue will be generated from either current production or inventories. Revenues will need to be sufficient to cover all expenses, however, not just those funded by the loan. These could include various operating expenses, family living expenses, payments on capital debt (for real estate and equipment), and any anticipated new capital expenditures. There should also be a margin to cover incorrect assumptions about yields and prices.

Most agricultural lenders recognize the need for yearly cash-flow projections to help determine credit needs and repayment capacity. Projections of both income and expense are usually made for each month (or each quarter) of the year to anticipate the amount and timing of peak financing needs, as well as the total net cash flow for the year. Obtaining and analyzing yearly federal income tax returns (particularly Schedule F) should be strongly encouraged as a means of reviewing actual operating results. Actual data can then be compared with projections to determine variances. Reasons for the variances should be understood as a part of the credit analysis process. This analysis will help the bank decide whether to grant or deny credit and service loans.

If a borrower loses money from operations in one year and cannot fully repay the operating loan, there will be "carryover debt." In general, carryover debt should be segregated, secured with additional collateral if possible, and amortized over a reasonable term that is consistent with the borrower's repayment capacity. Consistent losses and excessive carryover debt can preclude further advances and lead to the sale of certain assets or even to full liquidation of the operation.

Collateral for a typical operating loan includes growing crops, feed and grain, livestock, and other inventories. Normally, a bank also obtains a security interest in equipment, vehicles, government payments, and other receivables to strengthen the collateral margin. For new borrowers, a lien search is recommended to determine the presence of any senior liens. Pledged assets should be valued, either by a knowledgeable bank officer or an outside appraiser, and the operation and collateral should be inspected periodically to judge conditions and values. Inspections for established borrowers are usually done at least annually. More frequent inspections are usually performed on marginal borrowers or if the borrower has a feeder livestock operation with more rapid turnover of assets.

GOVERNMENT AGRICULTURAL SUBSIDY PROGRAMS

Federal government programs have long been able to help farmers financially and, to an extent, control the overproduction of agricultural products. These programs are continually evolving, but remain important in determining many producers' income levels and profitability. In addition to establishing subsidies, the programs also set limits on the number of acres of certain crops that a producer can plant to help control crop surpluses and support price levels.

Conservation Reserve Program

The Conservation Reserve Program (CRP) is a long-term retirement program for erodible land. Landowners submit bids for a 10-year contract, stating the annual payment per acre they would accept to convert the highly erodible land to a grass cover. The maximum bid per acre has been established, and accepted bids must not exceed prevailing local rental rates for comparable land. If the bid is accepted by the local Agricultural Stabilization and Conservation Service (ASCS) office, the landowner must sow the land to grass, with the cost of planting grass shared by the landowner and the government.

During the term of the 10-year contract, the landowner cannot plant a crop on the land, allow grazing on it, or cut the grass for hay. The CRP contract is assignable, so it can be transferred to a new owner along with title to the land.

Farmers Home Administration

The Farmers Home Administration (FmHA) is a federal lending agency operating within the U.S. Department of Agriculture. The FmHA performs two main functions: (1) providing supervised credit to farmers who are unable to obtain adequate credit from commercial banks and (2) improving rural communities and enhancing rural development.

Three basic programs allow the FmHA to extend funds to farmers: (1) grants, (2) direct loans, and (3) loan guarantees. The grant program is the smallest and generally relates to rural housing and community programs, most of which are for water and waste disposal systems. The direct loan programs are for loans made by FmHA through its county and state offices to farmers. The loan guarantee program permits the FmHA to guarantee up to 90 percent of the amount of loss on a loan made and serviced by another lender.

Most FmHA loans are (1) farm-operating loans, (2) farm ownership loans, or (3) emergency farm loans. Operating loans and farm ownership loans are for operators of family farms. Eligible purposes for operating loans include capital loans for machinery and livestock, as well as annual production inputs. Farm ownership loans are available for buying land, refinancing debts, and constructing buildings. Emergency loans are designed for farmers in counties where severe production losses have resulted from a disaster or from economic emergencies.

To qualify for a loan, a borrower must (1) be unable to obtain sufficient credit elsewhere at reasonable rates and terms, (2) be a citizen of the United States, (3) be an owner or tenant operator of a farm not larger than a family farm, and (4) have sufficient training or experience to ensure a reasonable chance of success in the proposed operation.

Banks have been highly motivated to use the FmHA-guaranteed loan program as a means of mitigating risk and perhaps developing a sound customer for the future. An FmHA loan also improves the bank's liquidity, since the guaranteed portion of the loan can be sold in the secondary market.

Small Business Administration

While it is not primarily a lender to agricultural producers, the Small Business Administration (SBA) has made low-interest-rate disaster loans available to individuals, including farmers. The SBA can make or guarantee various types of agricultural loans to producers whose annual revenues do not exceed $500,000. Banks occasionally make these loans, which are supported by collateral as well as a substantial percentage guarantee by the SBA. In many rural areas, however, it is probably more convenient for a bank to work with a nearby FmHA office than with an SBA office, which may be located some distance away in a metropolitan community.

Federal Crop Insurance Corporation

The Federal Crop Insurance Corporation, which is a part of the U.S. Department of Agriculture, writes multiperil crop insurance. The premiums for this insurance are subsidized by the federal government. For further information, see the following subsection on crop insurance.

CROP INSURANCE

The Federal Crop Insurance Reform Act of 1994 combined crop insurance and disaster aid into a single, unified program. To be eligible for any price support or production adjustment program and for new contracts in the conservation reserve program or any FmHA loan, farmers must carry crop insruance coverage. The expanded crop insurance program replaces the need for disaster bills as the federal response to emergencies involving widespread crop loss.

Aside from the basic required coverage under the federal program, known as the catastrophic coverage level, banks encourage some borrowers to carry crop insurance to reduce their risk of not being repaid on farm-operating loans. Borrowers that are more highly leveraged and have minimum margin in their operating loans are most likely to be required to carry crop insurance. Two common types of crop insurance are (1) crop hail insurance sold by private insurers, which insures only against hail damage, and (2) multiperil crop insurance written by the Federal Crop Insurance Corporation. As its name implies, multiperil crop insurance insures against drought, rain, hail, fire, wind, frost, winterkill, disease, and insect losses.

The federal government subsidizes the multiperil crop insurance premium by paying most of its administrative, actuarial, underwriting, and selling expenses. By subsidizing premiums and encouraging more producers to purchase the insurance, the government hopes to reduce the dependency on crop disaster payments when natural disasters occur. However, this program has not been particularly popular with farmers because they would have to suffer a high level of losses on all planted acres to receive any significant proceeds from the insurance. By diversifying their crops and planting in fields that are separated by significant distances, many farmers are willing to risk planting without crop insurance.

EVALUATING AGRICULTURAL MANAGEMENT

A crucial factor in loan analysis for banks, as well as for examiners, is an evaluation of the management capabilities of the agricultural producer. Cash earnings from an operation provide the primary source of repayment for most agricultural loans, so it is important to evaluate the borrower's ability to manage a profitable operation. The three kinds of management that agricultural lenders most often analyze are production, marketing, and financial management.

Production Management

A lender should first assess the borrower's technical ability as a producer of crops or livestock. This is primarily an objective measure because it consists of comparing an operation's output against industry and area norms. An operator whose production levels are consistently below average will probably have difficulty meeting debt-service requirements and may not be able to stay in business. There may be justifiable reasons for occasional years of below-average production, but lenders should be cautious of operators who consistently perform poorly.

Another factor to consider is the producer's ability to successfully cope with the inherent variability of agricultural production. Adverse weather, disease, and pest infestations are all production risks that continually affect crops and livestock. Some producers diversify the commodities they produce to reduce their dependency on one crop or type of livestock.

Marketing Management

Good marketing management enables the producer to reduce price risk exposure. Volatile markets have convinced most producers and lenders that sound marketing is crucial for an ongoing agricultural operation, and almost every producer needs a marketing plan designed to control price risk. Aside from helping to ensure profitability, the plan can be incorporated in formulating a more reliable statement of projected cash flow, which helps both the lender and producer anticipate financing needs.

Some of the techniques that producers use to manage price risk exposure are forward contracting, hedging, purchasing options, and using government programs. See the subsection "Marketing Farm Products" for details.

Financial Management

A producer should have the ability and willingness to understand, maintain, and use financial records. The importance of sound financial records began to be more fully appreciated in the 1980s when agricultural loan losses rose, and many agricultural producers and banks failed. During that time, the primary emphasis for many agricultural lenders shifted from collateral-based lending to cash-flow lending. While collateral may afford ultimate protection for the lender under a liquidation scenario, cash flow allows for repayment of debt in the normal course of business.

In addition to recordkeeping, financial management also encompasses how a producer uses his or her assets and liabilities. Maintaining financial reserves in the form of current assets is one means by which a producer can be prepared to overcome short-run adversity. The reserves need not necessarily be cash; they might be in the form of stored grain or other nonperishable produce or they could be earning assets such as livestock, which is readily marketable. Controlled, reasonable equipment purchases are another indication of good financial management. Overspending on equipment may be indicated if the borrower's equipment list includes many items that are new, especially costly, duplicative, or unneeded for the types of operations being conducted. The presence of sizable nonbank equipment debt on the borrower's financial statement can, in some cases, also reflect overspending.

MARKETING FARM PRODUCTS

Marketing considerations have become more important for many producers as they attempt to maximize returns. Rather than merely selling crops or livestock at prevailing market prices when the production cycle is complete, some producers attempt to lock in a price through the use of forward contracts or futures or options trading. Some producers of nonperishables may simply study market action and cycles and keep harvested crops in storage, waiting for higher prices. Some livestock producers may buy and sell throughout the year to help even out the effects of market fluctuations. Both the bank lending officer and the borrower need to have a clear understanding of the marketing plan, including its potential costs, benefits, and risks.

The following comments briefly describe some of the basic tools producers use as alternatives to the cash market to manage price risk.

- *Forward contracting*. The producer contracts with a buyer to sell farm products at a fixed price in advance of the actual marketing date. These contracts are simple to use if willing buyers can be found, but carry some risk of the buyer's defaulting, particularly if market prices decline significantly before the contract matures. This risk may be mitigated to some extent by requiring the buyer to provide security in the form of a 10 to 15 percent margin to help ensure that the buyer honors the contract.
- *Minimum-price forward contract*. This is a relatively new type of forward pricing that may be available to some producers. It establishes a floor but not a ceiling for the price the producer will receive for his commodities, so it protects against price declines but permits the producer to garner additional profits if the

market rises.

- *Basis contracting*. This is a variation on forward contracting, whereby the price the producer receives is not fixed when the contract is drawn, but will be determined by the futures market price plus or minus some agreed-on difference (basis). For example, cattle for September delivery might be priced at the September futures price (as of a date to be selected by the seller) plus 50 cents per hundredweight. Accordingly, a basis contract does not reduce risk until the price is set by the seller, so if the seller waits to set the price, he or she is still subject to all market risk. However, a basis contract can be combined with a put option (see below) to set a minimum price.
- *Hedging*. Hedging involves the use of counterbalancing transactions to substantially eliminate market risk. The type of hedge typically used by an agricultural producer is sometimes referred to as a "short hedge" because it involves use of the futures market to, in effect, sell short. Later, when the producer's commodities are ready for delivery, he sells them in the cash market. If the price has declined, he makes a profit on the sale of the futures contract to offset the lower price he receives in the cash market. Conversely, if the price has increased, a loss on the futures contract will be incurred to offset the gain in the cash market. Hedging is similar to fixing a price with a forward contract except that the price is said to be an "expected" fixed price, since the difference between the cash and futures prices may not be correctly anticipated and the resulting net price received will vary some from the expected level. Hedging can have an advantage over forward contracting because it is readily available and based on competitively determined futures prices. Since positions in the futures market require the producer to keep a cash margin with the broker, and additional margin calls may have to be met if the market goes up (after the producer has sold short), it is especially important that the bank loan officer be aware of and understand the borrower's marketing plan.
- *Put option*. Buying a put option gives the producer the right, but not the obligation, to sell a commodity at a given (strike) price any time before the put's expiration date. It protects against falling prices because the put becomes more valuable as prices fall. At the same time, a put allows the producer to benefit from rising prices, if they rise more than enough to cover the cost of the put. Puts can also be attractive because they can limit losses by establishing a minimum price at times when current prices are not profitable and the producer is reluctant to fix a low price with forward contracting or short hedging. Puts have the disadvantage of being more expensive than hedging; premiums for put options can be especially high when market prices are high.

Other more complex strategies are sometimes used that combine cash and futures instruments to minimize risk or to modify initial positions to adjust for changing market conditions, including the following.

- *Establishing minimum prices with basis contracts*. Purchasing a put option along with selling commodities on a basis contract establishes a minimum price, while allowing the producer to gain from rising prices.
- *Converting a fixed price into a minimum price*. If a producer accepts a fixed price via forward contracting and later regrets that decision, he or she may decide to purchase a call option (which becomes more valuable as prices rise). The combination of a fixed-price contract and a call option is called a "synthetic put" because the net effect is the same as buying a put option. The producer who has accepted an estimated fixed price via a short hedge can either lift the hedge (cover the open short sale in the futures market) or, depending on circumstances and relative costs, leave the hedge in place and purchase a call option.
- *Converting a minimum price into a fixed price*. If a put option has been used to set a minimum price at very low levels, and prices subsequently increase, the producer can either roll up the put to a higher strike price or sell futures and establish a fixed price when the market reaches an acceptable level. Buying one or a series of additional puts allows the producer to profit from a further rising market but may become expensive.

FINANCIAL AND INCOME INFORMATION FOR AGRICULTURAL PRODUCERS

The financial and income information most commonly used by agricultural lenders includes balance sheets, income tax returns, and statements of projected cash flow. Many producers do not prepare income statements on an accrual basis. Often, their only available income statement is Schedule F of the annual federal income tax return.

Balance Sheet

Balance sheets for agricultural producers usually divide assets and liabilities into three groups—current, intermediate, and long-term—based on the liquidity of assets and repayment schedules of liabilities. Current assets are those that will either be depleted within 12 months or can easily be converted to cash without affecting the ongoing business operation. Current assets include cash, accounts receivable, livestock held for sale, inventories of crops, feed, supplies, growing crops to be harvested within 12 months, and prepaid expenses.

Intermediate assets support production and may be held for several years. Principal intermediate assets include breeding stock, equipment, and vehicles. While these assets may be relatively liquid, their sale would seriously affect the productivity of the operation.

Long-term, or fixed, assets are more permanent in nature and benefit the operation on an ongoing basis. The principal fixed asset of an agricultural operation is farm real estate, although the producer may have other long-term assets, such as investments, which may or may not be related to his or her farming or ranching operation.

Current liabilities include those which must be paid within 12 months, including amounts owed for feed, seed, supplies, interest, and taxes. The amounts of any payments due within 12 months on intermediate-term and long-term debt should also be included in current liabilities.

Intermediate liabilities are generally those due between one and ten years from the statement date, and commonly represent debt to finance equipment and vehicles. As mentioned above, the amounts of payments due on these debts within 12 months are shown as current liabilities.

Long-term liabilities usually are those that, at inception, had a maturity of more than ten years. Debt on real estate is the main type of long-term liability on the balance sheets of most agricultural producers.

The difference between total assets and total liabilities is the net worth of the producer or the equity in the producer's assets. Most producers are individual or family farmers whose balance sheets also include personal assets not directly used in the operation, as well as debts owed on those items.

It is important to remember that the amount shown on the statement for net worth is subject to question. Since it is merely the difference between the amounts shown for total assets and total liabilities, its accuracy depends on how the assets are valued and whether all liabilities are reflected. Most agricultural borrowers value assets on their balance sheets at what they assume to be "market value." However, some tend to use rather optimistic valuations, particularly on items such as equipment and real estate. Also, some borrowers tend to carry the same values forward each year for real estate or equipment, which may cast some doubt on accuracy. Examiners reviewing agricultural credits should try to determine prevailing market prices for various types of land in the bank's trade area and acquire general knowledge of equipment values. Recent published sales data on both real estate and equipment provide reliable indications of current values.

Sometimes not all liabilities are fully or properly disclosed. A form of potential liability that is often not disclosed is the amount of deferred income tax that will be due on the sale of real estate in which the borrower may have a substantial unrealized capital gain. It may not be possible to readily estimate such deferred-tax liability unless the borrower's statement shows both cost and market values. However, the examiner should keep these points in mind in analyzing the balance sheet, in an attempt to accurately assess the borrower's financial strength. Comparison with previous balance sheets, other information in the loan file, and general knowledge about values will aid the examiner in this analysis.

It is advisable to determine how the balance sheet was prepared and by whom. Many are prepared by the borrower and submitted to the bank. Others may be prepared by the borrower and lending officer working together. Presumably, the latter method would tend to ensure a more accurate presentation but, if not, it could raise questions about lending practices or the lending officer's competency. Similarly, balance sheets that do not balance (not an unusual occurrence) might indicate a lack of appropriate analysis by the lending officer.

Balance-Sheet Ratio Analysis

The following are some basic, fairly simple ratios that can indicate the financial strength of a producer.

- *Current ratio (current assets/current liabilities).* This ratio can reflect a borrower's ability to meet current obligations without additional borrowing.
- *Quick ratio (liquid assets/current liabilities).* This ratio compares current assets that are easily converted into cash with current obligations and reflects a borrower's ability to immediately meet current obligations.
- *Leverage ratio (total liabilities/net worth).* This ratio shows the relationship between borrowed capital and owned capital. The higher the ratio, the greater is the reliance on borrowed capital, which means higher interest expense, potentially lower net income, and certainly less equity cushion to withstand risk and adversity. This is often called the *debt-to-worth ratio*.

Ratio Interpretation Guidelines[3]

Ratio	*Low Risk*	*Moderate Risk*	*High Risk*
Current Ratio	1.5:1	1:1–1.5:1	<1:1
Quick Ratio	1.1:1	.8:1–.5:1	<.5:1
Leverage Ratio	.75:1	1:1	1.25:1

Income Statement

Determining actual profitability for most agricultural borrowers is difficult, primarily because of the absence of complete income and expense information on an accrual basis. The most common income statement for agricultural producers is Schedule F of the federal income tax return (“Profit or Loss from Farming”), which accompanies Form 1040. It is prepared on a cash basis, showing cash income received and cash expenses paid, although the taxpayer is also permitted to deduct depreciation expense for items such as equipment, improvements to real estate, and breeding stock. Farmers may have other farm-related income reported on Form 4797, which reports sales of dairy and breeding livestock, or on Schedule D, which shows sales of real estate and equipment. Additional nonfarm income is reported on page 1 of Form 1040. All sources of income need to be considered by lenders and examiners, but for most farm borrowers, Schedule F is the primary report of income for the farming operation.

Tax returns probably provide the most accurate income and expense information for most farm operations. Some lenders attempt to convert the cash basis Schedule F to an accrual basis by adjusting for changes in inventory values, receivables, payables, and similar items, but the process requires timely, detailed financial information that often is not readily available. Instead, many lenders and examiners look at cash-basis income over a three-to-five year period to analyze trends and even out the cash-flow variances caused by differences in production and marketing cycles.

While cash income is not necessarily a good measure of farm business profits, it does help show the cash-flow situation and is useful in planning debt repayment programs and family budgets. In addition, cash income statements can be compared with projected cash flows to determine variances that need explanation or that may indicate the need for changes in the operation.

Operating Ratio Analysis

Key ratios can be calculated from income statements to aid in analysis. The most commonly used ratios measure profitability, repayment ability, and efficiency. Profitability is usually determined by return on equity and return on assets. Repayment ability can be determined by the earnings coverage ratio and debt payment ratio. The most common economic efficiency ratio used is the operating expense to revenue ratio. Although many smaller banks have not used income statements to any extent to analyze agricultural credits, this type of analysis can provide useful insights into an operator's efficiency and repayment ability.

3. These ratio interpretation guidelines are only rules of thumb and need to be viewed in conjunction with a thorough analysis of other pertinent factors, including balance-sheet composition, the nature of the operation, and an assessment of the borrower's management ability.

Return on assets is usually calculated by adding interest expense to net farm income and deducting a management fee (usually an amount for unpaid family labor), then dividing the resulting figure by average total farm assets for the year. Return on equity is usually calculated by deducting a management fee or unpaid family labor from net farm income and dividing the difference by total farm net worth.

Common ratios used to assess debt repayment ability and repayment risk are the earnings coverage ratio and the debt payment ratio. The earnings coverage ratio (also known as the cash-flow ratio) is a measure used to assess the operation's ability to repay. A strong earnings coverage ratio would be 30 percent or above. An acceptable but riskier level would be 10 to 30 percent. The debt payment ratio is used to determine risk over the term of the loan. It is calculated by dividing total annual debt payments by total revenue. As a general rule, total principal and interest payments should not exceed 25 percent of total revenue. A ratio of less than 15 percent would be relatively safe, while a 15 to 25 percent range would indicate some degree of risk.

The operating expense to revenue ratio measures the operating efficiency of the farm exclusive of debt obligations. A ratio of less than 70 percent usually reflects an efficient manager who can service larger amounts of debt. If the ratio exceeds 80 percent, repayment problems could occur if large amounts of debt are outstanding. The ratio tends to be higher for smaller operations.

The following example shows how the earnings coverage, debt payment, and operating expense to revenue ratios are determined from the income statement. This example reflects generally adequate ratios.

1. Total farm revenue	$210,000
2. PLUS: Nonfarm revenue	22,000
3. Total revenue (line 1 + line 2)	232,000
4. LESS: Farm operating expenses (excluding interest and depreciation)	153,000
5. LESS: Family living expenses and income taxes	35,000
6. Earnings available for interest and principal payments and new investments	44,000
7. LESS: Interest and principal payments	32,500
8. Remaining earnings available for risk, uncertainty, or new investments	11,500

Earnings coverage ratio = line 8 divided by line 7	35%
Debt payment ratio = line 7 divided by line 3	14%
Operating expense to revenue ratio = line 4 divided by line 1	73%

Statement of Projected Cash Flow

Projecting cash flow for an agricultural operation gives recognition to the importance of cash flow in servicing the debt of an ongoing operation. It also tends to impose some discipline on both borrower and lender by requiring a thoughtful planning process for the year in terms of anticipated income, expenses, financing needs, debt-servicing requirements, and capital expenditures. For individual or family farm operations, family living expenses should be included in the projections, as well as nonfarm income.

A cash-flow statement typically shows both the timing and amount of cash receipts and expenses. It can be either a forecasting device (statement of projected cash flow) or historical record (statement of actual cash flow). Banks and other lenders most commonly use the statement of projected cash flow because it aids in planning the borrower's credit needs, usually for the coming 12-month period.

A statement of projected cash flow shows not only how much credit is likely to be needed, but approximately when it will be needed. Perhaps most importantly, it shows whether cash income is expected to exceed expenses for the year. It also indicates the likely high point of the credit (amount and time) and the expected cash or debt position at the end of the year. The projected cash-flow statement represents a kind of budget that provides benchmarks against which actual performance can be compared. Significant variances call for explanations and may prompt certain actions to improve future operating results. Historical statements of actual cash flow have value for comparative purposes and can be an excellent aid in preparing projections for the following year, although banks do not typically request them from most agricultural borrowers. They tend to rely, instead, on income tax returns for information on actual operating results.

Cash flow projections are usually made near the beginning of a calendar year, although timing can vary depending on the nature of the operation. The statement is prepared as a spreadsheet normally listing, by month, anticipated cash receipts and disbursements. For each period, the projected operating-loan balance is shown after adjusting for the amount of projected net cash flow.

AGRICULTURAL LOAN POLICIES

Not all banks make agricultural loans, but for many banks, these loans comprise a significant portion of their portfolios. Any bank making agricultural loans should have developed an adequate, formalized set of written policies to guide the lending officers and staff. Agricultural loan policies should address the same general considerations as the policies used for other loan categories, such as desirable, undesirable, or prohibited loans; collateral requirements (including evaluation guidelines); maximum loan-to-value ratios; maximum maturities; documentation requirements; and concentration limitations. Given the specialized nature of agricultural assets and the varied types of operations, the policies should be comprehensive and specifically address the types of agricultural loans the bank intends to make.

Some banks may have general policies, supplemented by separate procedures or practices. Regardless of the individual bank's terminology or the way in which the material is organized, it is important that the bank's board of directors ensure that appropriate written guidance is provided for management in the agricultural lending area. The policies should help ensure that loans are made on a sound basis and provide a framework for identifying, addressing, and resolving problems that arise. Loan grading, either by the loan officers, a separate loan review function, or both is desirable, as well as a general plan for actions to be taken on loans with unsatisfactory grades. The policies should also address collection and charge-off considerations. Agricultural loan policies should be reviewed by the bank's board of directors and modified when deemed necessary. For more detailed guidance on bank loan policy, refer to section 2040.1, "Loan Portfolio Management."

AGRICULTURAL LOAN DOCUMENTATION

Loan documentation establishes the bank's legal position as creditor and secured party and evidences the borrower's ownership of and actual existence of collateral. Some documents, such as an insurance policy, give some evidence of collateral values and ensure that tangible collateral is protected. A number of documents play a supporting role, as they provide information that is vital in assessing a borrower s creditworthiness and in demonstrating the borrower's financial capacity to regulatory authorities, auditors, loan reviewers, senior management, and the board of directors. The documents also help management to service and grade the credit, determine the nature and extent of any problems, and formulate plans to resolve them by strengthening the bank's position or averting losses.

Absence of complete and current loan documentation is a weakness in the lending function and can pose a significant threat to the bank's safety and soundness. Some documentation exceptions are noted during virtually every examination, largely due to inadvertent oversights or unavoidable delays in obtaining original or updated documents. However, an unusually large volume of exceptions can be an important indication of weak and deteriorating loan quality. Excessive exceptions reflect unfavorably on management and indicate a need for management to either formulate stronger loan policies and procedures or to emphasize adherence to established guidance.

Many banks use a standard checklist to help ensure that all applicable documents are obtained when a loan is made. Most banks also have either an automated or manual "tickler" system to identify when updated documents are needed, such as current financial statements, tax returns, UCC-1 filings, collateral inspections, and evidence of insurance. Because of the large volume of required documents, many of which need to be updated at least annually, it is imperative that bank management be firmly committed to a sound loan documentation program. The program should establish responsibility for obtaining documents, monitoring compliance, and providing follow-up to help ensure that all required documents are obtained in a timely manner.

Not every document is applicable to each agricultural loan. Examiners need to assess which documents are appropriate for a given loan depending on its individual circumstances. There should be little disagreement between examiners and bank management about the basic documents needed. Basic documentation requirements are usually listed in the bank's loan policies or procedures. The need for certain supporting documents may be a matter of judgment, particularly in regard to frequency of updating documents. In most cases, however, bankers and examiners tend to agree on items that are to be considered documentation exceptions. Refer to section 2080.1, "Commercial and Industrial Loans," for further guidance on loan documentation. Following is a list of the types of documents a bank should have in connection with agricultural loans:

- promissory note
- security agreement
- financing statement
- real estate mortgage or deed of trust
- other collateral assignments, as appropriate (such as assignments of third-party notes, mortgages or deeds of trust, life insurance policies, deposit accounts, securities, or other contracts)
- subordination agreements (for example, a prior lienholder may subordinate its lien position to a bank to induce the bank to make a loan)
- appraisals
- hazard insurance policy or certificate of coverage
- cash-flow projections, usually prepared annually
- income tax returns
- financial statements (balance sheets) for the borrower, cosigner, or guarantor
- collateral inspection reports by the bank
- bill of sale for livestock or equipment
- worksheet for each note (showing the purpose, timing, and source of repayment; collateral; total existing bank debt; analysis)
- overall credit analysis (particularly on large or troubled loans)
- loan officer memos and comments
- correspondence

LOAN ADMINISTRATION AND SERVICING

In addition to making agricultural loans, analyzing creditworthiness, setting loan terms, obtaining collateral, and assembling required documentation, management needs to administer the portfolio of outstanding loans. They need to monitor borrowers' performance relative to agreed-upon terms, collateral margins, financial and income data, cash flow, crop prospects, and market trends that may affect borrower performance. If problems arise, bankers need to formulate and implement plans to protect the bank's position.

Farm and Livestock Inspections

A physical inspection of the farming operation is usually performed by bank management before advancing any substantial funds to a new borrower. Subsequent inspections, particularly for larger or more marginal borrowers and for readily moveable collateral, should be performed periodically. Inspections may be performed by the loan officer or by another bank officer or employee with agricultural experience. The inspector usually prepares a fairly detailed report listing farm assets (livestock, equipment, grain and feed on hand, and growing crops) and at least brief comments on the condition of assets and crop prospects. Often, a listing of machinery, equipment, and vehicles is prepared from the bank's records ahead of time to aid in the inspection process; any additions, deletions, or exceptions noted should be shown on the report. Livestock are listed by type, showing numbers, sex, and approximate weight. Values for all items should be shown on the report, based on current market prices. The report may note the number of acres the potential borrower owns and rents, as well as the approximate value of real estate owned. A real estate evaluation might be performed as part of a farm inspection, but a full appraisal, if required, would almost always be performed separately, usually by another individual.

Farm inspections are usually performed annually, unless the borrower has a livestock feeding operation or some other type of operation that involves frequent turnover of assets. Generally, it is desirable to inspect feeder operations approximately every six months or more frequently if deemed necessary. The absence of a current inspection report, especially for larger or troubled borrowers, may be considered a loan-documentation exception.

UNSOUND AGRICULTURAL LENDING PRACTICES

Following is a list of common unsound lending practices, some of which are general and apply to all types of loans while others relate more specifically to agricultural loans. This list includes the most common shortcomings. Depending on the extent of the unsound practices, the examiner should incorporate specific recommendations for improvement into the examination report or formal supervisory action where appropriate.

- absence of or failure to follow sound lending policies and procedures
- failure to require adequate performance on debt
- failure to monitor the borrower's performance and position, commonly evidenced by the—
  - —lack of periodic collateral inspections
  - —absence of current income and financial information
  - —failure to consider the borrower's total debt-service requirements
  - —presence of additional operating debt at another bank; or
  - —absence of a lien search to verify the bank's position in collateral
- inappropriate loan structuring, such as—
  - —untimely or inappropriate repayment schedules
  - —failure to identify or segregate carryover operating debt
- unwillingness to say "no" to a financially stressed borrower, which could be an indication of—
  - —overlending (building loan volume without regard to quality or long-term effects on the borrower and the bank)
  - —failure to consider borrower's management capabilities
  - —failure to analyze or project costs of production
  - —failure to observe market trends.
- lending for speculative purposes
- lending outside of the bank's normal trade area
- lending on new or unproven types of operations or operations in which bank management has little or no experience

TROUBLED AGRICULTURAL LOANS

Aside from readily identifiable problem loans such as past-due loans, loans on nonaccrual status, loans on the bank's watch list or those that were previously classified, or loans to borrowers who have filed for bankruptcy, the following characteristics may indicate existing or potential problems. Examiners should keep in mind both current conditions and trends.

- undermargined collateral position
- unusually high leverage
- marginal liquidity
- heavy investment in equipment, vehicles, or real estate
- need for unplanned credit advances
- deficiencies or problems revealed in the collateral inspection
- unfavorable financial trends (especially increasing debt-to-worth ratio or declining collateral margins)
- lack of performance (renewals without appropriate performance)
- capitalizing interest on debt
- charge-offs
- inability to meet scheduled debt payments
- tax problems
- reluctance of borrower to provide current, complete, and accurate financial information
- notification of insurance cancellation for failure to pay premium
- evidence of legal action against the borrower
- overdependence on guarantors
- overdependence on anticipated inheritance

CHAPTER 12 BANKRUPTCY

Chapter 12 bankruptcy for family farmers became effective in November 1986. It was designed specifically for the family-farm debtor and permits family farmers to reorganize farm debt so that the amount of the debt approximates the value of the collateral. Only a "family farmer with regular annual income" (which can be a partnership or corporate structure) may file a chapter 12 bankruptcy. To be eligible, a debtor must meet *all* of the following tests:

- have a farming operation
- have no more than $1.5 million in total debts

- derive at least 80 percent of total debts (excluding debt on the principal residence) from the farming operation
- derive more than 50 percent of the family's income from the farming operation during the year immediately preceding the filing

The family farmer will have regular annual income if the court finds the annual income to be sufficiently stable and regular to enable the farmer to make payments under the chapter 12 plan.

Under chapter 12, there is no requirement for accelerated payment of arrearage as there is with chapter 13. Instead, the farmer/debtor can commence making plan-required payments from the start of the chapter 12 bankruptcy. Also, a farmer/debtor will have the ability to modify a promissory note and continue payments on it beyond the life of the chapter 12 plan if the court approves the modification; in such cases, the creditor cannot object.

A secured creditor will be "adequately protected" during the chapter 12 bankruptcy if it receives cash payments to offset any decrease in the value of collateral and, in the case of farmland, if the creditor is paid a reasonable rental fee based on the earning capacity of the property. Also, chapter 12 does not allow the creditor to recover "lost opportunity costs," so the creditor will not be entitled to interest and other gains that would have been received by the creditor had bankruptcy not been filed. Elimination of the lost-opportunity-cost provision makes it more difficult for creditors to obtain a lift of stay on the grounds that there is not adequate protection.

Before confirming the chapter 12 plan, a court may permit a farmer to sell pledged assets without the consent of the secured creditor, although proceeds from the sale must go to the secured creditor. Creditors may bid at the sale, and collateral that is not sold will be subject to current evaluation in determining what amounts will be claimed by secured creditors under the plan. There is no time limit on the duration of a chapter 12 plan, except for a three-year limit (or five years with court approval) on unsecured debts.

If a chapter 12 debtor voluntarily dismisses the case, he is prohibited from refiling for 180 days. The law also provides for a dismissal from chapter 12, or a conversion to chapter 7, when the debtor commits fraud. Any other provisions of chapter 12 that are not discussed here are generally similar to those in chapter 11 and chapter 13 bankruptcy proceedings.

WORKING OUT PROBLEM AGRICULTURAL LOANS

When significant problems arise in agricultural credits, bank management resolves the problems in a timely manner to protect and strengthen the bank's condition. A sound and accurate loan-grading system, supported by a competent internal loan review program, will help to ensure timely identification of problems. Regulatory examinations provide an independent assessment, which may identify additional problems that management has not recognized. Once problems are identified, the following considerations are important in a workout program:

- identify the source of the problem
- establish a workout plan designed to strengthen the borrower and to minimize loss to the bank
- set at least a tentative timetable for the workout
- reach agreement with the borrower on the plan, if possible
- monitor progress frequently

Alternative actions in a workout plan might include—

- reducing the bank's exposure in outstanding debt by—
  - —obtaining additional collateral,
  - —obtaining financial assistance through sound cosigners, guarantors, or government guarantees,
  - —encouraging the borrower to modify his operations, or
  - —restructuring the credit to reduce the interest rate or payments
- advancing more funds to—
  - —refinance existing nonbank debt on more favorable terms or
  - —improve the bank's overall collateral position (for example, take out a small balance to a senior lender to put the bank in a first lien position)
- reducing or eliminating outstanding bank debt by—
  - —selling assets, which can range from a partial sale to reduce debt burden and improve chances for survival to a complete liquidation;

—refinancing a portion of bank debt (such as real estate) elsewhere if more favorable rates or terms are available; or

—recognizing a loss by partial or complete charge-off of the credit.

EXAMINER REVIEW OF AGRICULTURAL LOANS

A review of agricultural loans during an examination will follow the same basic guidelines employed in reviewing commercial or real estate loans. Certain practices, types of collateral, and documents may be unique to agricultural loans, and credit analysis will be somewhat specialized. However, the objectives of assessing credit quality based on the borrower's financial strength, cash flow, collateral, history of performance, and indications of management capabilities are much the same as for other loan types.

Sample size and sampling techniques will vary with the planned scope of the examination and size of the bank and its agricultural loan portfolio. As a minimum, the examination scope would usually include past-due and nonaccrual loans, watch-list loans, previously classified loans, insider loans, and some portion of other loans. See section 2080.1, "Commercial Loans," for details regarding this topic.

Classification of agricultural loans should be made using the same criteria established for other types of loans. See section 2060.1, "Classification of Credits," for regulatory definitions of substandard, doubtful, and loss classifications, as well as the special mention category and guidance on classifying loans.

1. To determine if lending policies, practices, procedures, and internal controls for agricultural loans are adequate.
2. To determine if bank officers are operating in conformance with the established guidelines.
3. To evaluate the agricultural loan portfolio for credit quality, performance, collectibility, and collateral sufficiency.
4. To determine the scope and adequacy of the audit function.
5. To determine compliance with applicable laws and regulations.
6. To initiate corrective action when policies, practices, procedures, objectives, or internal controls are deficient or when violations of laws or regulations have been noted.

INTRODUCTION

This section reinforces key factors in agricultural lending and provides a discussion of potential agricultural market issues and risk ramifications banking organizations and supervisory staff should consider when assessing the adequacy of the risk-management practices and capital needs for a bank's exposure to agriculture-related risks. This supervisory guidance also addresses factors that examiners should consider in evaluating individual agriculture-related credits and the adequacy of a banking organization's practices to monitor a borrower's capacity to repay given uncertain events. These concepts are based on the existing guidance within this manual's section entitled, "Agricultural Loans."[1]

A bank's risk-management and capital planning practices should be sufficiently robust to assess the level of agriculture-related credit risk and the adequacy of a bank's capital to withstand potential future market and economic distress. The risk-management principles discussed in this section are broadly applicable, irrespective of agricultural market conditions.

MARKET ISSUES AND RISK RAMIFICATIONS

Prolonged and abrupt declines in farm income, brought about by negative movements in commodity prices and/or increased production costs, could have serious ramifications for the repayment ability of previously sound farm borrowers and could result in substantial declines in farmland collateral values. Highly leveraged farm borrowers or those that are in weakened financial condition would be most vulnerable to abrupt or prolonged financial distress.

Banks should monitor a number of market factors in order to manage and control the risk of their agriculture-related loan portfolio (including collateral values for farmland) and determine the repayment ability of individual farm borrowers. These factors include the following:

- *Agricultural commodity prices.* These prices have exhibited volatility over the years.
- *Production costs.* Volatility in costs for labor, feed, fertilizer, seed, land rent, and machinery and equipment may challenge farm operators' ability to effectively manage operating profit margins.
- *Farmland values.* Surging land values can indicate capitalization rates are below historical norms and may reflect overly optimistic long-term expectations. An abrupt increase in interest rates, coupled with a decline in farm income, could trigger an increase in capitalization rates, thereby lowering farmland values.
- *Global market issues.* Global supply and demand imbalances can adversely affect commodity prices and the cost of production. For example, weather events, economic conditions, and numerous other factors can impact global supply as well as demand. For example, producers of ethanol and other biofuels may be adversely affected by the volatility in oil, corn, and other commodity prices.

SUPERVISORY EXPECTATIONS FOR CREDIT-RISK MANAGEMENT AND UNDERWRITING PRACTICES

The potential for volatile market conditions and risk factors raises the importance of ensuring that agricultural banks have in place appropriate risk-management programs and prudent lending standards. A key component of a sound risk-management program is the linkage between an analysis of market conditions and an agricultural bank's risk-management and capital planning practices. The range and extent of market analysis may vary depending on the composition of the bank's portfolio and overall risk exposure. This analysis should provide sufficient information on current market conditions, factors that could influence changes to market conditions, and possible events that could significantly change near- and long-term market conditions. Banks with significant agricultural exposure should have established risk-management practices that address the following:

- *Assessment of the Borrower's Creditworthiness.* A bank should conduct a thorough analysis of a borrower's creditworthiness, including assessments of the borrower's projected income and expenses compared to actual

1. See also, SR-11-14, "Supervisory Expectations for Risk Management of Agricultural Credit Risk."

results, adequacy of working capital, capital expense analysis, reliability of supplementary sources of income, and cash flow stress test analysis. Current borrower financial information is essential to the bank's ability to evaluate the borrower's creditworthiness and leverage. A successful agriculture-related business should exhibit strong repayment ability and risk analysis, liquidity, solvency, collateral, credit management, profitability, and management performance.

- *Assessment of the Borrower's Cash Flow.* In volatile markets, a highly leveraged borrower may not have the necessary cash flow to properly service the debt according to the loan terms. By reviewing the borrower-prepared cash flow statements, the bank should be able to identify potential repayment ability problems, calculate key cash flow ratios, and assess the ability of the business to handle risk and uncertainty. Risk and uncertainty due to commodity prices, production, and weather are prevalent characteristics of most farm operations and should be explained in the cash flow projections. A sensitivity analysis that determines a farm operation's ability to withstand risk and uncertainty is useful in analyzing cash flow projections, including the borrower's risk mitigation strategy. While there is a broad spectrum of agricultural activities (e.g., grain, livestock, and fruit), there are some key elements of sound financial analysis that should be applied to all situations. These elements include
  - — reviewing the reasonableness of budget assumptions and projections for yield, weight gain, production costs, and commodity prices;
  - — comparing these projections with actual performance results;
  - — assessing the impact of capital expenditures; and
  - — evaluating significant changes in the borrower's balance sheet structure.
- *Assessment of the Borrower's Risk Mitigation Strategy.* For those borrowers that employ risk mitigation strategies such as commodities derivatives to control the price of feed or feedstock and the sales price for agricultural production or crops, the bank should have a process in place to assess potential risks arising from the borrower's risk mitigation practices. The bank should conduct sufficient analysis to determine when such activities could pose a risk to the borrower's cash flow projections or ability to repay debt on the agreed upon loan terms.
- *Underwriting Standards.* A bank should periodically review its underwriting standards to ensure that loan policies do not become outdated and ineffective. The frequency and depth of the review will depend on circumstances specific to each institution, such as growth expectations, competitive factors, economic conditions, and the bank's overall financial condition. Planned changes to a bank's lending function or business plan should prompt a modification to lending policies. The appropriateness of minimum debt-service-coverage ratios and maximum loan-to-value ratios should be assessed. Significant criticisms and recommendations made during recent audits and examinations should also be considered during the updating process.
- *Credit Administration and Controls.* A bank should have appropriate policies and controls to monitor and segregate agricultural carryover debt. Bank management should understand the fundamental causes of carryover debt. Carryover debt resulting from the borrower's inability to generate sufficient cash flow from sales to repay the current cycle's production loans generally reflects a well-defined credit weakness. The identification of a troubled borrower does not, however, prohibit a banker from working with the borrower. When carryover debt arises, the bank should confirm the reasons for the carryover debt (e.g., weaknesses in a borrower's financial condition or operations, inappropriate credit administration on the bank's part, a poor marketing plan, or adverse weather conditions), as well as the viability of the borrower's operation so that an informed decision can be made on whether debt restructuring is appropriate. The restructured debt should generally be on a term basis and require clearly identified collateral, a reasonable amortization period, and payment amounts based on realistic expectations.
- *Loan Structure.* The structure of a loan will depend on the nature of the borrower's business. To properly structure the borrowing relationship, the bank should be able to
  - — project how the borrower will perform in the future, including likely primary and secondary repayment sources;
  - — anticipate challenges and problems that the borrower may encounter;

- match the type and terms of the loan to both the loan purpose and the likely repayment sources and ensure the loan is supported by sufficient cash flow from the expected repayment source;
- develop a set of loan agreement covenants that protects the bank for the term of the loan; and
- secure the credit facility with collateral and consider requiring loan support such as guarantees.

• *Reliable Collateral Evaluations and Reasonable Collateral Margins.* A bank should have a process in place to monitor periodically the value of collateral pledged to the debt in order to manage the risk over the life of the loan. Evidence of collateral lien perfection and timely collateral inspections should be documented in the loan file review. Evidence of declining collateral margins may signify emerging concerns over the ability of the borrower to repay and could adversely affect the bank's collateral protection in the event of default.

The level of sophistication of risk-management systems should vary based on the specific risk characteristics, complexity, and size of the bank's exposure to agriculture. In general, there should be higher expectations around risk-management systems and management oversight for banks with significant exposures to one or several agricultural sectors. An institution should assess the effect, if any, of its agricultural credit activities upon the institution's overall financial condition, including capital, the allowance, and liquidity.[2]

2. See, respectively, SR-09-4, "Applying Supervisory Guidance and Regulations on the Payment of Dividends, Stock Redemptions, and Stock Repurchases at Bank Holding Companies." See also the following sections in this manual: section 2012.1, "Allowance for Loan and Lease Losses," section 2013.1, "Allowance for Credit Losses," and section 3200.1, "Liquidity Risk."

INTRODUCTION

This section is intended to provide guidance on prudent risk management of energy lending activity to examiners reviewing reserve-based lending, usually to exploration and production (E&P) firms.[1]

Reserve-based lending or reserve-based loans (RBL) is a type of financing where a loan is secured by the reserves of oil and gas of a borrower and repaid primarily using the proceeds from the future sale of encumbered oil or gas reserves. The amount of an RBL is determined based on the borrower's "proved reserves" borrowing base, adjusted for certain risk factors. Categories of proved reserves include proved-developed-producing, proved-developed-nonproducing, and proved-undeveloped reserves.

A bank engaging in reserve-based lending should maintain a robust risk management program to manage and control the level of risk in and concentration of its reserve-based lending portfolio. The program should include timely market condition analysis that supports sound credit risk management and underwriting practices. The range and extent of market analysis may vary depending on the composition of the institution's energy-related loan portfolio and overall risk exposure to the energy industry. The analysis should provide an institution's management and its board of directors with sufficient information on market conditions to make informed decisions regarding both loan and portfolio risk changes.

OIL AND GAS INDUSTRY OVERVIEW AND BUSINESS DESCRIPTION

The Oil & Gas (O&G) industry comprises three business segments—upstream, midstream, and downstream:

Upstream companies, also known as Exploration and Production (E&P) companies, find, develop, and produce oil, natural gas, and natural gas liquids. The upstream business model is analogous to mining for raw materials. Upstream companies manage their development and production costs and emphasize production volume to generate profit margins, which are sensitive to commodities market prices. Commodity price changes can cause volatility in company cash flow and the value of O&G reserves.

Upstream companies make up-front investments to obtain and develop reserves from which they expect to generate satisfactory investment returns based on their expectations for production costs, production volumes, and future market prices. Once production begins, the existing O&G reserves start to deplete. Therefore, upstream companies require high levels of ongoing capital expenditures to maintain or increase reserves to offset depletion. Sustained periods of capital investment can reduce the amount of cash flow available for debt service or distributions.

The primary assets of an E&P company are its oil and gas reserves, that is, hydrocarbons below the earth's surface that have not yet been produced and are economically viable to extract. E&P firms are unique in that their primary asset base is depleting and therefore must be continually replaced through either drilling activities or acquisition. Lending to E&P companies are based solely on the predicted cash-flow value of the oil or gas production. Reserve-based lending is secured by interests in oil and/or gas properties with proved reserves. Cash flow generated from the future sale of encumbered oil and/or gas reserves is the primary, and in some cases, the only credible source of repayment. Therefore, production payments are usually assigned to the bank, and the liquidation value of collateral is expected to be sufficient to pay off the loan at any time. In considering this or any type of secured loan, the banker must assess a borrower's creditworthiness. (See the subsection entitled "Credit Risk Management and Administration" for more information.)

Because cash flow generated from the future sale of oil or gas is the justification or basis for production lending, proved-producing reserves are the most desirable collateral for a bank as they provide sufficiently predictable cash flow for debt service. For this reason, loan values are predicated primarily on reserves that are proved-developed-producing properties.

Midstream companies gather, process, store, and transport crude oil, raw natural gas, natural gas

1. See SR letter 16-17, "Supervisory Expectations for Risk Management of Reserve-Based Energy Lending Risk," for more information.

liquids, and refined petroleum products and chemicals. The midstream business model is similar to a toll road that charges fees for the movement or intermediate processing of O&G. Midstream companies require large up-front investments in long-lived infrastructure and then generate medium to low profit margins by collecting fees for services. These companies frequently are structured as master limited partnerships, which are not subject to income tax.

Downstream companies refine petroleum products and engage in the manufacturing, marketing, and distribution of refined petroleum products such as gasoline, jet fuel, heating oil, asphalt, motor oil, and lubricants. The downstream business model is similar to value-added manufacturing that earns low to medium profit margins from refining raw materials, turning them into products with valuable uses, and marketing and delivering finished goods to wholesale customers and end users. Developing the capacity to do so requires high capital investment up front. Large downstream companies may incorporate elements of upstream and midstream businesses.

O&G service companies provide support to upstream, midstream, and downstream operations. E&P and integrated O&G companies, specifically, are supported by various types of service companies that provide geological surveys, engineering, technology, drilling, extraction, processing, transporting, wastewater disposal, and other services. These service companies are capital intensive and can be highly complex and technologically advanced. Some service companies are large and multinational, and others are quite small, such as local trucking companies, small engineering firms, and small maintenance firms.

Integrated O&G companies are involved in almost every aspect of the O&G business: upstream, midstream, and downstream. This structure may better enable such companies to successfully manage business cycle risks and price risks. Most of these companies also manufacture and sell petrochemicals. International integrated O&G companies conduct their operations worldwide and are among the largest and most recognized companies in the world. Comparatively, smaller and independent integrated O&G companies have less diversification and may exhibit greater vulnerability to commodity price volatility, cost overruns, production delay disruptions, and economic cycles.

DEFINITIONS OF RESERVES

Reserves[2] are quantities of petroleum that E&P companies anticipate they will be able to recover commercially from known accumulations from a given date forward under defined conditions. Reserves must be discovered, recoverable, commercial, and remaining as of the evaluation date. Reserves are classified into one of three categories: proved, probable, or possible, with proved reserves divided into three subcategories: proved developed producing, proved developed nonproducing, and proved undeveloped.

Proved Reserves (1P) are of the lowest risk classification. This means that under current conditions, it is reasonably certain that the reserves will be recoverable and commercial (i.e., profitable to produce).

- *Proved-developed.* Proved reserves are considered developed only after the necessary equipment has been installed or when the costs to do so are relatively minor. There are two subcategories of developed reserves: producing reserves and nonproducing reserves.
  - — *Proved-developed-producing (PDP) reserves*. PDP reserves are those quantities of petroleum which, by analysis of geological and engineering data, can be estimated with reasonable certainty (90 percent) to be commercially recoverable, from a given date forward, from known reservoirs and under current economic conditions, operating methods, and government regulations.
  - — *Proved-developed-nonproducing (PDNP) reserves.* These are generally proved-developed reserves behind the casing of existing wells or at minor depths below the present bottom of such wells that are expected to be produced through these wells in the predictable future; including proved developed shut-in (PDSI) and proved developed behind the pipe reserves.

2. For more information, please refer to "Petroleum Reserves Definitions," Society of Petroleum Engineers, last modified March 1997, www.spe.org/industry/petroleum-reserves-definitions.php.

The development cost of this type of reserves should be relatively small compared with the cost of a new well.

- *Proved-undeveloped (PUD) reserves.* These are reserves that are proved resources to be recovered from new wells on undrilled acreage or from existing wells requiring a relatively major expenditure for recompletion to a producing state. A company's proved-undeveloped reserves should be economically and technically viable for development.

Probable Reserves (2P) are those unproved reserves which analysis of geological and engineering data suggests are more likely than not to be recoverable. In this context, when probabilistic methods are used, there should be at least a 50 percent probability that the quantities actually recovered will equal or exceed the sum of estimated proved plus probable reserves.

Possible Reserves (3P) are those unproved reserves which analysis of geological and engineering data suggests are less likely to be recoverable than probable reserves. In this context, when probabilistic methods are used, there should be at least a 10 percent probability that the quantities actually recovered will equal or exceed the sum of estimated proved plus probable plus possible reserves.

TYPES OF OWNERSHIP INTEREST IN OIL & GAS RESERVES

Ownership interests related to reserves can be held in a variety of forms including royalty (or mineral) interests, overriding royalty interests, and working interests. Royalty interests are created when the mineral interest owner leases a property. Royalty interests represent payments to mineral owners to drill on their property take preference over all other payments from lease revenue. Overriding royalty interests are similar to royalty interests except these may have limited value as they are dependent on production. Working interest owners share in the profits after the royalty interest payment, lease operating expenses, severance and ad valorem taxes, and capital expenditures associated with a property (lease or well), as well as the risks associated with drilling.

FUNDING SOURCES AND CAPITALIZATION

A traditional role of bank credit in the O&G industry has been to finance E&P capital expenditures. The repayment of E&P loans depends primarily on revenues and cash flows generated by the successful acquisition, development, completion, and production of O&G reserves, and secondarily on the liquidation of O&G reserves securing the debt.

There are several loan structures used by E&P companies to finance their businesses. Most independent, non-integrated E&P companies obtain financing through an RBL. An RBL typically is a revolving facility secured by proved reserves with the amount of the borrowing base determined by the valuation of those reserves.

RBLs typically have terms of three to five years. The RBL's purpose is primarily to fund acquisition and development costs of new reserves, which, if successful, increase the reserve valuations and provide increasing cash flow for debt service and profits for the company's shareholders and investors. Other forms of debt, such as senior notes or bonds, are normally subordinate to the RBL in collateral position, but in certain cases, second-lien loans are pari passu with the RBL in right of contractual payment streams.

Although less common in the United States, another credit structure that E&P companies use is a reducing revolver, which is a combination of a revolving loan and a term loan. The revolver can increase to a maximum commitment level and then step down at regular principal payment dates.

Lenders may also make term loans for project financing, acquisition of O&G properties, or acquisition of other fixed assets secured by a first lien on the company's reserves. For term loans, banks determine the lendable amount based on engineering reports and make a one-time advance for the acquisition. This type of financing amortizes over the loan term or the principal balance is paid at maturity. The term of loans typically varies from five to 10 years, but the term of these loans should always be tied to the economic life of the underlying asset.

Banks have historically been the primary financial provider of RBLs but other market participants are active in providing additional sources of capital to the industry. Examples of other forms of capital extended to the sector include the following:

- Second-lien debt: In energy lending, second-lien senior term loans may rank pari passu in right of payment with first-lien debt, including RBLs because of the additional risk to repayment but remain in a secured position ahead of unsecured debtors, such as bondholders. Second-lien loans often are structured with five-year maturities with interest-only payment requirements.
- Mezzanine debt: Mezzanine loans are subordinated to senior loans and are used to leverage acquisition or development activities, particularly when companies do not have sufficient producing reserves to support borrowing under an existing RBL. These loans may have tight covenants and extensive controls on funding and are generally unsecured and not subject to a borrowing base; rather, these loans are based on collateral coverage or cash flow ratios.
- Bonds: High-yield bond offerings and securitizations have played an important role in E&P financing by providing affordable access to capital markets. Longer-term bond offerings with 10-year maturities and interest-only payments have been common sources of funding for E&P companies.
- Private equity: Equity investors in the E&P industry play a significant role in E&P ownership and related financing structures. The increasingly complex corporate structure of E&P companies also requires that E&P lenders have more specialized expertise and monitoring systems.

Examiners should determine whether other financing sources are utilized, in addition to the loan under review, to meet the capital needs of the borrower. For example, banks that lack the in-house capacity to fund first- and second-lien facilities can either pair up with a mezzanine capital provider or try to stretch its borrowing base underwriting algorithms in an effort to meet a borrower's cash needs. This generates additional risk to the bank and may affect the liquidity and repayment capacity of the borrower.

EVALUATION OF RESERVES

When a lender decides to proceed with financing secured by oil or gas reserves, a bank obtains an engineering report. The initial step to determining the loan value of the collateral or assessing the borrower's creditworthiness is an analysis of the engineering report.

Banks that make RBLs will usually have a petroleum engineer on staff or contract with an engineering consultant firm to provide an engineer's report on the properties to be pledged. An engineering report provides reserves and production forecasts and then applies the pricing and cost assumptions to arrive at the net lease operating income available for debt service. This report is comparable to a real estate appraisal in its importance and function to the bank's credit decision.

Typically, most reports will cover five or more years. Production is usually broken down into categories of oil and gas, and sometimes the number of wells is detailed. Expenses may be divided into major components such as operating costs; production and ad valorem taxes; depreciation, depletion, and write-off of intangibles; general and administration expenses; and taxes on income. Also, if the owner expects to make capital improvements from income, this information will be included in the report. Some reports include the pro forma amount and terms of the loan to support the analysis.

Engineering reports must be generated by a fully qualified petroleum engineer. The lender should select an engineer based on the individual's competency, experience, and independence, as well as the individual's analytic skills. The integrity of engineering data that depict future cash stream is critical to the initial lending decision and equally important to an examiner in the assessment of credit quality. In summary, an acceptable engineering report must be an independent, detailed analysis of the reserves prepared by a competent engineer.

The examiner should carefully review the four elements below in establishing the amount of the borrowing base.

Pricing

When reviewing the engineering report, an examiner should carefully review the underlying pricing and production assumptions used. West Texas Intermediate (WTI) and Brent are the most common sources for benchmark prices used in engineering reports, but the actual price that is realized can vary significantly by wellhead. The difference between benchmark price and wellhead price is referred to as price differential. Factors affecting the price differential can include oil quality, transportation, and storage, to name a few. Banks should be able to support the pricing used in their forecasts, ensuring that benchmark prices are reasonable as compared to the wellhead prices.

E&P companies are exposed to the price volatility in commodity markets. In response, E&P companies may vary their production level and capital expenditures based on current and future price expectations, or hedge their reserves by utilizing the futures markets. A price sensitivity analyses should be run to test the valuation range, and long-term flat price cases should be run to test valuation at the floor or bottom price levels. Sound banking practices include a stress or downside analysis based on significantly lower prices.

The future price of oil is a judgment factor and should be based on conservative pricing and can include some reasonable escalation each year. This information can be obtained from a number of reliable sources, such as the NYMEX strip pricing. An examiner should determine the source of the data to judge the reliability of report information. The prices used for gas are usually contract prices plus escalation-clause rates. Special care is necessary in evaluating gas contracts, including their reasonableness in light of current conditions and the ability and willingness of the purchasers to honor the contracts. In some instances, certain purchasers have broken contracts or exercised "market-out" clauses to cease complying with long-term purchase commitments. The Securities and Exchange Commission (SEC) requires reserves with renegotiable contracts or under market-out clauses to value the reserves at spot prices at the date of renegotiation or immediately, in the case of market-out clauses.[3]

Cost

Cost assumptions should also be realistic and fully supported. Operating cost assumptions are based on the costs of similar operations in similar areas or, in the case of producing reserves, on historical performance, which may be escalated at some reasonable percentage each year. The report should consider increases and decreases in price as well as cost inflation over the "life of the properties."

Costs affect the economic life of reserves primarily in two ways: development costs and production costs. Production costs are a key focus in underwriting because the borrowing base is based primarily on PDP reserves. Production costs include lifting costs or lease operating expenses, which include operating and maintenance expenditures for materials, supplies, fuel, insurance, maintenance, and repairs. Additional production costs include property and severance taxes. If there are plans for further development, engineering reports may include development costs, or capital expenditures, for PDNP and PUD properties as well. Capital expenditures may include roads, utilities, drilling pads, site facilities, development wells, wellheads, well casing, and pipe and well equipment. To a lesser extent, capital expenditures may include workover costs for PDP wells.

Discount Rate

The discount rate depends on current market factors that consider the required market rate of return on future cash flows given the relative risks involved. Assumptions used to determine the discount rate should be fully supported. SEC reporting requirements require a 10 percent discount rate.

Timing

Preferably, the report should be no more than six months old under normal market conditions; if the commodity market becomes volatile, a report less than six months old will be adequate. A report that is up to 12 months old may be acceptable in some cases; however, it should not be more than 12 months old. Change is the most important factor in determining the adequacy and timeliness of reports. Significant price fluctuations or changes in interest rates may require the examiner to adjust the valuation of the reserves to reflect current conditions.

When engineering reports do not address one or more of these four critical concerns, the examiner should challenge management to pro-

3. For more information, see 17 CFR 210.4-10, "Financial accounting and reporting for oil and gas producing activities pursuant to the Federal securities laws and the Energy Policy and Conservation Act of 1975."

vide support for the evaluation assumptions, and may need to evaluate other bank methodologies, for example, recent cash flow histories, to determine the current collateral value. In addition, appropriate comments should be included in the report of examination and recommendations or matters requiring attention made to bank management for improving its engineering reporting and requirements.

ESTABLISHING THE BORROWING BASE

The borrowing base for an RBL, determined by analyzing previous production reports and independent engineering evaluations, represents the lending commitment established from the engineering valuation of the borrower's proved O&G reserves, subject to limitations and adjustments. It governs the maximum amount of availability under the RBL at any one time. The commodity prices, risk adjustment factors, and cash flow discount rate used to determine reserve values and the borrowing base should be fully supported in the lender's underwriting documentation.

The RBL is normally secured by a first lien on the borrower's O&G reserves, the cash flow from which is the loan's primary source of repayment. Banks typically perfect liens on reserve interests that produce 75 percent to 90 percent of the economic value of the borrowing base. Banks need to pay particular attention to state laws in order to understand what is required to perfect their security interest in their collateral. Additionally, banks need to ensure that liens remain enforceable as activities occur prior a borrower's sale of minerals. For example, a bank needs to protect its collateral interest when O&G assets are temporarily transferred from the well to storage containers across jurisdictions.

The engineer is responsible for ensuring that the evaluation includes only proved-developed reserves, unless otherwise directed by the lender. The lender might give value to reserves, properties or wells that are proved-developed-nonproducing under certain conditions. The lender would, however, deduct a safety factor by lowering the value of unseasoned or non-producing reserves. The lender will not generally loan against probable or possible reserves because of the production uncertainty and speculative nature of those categories. Their inclusion as collateral is usually as an abundance of caution with little or no value assigned to them.

The engineer must make a judgment on the accuracy of future revenues predictions. The engineer evaluates geologic conditions such as sand continuity, faulting, spacing, the number of wells, the diversity of properties, well productivity, the pressure production history, and overall data quality, as well as the degree of confidence the engineers have in their own numbers. Estimates based on well-established production performance are given the most credibility. Lesser weight is given to estimates derived from more speculative methods such as volumetric, analogy with similar reservoirs, or a computer simulation of new producing zones. The examiner should carefully review the narrative portion of the engineer's report to help determine its usefulness. It will detail what data were available, how they were used, the methods of analysis, and whether a field inspection was made, including individual well tests. This section of the report should inform the examiner of the true condition of the reserves and wells. It is possible for the projected cash flow to portray one picture while the narrative portrays an entirely different one.

For example, a bank will typically loan up to 65 percent of the net present value of risk-adjusted proved-developed-producing reserves; however, a lower percentage may be needed depending on a number of factors. If the reserves are in an area that is highly faulted, or if seismic work and drilling indicated that a zone is contiguous from one well to the next and the porosity and permeability of the pay-zone rock are very similar, then a lower percentage will be used. To avoid the possibility that any individual, unforeseen event will have a significant effect on the total projection, a wide spread of properties is preferable.

A bank needs to address the risk arising from a concentration of value in any one well, as well as a concentration in one reservoir, field, or producing area. Generally, a risk adjustment factor of not less than 10 percent will be used on unseasoned (less than six months in production) proved-producing reserves, but on long-life and high-quality reserves, a risk adjustment factor less than 10 percent is sometimes used. However, reserves that are highly faulted may require a higher risk adjustment factor than 10 percent even if they are long-life and high-quality. For non-producing reserves such as PDNP and PUD reserves, risk adjustment factors typically range from 25 percent to 75 percent. Terms of an RBL will usually require that the loan be fully repaid before the risk adjustment factor is reduced. Examiners should carefully review the risk adjustment factors used by the lender for determining borrowing base commitments. In addition, there should be a limit established for the contribution of nonproducing reserves to the borrowing base. This is commonly set at no more than one third of the valuation. All bank adjustments should be fully detailed and supported.

For RBLs, a bank will periodically evaluate the borrower's O&G reserves to re-determine the borrowing base commitment. Redeterminations typically occur semiannually, but lenders and borrowers normally have the right to additional redeterminations once or twice during a year, as defined by the credit agreement.

Typical financial covenants in the RBL credit agreement include cash flow leverage, interest coverage, and current ratio covenants:

- The cash flow leverage ratio is typically defined as senior funded debt or total debt over trailing 12 months (TTM) EBITDAX.[4] This covenant is the most critical of the three main RBL covenants because it may provide the least amount of headroom while also controlling the amount of additional borrower debt. The total debt to EBITDAX covenant is frequently set at 3.5x and normally does not exceed 4.0x, unless the covenant is increased to account for an acquisition with step-downs to more reasonable leverage.
- A standard definition for interest coverage is TTM EBITDAX divided by TTM interest expense. Interest coverage covenants for RBLs may require 2.5x to 3.0x EBITDAX coverage of TTM interest expense.
- A standard definition of the current ratio is current assets divided by current liabilities less current maturities, requiring at least 1.0x to 1.25x coverage. Some transactions, however, may define the current ratio covenant as current assets plus unfunded RBL availability divided by current liabilities less current RBL maturities.

Declining commodity prices and a corresponding drop in revenues can stress these measures and limit production growth, which can lead to reduced RBL borrowing bases during redeterminations. Lenders often work with borrowers to formulate plans and implement short-term solutions.

Borrowing Base Stretch

A "stretch" occurs when the bank agrees to provide the borrower with an RBL commitment that materially exceeds the lendable amount as determined by the bank's underwriting criteria and loan policy. In a syndication, each participant calculates the RBL lendable amount separately. The calculated lendable amount may vary by bank, and some banks may agree to "stretch" to meet the higher borrowing base amount agreed upon by the syndication group. Bank approval of the stretch should be supported by documented risk mitigation methods. The approval of a stretched borrowing base should not be used to avoid borrower repayment requirements caused by an over-advance. If the stretch is not well supported, the advance should be considered in the risk rating assessment.

Repayment Analysis

The lenders normally prepare base case and sensitivity case repayment analyses as part of the underwriting process. The primary repayment source for most RBLs is cash flow generated from the sale of oil and gas production. Therefore, a borrower's future cash flow generated from the sale of oil and gas reserves should demonstrate the ability to cover projected operating expenses and repay total debt within a reasonable time.

A base case analysis should use prevailing market prices, such as NYMEX futures prices, versus the bank's commodity price deck used for borrowing base determination. The repayment analysis should be based on repayment capacity from un-risked and undiscounted revenues from the borrower's total proved reserves.

4. EBITDAX is earnings before interest, taxes, depreciation, and amortization (EBITDA) with depletion, exploration, and abandonment expense added back. These expenses are add banks because they are often considered discretionary, while also providing consistent application of the covenant regardless of whether the company uses the full cost accrual or successful efforts accounting method. EBITDAX, rather than EBITDA, appears almost universally in O&G financing documents.

TABLE 1
GENERAL FRAMEWORK FOR CALCULATION COMPARABLE EARNINGS BEFORE INCOME TAX, DEPRECIATION, DEPLETION, AMORTIZATION, AND EXPLORATION COSTS (EBITDAX)

Full Cost Method	*Successful Efforts Method*
Operation Income	Operating Income
Plus: Depreciation, Depletion and Amortization	Plus: Depreciation, Depletion and Amortization
Plus: Accretion of Asset Retirement Obligation	Plus: Exploration Expenses
Plus: Deferred Taxes	Plus: Dry Hole, Abandonment, and/or Impairment Expense
	Plus: Accretion of Asset Retirement Obligation
	Plus: Deferred Taxes
= EBITDAX	= EBITDAX

Proved reserve life is the estimated productive life of a proved reservoir based on the economic limit of producing the reserves assuming certain price and cost parameters. The economic half-life of the proved reserves represents the point in time when the borrower will have generated half of the estimated future net revenue (FNR). The reserve life and economic half-life of the reserves can be stated in months or years or as a percentage of the total FNR.

In addition, a sensitivity case analysis subjecting the oil and gas reserves to adverse external factors, such as stressed market prices or higher operating expenses, should be prepared to determine the vulnerability of the borrower's repayment capacity to adverse economic conditions.

Analyzing E&P Borrowers Financial Statements

At times it may be desirable for examiners to review E&P borrowers' financial statements analysis prepared by the bank. Such analysis should include historical production volumes as well as the average hydrocarbon prices received for the periods under review. As hydrocarbons are a commodity, physical volumes produced and commodity concentrations indicate the borrower's sensitivity towards market price fluctuation. Production volumes are typically expressed as barrels of oil equivalent (BOE) or thousands of cubic feet equivalent (MCFE) for gas.

Other analytical ratios, such as lifting costs (lease operating expenses per BOE or MCFE produced during a period) and finding costs (costs associated with increasing reserves during a particular period) should also be calculated and reviewed. The quantitative measures of E&P performance are based primarily on the ability to replace and grow resources at a favorable cost, in contrast to profit margins and growth for traditional industrial companies.

Another primary pricing metric for E&P companies is EBITDAX. EBITDAX represents EBITDA (earnings before depreciation, interest, taxes, and depreciation and amortization) before *exploration costs* for "successful efforts" companies; for "full cost" firms, exploration costs are embedded in depreciation and depletion. (See table 1.) In addition, other noncash expenses such as impairments, accretion of asset retirement obligation, and deferred taxes should be added back in calculating EBITDAX. Free cash flow should also be considered where cash income taxes and capital expenditures are deducted from EBITDAX.

SAMPLE CASE

Table 2 below provides a sample repayment analysis for determining the borrower's ability to repay total secured debt within a reasonable time.

Cash flow available for debt repayment is equal to projected future net revenue (FNR) less general and administrative (G&A) expenses and interest expense on total debt (column J). The beginning borrowing base commitment (column K) is reduced by the incremental cash flow available for debt repayment from each period until payout and then applied to junior lien secured debt (column N). At payout, the FNR remaining (column Q) divided by the aggregate FNR represents the reserve tail (column R).

Examiners should evaluate the borrower's ability to repay total secured debt, including a fully funded RBL and interest expense on all debt. When it is unlikely that the borrower will use the full RBL commitment to fund projected capital expenditures or deficit cash flow, however, examiners may also run scenarios of the borrower's repayment capacity reflecting actual or anticipated usage on the RBL. The ability of the borrower to repay or refinance unsecured debt should consider the maturity structure and any contractual repayment obligations of the unsecured debt relative to the repayment capacity of the total secured debt.

TABLE 2
BORROWER CASH FLOW REPAYMENT ANALYSIS

	A	B	C=A+B	D	E	F	G=C–D–E–F	H	I	J=G–H–I
Year Ending	Oil, gas and NGL Revenues	Hedging Revenues (Losses)	Total Revenue	Total Lease Operating Expense (LOE)	Production/Ad Valorem Taxes	Capex	FNR	G&A	Total Interest Expense	Cashflow Available for Repayment

Year 6				23,480	23,480		139,067	41%

CLASSIFICATION GUIDELINES FOR RESERVE-BASED LENDING

The classification of an RBL is like all loan classifications in that it must be predicated on an independent assessment of all credit factors that are germane to the specific credit being reviewed. A comprehensive analysis of the credit should take place if any of the following factors are present:

- The loan balance exceeds 65 percent of the discounted present worth of future net income (PWFNI) of proved-developed-producing reserves, or the cash-flow repayment analysis indicates that the loan will not amortize within 60 percent of the economic life of the proved reserves (alternatively, 120 percent of the economic half-life), and within 75 percent of the economic life for total secured debt.
- The credit is not performing in accordance with terms or payment of interest and/or principal.
- The credit is identified by the bank as a problem credit.
- Other factors indicate a potential problem credit.

After performing the analysis, the examiner must determine if classification is warranted. When classification is warranted, the following guidelines are to be applied when repayment of the debt is solely dependent on oil and/or gas properties pledged as collateral. A lesser percentage or less severe criticism may be appropriate when other reliable means of repayment exist for a portion of the debt.

Proved-Developed-Producing Reserves

Sixty-five percent of discounted PWFNI should be classified substandard when the discounted PWFNI is determined using historical production data (decline-curve-analysis engineering). When less than 75 percent of the reserve estimate is determined using historical production data, or when the discounted PWFNI is predicated on engineering estimates of the volume of oil or gas flow (volumetric and/or analogy-based engineering data), the collateral value assigned to substandard should be reduced accordingly. The balance, but not more than 100 percent of discounted PWFNI of proved-developed-producing (PDP) reserves, should be extended doubtful. Any remaining deficiency balance should be classified loss.

Other Reserves

In addition to PDP, many reserve-based credits will include proved-developed-nonproducing reserves, shut-in reserves, behind-the-pipe reserves, and proved-undeveloped properties (PUPs) as collateral. Due to the nature of these other reserves, there are no strict percentage guidelines for the proportion of the credit supported by this type of collateral that should remain as a bankable asset. However, only in very unusual situations would the proportion of collateral values assigned to a classification category approach the values for PDP. The examiner must ascertain the current status of each reserve and develop an appropriate amount.

Examples could be reserves that are shut in due to economic conditions versus reserves that are shut in due to the absence of pipeline or transportation. PUPs require careful evaluation before allowing any bankable collateral value. An example of a bankable value for a PUP could be one that has a binding purchase contract. In every classification where a bankable value is given for any of these other reserves, the loan write-up should fully support the examiner's determination.

The above guidelines apply to production loans that are considered collateral-dependent and are devoid of repayment capacity from any other tangible source. Rarely should bankable consideration be given to loans that are completely collateral dependent in excess of the liquidation value of the pledged reserves. Once again, there is no substitute for a specific, case-by-case analysis of applicable credit and collateral factors pertaining to each individual credit. Frequently, when a lender encounters problems with a production credit, numerous other types of assets (for example inventories, or real estate) are encumbered in an effort to protect the bank's interests. Other types of collateral and sources of repayment should be carefully evaluated on a case-by-case basis.

DOCUMENTATION

The documentation for a term RBL is relatively simple. There is a note, a loan agreement, a deed of trust or mortgage, an assignment of production (usually in the mortgage), a title opinion, and a security agreement or financing statement. The assignment of oil and gas interests is unique because oil and gas are treated as real property while in the ground but convert to personal property interests as production is generated at the wellhead. Most lenders also require an affidavit as to payment of bills. Also, the owner or the operator is usually required to guarantee payment of the loan.

The bank will obtain an acceptable title opinion that indicates the borrower has, on the date of the loan, clear title to each of the leases under mortgage and that properties are free and clear of all liens. The bank should also perform a lien search to determine the existence of any previous liens before funding and should document the lien search in the loan file. After the loan is closed, the bank will send a letter of instruction to notify the company sending out production checks that the bank has taken a lien on the production and to request that production checks be sent directly to the bank. The mortgage covers surface rights and mineral interests. A copy of the mortgage containing an assignment of production will be sent to the company purchasing the production, along with a request that division orders or transfer orders be prepared recording its interest in production payments. This authorizes the purchaser to send production payments directly to the bank for the account of the borrower. The security agreement and financing statement covers removable equipment, oil and gas inventory above the ground, and accounts receivable. The financing statements are filed in the real estate records of the county in which the properties are located (usually with the county clerk) and in the secretary of state's office. This filing is done to perfect security interests in equipment, which may be moved from place to place. However, some states have different requirements, and the examiner should be familiar with each state's filing requirements. The affidavit as to payment of bills is executed by the borrower to ensure that all the bills have been paid on the properties or will be paid out of loan proceeds. If bills are to be paid out of proceeds, the bank should ensure that payments are verified. The examiner should review the loan agreement and, in particular, review both positive and negative loan covenants.

The bank will usually take a collateral interest in equipment, accounts receivables, and inventory. The deed of trust or real estate mortgage will cover real estate, surface rights, and mineral interests, and a security agreement will cover removable equipment, oil as inventory (in tanks), and accounts receivable. An appropriate filing is needed for each type of collateral to perfect the bank's security interest. Filing requirements may vary from state to state and should be researched. Generally, collateral documents should be filed with the state and county. It is reasonable to expect the bank to have collateral files completed within two to three months.

MARKET ISSUES AND RISK RAMIFICATIONS

Prolonged declines in crude oil prices often result in substantial declines in crude oil and natural gas reserve collateral values and associated cash flows, challenging the loan repayment ability of oil and gas exploration and production borrowers. Highly leveraged borrowers and those that are in weakened financial condition are most vulnerable to these market conditions. Banks should monitor market factors to better manage and control the risk of their reserve-based lending portfolios and to determine the repayment ability of their borrowers. These factors include

- *Oil and gas commodity prices.* Commodities are particularly susceptible to price volatility. Global supply and demand imbalances can affect commodity prices and the cost of production. For example, weather events, economic conditions, and numerous other factors can alter global supply as well as demand and place downward pressure on exploration and production company performance. Banks should take market developments and price volatility into consideration when critically reviewing collateral valuation assumptions and managing their reserve-based lending exposure.
- *Production costs and capital expenditure.* Production costs are also known as "lifting costs." These costs are incurred in the operation and maintenance of wells, related equipment, and

facilities, and can affect sustained production. Banks should critically review production costs and capital expenditures when determining borrower repayment capacity, financial viability, and liquidity. Additionally, production costs can vary significantly between wells and fields. Banks should use location-specific production cost and capital expenditure estimates instead of general assumptions, particularly for those reserve-based lending portfolios containing wells in different oil fields.

- *New technological drilling and completion improvements.* For example, horizontal wells with multistage hydraulic fracturing completions, have significantly increased the up-front capital needs for exploration and production borrowers. Banks engaging in exploration and production lending should understand the capital needs of these borrowers, including the use of new technologies, when determining borrower repayment ability. As reserves are depleted, additional capital spending is required to bring additional reserves into production and maintain productivity levels.
- *Lease provision and maintenance.* Oil and gas leases generally include a "continuous drilling" or "continuous operations" clause to prevent the lease from expiring at the end of the primary term while drilling operations are in progress. It gives the lessee the right to continue drilling any well that was begun before the lease expired and to begin drilling more wells. Maintaining production in order to exercise these lease maintenance clauses can potentially cause financial challenges to a borrower, particularly during weak market conditions. Banks should understand the scope of lease maintenance clauses in place and assess the borrower's ability to remain in compliance during stressed time periods.

CREDIT RISK MANAGEMENT AND ADMINISTRATION

Banks should have in place appropriate risk management programs and prudent underwriting standards for reserve-based lending. A risk management program should cover concentration limits and market condition analysis, as well as expectations to identify, measure, monitor and control concentration risks associated with reserve-based lending. Moreover, an institution's risk management program for reserve-based lending should be effectively integrated into its capital planning practices. A bank should regularly review its policies and practices for reserve-based lending, including any relevant contingency plans in the event of market changes, and should maintain capital levels commensurate with the level and nature of its reserve-based lending exposure. The information that follows should be considered whether the bank is lending directly or as a participant in a group, such as in the case of a syndicated loan.

At a minimum, an institution with significant reserve-based lending exposure should have established risk management practices that address the following items below.

Individual Reserve-Based Lending Credit Monitoring

- *Assessment of a borrower's creditworthiness.* An institution should conduct a thorough analysis of a borrower's past and prospective creditworthiness, including
  - — Projected income and expenses compared to actual results, as well as the results of peer oil and gas producers in the region,
  - — Working capital adequacy,
  - — Capital expense analysis,
  - — Cash flow analysis, and
  - — Price sensitivity analysis.

Current borrower financial information is essential to the institution's ability to evaluate the borrower's creditworthiness, leverage, and liquidity. A creditworthy exploration and production business should exhibit strong repayment ability, risk analysis, liquidity, solvency, reserve valuation, credit management, profitability, and management performance.

- *Assessment of a borrower's cash flow.* In volatile markets, a highly leveraged borrower may not have the necessary cash flow to properly service its debt according to the loan terms. By reviewing borrower-prepared cash flow statements, an institution should be able to identify potential repayment ability problems, calculate key cash flow ratios, and assess the ability of the business to handle risk and uncertainty.

Risk and uncertainty due to market factors, commodity prices, and production levels are prevalent characteristics of most exploration and production operations and should be reflected in the cash flow projections. A sensitivity analysis that determines an exploration and production operator's ability to withstand fluctuations in commodity prices and uncertainty in production levels is critical in analyzing cash flow projections. Some key elements of sound financial analysis that an institution should conduct include

— Reviewing the reasonableness of underlying assumptions and projections for production, pricing, and price differentials;
— Comparing these projections with historical production and performance results;
— Analyzing hedges in place as of collateral valuation date;
— Assessing the impact of changes in capital expenditures on production levels; and
— Evaluating a borrower's ability to timely service total debt and significant changes in its balance sheet structure.

• *Reliable collateral evaluations.* Valuation of oil and gas reserves demands expertise and industry experience. The interconnected nature of the energy industry is complex and demands breadth and depth of understanding across all business sectors which include upstream, midstream, and downstream segments. Specialized contracts with energy services providers, such as transportation to market or delivery point, should be carefully reviewed as part of risk management practices for reliable collateral valuation.

A typical reserve-based lending credit facility requires a borrower to deliver an updated reserve engineering report twice a year to the lender. A bank should identify additional costs and value adjustments not included in the engineering report, such as information on land mortgage restrictions and lease assignments, and use this information to understand the scope and limitation of the collateral securing the reserve-based lending. A bank should assess the assumptions contained in the reserve report, as this information forms the basis for its analysis of the reserve valuation.

A bank should have a well-defined and consistently applied process, including minimum frequency, for obtaining independent reserve engineering reports. These reports require significant industry expertise and should include a complete analysis of the wells and production requirements from current production and over the life of a well.

A bank should periodically conduct independent assessments of reserve valuation. Depending on the level and complexity of reserve-based lending in its portfolio, an institution should utilize its own independent staff engineers (if available) or retain independent petroleum engineers to conduct a comprehensive assessment of reserve valuation. This assessment should consider such factors as the relevant production volumes, expected ultimate recovery of reserves, and capital expenditures needed to convert reserves into production. An institution should also have processes in place to monitor periodically (at minimum, twice a year) the value of collateral pledged in order to manage repayment risk over the life of the loan. An institution's processes, risk adjustment factors, and discount rates for reserve analyses should be well defined in policy and consistently applied. Additionally, evidence of collateral lien perfection and collateral inspections should be documented in loan files.

• *Loan structure.* The structure of an RBL should depend on the nature of a borrower's business. To properly structure a borrowing relationship, a bank should be able to

— Project how the borrower will perform in the future, including likely primary and secondary repayment sources from producing and developing assets. There should be limits to the portion of repayment capacity derived from developing assets.
— Anticipate challenges and problems that the borrower may encounter, such as commodity price volatility, operational risks, and lease maintenance requirements.
— Match the type and terms of the loan to both the loan purpose and the likely repayment sources. This includes ensuring the loan is supported by sufficient cash flow from the expected repayment source, particularly when an RBL's collateral includes undeveloped fields (that is, proved-developed-nonproducing reserves and proved-undeveloped reserves) or fields that

do not have a continuous production history as collateral. The primary source of repayment is typically proved producing reserves.

— Develop loan agreement covenants that protect the bank, including provisions for monitoring the borrower's expenditures for the term of the loan. For example, a forward-looking liquidity test should provide a bank with visibility to the future consolidated liquidity position of the borrower and all guarantors to the loan. In addition, covenants should require the borrower to obtain the bank's approval prior to lifting any hedges upon which the institution is relying to mitigate collateral market value fluctuation.

— Secure the credit facility with collateral and consider requiring the borrower to provide loan support such as guarantees and hedges for commodity price volatility. Any guarantor should be included in the loan agreement. A bank should have processes and procedures in place to limit a borrower's commodity price hedging to its total production and thereby avoid over-hedging.

- *Risk rating credit facilities.* A bank should have in place a robust process to risk rate RBLs. Risk rating for RBLs should be based on realistic repayment assumptions for a borrower's ability to de-lever and repay the RBL and its total debt relative to the economic life of the borrower's oil and gas reserves. Financial support or credit enhancement from a sponsor (such as the borrower's parent company) should be demonstrated and documented for rating conclusions.

- *Timing of collateral impairment testing and impairment indicators.* Generally, RBL terms require a borrower to prepare a reserve impairment assessment at least annually, and more frequently depending on events or changes in circumstances. A bank should review the reserve impairment assessment report and associated recoverability test of pledged assets' value whenever events or changes in circumstances indicate that a pledged asset's carrying amount may not be recoverable.

Reserve-Based Lending Portfolio Monitoring

- *Underwriting standards.* An institution should periodically review its underwriting standards to ensure its reserve-based lending policies do not become outdated, ineffective, or unaligned with its stated risk appetite. The frequency and depth of the review will depend on circumstances specific to the institution, such as growth expectations, competitive factors, economic conditions, and overall financial condition. An institution's management should review and modify, as appropriate, reserve-based lending policies based on any planned changes to its reserve-based lending function or business plan. An institution should also address significant criticisms and recommendations about its underwriting standards that have been identified in recent audits and examinations.

- *Concentration limits.* In general, a bank should monitor and manage its aggregate energy lending portfolio to avoid concentration risk. The institution should set risk limits for reserve-based energy lending as well as energy services lending that are consistent with the risk appetite approved by the board of directors. In addition, an institution should monitor and manage its production and regional concentration risk for exploration and production borrowers to avoid any single well or field accounting for a high percentage of its energy-related loan portfolio.[5] For a bank with a lending footprint that is primarily in oil-dependent geographies, the bank should also be mindful of high correlations between energy and non-energy business in the local economy. The risk amplification that occurs during an extended commodity sector downturn should be heavily factored into concentration and risk analysis.

- *Credit administration and controls.* An institution should have appropriate policies and controls to monitor and separately manage troubled RBLs for which a borrower is unable to generate sufficient cash flow from oil and/or gas production to repay the loan (sometimes

5. For more information, see 17 CFR 210.4-10, "Financial accounting and reporting for oil and gas producing activities pursuant to the Federal securities laws and the Energy Policy and Conservation Act of 1975."

called "stretched" RBLs). A stretched RBL reflects a borrower with credit or liquidity weaknesses, and an institution should understand the fundamental causes of those weaknesses. An institution may still work with a troubled borrower to continue to service existing loans. An institution should confirm the reasons for the borrower's cash flow problems (for example, weaknesses in a borrower's financial condition or operations, or poor market conditions). An institution's credit administration process should appropriately monitor exposure to the borrower and adjust the credit facility rating to reflect the borrower's credit condition, as well as the viability of the borrower's operation, so that the institution can make an informed decision as to whether advancing additional funds is appropriate. Any additional funds advanced should be for the purpose of improving the borrower's financial condition.

Expectations for the level of sophistication of risk management systems will vary based on the specific risk characteristics, complexity, and size of an institution's reserve-based lending exposure. In general, there are higher expectations around risk management for banks with significant reserve-based lending exposures in concentrated geographic locations and market segments. An institution should assess the effect, if any, of its reserve-based lending activities on the institution's overall financial condition, including capital, the allowance for loan and lease losses, and liquidity.

TERMINOLOGY

The following are abbreviated explanations or discussions of some of the terms found in engineering reports and energy-lending transactions.

Analogy-based engineering data. Comparative analyses relating past performances of comparable properties to determine possible future reserves.

Assignment of production. Usually in the mortgage agreement, it allows direct payment from purchaser to the bank for oil production. Gas purchases generally are paid to the operator, and the operator then pays the bank.

Carried interest. When a party or parties have their expenses paid (carried) by other parties up to a specified limit.

Decline curves. Used to determine reserves by extrapolation of historical production data.

Deed of trust or mortgage. Covers real estate, surface rights, and mineral interests. Mortgage is unique because oil and gas are treated as real property while in the ground but converted to personal property interests as production is generated at the wellhead and as oil and gas enter storage tanks or a pipeline. The security agreement portion of the oil and gas mortgage will usually cover fixtures and equipment affixed to the well site.

Development wells. Drilled in the proven territory of a field, they have a high likelihood of producing oil or gas.

Division orders. Set out the borrower's interest in the property and direct production payments. Division order title opinions can be used to verify ownership and will contain the legal description of properties.

Escalating. Involves the difficult task of predicting future prices of oil and gas for valuing production. Escalating the value of production usually increases the risk to the lender. Examiners should carefully review the basis for escalating values when it has a significant impact on the value of the collateral and/or cash flow. Also, the examiner should carefully review how future expenses related to each well are estimated.

Exploratory well. Also known as a "wildcat," a well drilled in an unproven area. The term originated in early drilling days in Pennsylvania when wells were drilled within the sight and sound of wildcats.

Fault. A break or fracture in the earth's crust that causes rock layers to shift.

Field. An area in which a number of wells produce from a reservoir or from several reservoirs at various depths. There may be two or more reservoirs in a field that are separated vertically by intervening impermeable rock, laterally by local geologic barriers, or both.

Formation. A bed or deposit of substantially the same kinds of rocks.

Fracturing, frac'ing, frac job. Refers to pumping fluids under extremely high pressure into a formation to create or enlarge fractures through which oil or gas can move. Propping agents such as sand are sent down with fluids to hold the fractures open. Many completed wells require additional treatment (stimulation) before oil or gas can be produced.

Known accumulation. The term accumulation is used to identify an individual body of moveable petroleum in a reservoir. However, the key requirement is that in order to be considered as known, and hence contain reserves or contingent resources, each accumulation or reservoir must have been penetrated by a well. In general, the well must have clearly demonstrated the existence of moveable petroleum in that reservoir by flow to surface or at least some recovery of a sample of petroleum from the well. However, where log and/or core data exist, this may suffice, provided there is a good analogy to a nearby and geologically comparable known accumulation.

Lease. A contract between the landowner (lessor) and the lessee that gives the lessee the right to exploit the premises for minerals or other products and to use the surface as needed. However, surface damages would normally have to be reimbursed. Surface ownership is different from mineral ownership in many cases. Also, if drilling does not begin during a specified time period, the lease will expire.

Lithology. The scientific study of rocks.

Log(s). Used to record three basic measurements: electrical, radioactive, and sonic. The logging device is lowered into the well bore and transmits signals to the surface. These are recorded on film and used to make a log showing the recorded measurements that are used to analyze the formation's porosity, fluid saturation, and lithology. The log's header gives the log's type and date, the operator, the well name, and other information.

Market-out. A clause that basically allows the purchaser to stop paying the original contract price and institute a lower price with the intent of maintaining the marketability of the gas. Some contracts allow the producer to be released from the contract if he refuses the lower price or may offer other remedies.

Mineral rights. The ownership of minerals under a tract, which includes the right to explore, drill, and produce such minerals, or assign such rights in the form of a lease to another party. Mineral-rights ownership may or may not be severed from land-surface ownership, depending on state law. Title in fee simple means all rights are held by one owner; the fee in surface owner does not hold mineral rights. The term "minerals" is loosely used to refer to mineral ownership and even, incorrectly, to royalty ownership. A mineral acre is the full mineral interest under one acre of land.

Net revenue interest. A share of production after all burdens, such as royalty and overriding royalty, have been deducted from the working interest. It is the percentage of production that each party actually receives.

Operator. The manager of drilling and production for the owner.

Overriding royalty interest (ORRI). A royalty in excess of the royalty provided in the Oil & Gas Lease. Usually, an override is added during an intervening assignment. ORRIs are created out of the working interest in a property and do not affect mineral owners. An ORRI is a fractional, undivided interest with the right to participate or receive proceeds from the sale of oil and/or gas. It is not an interest in the minerals, but an interest in the proceeds or revenue from the oil & gas minerals sold. The interest is limited to a specific tract of land and is bound to the terms limits of the existing lease. If a lease is allowed to expire, an ORRI is dissolved or expires with the lease. Overrides expire and don't not continue into perpetuity in the same form as mineral or royalty interests.

Perforations. The holes in casing and cement through which oil and/or gas flow from formation into wellbore and up to surface.

Permeability. A measure of how easily fluids may flow through pore spaces. A tight rock or sand formation will have low permeability and, thus, low capacity to produce oil or gas. Wells in these zones usually require fracturing or other stimulation.

Porosity. Refers to the pore space in rock that enables it to hold fluids.

Proved developed shut-in (PDSI). Proved developed nonproducing reserves are subcategorized as nonproducing include proved developed shut-in (PDSI) and proved developed behind the pipe (PDBP) reserves. E&P companies expect to recover PDSI reserves from (1) completion intervals that are open at the time of the estimate but have not started producing, (2) wells that were shut-in for market conditions or pipeline connections, or (3) wells not capable of production for mechanical reasons.

Reservoir or pool. A subsurface rock formation containing an individual and separate natural accumulation of moveable petroleum that is confined by impermeable rock or by water barriers and is characterized by a single-pressure system.

Resource base or total petroleum initially-in-place. All estimated quantities of petroleum contained in the sub-surface, as well as those quantities already produced.

Reserves. The estimated amount of oil and gas in a given reservoir that is capable of being profitably recovered, assuming current costs, prices, and technology. Not to be confused with oil and gas in place (resource base), which is the total amount of petroleum in the earth regardless of whether or not it can be recovered. Recovery is a function not only of technology, but of the marketplace.

Reserve interest. The term used to describe the percent of revenue received.

Royalty interest. The share of gross production proceeds from a property received by its mineral owner(s), free of exploration, drilling, and production costs. Typically one-eighth to one-sixth of production, but fractions may be higher. Royalty payments take precedence over all other payments from lease revenues.

Primary, secondary, and tertiary recovery. Relates to the method of obtaining production from a well. Primary recovery is production from a reservoir through flowing or pumping wells because of the existence of natural energy within the reservoir. This usually recovers about 10 to 35 percent of the oil and gas in place. Secondary recovery is any method by which essentially depleted reservoir energy is restored. This may be accomplished by injection of liquids or gases or both. Tertiary recovery is any enhanced method employed after secondary recovery and is generally very costly.

Runs. A term used to refer to oil or gas production income from a lease.

Seismic survey or shooting. A method of gathering information by recording and analyzing shock waves artificially produced and reflected from subsurface rocks.

Shut-in well. A well that is capable of producing but is not presently operating. Reasons why a well may be shut in include lack of equipment or market.

Stripper wells. Wells that make less than 10 barrels of oil per day based on the last 12 months or wells that make less than 60,000 cubic feet of gas per day based on the last 90 days.

Volumetric calculations. Determine oil or gas reserves by use of rock volume and characteristics.

Working interest. Also referred to as an operating interest, the term used to describe the lease owner's interest in the well. Lease owners are the ones who pay for drilling and completing the well. Lease owners pay 100 percent of cost and receive all revenues after taxes and royalties are paid.

Workover. Relates to the process of cleaning out or other work on a well to restore or increase its production.

INTRODUCTION

Asset-based lending is a specialized area of commercial bank lending in which borrowers assign their interests in certain accounts receivable and inventory, and in selected cases fixed assets, to the lender as collateral. In asset-based lending, the primary repayment source is the conversion of the pledged assets into cash. Asset-based lending differs from a commercial loan in which the bank takes a security interest in all accounts receivable and inventory owned or acquired by the borrower. This section will discuss asset-based lending in relation to the characteristics of the borrower, its advantages to the borrower and the bank, credit and collateral analysis, documentation, and safeguards to ensure the authenticity and collectibility of the assigned receivables.

The examiner must judge the quality of the asset-based credit by evaluating the financial condition and debt-servicing ability of the borrower and the quality of the collateral. In addition, the examiner must evaluate the bank's credit policy, internal controls, audit procedures, and operational practices.

Many borrowers whose financial condition is not strong enough to allow them to qualify for regular, secured commercial bank loans may use asset-based loans to meet their financial needs. Some examples of asset-based borrowers are—

- businesses that are growing rapidly and need year-round financing in amounts too large to justify commercial lines of credit secured by blanket liens on accounts receivable and inventory,
- businesses that are nonseasonal and need year-round financing because working capital and profits are insufficient to permit periodic cleanups,
- businesses whose working capital is inadequate for their volume of sales and type of operation, and
- businesses that cannot obtain regular commercial loan terms because of deteriorating credit factors.

Some advantages of asset-based lending for the borrower are—

- efficiency in financing an expanding operation because the business's borrowing capacity expands along with increases in levels of accounts receivables, inventory, and sales;
- the ability to take advantage of purchase discounts because the company receives immediate cash on its sales and is able to pay trade creditors in a timely manner (consistent usage of purchase discounts reduces the cost of goods sold and enhances the gross profit margin); and
- the interest paid on asset-based loans may be lower than for alternate sources of funds.

Some advantages of asset-based lending for banks are—

- a relatively high-yield loan is generated commensurate with the perceived credit risk of the borrower;
- a depository relationship is formed that provides income and enhances the bank's ability to monitor changes in the borrower's cash flow and overall financial condition;
- banking relationships with longstanding customers whose financial conditions no longer warrant traditional commercial bank loans can continue;
- new business is generated by prudently lending to financially weaker customers who could not qualify for normal commercial loans; and
- potential loss is minimized when the loan is collateralized by a percentage of the accounts receivable and inventory.

CREDIT ANALYSIS

Although asset-based loans are collateralized and closely monitored, it is important to analyze the borrower's financial statements. Even if the collateral is of good quality and supports the loan, the borrower should demonstrate financial progress. Full repayment through collateral liquidation is normally a solution of last resort. An examiner should analyze the borrower's financial statements with particular emphasis on trends in working capital, review trade reports, analyze accounts receivable and inventory turnover, and review the agings of receivables and payables. Furthermore, the prompt payment of taxes, especially payroll taxes, should be verified. One reason for a company to obtain asset-based financing is to maximize discounts offered by suppliers; therefore, it should pay creditors promptly upon receiving the financing.

Bank management's ability to recognize a customer's financial problems as they develop, and to initiate orderly liquidation, if necessary, is important in the supervision of asset-based financing. Theoretically, a borrower's line could be fully liquidated by discontinuing further advances, collecting the assigned receivables, and liquidating pledged inventory. However, such drastic action would most likely cause the borrower's business to close, resulting in a probable deterioration of the receivables from new disputes and in returns and offsets. Consequently, the bank usually notifies its borrower of a contemplated liquidation, which gives the borrower time to seek other means of continuing business so that the bank's loan may be liquidated in an orderly manner without losses or other adverse effects. Unless the bank has initiated an orderly liquidation, examiners should specially mention or classify receivable and inventory lines in which the borrower's financial position has declined so that continued financing is not prudent. When a liquidation is occurring, classification of the credit may not be necessary if the borrower's business is continuing, the existing collateral is of good quality, liquidation value sufficiently covers outstanding debt, and no collateral deterioration is anticipated.

A related issue concerning asset-based loans is the amount of excess availability associated with the revolving line of credit. The quantity of a borrowing company's excess availability is an excellent indicator of whether it has the capacity to service its loan. If a status report shows little availability, the borrower has used all of the cash that the pledged receivables and inventory are capable of generating under the asset-based line of credit. Since these loans may not yet be on the bank's watch list or problem-loan report, it is important for the examiner to track, over a fiscal-year period, a borrower's changing levels of availability when performing an analysis of creditworthiness. This analysis is especially critical for borrowers whose business is seasonal. Initial credit analyses of potential asset-based loan customers should include detailed projections showing that availability under revolving lines of credit at anticipated advance rates would be sufficient to meet the borrower's working-capital needs. Occasionally, overadvance lines are part of the initial credit facility.

Bank management must continually evaluate the realizable value of receivables and inventory pledged. To do so, management should review the quality of the receivables and inventory pledged, including documentation; the safeguards imposed to ensure the authenticity and collectibility of the assigned receivables; and the loan agreement and compliance therewith. The information obtained is sometimes difficult to interpret unless it is related to other periods, comparable businesses, or industry statistics. Comparative analysis helps indicate the continuing value of the collateral.

Lender-liability exposure is a risk in all types of commercial lending, but especially in asset-based lending. Borrowers using asset-based financing are generally very dependent on its continuation, so an abrupt cessation of a line of credit would be more likely to result in legal action against a lender. To protect themselves as much as possible from lender-liability lawsuits, banks frequently use time notes (with renewal options). Time notes are supported by loan agreements that usually include more numerous and detailed loan covenants. Legal counsels for both the lender and borrower should approve the loan agreement and covenants. At times, the borrower may not comply with one or more covenants in a loan agreement. The lender may agree to waive specific covenant violations to give a borrower time to take corrective action. If a covenant such as a financial covenant requiring a minimum capital level is waived, the waiver should be formally communicated to the borrower in writing. The lender should avoid both not taking action for a period of time and not issuing a written waiver for a covenant violation. In either case, if a covenant violation is subsequently used as a reason to cancel an asset-based loan, the lender is more vulnerable to lender liability. The lender should be careful to be consistent in all actions regarding the borrower.

ASSET-BASED LOAN AGREEMENTS

An asset-based loan agreement is a contract between a borrower and the bank that sets forth conditions governing the handling of the account and the remedies available in the event of default. The following areas should be addressed in the loan agreement:

- *Eligible accounts receivable.* This involves identifying classes of receivables that will not be regarded as acceptable collateral. Certain types of receivables carry a higher degree of risk relative to the willingness and ability of account debtors to pay and, by their very nature, should be excluded from the lending formula. The following are typical classes of ineligible receivables:

—*Delinquent accounts.* Eligible receivables generally exclude accounts that are more than a given number of days delinquent, most often 60 days or more past due. Delinquency is frequently expressed in loan agreements as a given number of days from the invoice date, such as 90 days from the invoice date when payment is required in 30 days, which is the most common payment term. Expressing delinquency in days from the invoice date prevents a borrower from reducing the volume of ineligible delinquent accounts by giving dated terms (extending payment days). For example, accounts with 30-day trade terms that are becoming 60 days delinquent could otherwise be maintained in the eligible-receivable base by increasing payment terms to 90 days. Also, under what is commonly referred to as the "50 percent rule," accounts with multiple invoices that have more than 50 percent of the total balance past due are excluded from the eligible-receivable base. For example, if a borrower's customer owes payment for ten invoices, of which six are delinquent, all ten would be considered ineligible, not just the six that are delinquent. While 50 percent is standard industry practice, lenders may be more conservative and require ineligibility for an entire account if less than 50 percent of it is past due.

—*Contra accounts.* These usually arise when the borrower both sells to and purchases from the account debtor. The risk is the possibility of direct offset against these accounts.

—*Affiliate accounts.* These accounts, unlike contra-accounts, occur when a borrower sells to an account debtor, both of whom are associated through common ownership. Associated risks include forgiveness of debt on behalf of the affiliate and a temptation for the borrower to create fraudulent invoices.

—*Concentration accounts.* A lender may be vulnerable to loss if a large percentage of the dollar amount of receivables assigned is concentrated in a few accounts. Too many sales, even to a good creditworthy customer, could ultimately cause problems should disputes arise over products or contracts. A common benchmark is that no more than 20 percent of the receivables assigned should be from one customer. Some lenders will use a percentage that is also subject to a dollar limit.

—*Bill-and-hold sales.* These occur when a product ordered by a buyer has actually been billed and is ready for shipment, but is held by the seller pending receipt of shipping instructions from the buyer. Bill-and-hold sales are not eligible as receivables to be loaned against because they are not fully executed transactions. A second party's claim could be of little value when merchandise has not been shipped and there is no evidence of acceptance on behalf of the buyer.

—*Progress billings.* These are invoices issued on partial completion of contracts, usually on a percentage basis. This practice is standard in construction and other industries where long-term contracts are generally used. Failure to complete a contract could jeopardize the collectibility of progress receivables and, therefore, should generally not be considered eligible collateral. Moreover, failure to complete contracts can expose companies to lawsuits from their customers, who may be forced to pay higher prices to other parties to complete the contracts over much shorter time periods. The only exception for progress billings is when, on partial completion, there has been delivery of the product, and the contract clearly states that buyers have accepted the product and are responsible for payment of the product delivered.

—*Receivables subject to a purchase-money interest.* These include floor-plan arrangements, under which a manufacturer will frequently file financing statements when merchandise is delivered to the borrower. That filing usually gives the manufacturer a superior lien on the receivable. An alternative would be to enter into an agreement with the manufacturer, which specifies that rights to the receivables are subordinated to the bank.

- *Percentage advanced against eligible or acceptable accounts receivable.* The accounts-receivable advance rate, typically in the range of 75 to 85 percent, must serve the two primary functions of providing adequate cash flow for the borrower and providing a margin that gives adequate protection for the lender. Protection for the lender requires a sufficient margin for the continual costs of collection and absorption of dilution in the receivables. Selecting the proper advance rate for a borrower involves understanding the amounts and causes of portfolio dilution. Causes of dilution that are positive include the offering of discounts and various allowances. Causes that are negative include merchandise returns, bad debts, product liability, or warranty claims. An abundance of negative causes, such as bad debts, might indicate poor receivable-management practices. A lender must know how dilution is occurring in each receivable portfolio to measure it continually. This knowledge should lead to proper advance-rate selection, resulting in a loan balance protected by a receivables base with sufficient liquidation value to repay the loan.

- *Percentage advanced against eligible inventory.* The inventory advance rate typically ranges from 35 to 65 percent for finished products. Marketability and accessibility of the inventory are key factors in determining the advance rate. Proper evaluation of the liquidation value of inventory requires a firm understanding of marketability in all the various inventory stages (raw materials, works-in-process, finished merchandise). Works-in-process often have very low marketability because of their unfinished nature, and they will typically carry a very low advance rate—if they are even allowed as eligible inventory. Conversely, the raw materials or commodities (such as aluminum ingots, bars, and rolls) have a broader marketability as separately financed collateral components. When setting advance rates, it is also important to consider whether inventory is valued at LIFO (last in, first out) or FIFO (first in, first out). In an inflationary environment, FIFO reporting will result in higher overall inventory values on the customer's books.

The above factors are considerations in the conduct of inventory audits performed in connection with the granting and monitoring of asset-based loans. These audits will generally discuss the inventory from a liquidation basis. This information is critical in determining appropriate advance rates.

Pledged Receivables

The following factors should be considered in evaluating the quality of receivables pledged:

- Standard procedures require that the bank obtain a monthly aging report of the accounts receivable pledged. The eligible receivables base is then calculated by deducting the various classes of ineligible receivables. Usually the eligible receivables base will be adjusted daily during the month following receipt of the aging report. If accounts are ledgered, the base will be increased by additional sales, as represented by duplicate copies of invoices together with shipping documents and/or delivery receipts received by the bank. The receivables base will be decreased daily by accounts-receivable payments received by the borrower, who then remits the payments to the bank. Another method of payment in which the bank has tighter control is a lockbox arrangement. Under this arrangement, receivables are pledged on a notification basis and the borrower's customers remit their payments on accounts receivable directly to the bank through deposit in a specially designated account. If accounts are not ledgered but a blanket assignment procedure is used, the borrower periodically informs the bank of the amount of receivables outstanding on its books. Based on this information, the bank advances the agreed percentage of the outstanding receivables. Receivables are also pledged on a non-notification basis, with payments on the receivables made directly to the borrower who then remits them to the bank. Proper management of any asset-based credit line requires that all payments on accounts receivable be remitted to the bank, with the accounts-receivable borrowing base reduced by a like amount. The borrower's working-capital needs should then be met by drawing against the asset-based credit line.
- Slower turnover of the pledged receivables can be a strong indication of deterioration in credit quality of accounts receivable.
- Debtor accounts that are significant to the bank borrower's business should be well rated and financially strong. Borrowers should also

obtain financial statements on their major customers to make credit decisions. These financial statements should be reviewed when the bank performs its periodic audits. In addition, the borrower should maintain an appropriate level of reserves for doubtful accounts. Credit insurance is often used, which indemnifies a company against noncollection of accounts receivable for credit reasons. When credit insurance is used, the asset-based lender should be named as beneficiary.
- Dilution or shrinking of the accounts-receivable borrowing base can result from disputes, returns, and offsets. A large or increasing volume of these transactions could adversely affect the bank's collateral position.

The following safeguards, which bank management should consider and the examiner should evaluate, ensure the authenticity and collectibility of the pledged accounts receivable:

- *Audits.* To verify the information supplied by the borrower to the bank, the bank should audit the borrower's books. Audits should occur several times a year at the borrower's place of business. For satisfactory borrowers, the audit is usually performed quarterly. However, audits can occur more frequently if deemed necessary. Individuals who perform bank audits should be independent of the credit function. The scope of an audit should include—
  - —verification that the information on the borrowing-base certificate reconciles to the borrower's books;
  - —review of concentrations of accounts;
  - —review of trends in accounts receivable, accounts payable, inventory, sales, and costs of goods sold;
  - —review of the control of cash proceeds;
  - —determination that the general ledger is regularly posted;
  - —verification of submitted aging reports;
  - —review of bank reconciliations and canceled checks;
  - —determination if any accounts receivable are being settled with notes receivable;
  - —verification that the accounts-receivable ledger is noted to show that an assignment has been made to the bank;
  - —determination on non-notification accounts that all payments are remitted to the bank and that positive written confirmations are issued timely (for example, semiannually);
  - —verification that all taxes, especially sales and payroll, are paid timely; and
  - —review of compliance with the loan agreement.
- *Confirmation.* To verify the authenticity of the pledged collateral, the bank should institute a program of direct confirmation. This procedure is particularly important if the accounts receivable are pledged on a non-notification basis, since the bank does not have the same control over debtor accounts as it does when the receivables are pledged on a notification basis. Direct confirmation should be made before the initial lending arrangement and periodically thereafter. Confirmation should be on a positive basis. The bank should obtain written approval from the borrower before confirming accounts receivable on a non-notification basis.

Pledged Inventory

The following factors should be considered in evaluating the inventory pledged:

- A borrowing-base certificate, obtained from the borrower at least monthly, is normally used to calculate the dollar amount of inventory eligible for collateral. The borrowing-base certificate will show the different classes of inventory, such as raw materials, works-in-process, and finished goods. After this will be listed the different types of ineligible inventory, which will be subtracted to give the amount of eligible inventory. Finally, the advance rates are applied to the different classes of eligible inventory to determine the borrowing base.
- Factors affecting marketability, advance rates, and the decision whether to allow a class of inventory as eligible at even a low advance rate:
  - —*Obsolescence.* This could involve not only merchandise that is no longer in demand for various reasons, such as technological advances, but also style products, such as clothing, which obviously have a greater potential for obsolescence.
  - —*Seasonal goods.* It is necessary to know the seasonal highs and lows associated with a particular class of inventory, as well as the costs associated with these seasonal variations.

—*Oversupply.* If there is an oversupply in the general market of a particular class of inventory, then its value would be negatively affected.

—*Limited-use raw materials and finished goods.* These would be difficult to liquidate at a reasonable value.

Two other areas a lender must analyze in setting the inventory advance rate are the ease or difficulty, in terms of cost, of liquidating inventory in multiple locations, and the cost of maintaining certain inventory, such as food products that require refrigeration, in a salable state.

In addition to marketability, accessibility of the collateral is extremely important, as liquidation plans become meaningless if a lender cannot gain access to collateral. Constant vigilance is necessary to guard against actions that would preempt a lender's security interest in inventory. Following are some common actions that impede a lender's access to collateral:

- *Possessory liens.* A landlord lien is a common example. To protect their interest, lenders need to obtain landlord waivers to the lien.
- *Nonpossessory liens.* A purchase-money security interest is a common example. These are usually filed by trade suppliers against their customers.
- *Secret lien.* A tax lien is the most common example. To ensure that a loss of collateral does not occur, it is necessary to conduct periodic lien searches if a borrower develops financial problems.

Commercial lenders often use outside appraisal firms to help them determine prudent inventory-advance rates. Also, normal industry practice for advance rates on different classes of inventory is available through the Commercial Finance Association Information Exchange.

Turnover rates should be analyzed to identify potential slow-moving or obsolete inventory, which should be subject to a lower or no advance rate. The borrower should establish inventory reserves if the volume of slow-moving or obsolete inventory is significant, and charge-off procedures should be in effect. Inventory should be adequately insured in relation to its location and amount. Furthermore, bill-and-hold merchandise and goods held on consignment should be physically segregated from other warehoused inventory and should not be included as inventory on the borrower's books or on the borrowing-base certificate submitted to the bank.

UCC Requirements for Secured Transactions

Article 9 of the UCC applies to any transaction that is intended to create a security interest in personal property. For a detailed discussion of the UCC requirements regarding secured transactions, refer to section 2080.1, "Commercial and Industrial Loans."

1. To determine if the policies, practices, procedures, and internal controls for accounts receivable and inventory financing are adequate.
2. To determine if bank officers are conforming to established guidelines.
3. To evaluate the portfolio for collateral sufficiency, credit quality, and collectibility.
4. To determine the scope and adequacy of the audit function.
5. To determine compliance with laws and regulations.
6. To initiate corrective action when policies, practices, procedures, or internal controls are deficient or when violations of laws or regulations have been noted.

1. If selected for implementation, complete or update the asset-based lending section of the internal control questionnaire.
2. On the basis of the evaluation of internal controls and the work performed by internal or external auditors, determine the scope of the examination.
3. Test for compliance with policies, practices, procedures, and internal controls in conjunction with performing the remaining examination procedures. Also, obtain a listing of any deficiencies noted in the latest review done by internal or external auditors, and determine if corrections have been accomplished.
4. Obtain a trial balance of the customer liability records.
   a. Agree or reconcile balances to department controls and the general ledger.
   b. Review reconciling items for reasonableness.
5. Using an appropriate technique, select borrowers for examination. Prepare credit line cards.
6. Obtain the following information from the bank or other examination areas, if applicable:
   a. past-due loans
   b. loans in a nonaccrual status
   c. loans on which interest is not being collected in accordance with the terms of the loan (Particular attention should be paid to loans that have been renewed without payment of interest.)
   d. loans whose terms have been modified by a reduction of interest rate or principal payment, by a deferral of interest or principal, or by other restructuring of repayment terms
   e. loans transferred, either in whole or in part, to another lending institution as a result of a sale, participation, or asset swap since the previous examination
   f. loans acquired from another lending institution as a result of a purchase, participation, or asset swap since the previous examination
   g. loan commitments and other contingent liabilities
   h. Extensions of credit to employees, officers, directors, and principal shareholders and their interests, specifying which officers are considered executive officers
   i. extensions of credit to executive officers, directors, and principal shareholders and their interests of correspondent banks
   j. a list of correspondent banks
   k. miscellaneous loan-debit and credit-suspense accounts
   l. loans considered "problem loans" by management
   m. Shared National Credits
   n. specific guidelines in the lending policy
   o. each officer's current lending authority
   p. current interest-rate structure
   q. any useful information obtained from the review of the minutes of the loan and discount committee or any similar committee
   r. reports furnished to the loan and discount committee or any similar committee
   s. reports furnished to the board of directors
   t. loans classified during the preceding examination
7. Review the information received and perform the following procedures.
   a. *Loans transferred, either in whole or in part, to or from another lending institution as a result of a participation, sale or purchase, or asset swap.*
      - Participations only:
        - — Test participation certificates and records, and determine that the parties share in the risks and contractual payments on a pro rata basis.
        - — Determine that the bank exercises similar controls and procedures over loans serviced for others as for loans in its own portfolio.
        - — Determine that the bank, as lead or agent in a credit, exercises similar controls and procedures over syndications and participations sold as for loans in its own portfolio.
      - Procedures pertaining to *all* transfers:
        - — Investigate any situations in which loans were transferred immediately before the date of examination to determine if any were transferred

to avoid possible criticism during the examination.

— Determine whether any of the loans transferred were either nonperforming at the time of transfer or classified at the previous examination.
— Determine that the consideration received for low-quality loans transferred from the bank to an affiliate is properly reflected on the bank's books and is equal to the fair market value of the transferred loans. (While fair market value may be difficult to determine, it should at a minimum reflect both the rate of return being earned on these loans as well as an appropriate risk premium.) Section 23A of the Federal Reserve Act prohibits a state member bank from purchasing a low-quality asset.
— Determine that low-quality loans transferred to an affiliate are properly reflected at fair market value on the books of both the bank and its affiliate.
— If low-quality loans were transferred to or from another lending institution for which the Federal Reserve is not the primary regulator, prepare a memorandum to be submitted to the Reserve Bank supervisory personnel. The Reserve Bank will then inform the local office of the primary federal regulator of the other institution involved in the transfer. The memorandum should include the following information, as applicable:
  (1) name of originating institution
  (2) name of receiving institution
  (3) type of transfer (i.e., participation, purchase or sale, swap)
  (4) date of transfer
  (5) total number of loans transferred
  (6) total dollar amount of loans transferred
  (7) status of the loans when transferred (e.g., nonperforming, classified, etc.)
  (8) any other information that would be helpful to the other regulator

b. *Miscellaneous loan-debit and credit-suspense accounts.*
  • Discuss with management any large or old items.
  • Perform additional procedures as deemed appropriate.

c. *Loan commitments and other contingent liabilities.* Analyze the commitment or contingent liability if the borrower has been advised of the commitment, and analyze the combined amounts of the current loan balance (if any) and the commitment or other contingent liability exceeding the cutoff.

d. *Loans classified during the previous examination.*
  • Determine the disposition of loans so classified by transcribing—
    — current balance and payment status, or
    — date loan was repaid and source of payment.
  • Investigate any situations in which all or part of the funds for the repayment came from the proceeds of another loan at the bank, or as a result of a participation, sale, or swap with another lending institution. If repayment was a result of a participation, sale, or swap, refer to step 7a of this section for the appropriate examination procedures.

e. *Uniform review of Shared National Credits.*
  • Compare the schedule of credits included in the uniform review of Shared National Credits Program with line cards to ascertain which loans in the sample are portions of Shared National Credits.
  • For each loan so identified, transcribe appropriate information from schedule to line cards. (No further examination procedures are necessary in this area.)

8. Consult with the examiner responsible for the asset/liability management analysis to determine the appropriate maturity breakdown of loans needed for the analysis. If requested, compile the information using bank records or other appropriate sources. See "Instructions for the Report of Examination," section 6000.1, for the considerations to be taken into account when compiling maturity information for the gap analysis.

9. Prepare line cards for any loan not in the sample that, on the basis of the information derived from the above schedules, requires in-depth review.
10. Obtain liability and other information on common borrowers from examiners assigned to cash items, overdrafts, lease financing, and other loan areas, and together decide who will review the borrowing relationship.
11. Obtain credit files for each loan for which line cards have been prepared. In analyzing the loans, perform the following procedures:
    a. Analyze balance-sheet and profit-and-loss items as reflected in current and preceding financial statements, and determine the existence of any favorable or adverse trends.
    b. Review components of the balance sheet as reflected in the current financial statements, and determine the reasonableness of each item as it relates to the total financial structure.
    c. Review supporting information and consolidation techniques for major balance-sheet items.
    d. Ascertain compliance with provisions of loan agreements.
    e. Review digests of officers' memoranda, mercantile reports, credit checks, and correspondence.
    f. Review the following:
        - relationship between amount collected in a month on the receivables pledged as collateral and the borrower's credit limit
        - aging of accounts receivable
        - ineligible receivables
        - concentration of debtor accounts
        - financial strength of debtor accounts
        - disputes, returns, and offsets
        - management's safeguards to ensure the authenticity and collectibility of the assigned receivables
    g. Analyze secondary support offered by guarantors and endorsers.
    h. Ascertain compliance with established bank policy.
12. Transcribe significant liability and other information on officers, principals, and affiliations of appropriate borrowers contained in the sample. Cross-reference line cards to borrowers, where appropriate.
13. Determine compliance with laws and regulations pertaining to accounts receivable lending by performing the following steps.
    a. *Lending limits.*
        - Determine the bank's lending limit as prescribed by state law.
        - Determine advances or combinations of advances with aggregate balances above the limit, if any.
    b. *Section 23A, Relations with Affiliates (12 USC 371c), and section 23B, Restrictions on Transactions with Affiliates (12 USC 371c-1), of the Federal Reserve Act, and Regulation W.*
        - Obtain a listing of loans to affiliates.
        - Compare the listing with the bank's customer liability records to determine its accuracy and completeness.
        - Obtain a listing of other covered transactions with affiliates (i.e., acceptance of affiliate's securities as collateral for a loan to any person).
        - Ensure that covered transactions with affiliates do not exceed the limits of section 23A and Regulation W.
        - Ensure that covered transactions with affiliates meet the collateral requirements of section 23A and Regulation W.
        - Determine that low-quality loans have not been purchased from an affiliate.
        - Determine that all covered transactions with affiliates are on terms and conditions that are consistent with safe and sound banking practices.
        - Determine that all transactions with affiliates comply with the market-terms requirement of section 23B and Regulation W.
    c. *18 USC 215, Receipt of Commission or Gift for Procuring Loans.*
        - While examining the accounts receivable loan area, determine the existence of any possible cases in which a bank officer, director, employee, agent, or attorney may have received anything of value for procuring or endeavoring to procure any extension of credit.
        - Investigate any such suspected situation.
    d. *Federal Election Campaign Act (2 USC 441b), Political Contributions and Loans.*
        - While examining the accounts receivable loan area, determine the existence

of any loans in connection with any political campaign.
- Review each such credit to determine whether it is made in accordance with applicable banking laws and regulations and in the ordinary course of business.

e. *12 USC 1972, Tie-In Provisions.* While examining the accounts receivable loan area, determine whether any extension of credit is conditioned upon—
- obtaining or providing an additional credit, property, or service to or from the bank or its holding company (or a subsidiary of its holding company), other than a loan, discount, deposit, or trust service, or
- the customer not obtaining a credit, property, or service from a competitor of the bank or its holding company (or a subsidiary of its holding company), other than a reasonable condition to ensure the soundness of the credit.

f. *Insider lending activities.* The examination procedures for checking compliance with the relevant law and regulation covering insider lending activities and reporting requirements are as follows. (The examiner should refer to the appropriate sections of the statutes for specific definitions, lending limitations, reporting requirements, and conditions indicating preferential treatment.)
- *Regulation O (12 CFR 215), Loans to Executive Officers, Directors, and Principal Shareholders and Their Related Interests.* While reviewing information relating to insiders that is received from the bank or appropriate examiner (including loan participations, loans purchased and sold, and loan swaps)—
  - — test the accuracy and completeness of information about accounts receivable loans by comparing it with the trial balance or loans sampled;
  - — review credit files on insider loans to determine that required information is available;
  - — determine that loans to insiders do not contain terms more favorable than those afforded other borrowers;
  - — determine that loans to insiders do not involve more than normal risk of repayment or present other unfavorable features;
  - — determine that loans to insiders do not exceed the lending limits imposed by Regulation O;
  - — if prior approval by the bank's board was required for a loan to an insider, determine that this approval was obtained;
  - — determine compliance with the various reporting requirements for insider loans;
  - — determine that the bank has made provisions to comply with the disclosure requirements for insider loans; and
  - — determine that the bank maintains records of public disclosure requests and the disposition of the requests for a period of two years after the dates of the requests.
- *Title VIII of the Financial Institutions Regulatory and Interest Rate Control Act of 1978 (FIRA) (12 USC 1972(2)), Loans to Executive Officers, Directors, and Principal Shareholders of Correspondent Banks.*
  - — Obtain from or request that the examiners reviewing due from banks and deposit accounts verify a list of correspondent banks provided by bank management, and ascertain the profitability of those relationships.
  - — Determine that loans to insiders of correspondent banks are not made on preferential terms and that no conflict of interest appears to exist.

g. *Financial Recordkeeping and Reporting of Currency and Foreign Transactions (31 CFR 103.33), Retention of Credit Files.* Review the operating procedures and credit file documentation and determine if the bank retains records of each extension of credit over $10,000, specifying the name and address of the borrower, the amount of the credit, the nature and purpose of the loan, and the date thereof. (Loans secured by an interest in real property are exempt.)

14. Determine whether the consumer compliance examination uncovered any violations

of law or regulation in this department. If violations were noted, determine whether corrective action was taken. Extend testing to determine subsequent compliance with any noted law or regulation.

15. Perform the appropriate steps in “Concentrations of Credits,” section 2050.3.
16. Discuss with appropriate officers, and prepare summaries in appropriate report form of—
    a. delinquent loans
    b. loans not supported by current and complete financial information
    c. loans on which documentation is deficient
    d. inadequately collateralized loans
    e. classified loans
    f. Small Business Administration delinquent or criticized loans
    g. transfers of low-quality loans to or from another lending institution
    h. concentrations of credit
    i. extensions of credit to major shareholders, employees, officers, directors, and/or their interests
    j. violations of laws and regulations
    k. other matters concerning the condition of the department
17. Evaluate the function for—
    a. the adequacy of written policies, relating to accounts receivable financing;
    b. the manner in which bank officers are conforming with established policy;
    c. adverse trends within the accounts receivable financing department;
    d. the accuracy and completeness of the schedules obtained from the bank;
    e. internal control deficiencies or exceptions;
    f. recommended corrective action when policies, practices, or procedures are deficient;
    g. the competency of departmental management; and
    h. other matters of significance.
18. Update the workpapers with any information that will facilitate future examinations.

Review the bank's internal controls, policies, practices, and procedures for making and servicing accounts receivable financing loans. The bank's system should be documented in a complete and concise manner and should include, where appropriate, narrative descriptions, flow charts, copies of forms, and other pertinent information. Items marked with an asterisk require substantiation by observation or testing.

POLICIES

*1. Has the board of directors, consistent with its duties and responsibilities, adopted written accounts receivable financing policies that—
   a. establish procedures for reviewing accounts receivable financing applications,
   b. establish standards for determining credit lines,
   c. establish standards for determining percentage advance to be made against acceptable receivables,
   d. define acceptable receivables,
   e. establish minimum requirements for verification of borrower's accounts receivable, and
   f. establish minimum standards for documentation?
2. Are accounts receivable financing policies reviewed at least annually to determine if they are compatible with changing market conditions?

RECORDS

*3. Is the preparation and posting of subsidiary accounts receivable financing records performed or reviewed by persons who do not also—
   a. issue official checks and drafts or
   b. handle cash?
*4. Are the subsidiary accounts receivable financing records reconciled, at least monthly, to the appropriate general ledger accounts, and are reconciling items investigated by persons who do not also handle cash?
5. Are loan statements, delinquent account collection requests, and past-due notices checked to the trial balances that are used in reconciling subsidiary records of accounts receivable financing loans with general ledger accounts, and are they handled only by persons who do not also handle cash?
6. Are inquiries about accounts receivable financing loan balances received and investigated by persons who do not also handle cash or pass adjustments?
*7. Are documents supporting recorded credit adjustments to loan accounts or accrued interest receivable accounts checked or tested subsequently by persons who do not also handle cash or initiate transactions (if so, explain briefly)?
8. Are terms, dates, weights, descriptions of merchandise, etc., shown on invoices, shipping documents, delivery receipts, and bills of lading scrutinized for differences?
9. Are procedures in effect to determine if the signatures shown on the above documents are authentic?
10. Are payments from customers scrutinized for differences in invoice dates, numbers, terms, etc.?

LOAN INTEREST

*11. Is the preparation and posting of loan interest records performed or reviewed by persons who do not also—
   a. issue official checks and drafts or
   b. handle cash?
12. Are independent interest computations made and compared or tested to initial loan interest records by persons who do not also—
   a. issue official checks and drafts or
   b. handle cash?

COLLATERAL

*13. Does the bank record, on a timely basis, a first lien on the assigned receivables for each borrower?
14. Do all loans granted on the security of the receivables also have an assignment of the inventory?

15. Does the bank verify the borrower's accounts receivable or require independent verification periodically?
16. Does the bank require the borrower to provide aged accounts receivable schedules periodically?
17. If applicable, are cash receipts and invoices block proven in the mailroom and subsequently traced to posting on daily transaction records?

CONCLUSION

18. Is the foregoing information an adequate basis for evaluating internal control in that there are no significant deficiencies in areas not covered in this questionnaire that impair any controls? Explain negative answers briefly and indicate any additional examination procedures deemed necessary.
19. Based on a composite evaluation, as evidenced by answers to the foregoing questions, internal control is considered (adequate/inadequate).

Some member banks provide lending services to stock brokerage firms using marketable securities as collateral. While various financial services are offered, typically most banks make loans to brokerage firms to provide them with the funding needed to carry their securities portfolio. The securities can either be held by the bank or a tri-party custodian or pledged to the bank at a depository. Collateral securities can be in physical form or can be held at a depository in book-entry form.

To promote efficiency, a brokerage firm may use a depository to hold the securities it has pledged as collateral for a bank loan. Brokerage firms deposit shares of eligible securities with the depository, and the stock certificates representing those shares are registered in the name of a common nominee. Beneficial ownership of the securities is transferred through computerized book entries, thus eliminating the physical movement of the securities. The depository has physical control of the securities while they are on deposit. Loan arrangements are made between the broker and the lending bank, with the broker providing electronic instructions to the depository to debit the firm's account and credit that of the lending bank. The depository acknowledges the transaction to the lending bank and will not reverse the entry or allow partial withdrawals without authorization from that institution. Participating banks receive daily reports showing their position in the program by broker name and type of security.

The New York Stock Exchange formed a subsidiary, the National Securities Clearing Corporation (NSCC), to provide equity clearance and continuous net settlement for the brokerage community. The Depository Trust Company in New York, under contract with the NSCC, handles the technical aspects of that operation, including final settlement. Collateral-pledging services may be offered by other depositories as well.

Book-entry transfer of ownership is limited to only those securities that are eligible for deposit in a depository. However, even if a security was depository-eligible, it would not be eligible for book-entry movement unless the lending bank was a direct or indirect participant in the depository. If the lending institution does not have a relationship, either directly or indirectly, with a depository, the securities would have to be delivered physically to the ultimate custodian (presumably the lending bank).

Securities lending is not always constrained by eligibility. Depending on the bank's underwriting standards, some banks may be willing to lend on the basis of securities that are not depository-eligible. This would preclude book-entry movement and require physical delivery.

1. To determine if policies, practices, procedures, objectives, and internal controls for securities broker and dealer loans are adequate.
2. To determine the types of loans (underwriting loan, day loan, inventory loan, margin loan, or guidance line) made, loan pricing and fees, loan-to-value ratios, and margin calls.
3. To evaluate credit quality, credit analysis, collateral and custody requirements, and procedures for lost and stolen securities.
4. To determine if bank officers are operating in conformance with the established guidelines.
5. To determine compliance with applicable laws and regulations, including Regulations T and U, the Securities Act of 1933, and the Securities Exchange Act of 1934.
6. To evaluate management information systems, particularly the lender's ability to ensure adequate collateral coverage by being able to automatically price collateral daily.
7. To determine the scope and adequacy of the audit function.
8. To initiate corrective action when policies, practices, procedures, objectives, or internal controls are deficient or when violations of laws or regulations have been noted.

1. If selected for implementation, complete or update the Securities Broker and Dealer Loans section of the Internal Control Questionnaire.
2. Based on the evaluation of internal controls and of the work performed by internal/external auditors ascertain the scope of the examination.
3. Test for compliance with policies, practices, procedures and internal controls in conjunction with performing the remaining examination procedures. Also, obtain a listing of any deficiencies noted in the latest review done by internal/external auditors, and determine if corrections have been accomplished.
4. Request the bank to supply:
   a. Schedule of approved lines for each dealer including outstanding balances.
   b. Delinquent interest billings, date billed amount of past-due interest.
5. Obtain a trial balance of all dealer accounts and:
   a. Agree balances to department controls and general ledger.
   b. Review reconciling items for reasonableness.
6. Using an appropriate technique, select borrowers to be reviewed.
7. Using the trial balance, transcribe the following information for each borrower selected onto the credit line cards.
   a. Total outstanding liability.
   b. Amount of approved line.
8. Obtain from the appropriate examiner the following schedules, if applicable to this area:
   a. Past-due loans.
   b. Loan commitments and other contingent liabilities.
   c. Miscellaneous loan debit and credit suspense accounts.
   d. Loans considered "problem loans" by management.
   e. Each officer's current lending authority.
   f. Current interest rate structure.
   g. Any useful information obtained from the review of the minutes of the loan and discount committee or any similar committee.
   h. Reports furnished to the loan and discount committee or any similar committee.
   i. Reports furnished to the board of directors.
   j. Loans classified during the preceding examination.
   k. A listing of loans charged-off since the preceding examination.
9. Review the information received and perform the following:
   a. For miscellaneous loan debit and credit suspense accounts:
      - Discuss with management any large or old items.
      - Perform additional procedures as deemed appropriate.
   b. For loans classified during the previous examination, determine disposition of loans so classified by transcribing:
      - Current balances and payment status, *or*
      - Date loan was repaid and sources of payment.
   c. For loan commitments and other contingent liabilities, analyze if:
      - The borrower has been advised of the contingent liability.
      - The combined amounts of the current loan balance and the commitment or contingent liability exceed the cutoff.
   d. Select loans which require in-depth review based on information derived when performing the above steps.
10. For those loans selected in step 6 above and for any other loans selected while performing the above steps, transcribe the following information from the bank's collateral record onto the credit-line cards:
    a. A list of collateral held, including date of entry, and amount advanced.
    b. A brief of the agreement between the bank and the dealer.
    c. Evidence that the proper documentation is in place.
    d. Details of any other collateral held.
11. The examiner should be aware that certain stock-secured purpose transactions with and for brokers and dealers are exempt from the

margin restrictions of Regulation U. Refer to the regulation for a complete description of such transactions, which include the following:
   a. Temporary advances to finance cash transactions.
   b. Securities in transit or transfer.
   c. Day loans.
   d. Temporary financing of distributions.
   e. Arbitrage transactions.
   f. Credit extended pursuant to hypothecation.
   g. Emergency credit.
   h. Loans to specialists.
   i. Loans to odd-lot dealers.
   j. Loans to OTC market makers.
   k. Loans to third-market makers
   l. Loans to block positioners.
   m. Loans for capital contributions.
12. Discuss with appropriate officer(s) and prepare summaries in appropriate report form of:
   a. Delinquent loans, including a breakout of "A" paper.
   b. Loans on which collateral documentation is deficient.
   c. Recommended corrective action when policies, practices or procedures are deficient.
   d. Other matters regarding the condition of the department.
13. Prepare appropriate comments for examination report stating your findings with regard to:
   a. The adequacy of written policies relating to dealer loans.
   b. The manner in which bank officers are conforming with established policy.
   c. Schedules applicable to the department that were discovered to be incorrect or incomplete.
   d. The competence of departmental management.
   e. Internal control deficiencies or exceptions.
   f. Other matters of significance.
14. Update the workpapers with any information that will facilitate future examinations.

Review the bank's internal control, policies, practices and procedures for making and servicing loans. The bank's system should be documented in a complete and concise manner and should include, where appropriate, narrative descriptions, flowcharts, copies of forms used and other pertinent information.

POLICIES

1. Has the board of directors, consistent with its duties and responsibilities, adopted written loan policies that:

    a. Establish standards for determining broker and dealer credit lines?

    b. Establish minimum standards for documentation?

2. Are such loan policies reviewed at least annually to determine if they are compatible with changing market conditions?

3. Is a daily record maintained summarizing loan transaction details, i.e., loans made, payments received and interest collected to support applicable general ledger account entries?

4. Are frequent note and liability ledger trial balances prepared and reconciled with controlling accounts by employees who do not process or record loan transactions?

5. Is an exception report produced and reviewed by operating management that encompasses extensions, renewals or any factors that would result in a change in customer account status?

6. Do customer account records clearly indicate accounts which have been renewed or extended?

LOAN INTEREST

7. Is the preparation and posting of interest records performed and reviewed by appropriate personnel?
8. Are any independent interest computations made and compared or adequately tested to initial interest records by appropriate personnel?

COLLATERAL

9. Are multicopy, prenumbered records maintained that:
    a. Detail the complete description of collateral pledged?
    b. Are typed or completed in ink?
10. Are receipts issued to customers covering each item of negotiable collateral deposited?
11. If applicable, are the functions of receiving and releasing collateral to borrowers and of making entries in the collateral register performed by different employees?
12. Are appropriate steps with regard to Regulation U being considered in granting dealer and broker loans?

CONCLUSION

13. Is the foregoing information an adequate basis for evaluating internal control in that there are no significant deficienicies in areas not covered in this questionnaire that impair any controls? Explain negative answers briefly, and indicate any additional examination procedures deemed necessary.
14. Based on composite evaluation, as evidenced by answers to the foregoing questions, internal control is considered (adequate/inadequate).

INTRODUCTION

Factoring is the purchase, essentially without recourse, of the accounts receivable of a client by a bank (the factor). Generally, factor clients are small, undercapitalized companies or start-up firms with limited liquidity that generally do not qualify for more traditional bank financing. In contrast to accounts receivable financing, where the client retains the credit and collection risk associated with the receivables, factoring transfers these risks to the factor. For the client, the principal advantage of factoring is the assurance that it will receive the proceeds of its sales, regardless of whether the factor is paid. Furthermore, the client does not have to maintain a credit department to evaluate the creditworthiness of customers, collect past-due accounts, or maintain accounting records on the status of receivables. The factor assumes these responsibilities. An additional advantage for the client is that under the terms of an ''advance factoring'' arrangement, the client receives payment for its receivables before the time stated on the invoice.

Two basic types of factoring service offered by the industry are (1) maturity factoring and (2) advance factoring. In maturity factoring, an average maturity due date is computed for the receivables purchased within a given time period, and the client receives payment on that date. Advance factoring is computed in the same way; however, the client has the option of taking a percentage of the balance due on a receivable in advance of the computed average maturity due date. The remainder of the receivable, sometimes called the ''client's equity,'' is payable on demand at the due date.

ACCOUNTING FOR FACTORING

The factor's balance sheet reflects the purchased accounts receivable as an asset account, ''factored receivables,'' with ''due to clients'' as the corresponding liability. Usually, the balance of due-to-clients will be less than the factored receivables because of payments and advances to the clients. If, however, the factor makes advances to the client in amounts that exceed amounts due to the client, the advances will be shown as ''overadvances.'' Overadvances are common and usually secured by other collateral. The factoring agreement should set limits on the amount of overadvances available at any one time, generally based on specified collateral, such as the client's inventory. The relationship to inventory is based on the premise that the inventory will be sold, thus generating receivables that the factor has contracted to purchase. Proceeds from the factored receivables resulting from the sale of inventory are then used to repay the overadvance. If the overadvance is unsecured, it should be offset by a corresponding reduction in the ''client's equity.'' The factor's income statement will show factoring commissions, which represent the discount on the receivables purchased, as income. Interest income for advances on the due-to-client balances may or may not be a separate line item.

Since factoring is a highly competitive industry, price cutting has reduced factoring commissions to the point that they provide minimal support to a factor's earnings. As a result, interest margins on factoring advances represent an increasingly important part of a factor's net income. An analysis of proportional changes in the due-to-clients account should provide valuable insight into the analysis of the earnings of a bank's factoring activities. As more clients take advances (reducing due-to-clients), profit margins should widen. Conversely, as the due-to-clients proportion of total liabilities rises, profit margins may be expected to narrow.

FACTORING AGREEMENT, APPROVAL PROCEDURES, AND EXAMINER'S EVALUATION

The typical factoring agreement stipulates that all of a client's accounts receivable are assigned to the factor. However, the agreement between the factor and the client will usually state that receivables subject to shipping disputes and errors, returns, and adjustments are chargeable back to the client because they do not represent bona fide sales. The agreement will, in most instances, require that a reserve be established against the purchased receivables to ensure the factor's access to funds for any future chargeback adjustments.

The usual approval process requires the client to contact the factor's credit department before filling a sales order on credit terms. The credit department conducts a credit review, determines the creditworthiness of the customer, and approves or rejects the sale. If the credit department rejects the sale, the client may complete the sale, but at its own risk. The most commonly rejected sales are those to affiliates, known bad risks, customers whose credit cannot be verified, and customers whose outstanding payables exceed the factor's credit line to that customer. Sales made by the client without the factor's approval are considered client-risk receivables, and the factor has full recourse to the client.

Once a sale has been made and the receivable assigned to the factor, whether or not the factor has approved it, the client's account will be credited for the net invoice amount of the sale. Trade or volume discounts, early payment terms, and other adjustments are deducted from the invoice amount. The receivable then becomes part of the client's "availability" to be paid immediately or at the computed date, depending on the basis of the factoring arrangement.

Each month the client receives an "accounts-current" statement from the factor, which details daily transactions. This statement reflects the daily assignments of receivables, remittances made (including overadvances and amounts advanced at the client's risk), deductions for term loans, interest charges, and factoring commissions. Credit memos, client-risk charge-backs, and other adjustments will also be shown. Client-risk charge-backs are the amounts deducted from the remittances to the client resulting from the failure of the client's customers to pay receivables that were advanced at the client's risk.

The accounts-current statement and the availability sheets are necessary for analyzing asset quality. The factor's ability to generate these reports daily is a basic control feature. Accounting systems for a high-volume operation probably will be automated, providing the factor with the data necessary to properly monitor the client. If a monitoring system is in place, the examiner should use the data provided in the asset analysis process.

The evaluation of a factoring operation includes a review of its systems and controls as well as an analysis of the quality of its assets. A major portion of a factor's assets will be factored receivables, for which the credit department has the responsibility for credit quality and collection. The other major portion of assets will consist of client loans and credit accommodations, such as overadvances and amounts advanced at the client's risk, for which the account officers are responsible.

CREDIT DEPARTMENT EVALUATION

Because of its integral function in the credit and collection process, the credit department is the heart of a factoring operation. The department should maintain a credit file for each of its client's customers, and these files should be continually updated as purchases are made and paid for by the customers. These files should include financial statements, credit bureau reports, and details of purchasing volume and paying habits. Each customer should have an assigned credit line based on the credit department's review of the customer's credit capacity.

The objective of a credit department evaluation is to critique the credit and collection process and to assess departmental effectiveness. The examiner should have a copy of departmental policies and procedures as well as a verbal understanding of them before beginning the review. The factor's policies should include, at a minimum, well-defined field audit procedures, a fraud detection and monitoring plan, and a computer back-up plan. Customer files selected for review may be drawn from large and closely monitored customers, or they may be selected by a random sample.

ASSET EVALUATION

The asset evaluation is a twofold process. The first part is to evaluate credit accommodations to each client. The second part is to evaluate customer receivables purchased by the factor at its own risk. For the first part of the process, the examiner should obtain a list that shows the aggregate of each client's credit exposure to the factor, both direct and indirect, including overadvances and receivables purchased at the client's risk. For the second part of the process, the examiner should obtain an aging schedule of factored receivables aggregated by customer but net of client-risk receivables. The selection of clients and customers for review should be based on the same selection methods as those used for the commercial loan review. Clients with a high "dilution" of receivables (that is, customer nonpayment due to returns, shipping disputes, or errors) and those with client-risk receivables equal to 20 percent or more of factored volume might also be selected for review. Past-due factored volume is not a meaningful measure of client quality because a factor usually collects principal and interest payments directly from the client's availability.

A maturity client's availability is the sum of all factored receivables less trade and other discounts, factoring commissions, client-risk charge-backs, and other miscellaneous charges to the client's account. There may also be deductions for letters of credit and other credit accommodations. An advance client's availability would be further reduced by advances on the factored receivables, interest charges, and the reciprocal of the contractually agreed-upon "advance" percentage. This reciprocal, 20 percent in the case of a client who receives an 80 percent advance, is sometimes referred to as the client's equity in the factored receivables. Availability may be increased by liens on additional collateral, such as inventory, machinery and equipment, real estate, and other marketable assets.

A client's balance sheet will show a "due-from-factor" account instead of accounts receivable. The account balance may be somewhat lower than a normal receivables balance, thus distorting turnover ratios and other short-term ratios. A client can convert sales to cash faster with a factor than if it collected the receivables. The statement analysis should consider the client's ability to repay any advances received from the factor in the form of overadvances, term loans, or other credit accommodations. The analysis should also assess the client's ability to absorb normal dilution and the potential losses associated with client-risk receivables, particularly when these elements are unusually high.

CLASSIFICATION GUIDELINES

When classifying the credit exposure to a client, the client-risk receivables portion of factored volume is the only amount subject to classification. Because of the recourse aspect, the balance is considered an indirect obligation rather than a direct obligation. Any other credit accommodations to a client that are not included in factored receivables, such as overadvances or term loans, are also subject to classification. Customer receivables purchased by the factor at its own risk are subject to classification. Care should be taken not to classify any receivables that have already been classified under client-risk exposure. Seasonal aspects of clients' businesses should be carefully analyzed in assessing asset quality based on classification data.

CONCLUSION

Due to the large volume of daily transactions that typically flows through a factor, any internal control procedure that can be easily circumvented is a potential problem. The review of the department's internal systems and controls should be continuous throughout the examination. This review should include credit controls for both clients and customers. Since credit problems can develop rapidly in factoring, credit controls and systems must be responsive to the identification of these problems. Earnings and capital adequacy are evaluated based on the department's own performance. The factoring department's earnings trends may be evaluated by comparing the yield on assets for various periods. Factors are subject to the same price competition in the commercial finance market as accounts receivable financiers. Declining portfolio yields may reflect competitive pressures and may portend declining future profitability.

1. To determine if policies, practices, procedures, and internal controls for factoring are adequate.
2. To determine if bank officers are operating in conformance with the established guidelines.
3. To evaluate the portfolio for performance, credit quality, collectibility, and collateral sufficiency.
4. To determine the scope and adequacy of the audit function.
5. To determine compliance with applicable laws and regulations.
6. To initiate corrective action when policies, practices, procedures, or internal controls are deficient or when violations of laws or regulations have been noted.

1. If selected for implementation, complete or update the Factoring section of the Internal Control Questionnaire.
2. Based on the evaluation of internal controls and the work performed by internal/external auditors, determine the scope of the examination.
3. Test for compliance with policies, practices, procedures and internal controls in conjunction with performing the remaining examination procedures. Also obtain a listing of any deficiencies noted in the latest reviews done by internal/external auditors, and determine if appropriate corrections have been made.
4. Obtain a trial balance(s) of applicable asset and liability accounts and:
   a. Agree or reconcile balances to department controls and general ledger.
   b. Review reconciling items for reasonableness.
5. Obtain the following information:
   a. A list of all clients with their outstanding balances including total factored receivables with those purchased at the client's risk segregated, overadvances, term loans and other credit accommodations.
   b. If not included in 5a above, a list of amounts due to each client by the factor (availability reports).
   c. Aging schedules of factored receivables by client and by customer with client risk receivables segregated.
   d. Past due status reports for 5c, above.
   e. Listings of all clients and customers considered to be problems.
   f. Credits classified at the previous examination.
   g. Concentration reports by client and by customer.
   h. Exception reports highlighting dilution of factored receivables because of shipping disputes and errors, returns, or any other adjustments.
   i. Credit commitments/lines for each client including amounts for overadvances and receivables purchased at the client's risk.
   j. Credit lines for each customer.
   k. Specific lending policy guidelines including each officer's current lending authority.
   l. Current fee schedule.
   m. Any useful information obtained from the review of the minutes of the loan and discount committee or any similar committees.
   n. Reports furnished to the board of directors.
   o. Any other management reports maintained by the factoring department.
6. After consulting with the examiner-in-charge, determine the appropriate cut-off lines for:
   a. Client's aggregate direct liability (i.e., overadvances, term loans and other credit accommodations).
   b. Client's indirect liability (i.e., client-risk exposure).
   c. Customer's factored receivables not including those in 6b above.
7. Transcribe information to line cards for all client and customer credits over the cut-off limits, for all credits recognized as problems, and for credits classified at the previous examination.
8. Cross reference clients and customers with the examiners assigned to other loan areas for common borrowers, and together decide who will review the borrowing relationship.
9. Obtain credit files for all clients and customers for whom line cards were prepared and analyze the accounts by performing the following procedures:
   a. Analyze balance sheet and profit and loss items as reflected in current and preceding financial statements, determine the existence of any favorable or adverse trends.
   b. Review components of the balance sheet as reflected in the current financial statements and determine the reasonableness of each item as its relates to the total financial structure.
   c. Review supporting information for the major balance sheet items and the techniques used in consolidation, if applicable, and determine the primary sources of repayment and evaluate their adequacy.
   d. Compare the amount of the credit line(s) with the lending officer's authority.
   e. Determine compliance with the bank's established commercial loan policy.

In addition to the above procedures which are applicable to both client and customer accounts, the following additional procedures should be performed for client accounts only:

f. Determine compliance with provisions of factoring agreements.
g. Review digest of officers' memoranda, mercantile reports, credit checks and correspondence to determine the existence of any problems which might deter the contractual program as set forth in the factoring agreement.
h. Relate collateral values to outstanding debt.
i. Compare fees charged to the fee schedule and determine that the terms are within established guidelines.
j. Analyze secondary support afforded by guarantors and endorsers.

10. Perform appropriate procedural steps in Concentration of Credits section, if applicable.
11. Discuss with appropriate officer(s) and prepare summaries in appropriate report form of:
    a. Delinquent amounts, segregating those considered "A" paper.
    b. Violations of laws and regulations.
    c. Accounts not supported by current and complete financial information or on which other documentation is deficient.
    d. Concentrations of credit.
    e. Criticized accounts.
    f. Other matters regarding condition of asset quality.
12. Evaluate the factoring department with respect to:
    a. The adequacy of written policies relating to factoring.
    b. The manner in which bank officers are operating in conformance with established policy.
    c. Adverse trends within the factoring department.
    d. Internal control deficiences or exceptions.
    e. Recommended corrective action when policies, practices or procedures are deficient.
    f. The competency of departmental management.
    g. Other matters of significance.
13. Update the workpapers with any information that will facilitate future examinations.

Review the bank's internal controls, policies, practices and procedures for its factoring operation. The bank's system should be documented in a complete and concise manner and should include, where appropriate, narrative descriptions, flowcharts, copies of forms used and other pertinent information. Items marked with an asterisk require substantiation by observation or testing.

POLICIES

1. Has the board of directors, consistent with its duties and responsibilities, adopted written factoring policies that:
   a. Establish procedures for reviewing factoring agreements?
   b. Establish standards for determining client credit lines for each of the various types of accommodations available (i.e., factored receivables, client-risk receivables, overadvances, term loans, etc.)?
   c. Establish standards for determining individual customer limits?
   d. Require a client to contact the factor for approval before filling a sales order on credit terms?
   e. Establish standards for approving the sales orders referred to above.
   f. Establish standards for determining the percentage of advance that will be made against acceptable receivables in advance factoring arrangements?
   g. Establish standards for determining the discount on factored receivables and the interest rate or fee charged for other credit accommodations?
   h. Establish minimum standards for documentation?
2. Are factoring policies reviewed at least annually to determine if they are compatible with changing market conditions?

INTERNAL CONTROL

*3. Is the preparation and posting of subsidiary factoring records performed or reviewed by persons who do not also:
   a. Issue official checks and drafts?
   b. Handle cash?

*4. Are the subsidiary factoring records reconciled, at least monthly, to the appropriate general ledger accounts, and reconciling items investigated by persons who do not also handle cash?

5. Are accounts current statements, delinquent account collection requests, and past-due notices checked to the trial balances that are used in reconciling subsidiary records of factoring accounts with general ledger accounts, *and* handled only by persons who do not also handle cash?
6. Are inquiries about factored balances received and investigated by persons who do not also handle cash?

*7. Are documents supporting recorded credit adjustments to factored receivable accounts and the due-to-clients accounts checked or tested subsequently by persons who do not also handle cash (if so, explain briefly)?

8. Are proper records maintained for approval of:
   a. Customer orders?
   b. Client credit accommodations?
9. Are items, dates, weights, description of merchandise, etc., shown on invoices, shipping documents, delivery receipts, and bills of lading scrutinized for differences?
10. Are procedures in effect to determine if the signatures shown on the above documents are authentic?
11. Are payments from customers scrutinized for differences in invoice dates, numbers, terms, etc.?

INTEREST AND FEES

*12. Is the preparation and posting of discount, interest, and fee records performed or reviewed by persons who do not also:
   a. Issue official checks and drafts singly?
   b. Handle cash?

13. Are independent discount, interest and fee computations made and compared or tested to initial records by persons who do not also:
   a. Issue official checks and drafts?
   b. Handle cash?

COLLATERAL

*14. Does the bank record, on a timely basis, a first lien on the assigned receivables for each borrower?

15. Does the bank verify the borrower's accounts receivable or require independent verification on a periodic basis?

16. Does the bank review aged accounts receivable schedules on a regular basis?

17. If applicable, are cash receipts and invoices block proved in the mailroom and subsequently traced to posting on daily transaction records?

CONCLUSION

18. Is the foregoing information an adequate basis for evaluating internal control in that there are no significant deficiencies in areas not covered in this questionnaire that impair any controls? Explain negative answers briefly, and indicate any additional examination procedures deemed necessary.

19. Based on a composite evaluation as evidenced by answers to the foregoing questions, internal control is considered (adequate/inadequate).

OTHER ASSETS

The term *other assets,* as used in this section, includes all balance-sheet asset accounts not covered specifically in other areas of the examination. Often, such accounts may be quite insignificant in the overall financial condition of the bank. However, significant subquality assets may be uncovered in banks lacking proper internal controls and procedures.

In many banks, other asset accounts are maintained on the daily statement but must be reflected in a specific asset category for reporting. Schedule RC-F of the Consolidated Report of Condition lists the specific accounts classified as "other assets" and includes a catchall heading of "other." Certain accounts in that other asset account, such as securities borrowed, are examined using the procedures described in the appropriate section of this manual.

Types of Other Asset Accounts

Types of other assets frequently found in banks are the various temporary holding accounts, such as suspense, interoffice, teller, transit, and bookkeeping differences having debit balances. Those accounts should be used only for temporary recording until the offsetting entry is received or fully identified and posted to the proper account. A bank should have written internal control procedures to ensure that difference accounts are reconciled and closed out on a timely basis. Nothing should be allowed to remain in those accounts for any significant length of time—usually no more than a few business days. All difference accounts should be closed out at least quarterly.

General categories of other assets common to banks are accrued interest receivables (on loans, debt securities, and other interest-bearing assets) and other types of income earned but not yet collected (income derived from an asset that is recognized but not yet collected or received on the reporting date), net deferred tax assets (deferred tax assets less deferred tax liabilities that result in a debit balance for a particular tax jurisdiction), interest-only strips receivables for mortgage loans and other financial assets, prepaid expenses (cash outlays for goods and services, the benefits of which will be realized in future periods), equity securities (cost of) that do not have readily determinable fair values (including Federal Reserve stock and bankers' bank stock), the cash surrender value of bank-owned life insurance (BOLI), and other nonsecurity or other interest-only strips receivables.

An interest-only strip receivable is the contractual right to receive some or all of the interest due on a bond, mortgage loan, collateralized mortgage obligation, or other interest-bearing financial asset. This includes, for example, the contractual rights to future interest cash flows that exceed contractually specified servicing fees on financial assets that have been sold.

The other assets category also consists of unique and unusual transactions that are not appropriate to include in other line items of a bank's balance sheet. An unlimited number of possible account titles could be included in this category, such as redeemed food stamps, art objects, antiques, and coin and bullion. Regardless, the examiner must design specific procedures for review and testing to fit the particular account and situation and must document the scope of the review in the workpapers.

Examination Review of Other Assets

Examiners assigned to "other assets" must obtain the detailed breakdown of these accounts when they are reported on the bank's statement of condition and when they are so designated for the purposes of reporting on the bank's Call Report. When the account can best be examined by examiners assigned to other areas of the bank, the detailed breakdown of the accounts should be furnished to those examiners. The remaining accounts should be reviewed and evaluated by examiners assigned to this section. The major factor in deciding which accounts are to be reviewed are materiality and the volume of transactions flowing through the account.

With regard to materiality, the examiner should evaluate whether to analyze the nature and quality of each individual item, on the basis of its impact on the overall soundness of the bank or the quality of the bank's earnings. Therefore, the examiner needs to verify—

- the existence of the asset;
- the proper valuation of the asset;

- that the asset is properly classified, described, and disclosed in the financial statements (including the existence of any liens);
- that the asset is being properly amortized on a consistent basis over the estimated period of benefit;
- that any sales of assets, including the recognition of gains and losses, have been properly recognized; and
- the adequacy of the accounting and disposition controls for, as well as the quality of, the asset.

With regard to transaction volume, the examiner should evaluate whether any accounts with small balances have an unusually high level of transaction volume. Therefore, it is important that the examiner verify that—

- the account has a valid business purpose,
- the account is reconciled on a regular basis, and
- the accounting controls are adequate.

An examiner should authenticate the existence of the selected assets by ensuring that their supporting documentation is adequate. Also, the examiner should verify that ownership of the asset rests with the bank. (In the case of organizational costs borne by the bank for the formation of a holding company, those costs, and the related ownership rights in the capitalized asset, should more properly be borne by the ownership interests and should not be recorded as assets of the bank.)

Proper valuation and reporting of other asset accounts is another potential area of concern for the examiner. Assets are generally acquired through purchase, trade, repossession, prepayment of expenses, or accrual of income. Generally, assets purchased, traded, or repossessed are transferred at their fair market value. Prepaid expenses and income accrued are booked at cost. An examiner should be particularly alert in identifying those assets that lose value over time to ensure that they are appropriately depreciated or amortized. All intangible assets should be regularly amortized, and management should have a system in place to confirm the valuation of the remaining book balance of the intangible assets.

The examiner needs to ensure that the controls concerning other assets protect the bank's ownership rights, the accounts are properly valued and accurately reported, and control activities are monitored regularly by management. A bank with good control and review procedures will periodically charge off all uncollectible or unreconcilable items. However, the examiner must frequently go beyond the general ledger control accounts and scan the underlying subsidiary ledgers to ensure that posting errors and the common practice of netting certain accounts against each other do not cause significant balances to go unnoticed because of lack of proper detail.

Deferred Tax Assets

For verifying compliance with the limits found in the risk-based capital guidelines, examiners need to review the net deferred tax assets (deferred tax assets less deferred tax liabilities) that a bank reports in its regulatory reports and the amount of limited deferred tax assets that are not deducted from a bank's tier 1 capital. The net deferred taxes result from the application of an asset and liability approach for financial-accounting and reporting for income taxes. Net deferred taxes (net deferred tax assets) generally arise from the tax effects of reporting income or expense charges in one period for financial-statement purposes and in another period for tax purposes. This effect, known as a temporary difference, is at times sizable. Tax laws often differ from the recognition and measurement requirements of financial accounting standards. Differences can arise between (1) the amount of taxable income and pretax financial income for a year and (2) the tax bases of assets or liabilities and their reported amounts in financial statements. Charges that result in a significant deferred tax asset are often caused by loan-loss provisions exceeding bad debt deductions for tax purposes in a given period. While banks are permitted to carry deferred income tax assets on their reports of condition, they are limited by generally accepted accounting principles (GAAP) to the extent these items can be carried.

The Financial Accounting Standards Board's (FASB) Statement No. 109 (FAS 109), "Accounting for Income Taxes," establishes procedures to (1) measure deferred tax assets and liabilities using a tax-rate convention and (2) assess whether a valuation allowance should be established for deferred tax assets. Enacted tax laws and rates are considered in determining the applicable tax rate and in assessing the need for a valuation allowance. FAS 109 was to be adopted by banks as of January 1, 1993, or the beginning of their first fiscal year thereafter, if later.

FAS 109 requires a deferred tax asset to be recognized for all temporary differences that will result in deductible amounts in future years and for tax credit carryforwards. For example, a temporary difference may be created between the reported amount and the tax basis of a liability for estimated expenses if, for tax purposes, those estimated expenses are not deductible until a future year. Settlement of that liability will result in tax deductions in future years, and a deferred tax asset is recognized in the current year for the reduction in taxes payable in future years. A valuation allowance is recognized (deducted from the amount of the deferred tax asset) if, based on the weight of available evidence, it is *likely* that some or all of the deferred tax asset will not be realized.

Deferred Tax Liabilities

A deferred tax liability is recognized for temporary differences that will result in taxable amounts in future years. Deferred tax liabilities that may be related to a particular tax jurisdiction (for example, federal, state, or local) may be offset against each other for reporting purposes. A resulting debit balance is included in ''other assets'' on the bank Call Report and reported in Schedule RC-F; a resulting credit balance is included in ''other liabilities'' on the bank Call Report and reported in Schedule RC-G. A bank may report a net deferred tax debit (or asset) for one tax jurisdiction (for example, federal taxes) and also report a net deferred tax credit (or liability) for another tax jurisdiction (for example, state taxes).

Limitation on Deferred Tax Assets for Tier 1 Risk-Based Capital and Leverage Capital

The risk-based capital and leverage capital guidelines include a limit on the amount of certain deferred tax assets that may be included in (that is, not deducted from) tier 1 capital for determining the amount of the bank's required risk-based and leverage capital levels. Certain deferred tax assets can only be realized if a bank earns taxable income in the future. Deferred tax assets are limited, for regulatory capital purposes, to (1) the amount that the bank expects to realize within one year of the quarter-end report date (based on its projections of future taxable income for that year) or (2) 10 percent of tier 1 capital, whichever is less. The reported amount of deferred tax assets, net of any valuation allowance for deferred tax assets, in excess of the lesser of these two amounts is to be deducted from a bank's core capital elements in determining tier 1 capital. See section 3020.1 for more detailed information on how to determine the capital composition and limitation on deferred tax assets.

Bank-Owned Life Insurance to Be Included in Other Assets

FASB's Technical Bulletin No. 85-4 (FTB 85-4), "Accounting for the Purchases of Life Insurance," addresses the accounting for BOLI. "Other assets" are to include the amount of the assets that represent the cash surrender value of the insurance policy that is reported to the institution by the insurance carrier (less any applicable surrender charges not reflected by the insurance carrier in the reported cash surrender value that could be realized under the insurance contract) as of the balance-sheet date. Because there is no right of offset, an investment in BOLI is reported as an asset separately from any deferred compensation liability. BOLI is reported on the balance sheet of the bank Call Report as "other assets" and on its schedule RC-F as "all other assets—cash surrender value of life insurance." (See SR-04-4 and SR-04-19.) (The net earnings (losses) on, or the net increases (decreases) in, the net cash surrender value of BOLI should be reported according to the bank Call Report instructions for the glossary and the income statement, Schedules RI and RI-E.)

OTHER LIABILITIES

The term *other liabilities* represents the bank's authorized obligations. Other liabilities, as used in this section, include all balance-sheet liability accounts not covered specifically in other areas of the examination. The accounts often may be quite insignificant when compared with the overall size of the bank. In some banks, individual accounts are established for control purposes and appear on the balance sheet as "other liabilities." For reporting, however, these accounts must be assigned to specific liability categories or netted from related asset categories, as appropriate.

Schedule RC-G of the Consolidated Report of Condition lists the specific accounts classified as "other liabilities." The schedule includes interest accrued and unpaid on deposits and other expenses that are accrued and unpaid (including accrued income taxes payable), net deferred tax liabilities, the allowance for credit losses on off-balance-sheet credit exposures, and all other liabilities. "All other liabilities" includes liability accounts such as accounts payable, deferred compensation liabilities, dividends that are declared but not yet payable, and derivatives with a negative fair value held for purposes other than trading.

As stated above, the "all other liabilities" term includes deferred compensation liabilities. This account is used to record the bank's obligation under its deferred compensation agreements. Section 3015.1 discusses deferred compensation agreements in detail, both as to the nature and operation of the different types of agreements and the accounting standards and guidance that are applicable to those agreements—in particular, a revenue-neutral plan or an indexed retirement plan. (See also SR-04-4, SR-04-19, and the glossary entry for "deferred compensation agreements" in the bank Call Report instructions.)

Types of Other Liability Accounts

A general category of other liabilities common to banks is expenses accrued and unpaid. These accounts represent periodic charges to income based on anticipated or contractual payments of funds to be made at a later date. They include such items as interest on deposits, dividends, taxes, and expenses incurred in the normal course of business. There should be a correlation between the amount being accrued daily or monthly and the amount due on the stated or anticipated payment date.

Other liability accounts should be reviewed to determine that accounts, such as deferred taxes, are being properly recognized when there are temporary differences in the recognition of income and expenses between the books and the income tax returns. This review should also determine that matters such as pending tax litigation, equipment contracts, and accounts payable have been properly recorded and are being discharged in accordance with their terms and requirements.

Various miscellaneous liabilities may be found in accounts, such as undisbursed loan funds, deferred credits, interoffice, suspense, and other titles denoting pending status. An unlimited number of possible items could be included. The review of these accounts should determine that they are used properly and that all such items are clearing in the normal course of business. Because of the variety of such accounts, the examiner must develop specific examination procedures to fit the particular account and situation.

Examination Review of Other Liabilities

Examiners assigned to "other liabilities" are responsible for obtaining the bank's breakdown of these accounts and, when the accounts are to be examined under other sections, must ensure that examiners in charge of those sections receive the necessary information. The remaining accounts should be reviewed and evaluated by examiners assigned to this section.

The primary emphasis of examining other liabilities is to obtain reasonable assurance that (1) the liabilities represent the bank's authorized obligations and (2) all contingencies and estimated current-period expenses that will be paid in future periods that should be accrued during the period have been accrued, classified, and described in accordance with GAAP, and the related disclosures are adequate. Another emphasis in examining this area should be the adequacy of the controls and procedures the bank employs to promptly record the amount of liability. Without proper management attention, these accounts may be advertently or inadvertently misstated. Unless properly supervised, these accounts may be used to conceal shortages that should be detected immediately. For instance, other liabilities may include fraudulent entries for suspense or interbranch accounts that could be rolled over every other day to avoid stale dates, causing shortages of any amount to be effectively concealed for indefinite periods of time.

Similar to "other assets," other liability accounts with small balances may be significant. Scanning account balances may disclose a recorded liability, but it does not aid in determining the accuracy of liability figures. Therefore, it is important to review the documented information obtained from examiners working with and reviewing the minutes of the board and its committees. Responses from legal counsel handling litigation could also be important because this information might reveal a major understatement of liabilities. Determining accurate balances in other liability accounts requires an in-depth review of source documents or the other accounts in which the liability arose.

Other Assets and Other Liabilities

Examination Procedures

Effective date May 2022

Section 2300.3

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Other Assets and Liabilities

Cash accounts include U.S. and foreign coin and currency on hand and in transit, clearings, and cash items.

CASH

Every bank maintains a certain amount of U.S. currency and some may have foreign currency on hand. To avoid having excess nonearning assets and to minimize exposure to misappropriation and robbery, each bank should establish a policy to maintain cash balances at the minimum levels necessary to serve its customers. The amount will vary from bank to bank depending on anticipated needs of customers and the availability of replenishment monies, with a reasonable allowance made for unusual demands.

Foreign currency may not be included in cash positions for management purposes when the amounts are not significant. However, the coin and currency of other countries are foreign-currency assets, as are loans or nostro accounts, and should be included in the foreign-currency positions.

CLEARINGS

Clearings are checks, drafts, notes, and other items that a bank has cashed or received for deposit that are drawn on other local banks and cleared directly with them. These items can usually be exchanged more efficiently among local banks than through correspondent banks or the Federal Reserve System. Many communities with two or more banks have formally organized clearinghouse associations, which have adopted rules governing members in the exchange of checks. Clearinghouse associations often extend their check-exchange arrangements to other nearby cities and towns. In most banks, clearings will be found in the department responsible for processing checks.

Proof and transit were once two separate functions in a bank: the proving of work (proof) and the sending of out-of-town cash items (transit) for collection. Most banks have now combined these two functions. Proof and transit may be performed by any combination of tellers or proof clerks, a separate proof and transit department, a check-processing department, an outclearing department, or some other department that is characteristic of the area of the country where the bank operates. The functions may be centralized or decentralized, manual or automated, depending on the size of the bank and the volume of transactions. The volume of clearings may be so great that the bank's proof operations are conducted after time deadlines for transaction posting or courier delivery. In these cases, daily clearings customarily are determined as of a specific cutoff time. Checks processed to that time are carried in one day's totals, and checks processed after that time are carried in the following day's totals. However, no matter who performs the function or how large the bank, the objectives of a proof and transit system are the same:

- to forward items for collection so that funds are available as soon as possible
- to distribute all incoming checks and deposits to their destinations
- to establish whether deposit totals balance with the totals shown on deposit tickets
- to prove the totals of general ledger entries and other transactions
- to collect data for computing the individual customer's service charges and determining the availability of the customer's funds
- to accomplish the assigned functions at the lowest possible cost

CASH ITEMS

Cash items are checks or other items in the process of collection that are payable in cash upon presentation. A separate control of all cash items is usually maintained on the bank's general ledger and, if applicable, on the international division general ledger. The ledger is supported by a subsidiary record of individual amounts and other pertinent data. Cash items and the related records are usually in the custody of one employee at each banking office.

In their normal daily operations, banks have an internal charge, on the general ledger, to total demand deposits not charged to individual accounts because of insufficient funds, computer misreads, or other problems. Commonly known as return items or rejected or unposted debits, these items may consist of checks received in the ordinary course of business, loan-payment debits, and other debit memos. In some banks, return items are separated by the bookkeepers and an entry is made reclassifying them to a separate asset account entitled ''bookkeepers' return items.'' Other banks do not use a separate asset account; instead, the bookkeepers include the items in a subsidiary control account in the individual demand deposit ledgers. In that case, the account would have a debit balance and would be credited when the bank processes items for posting or returns the checks to their source.

Since bookkeepers' return items are usually processed and posted to an individual account or returned to their source on the next business day, the balance of the bookkeepers' return items account should represent the total of only one day's returned items.

When data processing systems are used, the common practice is to post all properly encoded debit items, regardless of whether an overdraft is created. The resulting preliminary overdraft list, together with the items charged, is subsequently reviewed by bank employees, and unapproved items are reversed and separated as bookkeepers' return items. The total of the resulting final overdraft list becomes the final overdraft figure shown on the general ledger. The examination of overdrafts is discussed in ''Deposit Accounts,'' section 3000.1. The examination of international overdrafts is discussed in ''Due from Banks,'' ''Borrowed Funds,'' and ''International—Foreign Exchange,'' sections 2010.1, 3010.1, and 7100.1, respectively.

Several types of cash items should be considered ''cash items not in the process of collection'' and shown in an appropriate ''other assets'' account. Some examples are (1) items that are payable upon presentation but which the bank has elected to accumulate and periodically forward to the payor, such as Series EE bonds or food stamps; (2) items that are not immediately payable in cash upon presentation; and (3) items that were not paid when presented and require further collection effort.

In addition to those items carried in the separate ''cash items'' account on the general ledger, most banks will have several sources of internal float in which irregular cash items can be concealed. Such items include any memoranda slips; checks drawn on the bank; checks returned by other banks; checks of directors, officers, employees, and their interests; checks of affiliates; debits purporting to represent currency or coin shipments; notes, usually past due; and all aged and unusual items of any nature that might involve fictitious entries, manipulations, or uncollectible accounts.

CURRENCY TRANSACTIONS

The reporting of currency and foreign transactions as covered in 31 CFR 1010 requires financial institutions to maintain records that might be useful in criminal, tax, or regulatory investigations. The regulation also seeks to identify persons who attempt to avoid payment of taxes through transfers of cash to or from foreign accounts. The examination procedures for determining compliance with the regulation require the examiner to ascertain the quality of the bank's auditing procedures and operating standards relating to financial recordkeeping.[1] Examiners also determine the adequacy of written policies and bank training programs. The *Bank Secrecy Act/Anti-Money Laundering Examination Manual* is to be used in checking compliance and for reporting apparent violations in the reporting of currency and foreign transactions. Any violations noted should be listed with appropriate comments in the report of examination. Inadequate compliance could result in a cease-and-desist order to effect prompt compliance with the statute.

1. Section 208.63 of Regulation H establishes procedures to ensure that state member banks establish and maintain procedures reasonably designed to ensure and monitor compliance with the regulation.

1. To determine if the policies, practices, procedures, and internal controls regarding "cash accounts" are adequate.
2. To determine if bank officers and employees are operating in conformance with the established guidelines.
3. To determine the scope and adequacy of the audit function.
4. To determine compliance with laws and regulations.

5. To initiate corrective action when policies, practices, procedures, or internal controls are deficient or when violations of laws or regulations have been noted.

1. If selected for implementation, complete or update the cash accounts section of the internal control questionnaire.
2. Based on the evaluation of internal controls and the work performed by internal or external auditors, determine the scope of the examination.
3. Test for compliance with policies, practices, procedures and internal controls in conjunction with performing the remaining examination procedures. Also obtain a listing of any deficiencies noted in the latest review done by internal or external auditors from the examiner assigned to that area of examination, and determine if appropriate corrections have been made.
4. Scan the general ledger cash accounts for any unusual items or abnormal fluctuations. Investigate any such items and document any apparent noncompliance with policies, practices and procedures for later review with appropriate management personnel.
5. Obtain teller settlement sheet recap or similar document as of the examination date and agree to the general ledger. Scan for reasonableness and conformity to bank policy.
6. Obtain detailed listings of cash items, including any bank items which are carried in the general ledger under "other assets," agree listings to general ledger balances and scan for propriety and conformity to bank policy.
7. Test compliance with Regulation H (12 CFR 208) by—
   a. selecting teller and banking office cash-balance sheets and determining that balances are within currency limits established;
   b. selecting bait money and agreeing serial numbers to applicable records;
   c. reviewing documentation showing training sessions held since the preceding examination;
   d. performing any visual inspections deemed appropriate;
   e. analyzing the bank's system of security and protection against external crimes (Guidance for this analysis is provided in the internal control questionnaire in this section of the manual.); and
   f. determining, through discreet corroborative inquiry of responsible bank officials and review of documentation, whether a security program that equals or exceeds the standards prescribed by Regulation H (12 CFR 208.61(c)) is in effect and that the annual compliance report and any other reports requested by the Federal Reserve System have been filed.
8. Review compliance with recordkeeping requirements and currency and foreign transaction reports. (See 31 CFR 1010.)
9. Review tellers' over and short accounts for recurring patterns and any large or unusual items and follow up as considered necessary. Investigate differences centered in any one teller or banking office. Determine whether corrective action has been taken, if required.
10. Determine, by discreet corroborative inquiry of responsible bank officials and review of documentation, whether defalcations and/or mysterious disappearances of cash since the preceding examination have been properly reported pursuant to current requirements of the Board of Governors.
11. Review foreign-currency control ledgers and dollar book value equivalents for the following:
    a. accuracy of calculations and booking procedures
    b. unusual fluctuations
    c. concentrations
    d. unusual items
12. Review international division revaluation calculations and procedures.
13. Review the following items with appropriate management personnel (or prepare a memo to other examining personnel for their use in reviewing with management):
    a. internal-control exceptions and deficiencies in, or noncompliance with, written policies, practices and procedures
    b. uncorrected audit deficiencies
    c. violations of law
    d. inaccurate booking of U.S. dollar book value equivalents for foreign currencies
    e. inaccurate revaluation calculations and procedures performed by cash-account operations staff

14. Prepare comments on deficiencies orviolations of law noted above for inclusion in the examination report.
15. Update the workpapers with any information that will facilitate future examinations.

Review the bank's internal-control policies, practices, and procedures for cash accounts. The bank's system should be documented completely and concisely and should include, where appropriate, narrative descriptions, flow charts, copies of forms used, and other pertinent information. Items marked with an asterisk require substantiation by observation or testing.

CASH ON HAND

*1. Do all tellers, including relief tellers, have sole access to their own cash supply, and are all spare keys kept under dual control?
*2. Do tellers have their own vault cubicle or controlled cash drawer in which to store their cash supply?
3. When a teller is leaving for vacation or for any other extended period of time, is that teller's total cash supply counted?
4. Is each teller's cash verified periodically on a surprise basis by an officer or other designated official (if so, is a record of such count retained)?
*5. Are cash drawers or teller cages provided with locking devices to protect the cash during periods of the teller's absence?
6. Is a specified limit in effect for each teller's cash?
*7. Is each teller's cash checked daily to an independent control from the proof or accounting control department?
8. Are teller differences cleared daily?
9. Is an individual, cumulative over and short record maintained for all persons handling cash, and is the record reviewed by management?
10. Does the teller prepare and sign a daily proof sheet detailing currency, coin, and cash items?
*11. Are large teller differences required to be reported to a responsible official for clearance?
12. Is there a policy against allowing teller "kitties"?
*13. Are teller transactions identified through use of a teller stamp?
*14. Are teller transfers made by tickets or blotter entries which are verified and initialed by both tellers?
15. Are maximum amounts established for tellers' cashing checks or allowing withdrawal from time deposit accounts without officer approval?
16. Does the currency at each location include a supply of bait money?
17. Are tellers provided with operational guidelines on check-cashing procedures and dollar limits?
18. Is a record maintained showing amounts and denominations of reserve cash?
*19. Is reserve cash under dual custody?
*20. Are currency shipments—
    a. prepared and sent under dual control and
    b. received and counted under dual control?
*21. If the bank uses teller machines—
    a. is the master key controlled by someone independent of the teller function,
    b. is the daily proof performed by someone other than the teller, and
    c. are keys removed by the teller during any absence?
*22. Is dual control maintained over mail deposits?
23. Is the night depository box under a dual lock system?
24. Is the withdrawal of night deposits made under dual control?
25. Regarding night depository transactions—
    a. are written contracts in effect;
    b. are customers provided with lockable bags; and
    c. are the following procedures completed with two employees present:
        • opening of the bags
        • initial recording of bag numbers, envelope numbers, and depositors' names in the register
        • counting and verification of the contents
*26. Regarding vault control—
    a. is a register maintained which is signed by the individuals opening and closing the vault;
    b. are time-clock settings checked by a second officer;
    c. is the vault under dual control; and
    d. are combinations changed periodically and every time there is a change in custodianship?

27. Are tellers prohibited from processing their own checks?
*28. Are tellers required to clear all checks from their funds daily?
*29. Are tellers prevented from having access to accounting department records?
*30. Are teller duties restricted to teller operations?

CASH-DISPENSING MACHINES

*31. Is daily access to the automated teller machine (ATM) made under dual control?
*32. When maintenance is being performed on a machine, with or without cash in it, is a representative of the bank required to be in attendance?
*33. Are combinations and keys to the machines controlled (if so, indicate controls)?
34. Do the machines and the related system have built-in controls that—
    a. limit the amount of cash and number of times dispensed during a specified period (if so, indicate detail) and
    b. capture the card if the wrong PIN (personal identification number) is consecutively used?
35. Does the machine automatically shut down after it experiences recurring errors?
36. Is lighting around the machine provided?
37. Does the machine capture cards of other banks or invalid cards?
38. If the machine is operated "off line," does it have negative-file capability for present and future needs, which includes lists of lost, stolen, or other undesirable cards which should be captured?
39. Is use of an ATM by an individual customer in excess of that customer's past history indicated on MIS reports reviewed for suspicious activity by bank management (for example, three uses during past three days as compared with a history of one use per month)?
40. Have safeguards been implemented at the ATM to prevent, during use, the disclosure of a customer's PIN by others observing the PIN pad?
41. Are "fish-proof" receptacles provided for customers to dispose of printed receipts, rather than insecure trash cans, etc.?
42. Does a communication interruption between an ATM and the central processing unit trigger the alarm system?
43. Are alarm devices connected to all automated teller machines?
44. For on-line operations, are all messages to and from the central processing unit and the ATM protected from tapping, message insertion, modification of message or surveillance by message encryption (scrambling techniques)? (One recognized encryption formula is the National Bureau of Standards Algorithm.)
*45. Are PINs mailed separately from cards?
*46. Are bank personnel who have custody of cards prohibited from also having custody of PINs at any stage (issuance, verification, or reissuance)?
47. Are magnetic stripe cards encrypted (scrambled) using an adequate algorithm (formula) including a total message control?
48. Are encryption keys, i.e., scramble plugs, under dual control of personnel not associated with operations or card issuance?
*49. Are captured cards under dual control of persons not associated with bank operation card issuance or PIN issuance?
*50. Are blank plastics and magnetic stripe readers under dual control?
51. Are all cards issued with set expiration dates?
52. Are transaction journals provided that enable management to determine every transaction or attempted transaction at the ATM?

CASH ITEMS

*53. Are returned items handled by someone other than the teller who originated the transaction?
54. Does an officer or other designated individual review the disposition of all cash items over a specified dollar limit?
55. Is a daily report made of all cash items, and is it reviewed and initialed by the bank's operations officer or other designated individual?
56. Is there a policy requiring that all cash items uncollected for a period of 30 days be charged off?

57. Do the bank's present procedures forbid the holding of overdraft checks in the cash-item account?
58. Are all cash items reviewed at least monthly at an appropriate level of management?
*59. Are cash items recommended for charge-off reviewed and approved by the board of directors, a designated committee thereof, or an officer with no operational responsibilities?

PROOF AND TRANSIT

60. Are individuals working in the proof and transit department precluded from working in other departments of the bank?
61. Is the handling of cash letters such that—
    a. they are prepared and sent on a daily basis;
    b. they are photographed before they leave the bank;
    c. copy of proof or hand-run tape is properly identified and retained;
    d. records of cash letters sent to correspondent banks are maintained with identification of the subject bank, date, and amount; and
    e. remittances for cash letters are received by employees independent of those who send out the cash letters?
62. Are all entries to the general ledger either originated or approved by the proof department?
63. Are all entries prepared by the general ledger and/or customer accounts department reviewed by responsible supervisory personnel other than the person preparing the entry?
64. Are errors detected by the proof operator in proving deposits corrected by another employee or designated officer?
65. Are all postings to the general ledger and subsidiary ledgers supported by source documents?
66. Are returned items—
    *a. handled by an independent section of the department or delivered unopened to personnel not responsible for preparing cash letters or handling cash,
    b. reviewed periodically by responsible supervisory personnel to determine that items are being handled correctly by this section and are clearing on a timely basis,
    *c. scrutinized for employee items, and
    d. reviewed for large or repeat items?
67. Are holdover items—
    a. appropriately identified in the general ledger,
    *b. handled by an independent section of the department, and
    c. reviewed periodically by responsible supervisory personnel to determine that items are clearing on a timely basis?
68. Does the proof and transit department maintain a procedures manual describing the key operating procedures and functions within the department?
*69. Are items reported missing from cash letter promptly traced and a copy sent for credit?
*70. Is there a formal system to ensure that work distributed to proof machine operators is formally rotated?
71. Are proof machine operators prohibited from—
    a. filing checks or deposit slips or
    b. preparing deposit account statements?
72. Are proof machine operators instructed to report unusually large deposits or withdrawals to a responsible officer (if so, over what dollar amount $___________)?

REGULATION H (12 CFR 208)—COMPLIANCE QUESTIONNAIRE

73. Has a security officer been designated by the board of directors in accordance with Regulation H (12 CFR 208.61(b))?
74. Has a security program been developed and implemented in accordance with Regulation H (12 CFR 208.61(c))?
75. Does the bank have security devices that give a general level of protection and that are at least equivalent to the minimum requirements of Regulation H?
76. Has the installation, maintenance, and operation of security devices considered the operating environment of each office and the requirements of Regulation H (12 CFR 206.61(c))?
77. Does the security officer report at least annually to the bank's board of directors on the administration and effectiveness of

the security program in accordance with Regulation H (12 CFR 206.61(d))?

31 CFR 1010—COMPLIANCE QUESTIONNAIRE

78. Is the bank in compliance with the financial recordkeeping and reporting regulations?

INTERNATIONAL DIVISION

*79. Are foreign-currency control ledgers and dollar-book-value equivalents posted accurately?
*80. Is each foreign currency revalued at least monthly, and are profit and loss entries passed on to the appropriate income accounts?
*81. Are revaluation calculations, including the rates used, periodically reviewed for accuracy by someone other than the foreign-currency tellers?
*82. Does the internal auditor periodically review for accuracy revaluation calculations, including the verification of rates used and the resulting general ledger entries?

CONCLUSION

83. Is the foregoing information considered an adequate basis for evaluating internal control in that there are no significant deficiencies in areas not covered in this questionnaire that impair any controls? Explain negative answers briefly, and indicate any additional examination procedures deemed necessary.
84. Based on a composite evaluation as evidenced by answers to the foregoing questions, internal control is considered (adequate/inadequate). A separate evaluation should be made for each area, i.e., cash on hand, cash items, etc.

Banks maintain deposits in other banks to facilitate the transfer of funds. Those bank assets, known as "due from bank deposits" or "correspondent bank balances"[1] are a part of the primary, uninvested funds of every bank. A transfer of funds between banks may result from the collection of cash items and cash letters, the transfer and settlement of securities transactions, the transfer of participating loan funds, the purchase or sale of federal funds, and many other causes.

In addition to deposits kept at the Federal Reserve Bank and with correspondent banks, a bank may maintain interest-bearing time deposits with international banks. Those deposits are a form of investment, and relevant examination considerations are included in "Investment Securities and End-User Activities," section 2020.1, and "International—Due from Banks—Time," section 7070.1.

Banks also use other banks to provide certain services that can be performed more economically or efficiently by another facility because of its size or geographic location. These services include processing of cash letters, packaging loan agreements, performing EDP services, collecting out-of-area items, providing safekeeping for bank and customer securities, exchanging foreign currency, and providing financial advice in specialized loan areas. When the service is one way, the receiving bank usually maintains a minimum balance at the providing bank to compensate in full or in part for the services received.

DEPOSITS WITH OTHER DEPOSITORY INSTITUTIONS

Section 206.3 of Regulation F (12 CFR 206) requires FDIC-insured depository institutions to adopt written policies and procedures to address the risk arising from exposure to a correspondent, and to prevent excessive exposure to any individual correspondent. These policies and procedures should take into account the financial condition of a correspondent and the size, form, and maturity of the exposure. Section 206.4(a) of Regulation F stipulates that any FDIC-insured depository institution must limit its interday credit exposure to an individual correspondent that is not "adequately capitalized"[2] to 25 percent of the institution's total capital.[3] For a more detailed discussion of Regulation F, refer to sections 2015.1–.4 and SR-93-36 ("Examiner Guidelines for Regulation F—Interbank Liabilities").

BALANCES WITH FEDERAL RESERVE BANKS

All state member banks are required by Regulation D (12 CFR 204) to keep reserves equal to specified percentages of the deposits on their books. These reserves are maintained in the form of vault cash or deposits with the Federal Reserve Bank. The Federal Reserve Bank monitors the deposits of each bank to determine that reserves are kept at required levels. The reserves provide the Federal Reserve System with a means of controlling the nation's money supply. Changes in the level of required reserves affect the availability and cost of credit in the economy. The examiner must determine that the information supplied to the Federal Reserve Bank for computing reserves is accurate.

The Monetary Control Act of 1980 enables a nonmember financial institution to borrow from the Reserve Bank's discount window on the same terms and conditions as member banks. For member banks, loan transactions are usually effected through their reserve account. For nonmember banks, the Reserve Bank typically requires the institution to open a special account called a clearing account. The loan transactions are then processed through the clearing account. However, in some instances, the Reserve Bank may allow a nonmember institution to process discount loan transactions through the account of a member bank. In most of these isolated

1. Balances due from such institutions include all interest-bearing and non-interest-bearing balances, whether in the form of demand, savings, or time balances, including certificates of deposit, but excluding certificates of deposit held in trading accounts.

2. See section 206.5(a) of Regulation F for the capital ratios necessary for a correspondent bank to be considered adequately capitalized.

3. The Board may waive this requirement if the primary federal supervisor of the insured institution advises the Board that the institution is not reasonably able to obtain necessary services, including payment-related services and placement of funds, without incurring exposure to a correspondent in excess of the otherwise applicable limit.

cases, a transaction of a nonmember institution is being processed through the account of the bank with which the nonmember institution has a correspondent relationship.

Under the reserve account charge agreements used by most Federal Reserve Banks, the member bank's reserve account may be charged if the nonmember bank defaults on the loan processed through the member bank's account. Since member banks may not act as the guarantor of the debts of another, member banks may only legally enter into revocable reserve account charge agreements. Revocable agreements allow the member bank, at its option, to revoke the charge and thus avoid liability for the debt of the nonmember correspondent. In contrast, irrevocable charge agreements constitute a binding guarantee of the nonmember correspondent's debt and generally cannot be entered into by a member bank. Banks that enter into revocable charge agreements should establish written procedures to ensure their ability to make prudent, timely decisions.

DEPOSIT BROKERS

On the asset side of the balance sheet, examiners should review the activities of banks that place deposits through money brokers. These banks should have sufficient documentation to, among other things, verify the amounts and terms of individual deposits and the names of depository institutions in which the deposits are placed. Banks should also be able to demonstrate that they have exercised appropriate credit judgment with respect to each depository institution in which they have placed funds. Deficiencies in this area could constitute an unsafe or unsound banking practice. A more detailed discussion of brokered deposits is included in "Deposit Accounts," sections 3000.1–3000.3 of this manual.

DUE FROM FOREIGN BANKS

Due from foreign banks demand or nostro accounts are handled in the same manner as due from domestic bank accounts, except that the balances due are generally denominated in foreign currency.

A bank must be prepared to make and receive payments in foreign currencies to meet the needs of its international customers. This can be accomplished by maintaining accounts (nostro balances) with banks in foreign countries in whose currencies receipts and payments are made.

Nostro balances may be compared with an inventory of goods and must be supervised in the same manner. For example, payment to import goods manufactured in Switzerland to the United States can be made through a U.S. bank's Swiss franc account with another bank in Switzerland. Upon payment in Switzerland, the U.S. bank will credit its nostro account with the Swiss bank and charge its U.S. customer's dollar account for the appropriate amount in dollars. Conversely, exporting U.S. goods to Switzerland results in a debit to the U.S. bank's Swiss correspondent account. The first transaction results in an outflow of the U.S. bank's "inventory" of Swiss francs, while the second transaction results in an inflow of Swiss francs. The U.S. bank must maintain adequate balances in its nostro accounts to meet unexpected needs and to avoid overdrawing those accounts for which interest must be paid. However, the bank should not maintain excessive idle nostro balances that do not earn interest, causing a loss of income.

The U.S. bank also runs risks by being either long or short in a particular foreign currency or by maintaining undue gaps. Losses could result if that currency appreciates or depreciates significantly or if the bank must purchase or borrow the currency at a higher rate.

Excessive nostro overages and shortages can be avoided by entering into spot and forward exchange contracts to buy or sell such nostro inventories. Those contracts are discussed in "International—Foreign Exchange," section 7100.1. However, all foreign-currency transactions, except over-the-counter cash trades, are settled through nostro accounts. Therefore, the volume of activity in those accounts may be substantial, and the accounts must be properly controlled.

In addition, an account service known as a payable-through account is being marketed by U.S. banks, Edge corporations, and the U.S. branches and agencies of foreign banks to foreign banks that otherwise would not have the ability to offer their customers access to the U.S. banking system. This account service, referred to by other names such as pass-through accounts and pass-by accounts, involves a U.S. banking entity's opening of a deposit account for the foreign bank. Policies and procedures should be developed to guard against the possible improper or illegal use of payable-through account facilities by foreign banks and their customers. Examination procedures relating to this area are part of the *FFIEC Bank Secrecy Act/Anti-Money Laundering Examination Manual*.

1. To determine if the policies, practices, procedures, and internal controls regarding due from banks are adequate.
2. To determine if bank officers and employees are operating in conformance with the established guidelines.
3. To determine that all due from accounts are reasonably stated and represent funds on deposit with other banks.
4. To evaluate the credit quality of banks with whom demand accounts are maintained.
5. To determine the scope and adequacy of the audit coverage.
6. To determine compliance with laws, rulings, and regulations.
7. To initiate corrective action when policies, practices, procedures, or internal controls are deficient or when violations of law, rulings, or regulations have been noted.

1. If selected for implementation, complete or update the Due From Banks Internal Control Questionnaire.
2. Determine the scope of the examination, based on the evaluation of internal controls and the work performed by internal/external auditors.
3. Test for compliance with policies, practices, procedures and internal controls in conjunction with performing the remaining examination procedures. Also, obtain a listing of any deficiencies noted in the latest review done by internal/external auditors from the examiner assigned "Internal Control," and determine if corrections have been accomplished.
4. Scan the most recent bank-prepared reconcilements for any unusual items and determine that closing balances listed on reconcilements agree with the general ledger and with the balance shown on the cut-off statement if one has been obtained.
5. If the bank's policy for charge-off of old open items provides for exceptions in extenuating circumstances, review excepted items and determine if charge-off is appropriate.
6. If the bank has no policy for charge-off of old open items, review any items which are large or unusual or which have been outstanding for over two months, along with related correspondence, and determine if charge-off is appropriate.
7. Test the bank's calculation of its Federal Reserve requirement and determine that reports are accurate and complete by:
   a. Performing a limited review of a sample of line items if the bank has effective operating procedures and has an audit program covering the required reports.
   b. Performing a detailed review of all line items if the bank has not established operating procedures or does not have an audit program covering the required reports.
8. Confer with the examiner assigned to check for compliance with the laws and regulations relating to insider loans at correspondent banks and loans to insiders of correspondent banks (Regulation O and 12 USC 1972(2)) and either provide a list, or verify a bank supplied list, of correspondent banks. (This effort should be coordinated with the examiner assigned to "Deposit Accounts" to avoid duplication of work.)
9. Review the maximum deposit balance established for each due from bank account and determine if the maximum balance:
   a. Is established after consideration of compensating balance requirements resulting from commitments or credit lines made available to the bank or its holding company. Coordinate this effort with examiner assigned "Bank-Related Organizations."
   b. Appears to be related to loans of executive officers or directors or to loans which have been used to acquire stock control of the bank under examination.
      - If such due from accounts are detected, provide full details of the account to the examiner assigned to check for compliance with the law relating to loans to insiders of correspondent banks (12 USC 1972(2)).
10. Determine the existence of any concentrations of assets with other banks. Include correspondent accounts, time deposits and any federal funds sold in computation. For concentrations exceeding 25 percent of the bank's capital structure, forward the information to examiners assigned "Concentrations of Credit" for possible inclusion in the report of examination.

Note: Procedures 11 through 21 apply to due from foreign banks—demand (nostro accounts).

11. Obtain or prepare a trial balance (including local currency book values) of due from foreign banks—demand by bank customer and:
    a. Agree or reconcile balances to department controls and the general ledger.
    b. Review reconciling items for reasonableness.
12. Using the appropriate sampling technique, select demand account banks for examination.
13. Prepare credit line sheets to include:

a. Customer's aggregate due from banks—demand liability in foreign currency amount and local currency equivalent.
b. Amount of customer's line designated by the bank.
c. Frequency of recent overdrawn nostro accounts.

(Overdrawn nostro accounts as they relate to foreign exchange activities are discussed in the International—Foreign Exchange section. Also, the examiner assigned "Borrowed Funds" must obtain (or prepare) a listing of overdrawn nostro accounts for inclusion in the borrowing section of the report of examination.)

d. Past compliance with customer's line limitation as determined from review of liability ledger records.

14. Obtain from the examiner assigned "International—Loan Portfolio Management," schedules on the following, if they are applicable to the due from foreign banks—demand:
   a. Delinquencies.
   b. Miscellaneous loan debit and credit suspense accounts.
   c. Criticized shared national credits.
   d. Interagency Country Exposure Review Committee credits.
   e. Loans criticized during the previous examination.
   f. Information on directors, officers and their interests, as contained in statements required under Regulation O (12 CFR 215).
   g. Specific guidelines in the bank policy relating to due from banks—demand.
   h. Current listing of due from foreign banks—demand approved customer lines.
   i. Any useful information resulting from the review of the minutes of the loan and discount committee or any similar committee.
   j. Reports furnished to the board of directors.
15. Review the information received and perform the following for:
   a. Miscellaneous loan debit and credit suspense accounts:
      • Discuss with management any large or old items.
      • Perform additional procedures as deemed appropriate.
   b. Interagency Country Exposure Review Committee Credits:
      • Compare the schedule to the trial balance to determine which due from foreign banks—demand deposits are portions of Interagency Country Exposure Review Committee credits.
      • For each due from foreign bank—demand deposit so identified, transcribe appropriate information to line sheets and forward the information to the examiner assigned "International—Loan Portfolio Management."
   c. Loans criticized during the previous examination (due from foreign banks—demand portion):
      • Determine the disposition of the due from foreign banks—demand so criticized by transcribing:
         — Current balance and payment status, or
         — Date the deposit was paid and the source of repayment.
16. Transcribe or compare information from the above schedules to credit line sheets, where appropriate, and indicate any cancelled bank lines.
17. Prepare credit line cards for any due from foreign banks—demand not in the sample which, based on information derived from the above schedules, requires in-depth review.
18. Obtain liability and other information on common borrowers from examiners assigned to cash items, overdrafts and loan areas and together decide who will review the borrowing relationship. Pass or retain completed credit line cards.
19. Obtain credit files for all due from foreign banks—demand for whom credit line cards were prepared and complete credit line cards where appropriate. To analyze the loans, perform the procedures set forth in step 14 of the International—Due From Banks–Time section.
20. By reviewing appropriate bank records, determine that:
   a. Profit or losses resulting from revaluation adjustment on net open positions spot are passed properly to the respective due from foreign bank—demand (nostro) account (usually monthly).
   b. At the delivery of the "swap" forward contract, proper entries are made to the

respective due from foreign bank—demand (nostro) and swap adjustment accounts.

21. Determine compliance with laws, regulations and rulings pertaining to due from foreign banks—demand activities by performing the following for:
    a. Reporting of Foreign Exchange Activities:
        - Determine that Foreign Currency Forms FC-1, FC-2, FC-1a and FC-2a, as required, are submitted to the Department of the Treasury under the provisions of 31 CFR 128.
        - Check that copies of those forms are forwarded by each state member bank to the Federal Reserve at each filing time specified in 31 CFR 128.

    Note: Due from foreign banks—demand (nostro) deposits will be reviewed, discussed with appropriate bank officers, and prepared in suitable report form by the examiner assigned ''International—Due From Banks–Time'', if the bank maintains international due from banks—time and/or call money deposits.

22. Forward list of due from banks accounts to the examiner assigned to ''Investment Securities'' and to ''Loan Portfolio Management.''
23. Consult with the examiner assigned ''Asset/Liability Management'' and provide the following, if requested:
    a. A listing, by maturity and amount, of due from banks—time deposits.
    b. The amounts of due from banks—demand deposits that exceed the required reserve balance at the Federal Reserve Bank and that exceed the working balances at correspondent banks.
24. Discuss with appropriate officer(s) and prepare in suitable report form of:
    a. Cancelled due from foreign banks—demand deposit lines that are unpaid.
    b. Violations of laws, regulations and rulings.
    c. Internal control exceptions and deficiencies, or noncompliance with written policies, practices and procedures.
    d. Any items to be considered for charge-off.
    e. Uncorrected audit deficiencies.
    f. Due from foreign banks—demand deposits not supported by current and complete financial information.
    g. Due from foreign banks—demand deposits on which documentation is deficient.
    h. Concentrations.
    i. Criticized loans (portions applicable to due from foreign banks—demand deposits).
    j. Due from foreign banks—demand deposits which for any other reason are questionable as to quality and ultimate collection.
    k. Other matters regarding condition of the department.
25. Update the workpapers with any information that will facilitate future examinations.

Review the bank's internal controls, policies, practices and procedures for due from bank accounts. The bank's system should be documented in a complete and concise manner and should include, where appropriate, narrative descriptions, flowcharts, copies of forms used and other pertinent information. Items marked with an asterisk require substantiation by observation or testing.

POLICIES FOR DUE FROM BANK DOMESTIC AND FOREIGN—DEMAND ACCOUNTS

1. Has the board of directors, consistent with its duties and responsibilities, adopted written policies for due from bank accounts that:
   a. Provide for periodic review and approval of balances maintained in each such account?
   b. Indicate person(s) responsible for monitoring balances and the application of approved procedures?
   c. Establish levels of check-signing authority?
   d. Indicate officers responsible for approval of transfers between correspondent banks and procedures for documenting such approval?
   e. Indicate the supervisor responsible for regular review of reconciliations and reconciling items?
   f. Indicate that all entries to the accounts are to be approved by an officer or appropriate supervisor and that such approval will be documented?
   g. Establish time guidelines for charge-off of old open items?
2. Are the policies for due from bank accounts reviewed at least annually by the board or the board's designee to determine their adequacy in light of changing conditions?

BANK RECONCILEMENTS

3. Are bank reconcilements prepared promptly upon receipt of the statements?

*4. Are bank statements examined for any sign of alteration and are payments or paid drafts compared with such statements by the persons who prepare bank reconcilements (if so, skip question 5)?

*5. If the answer to question 4 is no, are bank statements and paid drafts or payments handled before reconcilement only by persons who do not also:
   a. Issue drafts or official checks and prepare, add or post the general or subsidiary ledgers?
   b. Handle cash and prepare, add or post the general ledger or subsidiary ledgers?

*6. Are bank reconcilements prepared by persons who do not also:
   a. Issue drafts or official checks?
   b. Handle cash?
   c. Prepare general ledger entries?

7. Concerning bank reconcilements:
   a. Are amounts of paid drafts or repayments compared or tested to entries on the ledgers?
   b. Are entries or paid drafts examined or reviewed for any unusual features?
   c. Whenever a delay occurs in the clearance of deposits in transit, outstanding drafts and other reconciling items, are such delays investigated?
   d. Is a record maintained after an item has cleared regarding the follow-up and reason for any delay?
   e. Are follow-up and necessary adjusting entries directed to the department originating or responsible for the entry for correction with subsequent review of the resulting entries by the person responsible for reconcilement?
   f. Is a permanent record of the account reconcilement maintained?
   g. Are records of the account reconcilements safeguarded against alteration?
   h. Are all reconciling items clearly described and dated?
   i. Are details of account reconcilement reviewed and approved by an officer or supervisory employee?
   j. Does the person performing reconcilements sign and date them?

k. Are reconcilement duties for foreign demand accounts rotated on a formal basis?

DRAFTS

8. Are procedures in effect for the handling of drafts so that:
   *a. All unissued drafts are maintained under dual control?
   b. All drafts are prenumbered?
   c. A printer's certificate is received with each supply of new prenumbered drafts?
   d. A separate series of drafts is used for each bank?
   e. Drafts are never issued payable to cash?
   f. Voided drafts are adequately cancelled to prevent possible reuse?
   *g. A record of issued and voided drafts is maintained?
   *h. Drafts outstanding for an unreasonable period of time (perhaps six months or more) are placed under special controls?
   i. All drafts are signed by an authorized employee?
   *j. The employees authorized to sign drafts are prohibited from doing so before a draft is completely filled out?
   *k. If a check-signing machine is used, controls are maintained to prevent its unauthorized use?

FOREIGN CASH LETTERS

9. Is the handling of foreign cash letters such that:
   a. They are prepared and sent on a daily basis?
   b. They are copied or photographed prior to leaving the bank?
   c. A copy of proof or hand run tape is properly identified and retained?
   d. Records of foreign cash letters sent to correspondent banks are maintained, identifying the subject bank, date and amount?

FOREIGN RETURN ITEMS

10. Are there procedures for the handling of return items so that:
    *a. They are delivered unopened and reviewed by someone who is not responsible for preparation of cash letters?
    b. All large unusual items or items on which an employee is listed as maker, payee or endorser are reported to an officer?
    c. Items reported missing from cash letters are promptly traced and a copy sent for credit?

FOREIGN EXCHANGE ACTIVITIES

*11. Are persons handling and reconciling due from foreign bank—demand accounts excluded from performing foreign exchange and position clerk functions?

*12. Is there a daily report of settlements made and other receipts and payments of foreign currency affecting the due from foreign bank—demand accounts?

*13. Is each due from foreign bank—-demand foreign currency ledger revalued monthly and are appropriate profit or loss entries passed to applicable subsidiary ledgers and the general ledger?

*14. Does an officer not preparing the calculations review revaluations of due from foreign bank—demand ledgers, including the verification of rates used and the resulting general ledger entries?

OTHER—FOREIGN

*15. Are separate dual currency general ledger or individual subsidiary accounts maintained for each due from foreign bank—demand account, indicating the foreign currency balance and a U.S. dollar (or local currency) equivalent balance?

16. Do the above ledger or individual subsidiary accounts clearly reflect entry and value dates?

17. Are the above ledger or individual subsidiary accounts balanced to the general ledger on a daily basis?

18. Does international division management receive a daily trial balance of due from

foreign bank—demand customer balances by foreign currency and U.S. dollar (or local currency) equivalents?

OTHER

19. Is a separate general ledger account or individual subsidiary account maintained for each due from bank account?
20. Are overdrafts of domestic and foreign due from bank accounts properly recorded on the bank's records and promptly reported to the responsible officer?
21. Are procedures for handling the Federal Reserve account established so that:
    a. The account is reconciled on a daily basis?
    b. Responsibility is assigned for assuring that the required reserve is maintained?
    c. Figures supplied to the Federal Reserve for use in computing the reserve requirement are reviewed to ensure they do not include asset items ineligible for meeting the reserve requirement, and that all liability items are properly classified as required by Regulation D and its interpretations?
22. Does the foregoing information constitute an adequate basis for evaluating internal control in that there are no significant deficiencies in areas not covered in this questionnaire that impair any controls? Explain negative answers briefly and indicate any additional examination procedures deemed necessary.
23. Based on a composite evaluation, as evidenced by answers to the foregoing questions, internal control is considered (adequate/inadequate).

INTRODUCTION

Deposits are funds that customers place with a bank, which the bank is obligated to repay on demand, after a specific period of time, or after expiration of some required notice period. Banks use deposits in a variety of ways, primarily to fund loans and investments. At most banks, deposits are the primary source of funding. Other sources of bank funding include loans from the Federal Home Loan Bank (FHLB) System, borrowing in the federal funds market, and discount window borrowing as well as subordinated debt.

The movement of deposits can have a significant effect on a bank's liquidity risk. For example, competition for funds with other banks could lead to deposit outflows. Furthermore, the need for most individuals and corporations to minimize idle funds could result in deposits moving to other higher-yielding markets. However, during times of bank stress, stable deposits can provide a bank with a reliable funding source and can mitigate liquidity risk.

Interest paid on deposits generally represents a significant expense to a bank, and therefore affects bank earnings. By offering interest rates significantly higher than local and national market levels, a bank can increase its interest-bearing deposits more quickly. However, this strategy can substantially increase a bank's funding costs. In addition, high-interest-rate deposits may attract customers that are highly rate sensitive that would require a bank to match market rates to retain the deposits. There are other operating costs associated with attracting and administering deposit accounts, such as hiring personnel, branch expansion, and advertising, which should be considered in a bank's deposit management program.

BANK MANAGEMENT OF DEPOSITS

A bank typically has an Asset Liability Committee (ALCO), which is responsible for managing market risk tolerances, establishing appropriate management information systems (MIS), reviewing and approving the liquidity and funds management policy, developing and maintaining a contingency funding plan, and reviewing immediate funding needs and sources. A major goal of an ALCO is to ensure that a bank has adequate liquidity while managing the bank's spread between interest income and interest expense.

In general, a bank's ALCO is responsible for developing and overseeing the bank's deposit management program. A deposit management program addresses the composition and volatility of the bank's deposit structure. An effective deposit management program includes

- regular reports detailing existing deposit types and levels;
- projections for asset and deposit growth;
- associated cost and interest rate scenarios;
- clearly defined marketing strategies to attract deposits;
- procedures to compare results against projections; and
- steps to revise the program as necessary.

Bank management should periodically review and make timely modifications to the deposit program that aligns with the bank's overall risk tolerance. When developing or modifying deposit management programs, bank management should generally consider

- the adequacy of current operations (staffing and systems);
- the location and number of bank branches relative to the bank's volume of business in a particular market;
- the degree of competition from other banks and nonbank financial institutions and their marketing programs to attract deposit customers; and
- the effects of the national economy and federal monetary and fiscal policies on the bank's service area.

The formality or complexity of a bank's deposit program depends on its activities and market composition. Bank management should closely monitor concentrations of deposits, particularly concentrations among customers who reside or conduct their business outside of the bank's normal service area. Such deposits may be the product of personal relationships or good customer service. However, large volumes of aggregate out-of-area deposits are sometimes attracted by less stringent lending criteria or significantly higher interest rates than those offered by competitors. Deposit growth that is due to liberal credit accommodations generally proves costly in terms of the credit risks taken relative to the benefits received from corresponding deposits, which may be less likely to remain at the bank (i.e., less stable). Deposit development and retention policies should recognize the limits imposed by prudent competition and the bank's service area.

DEPOSIT STRUCTURE AND VOLATILITY

The process of measuring liquidity risk should include robust methods for comprehensively projecting cash flows arising from assets, liabilities, and off-balance-sheet items over an appropriate time horizon.[1] In measuring a bank's overall liquidity risk, bank management should closely monitor the volume of deposits as well as the stability of the overall deposit structure. The volatility or stability of a bank's funding has a significant effect on how bank management should approach lending and investment activities. The stability of deposits is especially important in bank management's evaluation of available alternative sources of funds under adverse contingent liquidity scenarios.

Insured Deposits versus Uninsured Deposits

Deposit Insurance

One key factor in determining the stability of a bank's deposit structure is to assess the level of insured deposits versus uninsured deposits. The Federal Deposit Insurance Corporation (FDIC) protects depositors against the loss of their insured deposits in the event of a failure of an insured bank, savings bank, savings association, insured branch of a foreign bank, or other depository institution whose deposits are insured pursuant to the Federal Deposit Insurance Act (FDIA). The FDIC fully insures up to the standard maximum deposit insurance amount ($250,000, as of the effective date of this manual section) per depositor, per FDIC-insured bank, per legal ownership category. Information on FDIC insurance coverage for different deposit products is available on the FDIC public website.

One of the objectives of deposit insurance is to remove depositors' incentives to withdraw their deposits from their bank, which could result in a deposit run on a particular bank when questions about a bank's viability are raised. If a bank fails, insured depositors can be confident that they will have access to their insured deposits without interruption. As a result, insured deposits are generally fairly stable as these depositors do not have compelling reasons to withdraw their deposits from their bank, even if they expect other depositors to do so or if they believe their bank to be insolvent.

Uninsured Deposits

For most retail depositors, FDIC insurance fully insures the funds held in their deposit accounts. However, businesses and other organizations may hold deposits in excess of the standard maximum deposit insurance amount at a single bank, otherwise known as uninsured deposits. A bank that relies heavily on uninsured deposits to fund activities can encounter liquidity risks that can be very difficult to manage. Furthermore, large concentrations of uninsured deposits can exacerbate the potential for bank runs as depositors who are inadequately protected by FDIC insurance may consider moving their funds to another bank when they are concerned about the liquidity or solvency of their bank. In the modern banking environment, the technological advancements in banking afford customers the opportunity to move deposits from one bank to another bank with incredible speed. Once a bank run is underway, a bank has few options to stop the deposit outflow and correct any mismanagement of liquidity risk. If a bank run at one institution extends to bank runs at other institutions, the contagion effect can compromise overall financial stability.

In some cases, uninsured deposit relationships can represent a source of stable funding, provided the depositor has a longstanding relationship with the bank and the bank is in sound financial condition. However, such uninsured deposit relationships might become less stable if the bank experiences financial problems. As

1. SR-10-6, "Interagency Policy Statement on Funding and Liquidity Risk Management" (March 17, 2010). This SR letter was revised in August 2023 to attach an addendum reinforcing that depository institutions should maintain actionable contingency funding plans. See Addendum (August 1, 2023).

such, when conducting liquidity stress testing activities, a bank should consider and appropriately identify deposit accounts likely to be unstable in times of stress.

Core Deposits Versus Non-Core Deposits

Core deposits generally include stable, lower-cost funding sources that typically lag behind other funding sources in repricing during a period of rising interest rates. Core deposits are typically funds of local customers that also have a borrowing or other relationship with the bank. Several factors contribute to the stability of core deposits, such as the insured status of the account and the type of depositor (for example, retail, commercial, or municipal).

Core deposits are not defined by statute. Rather, the Uniform Bank Performance Report (UBPR) calculates core deposits as the sum of

1. All transaction accounts.
2. Money market deposit accounts (MMDAs).
3. Nontransaction other savings deposits (excluding MMDAs).
4. Fully insured time deposits (i.e., time deposits of $250,000 and less), less brokered deposits of $250,000 and less (i.e., fully insured brokered deposits).

The UBPR definition of core deposits represents an analytic starting point for assessing deposit volatility at banks. When analyzing the stability of deposit funding sources, UBPR accounts and ratios should be considered in light of the bank's balance sheet composition, risk profile, deposit stability trends, and other relevant and unique characteristics of the institution. In some instances, core deposit accounts may exhibit characteristics generally associated with more volatile funding sources and vice versa. For example, out-of-area certificates of deposit of $250,000 or less that are obtained from a listing service tend to be volatile even though this product would be considered a core deposit on the UBPR. From a supervisory perspective, brokered deposits generally are not considered core deposits or a stable funding source as they are generally highly rate-sensitive deposits and possess other wholesale deposit characteristics, such as high sensitivity to the credit rating of the bank.

Conversely, *noncore deposits* are generally viewed as less-stable funding sources, and include higher-cost, non-relationship deposits, such as internet deposits or deposits obtained through special-rate promotions. Such deposits are typically attractive to rate-sensitive customers who may not have significant loyalty to the bank. Extensive reliance on funding products of this type, especially those obtained from outside a bank's geographic market area, has the potential to weaken a bank's funding position. Furthermore, volatile noncore deposits can be sensitive to adverse publicity and reputational concerns about the bank.

Deposit volatility can be a warning signal of emerging problems at a bank. Below are additional characteristics that distinguish volatile (noncore) from nonvolatile (core) deposits:

- type of depositor (e.g., individual, commercial, or municipal)
- length and nature of the banking relationship (e.g., reliance on multiple services or products such as loans, bill pay, or direct deposit)
- depositor's geographic location relative to the bank's market area (however, technology enables customers to easily bank without consideration of geographic location)
- historical pricing (interest rate change) associated with deposit relationships
- changes in the average balance over time
- effort expended by the bank to retain relationships
- insured versus uninsured balances in the deposit accounts

Brokered and High-Rate Deposits

Historically, most banks have not relied on funds obtained through deposit brokers to supplement their traditional funding sources. The use of brokered deposits by sound, well-managed banks can play a legitimate role in the asset-liability management of a bank and enhance the efficiency of financial markets.

However, brokered and high-rate deposits have long been a supervisory concern as such deposits pose various risks to banks. Without proper monitoring and management, brokered and other highly rate-sensitive deposits may be unstable sources of funding for a bank. An overarching concern regarding the activities of deposit brokers is that the ready availability of large amounts of funds through the issuance of insured obligations undercuts market discipline. In addition, supervisors are concerned that such deposits can

- facilitate a bank's rapid growth in risky assets without adequate controls;
- be used by a bank to fund additional risky assets in an attempt to "grow out" of its problems, a strategy that ultimately could increase the losses to the FDIC's Deposit Insurance Fund if the bank were to fail;[2] and
- increase funding volatility because deposit brokers (on behalf of customers), or the customers themselves, are often drawn to high interest rates and are prone to leave the bank when they find a better rate, or they become aware of problems at the bank.

Definition of Deposit Broker

As defined in FDIC regulations, brokered deposits are funds a depository institution obtains, directly or indirectly, from or through the mediation or assistance of a deposit broker.[3] Brokered deposits include both those in which the entire beneficial interest in a given bank deposit account or instrument is held by a single depositor and those in which the deposit broker pools funds from more than one investor for deposit in a given bank deposit account. Section 29 of the FDIA (Section 29) and the FDIC's regulations define a *deposit broker* to mean

- any person engaged in the business of placing deposits of third parties with insured depository institutions,
- any person engaged in the business of facilitating the placement of deposits of third parties with insured depository institutions,
- any person engaged in the business of placing deposits with insured depository institutions for the purpose of selling those deposits or interests in those deposits to third parties, and
- an agent or a trustee who establishes a deposit account to facilitate a business arrangement with an insured depository institution to use the proceeds of the account to fund a prearranged loan.[4]

The term *deposit broker* does not include

- an insured depository institution, with respect to funds placed with that depository institution;
- an employee of an insured depository institution, with respect to funds placed with the employing depository institution;
- a trust department of an insured depository institution, if the trust or other fiduciary relationship in question has not been established for the primary purpose of placing funds with insured depository institutions;
- the trustee of a pension or other employee benefit plan, with respect to funds of the plan;
- a person acting as a plan administrator or an investment adviser in connection with a pension plan or other employee benefit plan provided that person is performing managerial functions with respect to the plan;
- the trustee of a testamentary account;
- the trustee of an irrevocable trust,[5] as long as the trust in question has not been established for the primary purpose of placing funds with insured depository institutions;
- a trustee or custodian of a pension or profit-sharing plan qualified under section 401(d) or 403(a) of the Internal Revenue Code of 1986 (26 U.S.C. 401(d), 503(a));
- an agent or a nominee whose primary purpose is not the placement of funds with depository institutions;[6]

2. In accordance with the safety-and-soundness standards, a bank's asset growth should be prudent, and its management must consider the source, volatility, and use of the funds generated to support asset growth. See 12 CFR 208 appendix D-1.

3. See 12 CFR 337.6(a)(2). Section 29 of the FDIA does not explicitly define the term "brokered deposit." Restrictions on brokered deposits are tied to the statutory definition of "deposit broker" that Congress adopted in 1989 as part of the legislative response to the bank and thrift crisis of the late 1980s, and the FDIC's regulations and interpretations of the term.

4. 12 U.S.C. 1831f(g)(1); 12 CFR 337.6(a)(5).

5. This exception does not apply to an agent or a trustee who establishes a deposit account to facilitate a business arrangement with an insured depository institution to use the proceeds of the account to fund a prearranged loan.

6. In January 2021, the FDIC issued a final rule on brokered deposits and interest rate restrictions (Final Rule). See 86 Fed Reg. 6742 (January 22, 2021). Notably, this rule narrows and clarifies the FDIC's prior interpretations of the "deposit broker" definition in its rules and broadens exclusions from the definition. The FDIC's Final Rule clarifies that the primary purpose exception applies when the primary purpose of the agent's or nominee's business relationship *with its customers* is not the placement of funds with insured depository institutions and designates certain business relationships as presumptively meeting the primary purpose exception with respect to a particular business line. The Final

- an insured depository institution acting as an intermediary or agent of a U.S. government department or agency for a government-sponsored minority or women-owned depository institution deposit program; or
- any person that receives/facilitates third-party funds and deposits them at a *single* insured depository institution.[7]

Brokered Deposit Limitations and Interest Rate Restrictions

To compensate for the high rates typically offered for brokered deposits, banks holding the deposits tend to seek assets that carry commensurately higher yields. These assets can often involve excessive credit risk or cause the bank to take on undue interest rate risk through a mismatch in the maturity of its assets versus its liabilities. As such, the acceptance of brokered deposits is subject to statutory and regulatory restrictions.

Section 29 includes certain restrictions on the use of brokered deposits to generally prohibit insured depository institutions that are not well capitalized from accepting funds obtained, directly or indirectly, by or through any deposit broker for deposit into one or more deposit accounts.[8] Adequately capitalized banks may only accept brokered deposits upon receiving a waiver from the FDIC, and banks that are undercapitalized may not accept them at all.[9] The definitions of well capitalized, adequately capitalized, and undercapitalized align with the prompt corrective action (PCA) statutes, as implemented by the Federal Reserve in subpart D to Regulation H.[10] For more information on the PCA capital categories, see this manual's section entitled, "Prompt Corrective Action."

Although Section 29 does not place restrictions on the rate of interest that well capitalized institutions can pay on deposits, the statute imposes different interest rate restrictions on different categories of insured depository institutions that are less than well capitalized. Section 29 prohibits such banks from paying rates on deposits that significantly exceed their normal market area or the national rate as established by the FDIC by regulation.[11] Statutory and regulatory deposit rate restrictions prevent a bank that is not well capitalized from circumventing the prohibition on brokered deposits by offering rates significantly above market in order to attract a large volume of deposits quickly. However, the statute imposes different interest rate restrictions on different categories of insured depository institutions that are adequately capitalized. Table 1 provides a high-level summary of the brokered deposit and interest rate restrictions in the FDIC's regulations.

Risk-Management Expectations for Brokered Deposits

On May 11, 2001, the Federal Reserve Board and the other federal banking agencies (the agencies) issued a Joint Agency Advisory on Brokered and Rate-Sensitive Deposits.[12] The advisory sets forth risk-management guidelines for brokered deposits. A bank's management is expected to implement risk-management systems that are commensurate in complexity with the bank's liquidity and funding risks. Effective risk-management systems incorporate the following principles:

- *Proper funds-management policies*. An effective policy should generally provide for forward planning, establish an appropriate cost structure, and set realistic limitations and business strategies. The policy should clearly convey the board's risk tolerance and should clearly explain who holds responsibility for funds-management decisions.
- *Adequate due diligence when assessing deposit brokers*. Bank management should implement adequate due diligence procedures before entering into any business relationship with a deposit broker. The agencies do not regulate deposit brokers.
- *Due diligence in assessing the potential risk to earnings and capital associated with brokered or other rate-sensitive deposits, and prudent strategies for their use*. Bankers should man-

Rule also allows insured depository institutions and third parties that wish to use the primary purpose exception but that do not meet one of the designated exceptions to apply for a primary purpose exception. Prior to the FDIC's Final Rule, the FDIC had taken a case-by-case approach to the primary purpose exception.

7. The FDIC's Final Rule clarified this exception and codified it at 12 CFR 337.6(a)(5)(ii), (iii).

8. 12 U.S.C. 1831f(a).

9. 12 U.S.C. 1831f(c).

10. 12 CFR 208.40–208.45. See this manual's section entitled, "Prompt Corrective Action."

Table 1. Brokered deposits and interest rate restrictions

PCA capital category of insured depository institution (IDI)	**Brokered deposit restrictions (12 CFR 337.6(b))**	**Interest rate restrictions (12 CFR 337.7(c))**
Well capitalized	None. An IDI may solicit and accept, renew, or roll over any brokered deposit without restriction by rules pertaining to brokered deposits.	None. An institution may pay interest without restriction by rules pertaining to brokered deposits.
Adequately capitalized	An IDI may not accept, renew, or roll over any brokered deposit unless it has applied for and been granted a waiver of this prohibition by the FDIC.	An IDI may not solicit deposits by offering a rate of interest that exceeds the applicable rate cap. Where an IDI has accepted brokered deposits pursuant to a waiver by the FDIC, the IDI may not pay an interest rate that, at the time such deposit is accepted, exceeds the applicable rate cap.[1]
Undercapitalized	An IDI may not accept, renew, or roll over any brokered deposit.	Not applicable.

1. For purposes of 12 CFR 337, the applicable rate cap is the national rate cap or, if the institution has provided the notice and evidence described in 12 CFR 337.7(d), the local market rate cap for deposits gathered in the institution's local market area. If an institution gathers deposits from more than one local area, it may seek to pay a rate of interest up to its local market rate cap for deposits gathered in each respective local market area.

age highly sensitive funding sources carefully, avoiding excessive reliance on funds that may be only temporarily available to the bank or which may require premium rates to retain.

- *Reasonable control structures to limit funding concentrations*. Deposit limit structures should consider typical behavioral patterns for depositors or investors and be designed to control excessive reliance on any significant source(s) or type of funding. This includes brokered funds and other rate-sensitive or credit-sensitive deposits obtained through the internet or other types of advertising.
- *MIS that clearly identifies non-relationship or higher-cost funding programs which should allow management to track performance, manage funding gaps, and monitor compliance with concentration and other risk limits*. Effective MIS includes a listing of funds obtained through each significant deposit program, rates paid on each instrument and an average per program, information on maturity of the instruments, and concentration or other limit monitoring and reporting. Management should also correctly report brokered deposits in the bank's Call Report.[13]
- *Contingency funding plans that address the risk that these deposits may not "roll over" and provide a reasonable alternative funding strategy*. Contingency funding plans should consider possible market reaction if the bank were to reduce its interest rates on rate-sensitive deposits. The potential for triggering legal limitations that restrict the bank's access to brokered deposits under PCA standards, and the effect that this would have on the bank's liability structure, should also be factored into the plan.

13. See the FFIEC Bank Call Report and Instructions for Consolidated Reports of Condition and Income, Schedule RC-E, Deposit Liabilities.

OTHER TYPES OF DEPOSITS AND DEPOSIT PROGRAMS

Reciprocal Deposits

Banks can participate in networks that effectively permit their customers to receive full FDIC insurance while placing deposit balances of more than $250,000 in a single account at the same bank. The FDIA and the FDIC's regulations define "reciprocal deposits" as "deposits received by an agent institution through a deposit placement network with the same maturity (if any) and in the same aggregate amount as covered deposits placed by the agent institution in other network member banks."[14] A bank that the FDIC considers an "agent" institution is allowed to report a certain amount of reciprocal deposits as non-brokered deposits. Any one of the following three situations allows a bank to report reciprocal deposits as non-brokered deposits:

1. The bank has a composite rating that is satisfactory or better and is well capitalized.
2. The bank has a waiver from the FDIC.
3. The bank has a total amount of reciprocal deposits that does not exceed the average total of reciprocal deposits the bank held on the last day of the four quarters preceding the calendar quarter the institution was found to be in less than satisfactory condition or less than well capitalized. This is referred to as the "special cap."

The Call Report provides more information on reporting reciprocal deposits as well as definitions for "covered deposits," "deposit placement networks," and "network member banks." There are several risks associated with reciprocal deposits as a funding source, including, among other things:

- If a bank inappropriately reports reciprocal deposits as non-brokered deposits when they should be categorized as brokered deposits (e.g., because they exceed the statutory limit), the bank's contingency funding plan may not accurately represent how potential brokered deposit restrictions can affect the bank in a stress scenario.
- Depending on the relationship that depositors have with their relationship banks, reciprocal deposits may still have volatile qualities similar to brokered deposits and could expose a bank to heightened funding risks in a stress scenario.

Banks should understand the relationships tied to reciprocal deposits to assess their stability. Furthermore, contingency funding plans should appropriately consider how reciprocal deposits might behave in various situations.

14. 12 U.S.C. 1831f(i)(2)(E); 12 CFR 337.6(e)(2)(v). For more information on an "agent institution" see 12 U.S.C. 1831f(i)(2).

Treasury Tax and Loan Accounts

Treasury Tax and Loan accounts (TT&L accounts) are maintained at banks by the U.S. Treasury to facilitate payments of federal withholding taxes. Banks may select either the "remittance-option" or the "note-option" method of forwarding deposited funds to the U.S. Treasury.

- In the remittance option:
  - — The bank remits the TT&L account deposits to the Federal Reserve Bank the next business day after deposit.
  - — The remittance portion is not interest-bearing.
- In the note option:
  - — The bank retains the TT&L deposits.
  - — The bank debits the TT&L remittance account for the amount of the previous day's deposit and simultaneously credits the note-option account.
  - — Note-option accounts are interest-bearing and can grow to a substantial size.

TT&L funds are considered purchased funds, evidenced by an interest-bearing, variable-rate, open-ended, secured note callable on demand by Treasury. Pursuant to 31 CFR 203.24, the TT&L balance requires pledged collateral, usually from the bank's investment portfolio. Because they are secured, TT&L balances reduce standby liquidity from investments, and because they are callable, TT&L balances are considered to be volatile and they must be carefully monitored. However, in most banks, TT&L deposits constitute only a small portion of total liabilities.

Bank-Controlled Deposit Accounts

Bank-controlled deposit accounts, such as suspense, official checks, cash-collateral, dealer reserves, and undisbursed loan proceeds, are used to perform many necessary banking functions. However, the absence of sound administrative policies and adequate internal controls can cause significant loss to a bank.

A bank's deposit suspense account is used to process unidentified, unposted, or rejected items. Characteristically, items posted to such accounts clear in one business day. The length of time an item remains in control accounts often reflects on a bank's operational efficiency. This deposit type has a higher risk potential because the transactions are incomplete and require manual processing to be completed. As a result of the need for manual intervention and the exception nature of these transactions, the possibility exists that these funds may be misappropriated.

Official checks, a type of demand deposit, include bank checks, cashier's checks, certified checks, and money orders. Official checks reflect a bank's promise to pay a specified sum upon presentation of these official bank check. Because accounts are controlled and reconciled by bank personnel, it is important that appropriate internal controls are in place to ensure that account reconcilement is segregated from bank functions that originate these types of checks. Operational inefficiencies, such as unrecorded checks that have been issued, can result in a significant understatement of a bank's liabilities. Misuse or theft of official checks may result in substantial losses to a bank.

Cash-collateral, dealer differential or reserve, undisbursed loan proceeds, and various loan escrow accounts are also sources of potential losses to a bank. The risk lies in management inefficiency or misuse of these accounts resulting in the account being overdrawn or account funds being diverted for other purposes, such as the payment of principal or interest on bank loans. Funds deposited to these accounts should only be used for their stated purposes.

A bank should implement appropriate policies and processes to properly administer and control such accounts. Effective policies establish

- acceptable purposes and uses;
- appropriate entries; and
- limits on the length of time an item may remain unrecorded, unposted, or outstanding.

An effective deposit program provides for internal controls that

- limit employee access to bank-controlled accounts;
- determine the responsibility for frequency of reconcilement of an account;
- discourage improper posting of items; and
- provide for periodic internal review of account activity.

Employee Deposit Accounts

Employee deposit accounts are a potential source of irregularities and potential malfeasance. As a result, a bank should implement processes that segregate or specially encode employee accounts and should conduct periodic internal reviews of such accounts.

Payable-Through Accounts

A payable-through account is an accommodation offered to a correspondent bank or other customer by a U.S. banking organization whereby drafts drawn against client subaccounts at the correspondent bank are paid upon presentation by the U.S. banking institution. The subaccount holders of the payable-through bank are generally non–U.S. residents or owners of businesses located outside of the United States. Usually, the contract between the U.S. banking organization and the payable-through bank purports to create a contractual relationship solely between the two parties to the contract. Under the contract, the payable-through bank is responsible for screening subaccount holders and maintaining adequate records with respect to such holders.

Public Funds

Public funds generally represent deposits of the U.S. government as well as state and political subdivisions, and typically require collateral in the form of securities to be pledged against them. A bank with a high reliance on public funds as a percentage of total deposits can cause potential liquidity concerns. Another factor that can cause potential liquidity concerns relates to the volatile nature of public fund deposits. This volatility occurs because the volume of public funds normally fluctuates on a seasonal basis due to timing differences between tax collections and expenditures. A bank's ability to attract public funds is typically based upon the government entity's assessment of the following key points:

1. The safety and soundness of the institution with which the funds have been placed.
2. The yield on the funds being deposited.
3. Whether the bank can provide or arrange the best banking service at the least cost to the government entity.

Additionally, a government entity also considers whether a bank can offer competitive interest rates and provide collection, financial advisory, underwriting, and data processing services at competitive costs. Public funds deposits acquired through political influence should be regarded as particularly volatile.

A bank's failure to identify, measure, control, and monitor the risks associated with concentrations of public funds deposits and to monitor compliance with collateral protection requirements may raise supervisory concerns about a bank's liquidity risk. Collateral protection requirements become particularly relevant as a bank's condition changes or deteriorates. Asset quality deterioration or financial underperformance could preclude a problem bank from acquiring or retaining public funds. Individual states can have heightened collateral protection requirements for public funds on deposit in problem banks. If a bank is unable to meet the requirements, the bank will be required to close the deposit account and return the funds to the depositor.

Zero-Balance Accounts

Zero-balance accounts (ZBAs) are demand deposit accounts used by a bank's corporate customers through which checks or drafts are received for either deposit or payment. The total amount received on any particular day is offset by a corresponding debit or credit to the account before the close of business to maintain the balance at or near zero. ZBAs enable a corporate treasurer to effectively monitor cash receipts and disbursements. For example, as checks arrive for payment, they are charged to a ZBA with the understanding that the corporate customers will deposit funds into the account to cover the checks before the end of the banking day.

The absence of prudent safeguards and a lack of full knowledge of the creditworthiness of the depositor may expose the bank to large, unwarranted, and unnecessary risks. Moreover, the magnitude of unsecured credit risk may exceed prudent limits.

Overdraft Protection Programs

The size, frequency, and duration of deposit-account overdrafts are matters that should be governed by bank policy and controlled by adequate internal controls, practices, and procedures. Overdraft authority should be approved in the same manner as lending authority and should never exceed an employee's lending authority. Systems for monitoring and reporting overdrafts should emphasize a secondary level of administrative control that is distinct from other lending functions so account officers who are less than objective do not allow influential customers to exploit their overdraft privileges. Overdrafts outstanding for more than 60 days, lacking mitigating circumstances, should be considered for charge-off. See SR-05-3/CA-05-2, "Interagency Guidance on Overdraft Protection Programs" (February 23, 2005) and this manual's section entitled, "Consumer Credit."

Deposit Sweep Programs or Master-Note Arrangements

Deposit sweep programs or master-note arrangements (sweep programs) use an agreement with a bank's deposit customers (typically corporate accounts) that permits these customers to reinvest amounts in their deposit accounts above a designated level in overnight obligations of the parent bank holding company (BHC), another affiliate of the bank, or a third party. These obligations include instruments, such as commercial paper, program notes, and master-note agreements.

Sweep programs can be implemented on a bank level or on a parent BHC level. On a bank level, these sweep programs exist primarily to facilitate the cash-management needs of bank customers, thereby retaining customers who might otherwise move their account to an entity offering higher yields. On a BHC level, the sweep programs are maintained with customers at the bank level, and the funds are up-streamed to the parent as part of the BHC's funding strategy.

Banking organizations with sweep programs should have adequate policies, procedures, and internal controls in place to ensure that the activity is conducted in a manner consistent with safe-and-sound banking principles and in accordance with all banking laws and regulations. Bank policies and procedures should ensure that the bank provides deposit customers participating in a sweep program with proper disclosures and information.

For more information on sweep programs, see SR-90-31, "Bank Holding Company Funding from Sweep Accounts" as well as section 2080.6 of the *Bank Holding Company Supervision Manual*.

COMPLIANCE CONSIDERATIONS ASSOCIATED WITH DEPOSITS

Abandoned-Property Law and Dormant Accounts

A dormant account is one in which customer-originated activity has not occurred for a predetermined period of time. Because of this inactivity, dormant accounts are frequently the target of malfeasance and should be carefully controlled by a bank. State abandoned-property laws generally are called escheat laws. Although escheat laws vary from state to state, these state laws normally require a bank to remit the funds in a deposit account to the state treasurer when

- the deposit account has been dormant for a certain number of years, and
- the owner of the account cannot be located.

Service charges on dormant accounts should not be excessive and generally should reflect the cost of servicing the accounts. A bank's board of directors (or a committee appointed by the board) should periodically review bank policies that address service charges on dormant accounts. Because of the risks associated with dormant accounts, bank management should implement policies and control procedures, addressing

- the types of deposit categories that could contain dormant accounts, including demand, savings, and official checks;
- the length of time without customer-originated activity that qualifies an account to be identified as dormant;
- the controls exercised over the accounts and their signature cards, that is, prohibiting release of funds by a single bank employee; and
- the follow-up by the bank when ordinary bank mailings, such as account statements and advertising flyers, are returned to the bank because of changed addresses or other reasons for failure to deliver.

Reserve Requirements (Regulation D)

Section 19 of the Federal Reserve Act (FRA) requires the Board to impose reserve requirements on certain deposits and other liabilities of depository institutions within limits specified in the FRA.[15] "Depository institutions" include banks, savings associations, savings banks, and credit unions as well as institutions that are federally insured and those that are eligible to apply for federal deposit insurance. Regulation D implements the reserve requirements of section 19 of the FRA, sets forth related reporting requirements, and authorizes the payment of interest on balances maintained by eligible institutions in accounts at Federal Reserve Banks.[16]

In March 2020, the Board reduced all reserve requirements to zero percent. Accordingly, depository institutions are not required to satisfy reserve requirements. Regulation D also sets forth definitions of certain types of deposits that must be reported by depository institutions and identifies the obligations of institutions to file reports of deposits. In addition, Regulation D specifies the rate of interest that is paid on balances of eligible institutions in accounts at Federal Reserve Banks. For more information, see the Regulation D Compliance Guide to Small Entities.

15. 12 U.S.C. 461.
16. 12 CFR 204. Regulation D also implements section 7 of the International Banking Act of 1978 (12 U.S.C. 3105), which imposes reserve requirements on certain U.S. branches and agencies of foreign banks to the same extent as depository institutions.

Bank Secrecy Act (Regulation H)

The Bank Secrecy Act (BSA) establishes reporting requirements for banks' deposit activity. For example, a bank must electronically file a Currency Transaction Report (CTR) for certain transactions in currency, which include deposits, withdrawals, exchanges of currency, or other payments or transfers. The BSA is implemented by the Treasury Department's Financial Recordkeeping and Reporting of Currency and Foreign Transactions Regulation. For further information, see

- The Board's Regulation H (12 CFR 208.63);
- This manual's section entitled, "Regulation H: Bank Secrecy Act and Anti-Money-Laundering";
- The *FFIEC Bank Secrecy Act Examination Manual*; and
- The Financial Crimes Enforcement Network (FinCEN)'s BSA regulations at 31 CFR Chapter X.

Banks should be aware that there are varying degrees of risk associated with the treatment of accounts for foreign governments, foreign embassies, and foreign political figures. Further guidance on this topic can be found in

- SR-04-10, "Banking Accounts for Foreign Governments, Embassies, and Political Figures" (June 16, 2004); and
- SR-11-6, "Guidance on Accepting Accounts from Foreign Embassies, Consulates and Missions (foreign missions)" (March 24, 2011).

These guidance issuances explain that banking organizations should take appropriate steps to manage such risks consistent with sound practices and applicable anti-money-laundering laws and regulations. In particular, SR-11-6 clarifies information specific to banking organizations providing account services to foreign embassies, consulates and missions in a manner that fulfills the banking service needs of foreign governments while complying with the provisions of the BSA. As is the case with all accounts, a bank should demonstrate the capacity to conduct appropriate risk assessments and implement the requisite controls and oversight systems to effectively manage varying degrees of risks in financial relationships with foreign missions.

Overdrafts (Regulation O)

Overdrafts paid by a bank to its insiders are subject to two sets of requirements in the Board's Regulation O.[17] First, an overdraft is a type of "extension of credit" for purposes of the Board's Regulation O and thus is subject to the quantitative and qualitative requirements in that rule, including that large overdrafts must be approved in advance by a bank's board of directors.[18] Second, Regulation O prohibits a bank's payment of an overdraft for an executive officer or director.[19] However, overdrafts that meet certain criteria are not subject to these restrictions.[20]

Availability of Funds and Collection of Checks (Regulation CC)

Regulation CC Overview

Regulation CC (12 CFR 229), as amended, implements two laws—the Expedited Funds Availability Act (EFA Act) and the Check Clearing for the 21st Century Act (Check 21). The regulation requires banks to make funds deposited into transaction accounts available according to specified time schedules and to disclose funds availability policies to customers. The regulation also establishes rules designed to speed the collection and return of checks and electronic checks and describes requirements when a bank creates or receives substitute checks, including requirements related to consumer disclosures and expedited recredit procedures.

For more information on Regulation CC, see

- Compliance with Regulation CC: A Guide for Financial Institutions;

17. See generally 12 CFR 215. An "insider" is a director, executive officer, principal shareholder, or related interest of such persons. See also 12 CFR 215.2(h)

18. Most requirements for extensions of credit are set forth in 12 CFR 215.4. The prior approval requirement is set forth in 12 CFR 215.4(b).

19. See 12 CFR 215.4(e). The prohibition against overdrafts does not apply to overdrafts paid to a related interest of an executive officer or director.

20. Certain overdrafts are excepted from the definition of "extension of credit." See 12 CFR 215.3(b)(2) and (6). A similar but not identical set of overdrafts are not subject to the prohibition on overdrafts to executive officers and directors. See 12 CFR 215.4(e)(1)(i)–(ii) and (e)(2).

- The Federal Reserve's *Consumer Compliance Handbook*; and
- CA-18-8, "Revised Interagency Examination Procedures for Regulation CC" (October 17, 2018).

Check Kiting

Check kiting occurs when

- a depositor with accounts at two or more banks draws checks against the uncollected balance at one bank to take advantage of the float—that is, the time required for a bank to collect funds from the paying bank; and
- the depositor initiates the transaction with the knowledge that the depositor has insufficient funds to cover the amount of the checks drawn on all the depositor's accounts.

The key to this deceptive practice, a prevalent type of check fraud, is the ability to draw against uncollected funds. However, drawing against uncollected funds in and of itself does not necessarily indicate kiting. Kiting only occurs when the depositor's aggregate amount of drawings exceeds the sum of the collected balances in all the depositor's accounts. Since drawing against uncollected funds is the initial step in the kiting process, management should closely monitor this type of deposit activity and maintain internal controls to mitigate the potential loss. Therefore, management should promptly investigate unusual or unauthorized activity since the last bank to recognize check kiting and pay on the uncollected funds suffers the loss.

Regulation CC provides for exceptions that allow banks to exceed the maximum hold periods specified in the availability schedule. The exceptions are considered "safeguards" because they offer institutions a means of reducing risk based on the size of the deposit, the depositor's past performance, the absence of a record on the depositor's past performance, or a belief that the deposit may not be collectible. One exception includes cases in which the bank has reasonable cause to believe the check being deposited is uncollectible. The reasonable-cause exception may also be invoked in cases in which the depositary bank believes that the depositor may be engaged in check kiting.

Delayed Disbursement Practices

Regulation CC stipulates time frames for funds availability and return of items. However, delayed disbursement practices (also known as remote disbursement practices) are used by a bank to address certain risks, especially concerning cashier's checks, which have next-day availability of funds. Delayed disbursement is a common cash management practice that consists of arrangements designed to delay the collection and final settlement of checks drawn on institutions located substantial distances from the payee.

Delayed disbursement arrangements could give rise to credit risks:

1. Delayed disbursement arrangements often increase the collection time for checks.
2. Payment against uncollected funds could be a method of extending unsecured credit to a depositor.
   a. absent of proper and complete documentation regarding the creditworthiness of the depositor, paying items against uncollected funds could be considered an unsafe or unsound banking practice.
3. Furthermore, payment against uncollected funds, even if properly documented, might exceed the bank's legal lending limit for loans to one customer.

SUPERVISORY CONSIDERATIONS

SR-96-38, "Uniform Financial Institutions Rating System" (December 27, 1996), provides guidance on assigning ratings for depository institutions, which includes the liquidity position. In evaluating the adequacy of a depository institution's liquidity position, examiners should consider the current level and prospective sources of liquidity compared to funding needs, as well as the adequacy of funds management practices relative to the institution's size, complexity, and risk profile. Among other factors, examiners' assessment of liquidity should also consider

- the degree of reliance on short-term, volatile sources of funds, including borrowings and brokered deposits, to fund longer term assets; and
- the trend and stability of deposits.

In analyzing the deposit structure, information gathered by the various examination procedures should be sufficient to allow the examiner to evaluate the composition of both volatile noncore deposits and core deposits. To guide the assessment of a bank's deposit structure and deposit volatility, examiners should reference the "Liquidity" Examination Documentation (ED) module. In general, examiners should

- assess the ability of bank management to identify, measure, and monitor deposit volatility;
- determine whether management considers the stability of deposit accounts and significant customer relationships and reflects them accordingly in the bank's liquidity monitoring and reporting systems;
- determine whether the bank's liquidity stress scenarios are conducted across multiple time horizons, use reasonable modeling assumptions under various stress scenarios, and are commensurate with the bank's complexity and level of risk exposure that consider (among other things) availability of liquidity, given potential haircuts on borrowings, FHLB restrictions, deposit runoff;
- review the various types of deposit accounts that the bank uses for its funding base;
- determine whether the bank complies with statutes and regulations that apply to deposit accounts; and
- analyze the present and potential effect deposit accounts have on the bank's earnings by reviewing
  - — an estimated change in interest expense resulting from a change in interest rates on deposit accounts or a shift in funds from one type of account to another;
  - — service-charge income;
  - — projected operating costs;
  - — changes in required reserves; and
  - — promotional and advertising costs.

Given the potential risks involved in using brokered deposits, examiners should review banks' management of brokered or other rate-sensitive deposits. Examiners should not wait for PCA provisions to be triggered or the viability of the bank to come into question, before raising relevant safety-and-soundness issues regarding the use of these funding sources. Examiners should refer to the "Brokered and High-Rate Deposits" ED module for further analysis of material exposure to brokered deposits and less stable or rate-sensitive funding sources. Examination work on assessing brokered deposits should focus on the

- rate of growth and the credit quality of the loans or investments funded by brokered deposits;
- corresponding quality of loan files, documentation, and customer credit information;
- ability of bank management to adequately evaluate and administer these credits and manage the resulting asset growth;
- degree of interest rate risk involved in the funding activities and the existence of a possible mismatch in the maturity or rate sensitivity of assets and liabilities;
- composition and stability of the deposit sources and the role of brokered deposits in the bank's overall funding position, plan, and strategy; and
- effect of brokered deposits on the bank's financial condition and whether the use of brokered deposits constitutes an unsafe and unsound banking practice.

The following represent potential supervisory concerns that may indicate unsafe and unsound banking practices associated with brokered or other rate-sensitive funding sources:

- ineffective management or the absence of appropriate expertise;
- a newly chartered institution with few relationship deposits and an aggressive growth strategy;
- inadequate internal audit coverage;
- inadequate information systems or controls;
- identified or suspected fraud;
- high on- or off-balance-sheet growth rates;
- use of rate-sensitive funds not in keeping with the bank's strategy;
- inadequate consideration of risk, with management focus exclusively on interest rates;
- significant funding shifts from traditional funding sources;
- the absence of adequate policy limitations on these kinds of funding sources;
- high loan delinquency rate or deterioration in other asset-quality indicators;
- deterioration in the general financial condition of the institution; and
- other conditions or circumstances warranting the need for administrative action.

If examination staff determine that a bank's use of funding sources is not safe and sound, or that the risks are excessive or that they adversely affect the bank's condition, then the examiner or central point of contact should recommend to the Reserve Bank management that it consider taking immediate appropriate supervisory action.

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED modules for examination procedures on this topic:

- Liquidity
- Other Assets and Liabilities

INTRODUCTION

Bank premises and equipment includes land, buildings, furniture, fixtures, and other equipment, either owned or acquired by means of a capitalized lease, and any leasehold improvements. This section covers the fair valuation, general propriety, and legality of the bank's investment in premises and equipment. Other real estate owned and insurance coverage on fixed assets are discussed in other sections of this manual.

ACQUISITION AND VALUATION

Banks obtain premises and equipment in three primary ways:

- directly purchasing premises and equipment with cash outlays or by incurring debt, such as a mortgage;
- indirectly investing in a corporation that holds title to bank premises (the corporation may or may not be affiliated with the bank); or
- leasing bank premises and equipment from a third party

The bank's initial investment in premises and equipment should be booked at cost, which should be determined according to generally accepted accounting principles (GAAP). Nondepreciable assets such as land and art should remain on the books at cost, unless the asset incurs a material and permanent decline in value. Under such circumstances, the asset should be reduced to its fair value on the books, and a loss should be recorded.

The bank should depreciate assets that, over time, decline in economic value. These assets may be depreciated differently for book and tax purposes, which may give rise to deferred tax assets and deferred tax implications. GAAP allows depreciation using various methods. These include time-factor methods such as straight-line and accelerated methods. Accelerated methods include sum-of-the-years' digits depreciation, declining-balance depreciation, double-declining-balance depreciation, and other accelerated methods. The Internal Revenue Service allows accelerated depreciation methods for many assets to encourage businesses to make capital investments. While many banks follow these accelerated schedules for tax purposes, they may not depreciate these same assets as rapidly for book purposes.

Examiners should review internal controls for the bank's premises and equipment to ensure that these assets are properly safeguarded and appropriately recorded on the bank's books. Controls should be in place to inventory these assets and address the periodic review of their economic usefulness. Furniture, fixtures, and equipment whose economic usefulness have expired or that are otherwise damaged, impaired, or obsolete should be written down to value. Assets that cannot be located should be accounted for as a loss.

LEASES

Banks frequently lease their premises and equipment rather than own them. Leases should be accounted for appropriately. In February 2016, the Financial Accounting Standards Board (FASB) issued Accounting Standards Update (ASU) 2016-02, "Leases (Topic 842)," which supersedes Accounting Standards Codification (ASC) 840.[1] Entities that have not adopted ASU 2016-02, should continue to account for leases in accordance with ASC Topic 840, Leases. Entities that have adopted ASU 2016-02, should account for leases in accordance with ASC Topic 842, Leases.

The instructions, including the supplemental instructions, for the preparation of the Call Report detail the capitalization of leases and specify treatment for leases. The accounting requirements for leasing transactions are somewhat complex, and examiners who have ques-

1. ASU 2016-02 is effective for fiscal years beginning after December 15, 2018, including interim periods within those fiscal years, for banks that are public business entities (PBEs). For banks that are not PBEs, the guidance is effective for fiscal years beginning after December 15, 2019, and for interim periods within fiscal years beginning after December 31, 2020. For further information, see the Glossary entries in the Call Report Instructions for "public business entity" and "private company." Early adoption is permitted for all banks. An institution that early adopts these standards must apply them in their entirety. If an institution chooses to early adopt these standards for financial reporting purposes, the institution should implement them in its FFIEC Consolidated Reports of Condition and Income (Call Report) for the same quarter-end report date.

tions on the capitalization of leases should refer to the applicable ASC Topic for necessary detail.

Lease arrangements between a state member bank and its parent company or other affiliated entity should be reviewed in detail. Examiners should consider whether the lease arrangement is reasonable in relation to the cost of the asset, its current fair value, or similar lease arrangements in the current market. Transactions that appear to be self-serving or otherwise unreasonable to the bank should be criticized.

APPLICATION PROCEDURES FOR INVESTING IN BANK PREMISES

Section 24A of the Federal Reserve Act (12 USC 371d) requires state member banks to obtain Federal Reserve System approval to make additional investments that would cause the bank's total bank premises investments to exceed certain percentage-of-capital thresholds. Section 208.21 of Regulation H implements this requirement. Note that for purposes of this requirement, "bank premises investments" include a bank's direct investment in premises; its investment in the stock (or other ownership interests), bonds, debentures, or other such obligations of any company holding the premises of the bank; and loans made to (or on security of) any company holding the premises of the bank.

A bank that is well-capitalized (as defined in Regulation H) and has a CAMELS composite rating of 1 or 2 (as of its most recent examination) must obtain prior Federal Reserve System approval for a bank premises investment only if the investment would cause the bank's total bank premises investments (plus any debt incurred by any bank premises company affiliated with the bank) to exceed 150 percent of the bank's perpetual preferred stock (and related surplus) plus its common stock (and related surplus).

A bank not eligible for the 150 percent threshold must obtain prior Federal Reserve System approval for a bank premises investment only if the investment would cause the bank's total bank premises investments (plus any debt incurred by any bank premises company affiliated with the bank) to exceed the bank's perpetual preferred stock (and related surplus) plus its common stock (and related surplus).

To make a bank premises investment that exceeds the applicable threshold, a bank must notify the Federal Reserve of the proposed investment at least 15 days before making it, and must not have been advised by the Federal Reserve prior to the end of the 15-day period that the investment is subject to further review.

Approval is not required under Section 24A where a change in U.S. GAAP requires a state member bank to capitalize premises leased prior to the effective date of the new accounting standard. Thus, if prior to adoption of the new accounting standard a state member bank's investment in bank premises is less than capital stock, but that investment increases to an amount in excess of capital stock by virtue of adopting the new accounting standard, the bank need not seek the Board's approval under Section 24A. However, approval will be required under Section 24A for any bank premises investment in excess of capital stock made following adoption of ASU 2016-02.[2]

Section 208.6(b) of Regulation H provides factors that the Board will consider in approving domestic-branch applications. One of the factors the Board will analyze is whether the bank's investment in premises for the branch is consistent with section 208.21 of Regulation H. Reserve Banks, under their delegated authority, can also perform this analysis.

FUTURE USE AND CLASSIFICATION AS OREO

Member banks are encouraged to plan for their future premises needs. However, examiners should not arbitrarily classify real estate acquired for future use. The examiner needs to review the circumstances surrounding each individual case and determine if the period of time which the property has been held is reasonable relative to the intended use. Real estate acquired for future expansion is considered "other real estate owned" from the date when its use for banking is no longer contemplated. In addition, former banking premises are considered other real estate owned as of the date the bank relocated to new banking quarters.

2. See SR letter 19-7, "Statement on the Implications of the New Lease Accounting Standard on Regulation H," for more information.

TRANSACTIONS WITH INSIDERS

If a member bank contracts for or purchases any securities or other property from any of its directors, any firm its directors are members of, or any of its affiliates, the transaction is subject to the requirements of section 23B of the Federal Reserve Act and the Board's Regulation W. These sections require that transactions be made in the regular course of business on terms not less favorable to the bank than those offered to others. When the purchase is authorized by a majority of the board of directors who have no interest in the sale of such securities or property, the authority should be evidenced by affirmative vote or written assent. In addition, a member bank may sell securities or other property to any of its directors subject to the same stipulations.

EXAMINATION CONSIDERATIONS

As indicated earlier, the examiner responsible for the review of bank premises and equipment should assess the appropriateness of the bank's investment in this area and the overall impact of occupancy expense on the bank. Even if a bank's total investment in bank premises is within state or federal regulatory limits and all of its fixed assets are valued fairly, its total expenditures for or investment in premises and equipment may be inappropriate relative to the bank's earnings, capital, or the nature and volume of the its operations.

1. To determine whether the policies, practices, procedures, and internal controls regarding bank premises and equipment are adequate.
2. To determine whether bank officers and employees are operating in conformance with the bank's established guidelines.
3. To determine the scope and adequacy of the audit function.
4. To determine the adequacy and propriety of the bank's present and planned investment in bank premises.
5. To determine compliance with laws and regulations.
6. To initiate corrective action when policies, practices, procedures, or internal controls are deficient or when violations of laws or regulations have been noted.

1. Evaluate policies and procedures regarding premises and fixed assets. Satisfactory internal policies generally address items such as
   - requirements that the directorate approve all major purchases;
   - guidelines that discourage conflicts of interest or self-dealing with vendors, servicers, and insurers; and
   - guidelines for maintaining the level and nature of premises and fixed asset investments in compliance with applicable laws and regulations (e.g., state laws and Section 24A of the Federal Reserve Act).
2. Evaluate internal controls. Consider whether
   - individuals who post purchase and sale records are responsible for the custody or inventory of the property;
   - subsidiary ledgers of depreciation are balanced to the general ledger by persons who have sole custody of property;
   - periodic physical inventories confirm asset values;
   - adequate fire and extended insurance coverage is in force for bank premises, furniture, and equipment;
   - asset sales, including the recognition of gains and losses, are appropriately recognized; and
   - disclosures, including the existence of liens, are appropriate.
3. Determine whether investment in premises and equipment is reasonable and in compliance with state laws:
   - Review the current and prospective use of fixed assets in serving banking needs.
   - Review Uniform Bank Performance Report schedules to determine if investments in premises and fixed assets are reasonable in relation to total assets and consider the percentage of operating income absorbed by occupancy expense.
4. Determine whether audit procedures consider premises and equipment that are held by the bank, a subsidiary, or an affiliate realty corporation as part of sale and leaseback transactions or as lease-purchase contracts:
   - If significant, auditors should ensure capitalized lease designations are appropriate and in accordance with GAAP.
   - If part of sale-leaseback agreement, they should review for proper accounting treatment and accordance with GAAP.
5. Determine whether information and reporting regarding fixed assets to senior management and the board is adequate.
6. Determine whether real estate held for future expansion still qualifies as bank premises.
7. Reconcile premises and equipment subsidiary ledgers to the general ledger.

An internal control questionnaire (ICQ) helps an examiner assess a bank's internal controls for an area. ICQs typically address standard controls that provide day-to-day protection of bank assets and financial records. The examiner decides the extent to which it is necessary to complete or update ICQs during examination planning or after reviewing the findings and conducting preliminary examination activities. Items marked with an asterisk require substantiation by observation or testing.

CUSTODY OF PROPERTY

*1. Do the bank's procedures preclude persons who have access to property from having "sole custody of property," in that
   a. Its physical character or use would make any unauthorized disposal readily apparent?
   b. Inventory control methods sufficiently limit accessibility?

ACQUISITIONS, SALES, AND DISPOSALS

2. Is the addition, sale or disposal of property approved by the signature of an officer who does not also control the related disbursement or receipt of funds?
3. Is board of directors' approval required for all major additions, sales or disposals of property (if so, determine the amount that constitutes a major acquisition, sale or disposal)?

*4. Is the preparation, addition, and posting of property acquisitions, sales, and disposals records, if any, performed and/or adequately reviewed by persons who do not also have sole custody of property?

*5. Do persons who do not also have sole custody of property balance any property acquisition, sale, or disposal records, at least quarterly, to the appropriate general ledger?

6. Are the bank's procedures such that all acquisitions are reviewed to determine whether they represent replacements and that any replaced items are cleared from the accounts?
7. Do the bank's procedures provide for signed receipts for removal of equipment?

*8. Do the bank's policies cover procedures for selecting a seller, servicer, insurer, or purchaser of major assets (for example, through competitive bidding) to prevent any possibility of conflict of interest or self-dealing?

9. Do the review procedures provide for appraisal of an asset to determine the propriety of the proposed purchase or sales price?

DEPRECIATION

*10. Is the preparation, addition, and posting of periodic depreciation records performed and adequately reveiwed by persons who do not also have sole custody of property?

11. Do the bank's procedures require that regular charges be made for depreciation expense?

*12. Do persons who do not also have sole custody of property balance subsidiary depreciation records, at least quarterly, to the appropriate general ledger controls?

PROPERTY RECORDS

*13. Are subsidiary property records posted by persons who do not also have sole custody of property?

*14. Do persons who do not also have sole custody of property balance the subsidiary property records, at least quarterly, to the appropriate general ledger accounts?

BANK AS LESSOR (BANK PREMISES AND BANK-RELATED EQUIPMENT ONLY)

*15. Do policies provide for division of the duties involved in billing and collection of rental payments?

16. Are the lease agreements subject to the same direct verification program applied to other bank assets and liabilities?
17. Are credit checks performed on potential lessees?
18. Do policies provide for a periodic review of lessees for undue concentrations of affiliated or related concerns?

BANK AS LESSEE (BANK PREMISES AND BANK-RELATED EQUIPMENT ONLY)

19. Does the bank have a clearly defined method of determining whether fixed assets should be owned or leased, and is supporting documentation maintained by the bank?
20. Are procedures in effect to determine lease classification as defined by the generally accepted accounting principles?
21. Do the bank's operating procedures provide, on capitalized leases, that the amount capitalized is computed by more than one individual and/or reviewed by an independent party?

OTHER PROCEDURES

*22. Is the physical existence of bank equipment periodically checked or tested, such as by a physical inventory, and are any differences from property records investigated by persons who do not also have sole custody of property?

23. Do the bank's procedures provide for serial numbering of equipment?
24. Are the bank's policies and procedures on property in written form?
25. Is the benefit of expert tax advice obtained prior to final decision-making on significant transactions involving fixed assets?

*26. Does the bank maintain separate property files, which include invoices (for example, settlement sheets and bills of sale), titles on real estate and vehicles, Uniform Commercial Code (UCC) filings or liens for personal property, and other pertinent ownership data?

CONCLUSIONS

27. Is the foregoing information an adequate basis for evaluating internal control in that there are no significant additional deficiencies that impair any controls? Explain negative answers briefly, and indicate any additional examination procedures deemed necessary.
28. Based on a composite evaluation, as evidenced by answers to the foregoing questions, internal control is considered (adequate/inadequate).

A state member bank's authority to hold real estate is governed by state law. A bank is permitted to include owned real estate in its premises account if the real estate serves as premises for operations or is intended to be used as premises. In addition, a bank may hold other real estate owned (OREO), which is defined below. State laws dictate the terms and conditions under which state-chartered banks may acquire and hold OREO.

The bank's policies and procedures should address the management and disposition of its OREO holdings, including

- protection of a bank's interests in a property,
- account for the OREO asset and expenses associated with the maintenance and disposition of the property in conformance with generally accepted accounting principles and Call Report Instructions, and
- compliance with federal and state laws pertaining to the holding of OREO.

DEFINITION

Other real estate comprises all real estate, other than bank premises, owned or controlled by the bank or its consolidated subsidiaries, including real estate acquired through foreclosure, even if the bank has not received title to the property. Bank holdings of OREO may arise from the following events:

- the bank purchases real estate at a sale under judgment, decree, or mortgage when the property secured debts previously contracted;
- a borrower conveys real estate to the bank to fully or partially satisfy a debt previously contracted (acceptance of deed in lieu of foreclosure);
- real estate is obtained in exchange for future advances to an existing borrower to fully or partially satisfy debts previously contracted;
- a bank takes possession (although not necessarily title) of collateral in a collateral-dependent real estate loan (i.e., an in-substance foreclosure);
- a bank has relocated its premises and has not yet sold the old premises;
- a bank abandons plans to use real estate as premises for future expansion; and
- a bank has foreclosed real estate that is under contract for sale.

There are three major phases of the OREO life cycle: acquisition, holding period, and disposition.

ACCOUNTING AND REPORTING STANDARDS

The accounting and reporting standards for the acquisition phase are set forth in Accounting Standards Codification (ASC) 310-40, Receivables-Troubled Debt Restructurings by Creditors (formerly known as FAS 15, "Accounting by Debtors and Creditors for Troubled Debt Restructurings"); ASC 360-10-30, Property, Plant and Equipment-Initial Measurement (formerly included in FAS 144, "Accounting for the Impairment or Disposal of Long-Lived Assets"); and ASC 360-10-35, Property, Plant and Equipment-Subsequent Measurement. Until the effective date of Accounting Standards Update (ASU) 2014-09[1] "Revenue from Contracts with Customers," which includes amendments to ASC Subtopic 610-20, Other Income–Gains and Losses from the Derecognition of Nonfinancial Assets, the primary accounting guidance for sales of foreclosed real estate is ASC Subtopic 360-20, Property, Plant, and Equipment – Real Estate Sales (formerly FASB Statement No. 66, "Accounting for Sales of Real Estate"). When it takes effect, ASC Subtopic 610-20 supersedes ASC Subtopic 360-20 for real estate sales not

1. Effective date of ASU 2014-09, including ASC Subtopic 610-20 (and ASC Topic 606) – For institutions that are public business entities, these standards are effective for fiscal years beginning after December 15, 2017, including interim reporting periods within those fiscal years. For institutions that are not public business entities (i.e., that are private companies), the standards are effective for fiscal years beginning after December 15, 2018, and interim reporting periods within fiscal years beginning after December 15, 2019. For further information, see the Glossary entries in the Call Report Instructions for "public business entity" and "private company." Early application of these standards is permitted for all institutions for fiscal years beginning after December 15, 2016, and interim reporting periods as prescribed in the standards. An institution that early adopts these standards must apply them (including all of ASC Topic 606 on revenue recognition) in their entirety. If an institution chooses to early adopt these standards for financial reporting purposes, the institution should implement them in its Call Report for the same quarter-end report date.

accompanied by a leaseback and becomes the primary accounting guidance for sales of foreclosed real estate. Reference should also be made to the FFIEC 031 Consolidated Report of Condition and Income for a Bank with Domestic and Foreign Offices (Call Report), Schedules RC and M, and the instructions for the reporting of OREO transactions.

TRANSFER OF ASSETS TO OREO

Real estate assets transferred to OREO should be accounted for individually (on an asset-by-asset basis) on the date of transfer. Each transferred real estate asset should be recorded at its "fair value" less estimated cost to sell the asset. This "fair value" becomes the cost of the asset. "Fair value" is the amount the creditor should reasonably expect to receive for the asset in a current sale between a willing buyer and a willing seller (that is, not a forced liquidation sale).

The recorded amount of a loan (or an investment in a loan) at the time of foreclosure involving real estate transferred to OREO is the unpaid balance adjusted for any unamortized premium or discount and unamortized loan fees or costs, less any amount previously charged off, plus recorded accrued interest. Any excess of the recorded amount of the loan over the transferred property's fair value is a loss that must be charged against the allowance for loan and lease losses (ALLL) immediately upon the property's transfer to OREO. If the fair value (less costs to sell) of the property exceeds a recorded loan amount, the excess should be reported as a recovery of a previous charge-off or in current earnings, as appropriate. Legal fees and other direct costs incurred by the bank should generally be included in expenses.

The value of OREO properties must be reported at the fair value minus estimated selling expenses or the recorded loan amount. For example, if the recorded investment in the property is $125, the fair value of the property is $100, and the estimated selling expenses are $6, the carrying value for this property would be $94. The difference between the recorded loan amount of $125 and the fair value of $100 minus the $6 estimated cost to sell the property, or $31, would be charged to the ALLL at the time the property was transferred to OREO. Subsequent to the acquisition date, the OREO property should be reported at the lower of the cost of the property ($94 in this case) or the fair value of $100 less cost to sell of $6, which is also $94. Any subsequent declines in value should be recorded by creating a valuation allowance.

Alternatively, if the recorded loan amount is $250, the property's fair value is $275, and the estimated selling expenses are $18, the property's carrying value would be $257 (the property's fair value of $275 less estimated cost to sell of $18). The $7 difference between the fair value (less costs to sell) and the recorded loan amount would be recorded as a recovery of a previous charge-off or in current earnings, as appropriate. Before recording the $7 in earnings, significant scrutiny should be applied to understand why the borrower would risk losing the equity in the property. Additionally, in some states, lenders are required to return recovered amounts, in excess of the amount owed, to the borrower.

EVALUATIONS OF REAL ESTATE TO DETERMINE THE CARRYING VALUE OF OREO

The transfer of real estate pledged as collateral for a loan to OREO is considered to be a "transaction involving an existing extension of credit" under 12 CFR 225.63(a)(7) and is exempt from Regulation Y's appraisal requirement. However, under 12 CFR 225.63(b), the bank must obtain an "appropriate evaluation" of the real estate that is "consistent with safe and sound banking practices" to establish the carrying value of the OREO. A bank may elect, but is not required, to obtain an appraisal to serve as the "appropriate evaluation." Until the evaluation is available, a bank should rely on its best estimate of the property's value to establish the carrying value. The federal banking agencies have issued appraisal and evaluation guidelines to provide guidance to examining personnel and federally regulated institutions regarding prudent appraisal and evaluation policies, procedures, practices, and standards.

The appraisal or evaluation should provide an estimate of the parcel's market value. (Refer to section 4140.1, "Real Estate Appraisals and Evaluations," and its appendices A to D found in section A4140.1.) Generally, appraisals or evaluations contain an estimate of the property's fair value based on a forecast of expected cash flows, discounted at an interest rate that is commensurate with the risks involved. The cash flow estimate should include projected revenues and the costs of ownership, development, operation, marketing, and sale. In such situations, the appraiser or evaluator should fully describe the definition of value and the market conditions that have been considered in estimating the property's fair value.

PROPERTY ACQUIRED THROUGH FORECLOSURE—JUNIOR LIENHOLDER

When a bank acquires a property through foreclosure as a junior lienholder, whether or not the first lien has been assumed, the property should be recorded as an asset at its fair value less its estimated cost to sell. Any senior debt (principal and accrued interest) should be recorded as a corresponding liability. Senior debt should not be netted against the assets. Any excess of the recorded loan amount over the property's fair value less estimated cost to sell should be charged off to the ALLL. The recorded investment may not exceed the sum of any senior and junior debt. Payments made on senior debt should be accounted for by reducing both the asset and the liability. Interest that accrues on the senior debt after foreclosure should be recognized as interest expense.

COLLATERAL-DEPENDENT LOANS

Collateral-dependent loans are those for which repayment is expected to be provided solely from the underlying collateral when there are no other available and reliable sources of repayment. Guidance for the treatment of certain troubled debts and collateral dependent loans is found in ASC 310-40, Receivables-Troubled Debt Restructurings by Creditors.[2] According to the instructions in the Call Report, collateral-dependent real estate loans (other than consumer mortgage loans) should be transferred to OREO when the lender has taken physical possession of the collateral, regardless of whether formal foreclosure proceedings have taken place. Otherwise, the bank should keep the collateral-dependent real estate loan categorized as a loan. To facilitate administration and tracking, however, banks may choose to include a collateral-dependent real estate loan in the OREO portfolio as potential or probable OREO. Impairment of a collateral-dependent loan must be measured using the fair value of the collateral. In general, any portion of the recorded amount of a collateral-dependent loan in excess of the fair value of the collateral (less the estimated cost to sell) that can be identified as uncollectible should be promptly charged off against the ALLL. Examiners should review these loans using the same criteria applied to OREO.

For a residential real estate property collateralizing a consumer mortgage loan, a bank is considered to have received physical possession only upon the occurrence of either of the following:

(1) The bank obtains legal title to the residential real estate property upon completion of a foreclosure even if the borrower has redemption rights that provide the borrower with a legal right for a period of time after a foreclosure to reclaim the real estate property by paying certain amounts specified by law, or

(2) The borrower conveys all interest in the residential real estate property to the bank to satisfy the loan through completion of a deed in lieu of foreclosure or through a similar legal agreement. The deed in lieu of foreclosure or similar legal agreement is completed when agreed-upon terms and conditions have been satisfied by both the borrower and the creditor.

PROPERTY ACQUIRED FOR FUTURE USE

Property the bank originally acquired for future use as premises, but for which plans have been abandoned, and property that formerly served as bank premises, should be accounted for at the lower of (1) its fair value less cost to sell or (2) the cost of the asset on the date of transfer to OREO. Any excess of book value over fair

2. See also SR letter 13-17, "Interagency Supervisory Guidance Addressing Certain Issues Related to Troubled Debt Restructurings."

value should be charged to other operating expense during the current period.

CARRYING VALUE OF OREO

A bank should have a policy for periodically determining the fair value of its OREO property by obtaining an appraisal or an evaluation, as appropriate. While the Federal Reserve has no prescribed time frame for when a bank should reappraise or reevaluate its OREO property, the bank's policy should conform to state law, if applicable, and take into account the volatility of the local real estate market. A bank should determine whether there have been material changes to the underlying assumptions in the appraisal or valuation that have affected the original estimate of value. If material changes have occurred, the bank should obtain a new appraisal or evaluation based on assumptions that reflect the changed conditions.

ACCOUNTING FOR SUBSEQUENT CHANGES IN FAIR VALUE

Charges for subsequent declines in the fair value of OREO property should never be posted to the ALLL. If an appraisal or evaluation indicates a subsequent decline in the fair value of an OREO property, the loss in value should be recognized through the income statement by a charge to earnings. Banks should attempt to determine whether a property's decline in value is not recoverable, taking into consideration each property's characteristics and existing market dynamics. The preferred treatment for nonrecoverable losses in value is the direct write-down method, in which the charge to expenses is offset by a reduction in the OREO property's carrying value. If the reduction in value is deemed temporary, the charge to earnings may be offset by establishing a valuation allowance specifically for that property. In the event of subsequent appreciation in the value of an OREO property, the increase can only be reflected by reducing this valuation allowance or recognizing a gain upon disposition, but never by a direct write-up of the property's value. A change to the valuation allowance should be offset with a debit or credit to expense in the period in which it occurs.

In addition to the preceding treatment of the write-down in the OREO value, the previous subsection "Transfer of Assets to Other Real Estate Owned" discusses setting up a valuation allowance for estimated selling expenses associated with the sale of the other real estate. The balance of this valuation allowance can fluctuate based on changes in the fair value of the property held, but it can never be less than zero. The following examples are presented to illustrate the treatment that subsequent depreciation and appreciation would have on OREO properties.

Depreciation in an OREO Property's Value

Assume a bank has written down its initial recorded investment in an OREO property from \$125 to its fair value of \$100 minus costs to sell (assume costs to sell of \$6), or \$94. Assume that a new appraisal indicates a value of \$90, with reduced estimated selling expenses of \$5, or \$85. If the bank determines this decline in value is nonrecoverable, the bank must expense the depreciation of \$9 (\$94 minus \$85).

Appreciation in an OREO Property's Value

Assume a bank has written down its recorded investment in an OREO property to its fair value of \$110 less costs to sell of \$10, or \$100, and it subsequently created a valuation allowance for the \$10 temporary decline in value. A new appraisal indicates an increase in the value of the property to \$112 less costs to sell of \$9, or \$103. Notwithstanding the property's increased value, the recorded investment value cannot be increased above \$100. The valuation allowance for selling expenses can never be less than zero, thus prohibiting an increase in the value of the property above the recorded investment. In this case, the bank would reduce the valuation allowance to zero, which would increase the recorded value to \$100.

Accounting for OREO Income and Expense

Gross revenue from OREO should be recognized in the period in which it is earned. Direct costs incurred in connection with holding an OREO property, including legal fees, real estate taxes, depreciation, and direct write-downs, should be charged to expense when incurred.

A bank can expend funds to develop and improve OREO when it appears reasonable to expect that any shortfall between the property's fair value and the bank's recorded book value will be reduced by an amount equal to or greater than the expenditure. Such expenditures should not be used for speculation in real estate. The economic assumptions relating to the bank's decision to improve a particular OREO property should be well documented. Any payments for developing or improving OREO property are treated as capital expenditures and should be reflected by increasing the property's carrying value to the extent that those expenditures increase the value of the property.

DISPOSITION OF OREO

OREO property must be disposed of within any holding period established by state law and, in any case, as soon as it is prudent and reasonable. Banks should maintain documentation reflecting their efforts to dispose of OREO property, which should include

- a record of inquiries and offers made by potential buyers,
- methods used in advertising the property for sale whether by the bank or its agent, and
- other information reflecting sales efforts.

The sale or disposition of OREO property is considered a real estate-related financial transaction under the Board's appraisal regulation. A sale or disposition of an OREO property that qualifies as a federally related transaction under the regulation requires an appraisal conforming to the regulation. A sale or disposition that does not qualify as a federally related transaction nonetheless must comply with the regulation by having an appropriate evaluation of the real estate that is consistent with safe and sound banking practices.

The bank should promptly dispose of OREO if it can recover the amount of its original loan plus additional advances and other costs related to the loan or the OREO property before the end of the legal holding period. The holding period generally begins on the date that legal title to the property is transferred to the bank, except for real estate that has become OREO because the bank no longer contemplates using it as its premises. The holding period for this type of OREO property begins on the day that plans for future use are formally terminated. Some states require OREO property to be written off or depreciated on a scheduled basis, or to be written off at the end of a specified time period. The bank should determine whether such requirements exist and comply with them.

Financing Sales of OREO

Gains and losses resulting from a sale of OREO properties for cash must be recognized immediately. Until the effective date of ASU 2014-09, "Revenue from Contracts with Customers (Topic 606)," a gain resulting from a sale in which the bank provides financing should be accounted for under the standards described in ASC 360-20-40, Property, Plant and Equipment-Real Estate Sales-Derecognition. After the effective date of ASU 2014-09, a gain resulting from a sale in which the bank provides financing should be accounted for under the standards described in ASC Subtopic 610-20, Other Income–Gains and Losses from the Derecognition of Nonfinancial Assets. For further details, refer to the glossary section of the Call Report instructions under "foreclosed assets."

Nonrecourse Financing

Banks may promote the sale of foreclosed real estate by offering nonrecourse financing to buyers. These loans should be made under the same credit terms and underwriting standards the bank employs for its regular lending activity. Financing arrangements associated with this type of transaction are subject to the accounting treatment discussed above.

RENTAL OF RESIDENTIAL OREO PROPERTIES

OREO Rental Policy Statement Overview

The Federal Reserve issued a policy statement[3] on April 5, 2012, indicating that, consistent with

3. See SR letter 12-5/CA letter 12-3, "Policy Statement on Rental of Residential Other Real Estate Owned (OREO) Properties," and its attachment.

the general policy of the Federal Reserve and in light of the extraordinary market conditions that existed, banking organizations may rent one- to four-family residential OREO properties without having to demonstrate continuous active marketing of the properties, provided suitable policies and procedures are followed.[4] Under these conditions and circumstances, banking organizations would not contravene supervisory expectations that they show "good-faith efforts" to dispose of OREO by renting the property within the applicable holding period. Key risk-management considerations for banking organizations that engage in the rental of residential OREO, including compliance with holding-period requirements for OREO, compliance with landlord-tenant and associated requirements, and accounting according to generally accepted accounting principles (GAAP). Rental of OREO properties with leases in place and demonstrated cash flow from rental operations sufficient to generate a reasonable rate of return should generally not be classified.

The statement establishes specific supervisory expectations for banking organizations that undertake large-scale residential OREO rentals (generally, 50 properties or more available for rent). Such organizations should have formal policies and procedures governing the operation and administration of OREO rental activities, including property-specific rental plans, policies and procedures for compliance with applicable laws and regulations, a risk-management framework, and oversight of third-party property managers.

Policy Statement on Rental of Residential OREO Properties

In light of the large volume of distressed residential properties and the indications of higher demand for rental housing in many markets, some banking organizations may choose to make greater use of rental activities in their disposition strategies than in the past. In response to the volume of these activities, the Federal Reserve adopted an April 2012 policy statement, whereby banking organizations may rent one- to four-family residential OREO properties without having to demonstrate continuous active marketing of such properties, provided suitable policies and procedures are followed. This policy statement reminds banking organizations and examiners that the Federal Reserve's regulations and policies permit the rental of residential OREO properties to third-party tenants as part of an orderly disposition strategy within statutory and regulatory limits.[5] This policy statement applies to state member banks, BHCs, nonbank subsidiaries of BHCs, savings and loan holding companies, non-thrift subsidiaries of savings and loan holding companies, and U.S. branches and agencies of foreign banking organizations (collectively, banking organizations).

The general policy of the Federal Reserve is that banking organizations should make good-faith efforts to dispose of OREO properties at the earliest practicable date. Consistent with this policy, in light of the extraordinary market conditions that currently prevail, banking organizations may rent residential OREO properties (within statutory and regulatory holding-period limits) without having to demonstrate continuous active marketing of the property, provided that suitable policies and procedures are followed. Under these conditions and circumstances, banking organizations would not contravene supervisory expectations that they show "good-faith efforts" to dispose of OREO by renting the property within the applicable holding period. Moreover, to the extent that OREO rental properties meet the definition of community development under the Community Reinvestment Act (CRA) regulations, they would receive favorable CRA consideration.[6] In all respects, banking organizations that rent OREO properties are expected to comply with all applicable federal, state, and local statutes and regulations.

Home prices have been under considerable downward pressure since the financial crisis began, in part due to the large volume of houses for sale by creditors, whether acquired through foreclosure or voluntary surrender of the property by a seriously delinquent borrower (distressed sales). Creditors, in turn, often seek to

4. The policy statement supplements other relevant Federal Reserve guidance, including the Board's policy statement on the disposition of property acquired in satisfaction of debts previously contracted. See 12 CFR 225.140.

5. The term "residential properties" in this policy statement encompasses all one- to four-family properties and does not include multifamily residential or commercial properties.

6. The Federal Reserve's CRA regulations define community development to include activities that provide affordable housing for low- and moderate-income individuals as well as those activities that revitalize or stabilize low- and moderate-income areas (see 12 CFR 228.12(g)(1) and (4)).

liquidate their inventories of such properties quickly. Since 2008, it is estimated that millions of residential properties have passed through lender inventories. These distressed sales represent a significant proportion of all home sales transactions, despite some ebb and flow, and thus are a contributing element to the downward pressure on home prices. With mortgage delinquency rates remaining stubbornly high, the continued inflow of new real estate owned properties to the market—expected to be millions more over the coming years—will continue to weigh on house prices for some time.[7]

Banking organizations include their holdings of such properties in OREO on regulatory reports and other financial statements.[8] Existing federal and state laws and regulations limit the amount of time banking organizations may hold OREO property.[9] In addition, there are established supervisory expectations for management of OREO properties and the nature of the efforts banking organizations should make to dispose of these properties during that period.

Risk-Management Considerations for Residential OREO Property Rentals

In all circumstances, the Federal Reserve expects a banking organization considering such rentals to evaluate the overall costs, benefits, and risks of renting. The banking organization's decision to rent OREO might depend significantly on the condition of individual properties, local market conditions for rental and owner-occupied housing, and its capacity to engage in rental activity in a safe and sound manner and consistent with applicable laws and regulations.

Banking organizations should have an operational framework for their residential OREO rental activities that is appropriate to the extent to which they rent OREO properties. In general, banking organizations with relatively small holdings of residential OREO properties—fewer than 50 individual properties rented or available for rent—should use a framework that appropriately records the organizations' rental decisions and transactions as they take place, preserves key documents, and is otherwise sufficient to safeguard and manage the individual OREO assets.[10] In contrast, banking organizations with large inventories of residential OREO properties[11]—50 or more individual properties available for rent or rented—should utilize a framework that systematically documents how they meet the supervisory expectations described in the next section. All banking organizations that rent OREO properties, irrespective of the size of their holdings, should adhere to the guidance set forth in this section.

Compliance with Maximum OREO Holding-Period Requirements

Banking organizations should pursue a clear and credible approach for ultimate sale of the rental OREO property within the applicable holding-period limitations. Exit strategies in some cases may include special transaction features to facilitate the sale of OREO, potentially including prudent use of seller-assisted financing or rent-to-own arrangements with tenants.

Compliance with Landlord-Tenant and Other Associated Requirements

Banking organizations' residential property rental activities are expected to comply with all applicable federal, state, and local laws and regulations, including landlord-tenant laws; landlord licensing or registration requirements; property maintenance standards; eviction protec-

7. For further discussion of housing market conditions and the obstacles to conversions of OREO properties to rental, see "The U.S. Housing Market: Current Conditions and Policy Considerations," Federal Reserve staff white paper, January 4, 2012 (housing white paper).

8. "Other real estate owned" is comprised of all real estate other than (1) bank premises owned or controlled by the bank and its consolidated subsidiaries and (2) direct and indirect investments in real estate ventures.

9. Generally, the Federal Reserve allows BHCs to hold OREO property for up to five years, with an additional five-year extension subject to certain circumstances (see 12 CFR 225.140). National banks are subject to similar restrictions. State member banks and licensed branches of foreign banks are subject to the holding periods and other limitations on OREO activity established by their respective licensing authorities, which vary. Savings and loan holding companies generally may acquire real estate for rental (see 12 USC 1467a(c)(2) and 12 CFR 238.53(b)).

10. A preliminary analysis of December 2011 Call Report data suggests that roughly 98 percent of community banks held 50 or fewer residential OREO properties.

11. For purposes of this guidance, the supervisory expectations for OREO rentals and the number of properties available for rent should include those properties for which tenants were already in place at the time of foreclosure or transfer of ownership. See the *Federal Reserve Consumer Compliance Handbook*, Section IV for further information.

tions; protections under the Servicemembers Civil Relief Act;[12] and anti-discrimination laws, including the applicable provisions of the Fair Housing Act and the Americans with Disabilities Act. Prior to undertaking the rental of OREO properties, banking organizations should determine whether such activities are legally permissible under applicable laws, including state laws. When applicable, banking organizations should review homeowner and condominium association bylaws and local zoning laws for prohibitions on renting a property. Banking organizations may use third-party vendors to manage properties but should provide necessary oversight to ensure that property managers fully understand and comply with these federal, state, and local requirements.

Other Considerations

Banking organizations should account for OREO assets in accordance with GAAP and applicable regulatory reporting instructions.[13]

Specific Expectations for Large-Scale Residential OREO Rentals

Banking organizations with large inventories of residential OREO properties that decide to engage in rental activities should have in place a documented rental strategy, including formal policies and procedures for OREO rental activities and a documented operational framework. Policies and procedures should clearly describe how the banking organization will comply with all applicable laws and regulations. Policies and procedures should include processes for determining whether the properties meet local building code requirements and are otherwise habitable, and whether improvements to the properties are needed in order to market them for rent. In addition, policies and procedures should establish operational standards for the banking organization's rental activities, including that adequate insurance policies are in place, that property and other tax obligations are met on a timely basis, and that expenditures on improvements are appropriate to the value of the property and to prevailing norms in the local market.

Policies and procedures should also require plans for rental of residential OREO properties, down to the individual property level, that cover the full holding period from the time the bank received title to ultimate sale by the bank. Plans should identify which properties would be eligible for rental. Plans also should establish criteria by which properties are chosen for marketing as rental properties, and the process by which rental decisions should be made and implemented. Plans should describe the general conditions under which the organization believes a rental approach is likely to be successful, including appropriate consideration of rental market and economic conditions in respective local markets.

Finally, policies and procedures should address all risk-management issues that arise in renting residential OREO properties. Some risk elements parallel those found in other banking activities, for example, the credit risk associated with tenants' potential failure to make timely rent payments, or potential conflict of interest issues such as the use of a firm by a banking organization to both provide information on a property's value and list that property for sale on behalf of the banking organization. Other risks unique to such rental include

- dealing with vacancy, marketing, and re-rental of previously occupied properties;[14]
- liability risk arising from rental activities, along with the use and management of liability insurance or other approaches to mitigate that liability and risk; and
- legal requirements arising from the potential need to take action against tenants for rent delinquency, potentially including eviction. Such requirements may include notice periods.

Banking organizations may need to develop new policies and risk-management processes to address properly these categories of risk.

In many cases, banking organizations will use third-party vendors (for example, real estate agents or professional property managers) to manage their OREO properties. Policies and procedures should provide that such individuals or organizations have appropriate expertise in

12. See CA letter 05-3, "Servicemembers Civil Relief Act of 2003," May 6, 2005.

13. See the instructions for the Consolidated Reports of Condition and Income (Call Report) as to the reporting of OREO transactions and to the Consolidated Financial Statements for Holding Companies (FR Y-9C).

14. Various jurisdictions may apply specific requirements to landlords in their marketing and re-rental activities (for example, an obligation to offer potential tenants an initial lease term of two years).

property management, be in sound financial condition, and have a good track record in managing similar properties. Policies and procedures should also call for contracts with such vendors to carry appropriate terms and provide, among other key elements, for adequate management information systems and reporting to the banking organization, including rent rolls (along with actual lease agreements), maintenance logs, and security deposits and charges to these deposits. Banking organizations should provide for adequate oversight of vendors.

CLASSIFICATION OF OREO

The examiner should generally evaluate the adequacy of the bank's information to support the carrying value of an OREO property, and the appropriateness of its classification. OREO usually should be considered a problem asset, even when it is carried at or below its fair value. Despite the apparent adequacy of the property's fair value, the bank's acquisition of OREO through foreclosure usually indicates a lack of demand for the property or weaknesses in the property's condition.

When evaluating the OREO property for classification purposes, the examiner must consider the property's fair value, whether it is being held in conformance with state law, and whether it is being disposed of according to the bank's plan. The amount of an OREO property subject to classification is the carrying value of the property, net of any specific valuation allowance. The existence of a specific valuation allowance does not preclude adverse classification of OREO. Banking organizations should also provide the appropriate classification treatment for their residential OREO holdings. Residential OREO is typically treated as a substandard asset, as defined by the interagency classification guidelines (see section 2060.1, "Classification of Credits"). However, residential properties with leases in place and demonstrated cash flow from rental operations sufficient to generate a reasonable rate of return[15] should generally not be classified. The

15. Whether a rate of return is reasonable depends on a number of considerations, including local market conditions, the time horizon of the rental, and the nature of the property. Commonly used measures include a capitalization rate (known as a "cap rate," which generally is the expected annual cash flows from renting the property relative to the price at which the property holder could expect to sell it in the owner-occupied market), as discussed in the housing white paper, or other measures of internal rate of return. Depending on the circumstances and risks associated with the property, valid indications that a level of return is reasonable could include (but would not be not limited to) comparisons with normal returns for single-family rentals in the relevant local market; rates of return on other similar local real estate investments; or cap rates or other measures of internal rate of return on investments with similar risk profiles. For example, in many markets a cap rate above 8 percent would likely represent a reasonable rate of return. Large one-time expenditures that are idiosyncratic to a given year but are normal to residential properties over their lifetime, such as replacement costs for worn-out appliances, should generally not be the reason that a property would be classified. Costs of improvement should be treated as capital expenditures with a corresponding effect on the properties' carrying values, but only to the extent the

examiner should review all types of OREO for classification purposes. When the bank provides financing, the examiner should determine whether the loan is prudently underwritten.

The examiner should review all relevant factors to determine the quality and risk of the OREO property and the degree of probability that its carrying value will be realized. Some factors the examiner should consider include

- the property's carrying value relative to its fair value (including the date of any appraisal or evaluation relative to changes in market conditions), the bank's asking price, and offers received;
- the source and quality of the appraisal or evaluation, including the reasonableness of assumptions, such as projected cash flow for commercial properties;
- the length of time a property has been on the market and local market conditions for the type of property involved, such as history and trend of recent sales for comparable properties;
- bank management's ability and track record in liquidating other real estate and assets acquired in satisfaction of debts previously contracted;
- income and expenses generated by the property and other economic factors affecting the probability of loss exposure;
- the manner in which the bank intends to dispose of the property;
- other pertinent factors, including property-title problems, statutory redemption privileges, pending changes in the property's zoning, environmental hazards, other liens, tax status, and insurance.

improvements increase the properties' values.

ENVIRONMENTAL LIABILITY

Under federal and state environmental liability statutes, a bank may be liable for cleaning up hazardous substance contamination of OREO. In some cases, the liability may arise before the bank takes title to a borrower's real estate collateral. A property's transition from collateral to bank ownership may take an extended period of time. As the financial problems facing a borrower worsen, a bank may become more involved in managing a company or property. Such involvement may become extensive enough that the bank is deemed to have met substantially all ownership criteria, the absence of a clear title in the bank's name notwithstanding. Generally, the more bank management is involved in such activity, the greater the bank's exposure to any future clean-up costs assessed in connection with the property. A more thorough discussion of environmental liability can be found in section 2040.1, "Loan Portfolio Management," of this manual, under the subsection "Other Lending Concerns."

1. To determine if the policies, practices, procedures, and internal controls regarding other real estate owned are adequate.
2. To determine that bank officers and employees are operating in conformance with the established guidelines.
3. To evaluate the validity and quality of all other real estate owned.
4. To determine the scope and adequacy of the audit function.
5. To determine compliance with laws and regulations.
6. To initiate corrective action when policies, practices, procedures, or internal controls are deficient or when violations of law or regulations have been noted.

1. If selected for implementation, complete the Other Real Estate Owned section of the Internal Control Questionnaire.
2. Test for compliance with policies, practices, procedures and internal controls in conjunction with performing the remaining examination procedures and obtain a listing of any audit deficiencies noted in the latest review done by internal/external auditors and determine if appropriate corrections have been made.
3. Obtain a list of other real estate owned and agree total to general ledger.
4. Review the other real estate owned account to determine if any property has been disposed of since the prior examination and:
   a. If so, determine that:
      - The bank accepted written bids for the property.
      - The bids are maintained on file.
      - There is justification for accepting a lower bid if the bank did not accept the highest one.
   b. Investigate any insider transactions.
5. Test compliance with applicable laws and regulations:
   a. Determine that other real estate owned is held in accordance with the provisions of applicable state law.
   b. Determine if other real estate is being amortized or written off in compliance with applicable state law.
   c. Consult with the examiners assigned to ‘‘Loan Portfolio Management,’’ ‘‘Other Assets and Other Liabilities,’’ ‘‘Reserve for Possible Loan Losses’’ and ‘‘Bank Premises and Equipment’’ to determine if the situation holds real estate acquired as salvage on uncollectible loans, abandoned bank premises or property originally purchased for future expansion, which is no longer intended for such usage.
   d. Review the details of all other real estate owned transactions to determine that:
      - The property has been booked at its fair value.
      - The documentation reflects the bank’s persistent and diligent effort to dispose of the property.
      - If the bank has made expenditures to improve and develop other real estate owned, proper documentation is in the file.
      - Real estate that is former banking premises has been accounted for as other real estate owned since the date of abandonment.
      - Such property is disposed of in accordance with state law.
6. Review parcels of other real estate owned with appropriate management personnel and, if justified, assign appropriate classification. Classification comments should include:
   a. Description of property.
   b. How real estate was acquired.
   c. Amount and date of appraisal.
   d. Amount of any offers and bank’s asking price.
   e. Other circumstances pertinent to the classification.
7. Review the following with appropriate management personnel or prepare a memo to other examiners for their use in reviewing with management:
   a. Internal control exceptions and deficiencies in, or non-compliance with, written policies, practices and procedures.
   b. Uncorrected audit deficiencies.
   c. Violations of law.
8. Prepare comments in appropriate report form for all:
   a. Criticized other real estate owned.
   b. Deficiencies noted.
   c. Violations of law.
9. Update the workpapers with any information that will facilitate future examinations.

Review the bank's internal controls, policies, practices and procedures for other real estate owned. The bank's systems should be documented in a complete and concise manner and should include, where appropriate, narrative descriptions, flowcharts, copies of forms used and other pertinent information.

RECORDS

1. Is the preparation, addition, and posting of subsidiary other real estate owned records performed and/or tested by persons who do not have direct, physical or accounting, control of those assets?
2. Are the subsidiary other real estate owned records balanced at least annually to the appropriate general ledger accounts by persons who do not have direct, physical or accounting, control of those assets?
3. Is the posting to the general ledger other real estate owned accounts approved, prior to posting, by persons who do not have direct, physical or accounting, control of those assets?
4. Are supporting documents maintained for all entries to other real estate owned accounts?
5. Are acquisitions and disposals of other real estate owned reported to the board of directors or its designated committee?
6. Does the bank maintain insurance coverage on other real estate owned including liability coverage where necessary?
7. Are all parcels of other real estate owned reviewed at least annually for:
   a. Current appraisal or certification?
   b. Documentation inquiries and offers?
   c. Documented sales efforts?
   d. Evidence of the prudence of additional advances?

OTHER PROCEDURES

8. Are the bank's policies and procedures relating to the real estate owned in writing?

CONCLUSION

9. Is the foregoing information an adequate basis for evaluating internal control in that there are no significant deficiencies in areas not covered in this questionnaire that impair any controls? Explain negative answers briefly, and indicate any additional examination procedures deemed necessary.
10. Based on a composite evaluation, as evidenced by answers to the foregoing questions, internal control is considered (adequate/inadequate).

This section provides guidance on the management of a depository institution's investment and end-user activities. The guidance applies to (1) all securities in held-to-maturity and available-for-sale accounts,[1] (2) all certificates of deposit held for investment purposes, and (3) all derivative contracts not held in trading accounts (end-user derivative contracts).[2] The section discusses securities used for investment purposes, including money market instruments, fixed- and floating-rate notes and bonds, structured notes, mortgage pass-through and other asset-backed securities (ABS), and mortgage-derivative products.

National banks (in accordance with 12 CFR 1) and state member banks are to make assessments of a security's creditworthiness to determine whether it's investment-grade.[3] The section emphasizes bank-eligible investments—securities that meet an "investment grade" test—whereby the issuer of a security has an adequate capacity to meet its financial commitments under the security for the projected life of the asset or exposure. An issuer has an adequate capacity to meet financial commitments if (1) the risk of default by the obligor is low and (2) the full and timely repayment of principal and interest is expected. A bank is expected to assess credit risk in an investment security based on the bank's risk profile and for the size and complexity of the instrument.[4] Generally, investment securities are expected to have good to very strong credit quality. In the case of structured securities, this determination may be influenced more by the quality of the underlying collateral, the expected cash flows, and the structure of the security itself than by the condition of the issuer. While banks are no longer able to rely solely on external ratings, they can be used to support the credit risk due diligence processes of the bank. Banks are expected to conduct an appropriate level of due diligence to understand the inherent risks of a security and determine that it is a permissible investment. The extent of the due diligence should be sufficient to support the institution's conclusion that a security meets the "investment-grade" standards. The depth of the due diligence should be a function of the security's credit quality, the complexity of the structure, and the size of the investment. Third-party analytics may be part of this analysis. The bank's management, however, remains responsible for the investment decision and should ensure that prospective third parties are independent, reliable, and qualified. The board of directors should oversee management to make sure that appropriate decisionmaking processes are in place.[5]

Investments in securities and stock by state member banks are required under the Federal Reserve Act and Regulation H to comply with 12 CFR 1. They also should meet the supervisory expectations set forth in the OCC's investment guidance, "OCC Guidance on Due Diligence Requirements in Determining Whether Securities Are Eligible for Investment" (see section 2022.1), and the guidance set forth in SR-12-15. In addition, state member banks are expected to continue to meet long-established supervisory expectations for risk-management processes to ensure that the credit risk of the bank, including the credit risk of the investment portfolio, is effectively identified, measured, monitored, and controlled. Investments by state member banks must also comply with applicable state law.

Many of these expectations are set forth in the 1998 interagency "Supervisory Policy Statement on Investment Securities and End-User Derivatives Activities." See SR-98-12 ("FFIEC Policy Statement on Investment Securities and End-User Derivatives Activities"), which provides risk-management standards for the securities investment activities of banks and savings associations. SR-98-12 and the policy statement emphasize the importance of an institution conducting a thorough credit-risk analysis before and periodically after the acquisition of a security. Such analysis allows an institution to understand and effectively manage the risks within its investment portfolio, including credit risk, and is an essential element of a sound investment

1. Refer to Statement of FASB Accounting Standards Codification Section 320-10-35, Investments-Debt and Equity Securities-Subsequent Measurement (formerly FAS 115, "Accounting for Certain Investments in Debt and Equity Securities").

2. Derivatives, in general, are financial contracts whose values are derived from the value of one or more underlying assets, interest rates, exchange rates, commodities, or financial or commodity indexes.

3. For the OCC's final rules, see 77 *Fed. Reg.* 35253 (June 13, 2012); for its guidance, see 77 *Fed. Reg.* 35259 (June 13, 2012) and OCC Bulletin 2012-18 (June 26, 2012).

4. See 77 *Fed. Reg.* 35254 (June 13, 2012).

5. See 77 *Fed. Reg.* 35259 (June 13, 2012).

portfolio risk-management framework. These supervisory expectations include criteria that institutions can use in meeting the requirements within 12 CFR 1. State member banks should follow these expectations when deciding whether to invest in securities.

An institution's maintenance of timely information about market risk-measurement systems is discussed within this section, including the information on the current carrying values of its securities and derivative holdings. This includes an institution's use of internal models and its need to validate the models. (See SR-11-7.) Swaps, futures, and options and other end-user derivative instruments used for non-trading purposes are discussed.

Institutions must ensure that their investment and end-user activities are permissible and appropriate within established limitations and restrictions on bank holdings of these instruments. Institutions should also employ sound risk-management practices consistently across these varying product categories, regardless of their legal characteristics or nomenclature. This section provides examiners with guidance on—

- the permissibility and appropriateness of securities holdings by state member banks;
- sound risk-management practices and internal controls used by banking institutions in their investment and end-user activities;
- the review of securities and derivatives acquired by the bank's international division and overseas branches for its own account as well as the bank's foreign equity investments that are held either directly or through Edge Act corporations;
- banking agency policies on certain high-risk mortgage-derivative products; and
- unsuitable investment practices.

LIMITATIONS AND RESTRICTIONS ON SECURITIES HOLDINGS

Many states extend the investment authority that is available to national banks to their chartered banks—often by direct reference. The security investments of national banks are governed in turn by the seventh paragraph of 12 USC 24 (12 USC 24 (Seventh)) and by the investment securities regulations of the Office of the Comptroller of the Currency (OCC), 12 CFR 1. These standards also apply to federal branches of foreign banks. If state law permits, pursuant to 12 USC 335, state member banks are subject to the same limitations and conditions for purchasing, selling, dealing in, and underwriting investment securities and stocks as national banks under 12 USC 24 (Seventh).[6] To determine whether an obligation qualifies as a permissible investment for state member banks, and to calculate the limits with respect to the purchase of such obligations, refer to the OCC's investment securities regulation at 12 CFR 1. (See also section 2022.1, "OCC Guidance on Due Diligence Requirements in Determining Whether Securities Are Eligible for Investment," and section 208.21(b) of Regulation H (12 CFR 208.21(b)).)

Under 12 USC 24, "investment securities" are defined as "marketable obligations, evidencing indebtedness . . . in the form of bonds, notes and/or debentures commonly known as investment securities under such further definition of the 'investment securities' as may be by regulation prescribed by the Comptroller of the Currency." Nothing contained in this provision of the statute authorizes the purchase by the association (national bank) for its own account of any shares of stock of any corporation. The OCC's investment securities regulation (at 12 CFR 1) defines *investment security* as a marketable debt obligation that is investment grade and not predominately speculative in nature. *Investment grade* means the issuer of a security has an adequate capacity to meet financial commitments under the security for the projected life of the asset or exposure. An issuer has an adequate capacity to meet financial commitments if the risk of default by the obligor is low and the full and timely repayment of principal and interest is expected.

Marketable means that the security—

- is registered under the Securities Act of 1933, 15 USC 77a et seq.;
- is a municipal revenue bond exempt from registration under the Securities Act of 1933, 15 USC 77c(a)(2);
- is offered and sold pursuant to Securities and Exchange Commission Rule 144A, 17 CFR 230.144A, and investment grade; or

6. References to a "bank" in this section mean a state member bank and a national bank, unless stated otherwise.

• can be sold with reasonable promptness at a price that corresponds reasonably to its fair value.

Bank-Eligible Securities

The OCC's investment securities regulation, 12 CFR 1.2, identifies five basic types of investment securities (Types I, II, III, IV, and V) and establishes limitations on a bank's investment in those types of securities based on the percentage of capital and surplus that such holdings represent. For calculating concentration limits, the term "capital and surplus" includes a bank's tier 1 and tier 2 capital and the balance of a bank's allowance for loan and lease losses not included in tier 2 capital. Table 2 summarizes bank-eligible securities and their investment limitations.

Table 2—Summary of Investment-Type Categories

Type Category	*Characteristics*	*Limitations*
Type I securities	• U.S. government obligations and obligations issued, insured, or guaranteed by a U.S. department or agency, if backed by the full faith and credit of the U.S. government • general obligations of a state of the U.S. or any political subdivision thereof • municipal bonds, if the bank is well capitalized,* other than Types II, III, IV, or V securities	The bank may deal in, underwrite, purchase, and sell Type I securities for its own account. The amount of Type I securities that the bank may deal in, underwrite, purchase, and sell is not limited to a specified percentage of the bank's capital and surplus. With respect to all municipal securities, a member bank that is well capitalized* may deal in, underwrite, purchase, and sell any municipal bond for its own account without any limit tied to the bank's capital and surplus.

continued

* subject to the statutory prompt-corrective-action standards (12 USC 1831o)

Type Category	*Characteristics*	*Limitations*
Type II securities	• obligations issued by a state, or a political subdivision or agency of a state for housing, university, or dormitory purposes that would not qualify as a Type I municipal security • obligations of international and multilateral development banks • other obligations that a national bank is authorized to deal in, underwrite, purchase, and sell for the bank's own account as listed in 12 USC 24 (Seventh), other than Type I securities • other securities the OCC determines to be eligible as Type II securities	The bank may deal in, underwrite, purchase, and sell Type II securities for its own account, provided the aggregate par value of Type II securities issued by any one obligor held by the bank does not exceed 10 percent of the bank's capital and surplus. When applying this limitation, the bank is to take account of Type II securities that the bank is legally committed to purchase or to sell in addition to the bank's existing holdings. The bank may not hold Type II securities issued by any one obligor with an aggregate par value exceeding 10 percent of the bank's capital and surplus. However, if the proceeds of each issue are to be used to acquire and lease real estate and related facilities to economically and legally separate industrial tenants, and if each issue is payable solely from and secured by a first lien on the revenues to be derived from rentals paid by the lessee under net noncancellable leases, the bank may apply the 10 percent investment limitation separately to each issue of a single obligor. continued

Type Category	*Characteristics*	*Limitations*
Type III securities	• an investment security that does not qualify as Type I, II, IV, or V security; examples of Type III securities include— — corporate bonds, and — municipal bonds that do not satisfy the definition of Type I securities in 12 CFR 1.2 (j) or the definition of Type II securities in 12 CFR 1.2 (k)	The bank may purchase and sell Type III securities for its own account, provided the aggregate par value of Type III securities issued by any one obligor held by the bank does not exceed 10 percent of the bank's capital and surplus. In applying this limitation, a national bank shall take account of Type III securities that the bank is legally committed to purchase or to sell in addition to the bank's existing holdings. The bank may not hold Type III securities issued by any one obligor with an aggregate par value exceeding 10 percent of the bank's capital and surplus. However, if the proceeds of each issue are to be used to acquire and lease real estate and related facilities to economically and legally separate industrial tenants, and if each issue is payable solely from and secured by a first lien on the revenues to be derived from rentals paid by the lessee under net noncancellable leases, the bank may apply the 10 percent investment limitation separately to each issue of a single obligor. continued

Type Category	*Characteristics*	*Limitations*
Type IV securities	• a small business-related security as defined in section 3(a)(53)(A) of the Securities Exchange Act of 1934, 15 USC 78c(a)(53)(A), that is fully secured by interests in a pool of loans to numerous obligors • commercial mortgage-related security that is offered or sold pursuant to section 4(5) of the Securities Act of 1933, 15 USC 77d(5), that is investment grade, or a commercial mortgage-related security as described in section 3(a)(41) of the Securities Exchange Act of 1934 that represents ownership of a promissory note or certificate of interest or participation that is directly secured by a first lien on one or more parcels of real estate upon which one or more commercial structures are located and that is fully secured by interests in a pool of loans to numerous obligors • a residential mortgage-related security that is offered and sold pursuant to section 4(5) of the Securities Act of 1933, 15 USC 77d(5), that is investment grade, or a residential mortgage-related security as described in section 3(a)(41) of the Securities Exchange Act of 1934, 15 USC 78c(a)(41)) that does not otherwise qualify as a Type I security	The bank may purchase and sell Type IV securities for its own account. The amount of the Type IV securities that a bank may purchase and sell is not limited to a specified percentage of the bank's capital and surplus.
Type V securities	• a security that is— — investment grade; — marketable; — not a Type IV security; and — fully secured by interests in a pool of loans to numerous obligors and in which a national bank could invest directly	The bank may purchase and sell Type V securities for its own account provided that the aggregate par value of Type V securities issued by any one issuer held by the bank does not exceed 25 percent of the bank's capital and surplus. In applying this limitation, a national bank shall take account of Type V securities that the bank is legally committed to purchase or to sell in addition to the bank's existing holdings.

Type I securities are those debt instruments that national and state member banks can deal in, underwrite, purchase, and sell for their own accounts without limitation. Type I securities are obligations of the U.S. government or its agencies; general obligations of states and political subdivisions; municipal bonds (including municipal revenue bonds) other than a Type II, III, IV, or V security by a bank that is well capitalized; and mortgage-related securities. A bank may purchase Type I securities for its own account subject to no limitations, other than the exercise of prudent banking judgment. (See 12 USC 24 (Seventh) and 15 USC 78(c)(a).)

Type II securities are those debt instruments that national and state member banks may deal in, underwrite, purchase, and sell for their own account subject to a 10 percent limitation of a bank's capital and surplus for any one obligor. Type II investments include obligations issued by the International Bank for Reconstruction and Development, the Inter-American Development Bank, the Asian Development Bank, the Tennessee Valley Authority, and the U.S. Postal Service, as well as obligations issued by any state or political subdivision for housing, university, or dormitory purposes that do not qualify as a Type I security and other issuers specifically identified in 12 USC 24 (Seventh).

Type III securities is a residual securities category consisting of all types of investment securities not specifically designated to another security "type" category and that do not qualify as a Type I security. The bank may purchase and sell Type III securities for its own account, provided the aggregate par value of Type III securities issued by any one obligor held by the bank does not exceed 10 percent of the bank's capital and surplus for any one obligor. In applying this limitation, the bank must take account of Type III securities that the bank is legally committed to purchase or to sell in addition to the bank's existing holdings.

Type IV securities. A bank may purchase and sell Type IV securities for its own account. The amount of securities that a bank may purchase and sell is not limited to a specified percentage of the bank's capital and surplus. Type IV securities include the following ABS that are fully secured by interests in pools of loans made to numerous obligors:

- investment-grade residential mortgage-related securities that are offered or sold pursuant to section 4(5) of the Securities Act of 1933 (15 USC 77d(5))
- residential mortgage-related securities as described in section 3(a)(41) of the Securities Exchange Act of 1934 (15 USC 78c(a)(41)) that are rated in one of the two highest investment-grade rating categories
- investment-grade commercial mortgage securities offered or sold pursuant to section 4(5) of the Securities Act of 1933 (15 USC 77d(5))
- commercial mortgage securities as described in section 3(a)(41) of the Securities Exchange Act of 1934 (15 USC 78c(a)(41)) that are rated in one of the two highest investment-grade rating categories
- investment-grade, small-business-loan securities as described in section 3(a)(53)(A) of the Securities Exchange Act of 1934 (15 USC 78c(a)(53)(A))

For all Type IV commercial and residential mortgage securities and for Type IV small-business-loan securities, there is no limitation on the amount a bank can purchase or sell for its own account. In addition to being able to purchase and sell Type IV securities, subject to the above limitation, a bank may deal in those Type IV securities that are fully secured by Type I securities.

Type V securities consist of all ABS that are not Type IV securities. Specifically, they are defined as marketable, investment-grade securities that are not Type IV and are "fully secured by interests in a pool of loans to numerous obligors and in which a bank could invest directly." Type V securities include securities backed by auto loans, credit card loans, home equity loans, and other assets. Also included are residential and commercial mortgage securities as described in section 3(a)(41) of the Securities Exchange Act of 1934 (15 USC 78c(a)(41)) that are investment grade. A bank may purchase or sell Type V securities for its own account provided the aggregate par value of Type V securities issued by any one issuer held by the bank does not exceed 25 percent of the bank's capital and surplus. In applying this limitation, the bank must take account of Type V securities that the bank is legally committed to purchase or to sell in addition to the bank's existing holdings.

Additional Limitations

Securities Held Based on Estimates of Obligor's Performance

Notwithstanding the definition of "investment security" and "investment grade," a bank may treat a debt security as an investment security under the rule if it does not meet those definitions, provided that the security is marketable and the bank concludes, on the basis of estimates that the bank reasonably believes are reliable, that the obligor will be able to satisfy its obligations under that security. However, the aggregate value of such securities based on "reliable estimate" may not exceed 5 percent of the bank's capital and surplus. This activity must conform with the safety-and-soundness practices required by 12 CFR 1.5 (discussed below).

As shown in Table 2, there are *separate* Type I, II, III, IV, and V limits. In the extreme, however, banks can lend 15 percent of their capital to a corporate borrower, buy the borrower's corporate bonds amounting to another 10 percent of capital and surplus (Type III securities), and purchase the borrower's ABS up to an additional 25 percent of capital (Type V securities), for a total exposure of 50 percent of the bank's capital and surplus. This could be expanded even further if the borrower also issued highly rated Type IV securities, upon which there is no investment limitation. However, an exposure to any one issuer of 25 percent or more should be considered a credit concentration, and banks are expected to justify why exposures in excess of 25 percent do not entail an undue concentration.

Pooled Investments

A bank may purchase and sell for its own account investment company shares provided that—

a. the portfolio of the investment company consists exclusively of assets that the bank may purchase and sell for its own account, and
b. the bank's holdings of investment company shares do not exceed the limitations in 12 CFR 1.4(e).

Other Issues

The OCC may determine that a national bank may invest in an entity that is exempt from registration as an investment company under section 3(c)(1) of the Investment Company Act of 1940, provided that the portfolio of the entity consists exclusively of assets that a national bank may purchase and sell for its own account and that investments made under this authority comply with safe-and-sound practices under section 1.5 of the rule and applicable published OCC precedent. These investments also must be—

a. marketable and investment grade, or
b. satisfy the requirements of 12 CFR 1.3(i) (securities held based on estimates of obligor's performance). A bank may treat a debt security as an investment security if the security is marketable and the bank can conclude, on the basis of estimates that the bank reasonably believes are reliable, that the obligor will be able to satisfy its obligations under that security.

Safe-and-Sound Banking Practices

As set forth in section 1.5, a bank shall adhere to safe-and-sound banking practices and the specific requirements of this part when conducting the investment activities permitted under the rule. As stated in section 1.5, the bank is to consider, as appropriate, the interest rate, credit, liquidity, price, foreign exchange, transaction, compliance, strategic, and reputation risks presented by a proposed activity, and the particular activities undertaken by the bank, which must be appropriate for that bank.

When conducting these activities, the bank shall determine that there is adequate evidence that an obligor possesses resources sufficient to provide for all required payments on its obligations, or, in the case of securities deemed to be investment securities on the basis of reliable estimates of an obligor's performance, that the bank reasonably believes that the obligor will be able to satisfy the obligation.

The bank must maintain records that are available for examination purposes and are adequate to demonstrate that it meets the requirements of this part (12 CFR 1). The bank may store the information in any manner that can be readily retrieved and reproduced in a readable form.

Reservation of Authority

In addition to the investment securities discussed in 12 USC 24 (Seventh), the OCC may determine, on a case-by-case basis, that a national bank may acquire an investment security other than an investment security of a type set forth in this part, provided the OCC determines that the bank's investment is consistent with 12 USC 24 (Seventh) and with safe-and-sound banking practices. (See 73 *Fed. Reg.* 22235, April 24, 2008, and 12 CFR 1.1 for more information.) A state member bank should consult the Board for a determination with respect to the application of 12 USC 24 (Seventh), with respect to issues not addressed in 12 CFR 1. The provisions of 12 CFR 1 do not provide authority for a state member bank to purchase securities of a type or amount that the bank is not authorized to purchase under applicable state law. (See 12 CFR 208.21(b).)

Municipal Revenue Bonds

Upon enactment of the Gramm-Leach-Bliley Act (the GLB Act), most state member banks were authorized to deal in, underwrite, purchase, and sell municipal revenue bonds (12 USC 24 (Seventh)). Effective March 13, 2000, these activities (involving Type I securities) could be conducted by well-capitalized[7] banks, without limitation as to the level of these activities relative to the bank's capital. As a result of the GLB Act amendment, municipal revenue bonds are the equivalent of Type I securities for well-capitalized state member banks.[8] (See SR-01-13.)

The expanded municipal revenue bond authority under the GLB Act necessitates heightened awareness by banks, examiners, and supervisory staff of the particular risks of municipal revenue bond underwriting, dealing, and investment activities. Senior management of a state member bank has the responsibility to ensure that the bank conducts municipal securities underwriting, dealing, and investment activities in a safe and sound manner, in compliance with applicable laws and regulations. Sound risk-management practices are critical. State member banks engaged in municipal securities activities should maintain written policies and procedures governing these activities and make them available to examiners upon request.

Prudent municipal securities investment involves considering and adopting risk-management policies, including appropriate limitations, on the interest-rate, liquidity, price, credit, market, and legal risks in light of the bank's appetite and tolerance for risk. Historically, municipal revenue bonds have had higher default rates than municipal general obligation bonds. The risks of certain industrial development revenue bonds have been akin to the risks of corporate bonds. Therefore, when bondholders are relying on a specific project or private-sector obligation for repayment, banks should conduct a credit analysis, using their normal credit standards, to identify and evaluate the source of repayment before purchasing the bonds. Banks must also perform periodic credit analyses of those securities that remain in the bank's investment portfolio. Prudent banking practices require that management adopt appropriate exposure limits for individual credits and on credits that rely on a similar repayment source; these limits help ensure adequate risk diversification. Furthermore, examiners and other supervisory staff should be aware of the extent to which state laws place further restrictions on municipal securities activities but should defer to state banking regulators on questions of legal authority under state laws and regulations.

For underwriting and dealing activities, the nature and extent of due diligence should be commensurate with the degree of risk posed and the complexity of the proposed activity. Bank dealer activities should be conducted subject to the types of prudential limitations described above but should also be formulated in light of the reputational risk that may accompany underwriting and dealing activities. Senior management and the board of directors should establish credit-quality and position-risk guidelines, including guidelines for concentration risk.

A bank serving as a syndicate manager would be expected to conduct extensive due diligence

7. See the prompt corrective action at 12 USC 1831o and see subpart D of the Federal Reserve's Regulation H (12 CFR 208).

8. The OCC published final amendments to its investment securities regulation (12 CFR 1) on July 2, 2001 (66 *Fed. Reg.* 34784), and further amended this regulation on June 13, 2012 (77 *Fed. Reg.* 35257). State member banks must comply with the requirements of 12 CFR 1 with respect to investments in municipal and other securities.

to mitigate its underwriting risk. Due diligence should include an assessment of the creditworthiness of the issuer and a full analysis of primary and any contingent sources of repayment. Offering documents should be reviewed for their accuracy and completeness, as well as for full disclosure of all of the offering's relevant risks.

CLASSIFICATION AND APPRAISAL OF SECURITIES

This supervisory guidance[9] (2013 Securities Classification Guidance) outlines principles related to the proper classification of securities without relying on ratings issued by nationally recognized statistical rating organizations (external credit ratings) and applies to state member banks and, in principle, to all institutions supervised by the Federal Reserve. Section 939A of the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 requires each federal agency to remove references to, and requirements of reliance on, external credit ratings in any regulation issued by the agency that requires the assessment of the creditworthiness of a security or money market instrument. Therefore, in 2012, the OCC revised its investment security regulations (12 CFR 1) to remove reliance on external credit ratings. Investment in securities and stock by state member banks are required under the Federal Reserve Act (12 USC 335) and Regulation H (12 CFR 208.21) to comply with the OCC investment security regulations.

The OCC investment security regulations require an institution to monitor investment credit quality through an analytical review of the obligor rather than solely through external credit ratings. Credit quality monitoring provides an opportunity for management to determine whether a security continues to be investment grade or if it has deteriorated and thus requires classification. The 2013 Securities Classification Guidance clarifies the classification standards for securities held by an institution and includes illustrated examples that demonstrate when a security is investment grade and when it is not investment grade. See SR-13-18.

UNIFORM AGREEMENT ON THE CLASSIFICATION AND APPRAISAL OF SECURITIES HELD BY DEPOSITORY INSTITUTIONS (AGREEMENT)

This joint Agreement[10] applies creditworthiness standards to the classification of securities and removes the reliance on credit ratings as a determinant of classification.[11] Specific examples are illustrated to demonstrate the appropriate application of these standards to the classification of securities. This Agreement should be used by depository institutions to assist and facilitate the classification of investment securities.

I. The Classification of Assets in Depository Institutions

The agencies' longstanding asset classification definitions have not changed and are provided as an attachment to the Agreement. This Agreement clarifies how the unique characteristics exhibited by investment securities are to be interpreted within these classification categories.

II. The Appraisal of Securities in Depository Institutions

Fundamental credit analysis is central to understanding the risk associated with all assets and should be applied to investment securities as

9. The October 29, 2013, "Uniform Agreement on the Classification and Appraisal of Securities Held by Depository Institutions" was issued by the Board of Governors of the Federal Reserve System, the Federal Deposit Insurance Corporation, and the Office of the Comptroller of the Currency (OCC) (the agencies).

10. The agencies are issuing this joint Agreement to depository institutions to revise the 2004 Uniform Agreement on the Classification of Assets and Appraisal of Securities Held by Banks and Thrifts (2004 Agreement).

11. For the OCC's final rules, see 77 *Fed. Reg.* 35253 (June 13, 2012). For the OCC's guidance, see 77 *Fed. Reg.* 35259 (June 13, 2012), OCC Bulletin 2012-18, and OCC Bulletin 2012-26. For the Board, refer to SR letter 12-15, "Investing in Securities without Reliance on Nationally Recognized Statistical Rating Organization Ratings." For the FDIC, see Permissible Investments for Federal and State Savings Associations: Corporate Debt Securities, 77 *Fed. Reg.* 43151 (July 24, 2012) and "Guidance on Due Diligence Requirements for Savings Associations in Determining Whether a Corporate Debt Security Is Eligible for Investment," 77 *Fed. Reg.* 43155 (July 24, 2012).

part of a pre-purchase and ongoing due diligence process, as discussed in regulatory guidance. Depository institutions are expected to perform an assessment of creditworthiness that is not solely reliant on external credit ratings provided by a Nationally Recognized Statistical Rating Organizations (NRSRO). Such an assessment may include internal-risk analyses and a risk rating framework, third-party research and analytics (which could include NRSRO credit ratings), default statistics, and other sources of data as appropriate for the particular security. The depth of analysis should be a function of the security's risk characteristics, including its size, nature, and complexity. Individual security analysis should form the basis of any classification determination.

A. Investment Grade Debt Securities

A security is investment grade if the issuer of the security has an adequate capacity to meet financial commitments for the life of the asset.[12] An issuer has adequate capacity to meet its financial commitments if the risk of default is low, and the full and timely repayment of principal and interest is expected.[13] A "pass" rating may be supported by an appropriate credit analysis that documents the quality of an investment grade security, as well as ongoing analyses that demonstrate the obligor's continued repayment capacity. Therefore, investment-grade securities will generally not be classified. However, examiners may use discretion to classify a security when justified by available credit-risk information.

B. Sub-investment Grade Debt Securities

Securities that do not meet the investment grade standard, as defined in applicable regulations, and for which the timely repayment of principal and interest is not certain, have investment characteristics that are distinctly or predominantly speculative and are generally subject to classification. For investment securities, the classification should be based on the instrument's worth as an earning asset assuming it is held to maturity. Therefore, the phrase "liquidation of the debt" in the classification definitions is synonymous with "payment of the obligation in full." Accordingly, if payment of the obligation in full is in question, it is no longer investment grade and management should classify the security.

A *Doubtful* classification is appropriate when an asset has experienced significant credit deterioration and decline in fair value, but estimation of impairment involves significant uncertainty because of various pending factors. These factors could include uncertain financial data that may not permit the accurate forecasting of future cash flows or estimating recovery value. The use of the Doubtful classification is an interim measure until information becomes available to substantiate a more appropriate treatment.

C. Classification and Assessment of Other Types of Debt Securities

Some securities with equity-like risk and return profiles can have highly speculative performance characteristics. When determining classification examiners should evaluate such holdings based upon an assessment of each instrument's facts and circumstances. This Agreement does not apply to securities held in trading accounts that are measured at fair value

12. To determine whether a security to be acquired for investment must be investment grade and the applicable definition of "investment grade," a bank or savings association should consult the regulations of its appropriate federal banking agency, e.g., national banks should look to the OCC's rules at 12 CFR 1. For state-chartered financial institutions, the term "investment grade" may be defined differently across laws and regulations issued by each state, and therefore may be subject to restrictions on investments that are more stringent than those in 12 CFR 1. In addition, for corporate investments, federal and state savings associations are required to determine if the security meets the investment permissibility standards under 12 CFR 362 of the FDIC Rules and Regulations. 12 CFR 362 requires that the issuer has adequate capacity to meet all financial commitments under the security for the projected life of the investment. This standard is consistent with the one adopted by the OCC for national banks defined in 12 CFR 1, which was revised to replace the previous definition of "investment grade." State and federal savings associations had to comply with the FDIC's final rule on January 1, 2013. See 77 *Fed. Reg.* 43151 (July 24, 2012). Under the Federal Reserve Act (12 USC 335) and the Federal Reserve's Regulation H (12 CFR 208.21), state member banks are subject to the same limitations and conditions with respect to the purchasing, selling, underwriting, and holding of investment securities and stock as national banks under the National Banking Act (12 USC 24 (Seventh)) and may only invest in securities to the extent permitted under applicable state law.

13. See, e.g., 12 CFR 1.2(d). Generally, assets that defer payments, even if allowed for in the instrument's contracts, do not meet the "full and timely" repayment standard for investment grade and typically should be classified.

with changes in fair value recognized in current earnings and regulatory capital.[14]

D. Classification of Securities with Credit Deterioration

Depository institutions should continually assess whether securities meet the investment grade standard. Throughout the term of an investment security, its credit-risk profile can decline and improve as credit conditions change. Similarly, an institution's analysis should consider how potential adverse economic conditions can negatively affect an individual security. An institution's management expertise and the sophistication of its risk management and due diligence processes should be commensurate with the complexity of its investment portfolio holdings.

For securities already owned:

Depository institutions should classify a security to accurately reflect its credit-risk profile. For example, a security may meet the criteria for an investment grade rating at purchase and, therefore, be considered a "pass" security. However, as credit conditions deteriorate and ongoing analysis confirms a weakened repayment capacity, the security should be downgraded to Substandard or Doubtful. In situations where the credit condition subsequently improves, the facts and circumstances supported by current analysis may warrant an upgrade to "pass." An upgrade is only appropriate following a period of sustained performance. If the security incurs credit losses,[15] but subsequent analysis shows that all future contractual payments will be received, the security may warrant an upgrade to "pass." Notwithstanding this possibility, securities with realized credit losses do not conform to the investment grade standard and may be subject to restrictions under the agencies' permissible investment regulations or rules governing transfers to affiliates. In situations where credit losses are incurred and analysis does not support the full payment of future contractual amounts, the security cannot be upgraded to "pass."

For potential purchases:

Depository institutions may not purchase investment securities that fail to meet the investment-grade standard as defined by applicable regulations. If pre-purchase analysis reveals previous credit losses in a security under consideration, regardless of its current performance or projected payment analysis, the security does not, and cannot, meet the investment-grade standard.[16] In contrast, if a security experienced credit deterioration and downgrades in the past, but did not sustain actual credit losses, the security's current and projected payment performance may indicate that the security could meet the investment-grade criteria once more. If it is offered for sale at this point and has a history of sustained performance, this security would be considered eligible for purchase by a depository institution.

III. Classification Approach Illustrations

Table 3 that follows outlines examples of how the agencies would apply the uniform classification approach to specific situations. Examiners may use discretion to assess credit risk and assign a classification based on current information, independent of any assigned credit rating.

14. For more information, please refer to the Glossary section of the FFIEC Instructions for Preparation of Consolidated Reports of Condition and Income, which can be found at the following URL: www.fdic.gov/regulations/resources/call/.

15. Credit losses can occur throughout various stages of a security's existence and will depend on a variety of factors, that is, the type of instrument, the ability of the underlying payment source (for example, issuer, underlying asset, and obligors), and the existence of guarantees or credit enhancements. For corporate and municipal obligations, credit losses may represent payment defaults that the issuer does not have the financial capacity to cure. In the case of structured finance products, if a particular class of securities or tranches is no longer fully supported by cash flows from underlying assets, credit losses represent the deficiencies between remaining available cash flow and the principal and interest requirements.

16. One exception to this rule is a security that has undergone a court-supervised legally binding restructure, which has performed for a sustained period following the restructure. This scenario is discussed further in Table 3.

Table 3—Classification Approach Examples

Description of Scenario	*Currently Owned*	*Potential Purchase*[1]
• Credit deterioration caused concerns about potential loss that led to a Substandard classification. • *Credit deterioration is considered temporary.* • Subsequently, the credit condition improved and prior concerns no longer exist. • No actual credit losses were sustained. • Security has performed as agreed to date and is expected to perform to maturity.	Upgrade to "pass."	Eligible for purchase as investment grade.
• Credit deterioration caused concerns about potential loss that led to a Substandard classification. • *An other-than-temporary impairment (OTTI) charge is recognized in earnings; however, all contractual payments were received.* • Subsequent to adverse classification /OTTI determination, the credit condition improved and prior concerns no longer exist. • Current analysis shows that all future contractual payments will be received.	Upgrade to "pass."	Eligible for purchase as investment grade.
• Credit deterioration caused concerns about potential loss that led to a Substandard classification. • *An OTTI charge is recognized in earnings; however, contractual payments are received after recognition of the OTTI charge.* • Subsequently, credit conditions remain weak and analysis shows that *not all* contractual payments are expected to be received.	Substandard classification remains until issuer demonstrates adequate capacity to repay.	Not eligible for purchase as long as current credit conditions remain.

Description of Scenario	*Currently Owned*	*Potential Purchase*[1]
• Credit deterioration caused concerns about potential loss that led to a Substandard classification. • *Credit losses actually incurred.* • A court supervised a legally binding restructure of the obligation. • The issuer demonstrated performance, after the restructure, in accordance with the court approved plan over an appropriate time period. Current analysis shows that *all* future contractual payments will be received.	Upgrade to "pass" after a period of satisfactory performance.	Eligible for purchase as investment grade subsequent to the restructure.
• Credit deterioration caused concerns about potential loss that led to a Substandard classification. • *Credit losses actually incurred.* • Subsequently, the credit condition improved and prior concerns no longer exist. • Subsequent analysis shows that *all* future contractual payments will be received. • Previously incurred credit losses may or may not be recovered.	Substandard classification remains until issuer demonstrates adequate capacity to repay based on sustained period of performance. May be upgraded to "pass" but is not investment grade; considered a nonconforming investment.	Not eligible for purchase; does not meet the criteria for investment grade due to credit losses.
• Credit deterioration caused concerns about potential loss that led to a Substandard classification. • *Credit losses actually incurred.* • Subsequently, credit condition stabilization may, or may not, be evident. • Subsequent analysis shows that *not all* future contractual payments will be received; or analysis does not clearly show no future risk of loss.	Classification remains as long as credit analysis indicates future potential losses. Determine appropriate classification based on credit analysis.	Not eligible for purchase; does not meet the criteria for investment grade due to credit losses.

1. Depository institutions contemplating an investment purchase are not expected to be knowledgeable of the classification and impairment accounting treatment by the seller. However, all salient information leading to investment-grade determination should be gathered and analyzed before a purchase is consummated.

Note to the Agreement: Any upgrade in classification should follow a sustained period of performance and be based on improvement in credit condition and an analysis that supports that all future contractual payments will be received. Generally, the performance period should cover multiple payments as determined by the security's payment structure: monthly, quarterly, annually.

* * * *

CLASSIFICATION OF ASSETS IN EXAMINATIONS

Classification units are designated as Substandard, Doubtful, and Loss. The following definitions apply to assets adversely classified for supervisory purposes:

- A *Substandard* asset is inadequately protected by the current sound worth and paying capacity of the obligor or of the collateral pledged, if any. Assets so classified must have a well-defined weakness or weaknesses that jeopardize the liquidation of the debt. They are characterized by the distinct possibility that the institution will sustain some loss if the deficiencies are not corrected.
- An asset classified *Doubtful* has all the weaknesses inherent in one classified Substandard, with the added characteristic that the weaknesses make collection or liquidation in full, on the basis of currently existing facts, conditions, and values, highly questionable and improbable.
- Assets classified *Loss* are considered uncollectible and of such little value that their continuance as bankable assets is not warranted. This classification does not mean that the asset has absolutely no recovery or salvage value but rather that it is not practical or desirable to defer writing off this basically worthless asset even though partial recovery may be effected in the future. Amounts classified Loss should be promptly charged off.

FOREIGN DEBT SECURITIES

The Interagency Country Exposure Review Committee (ICERC) assigns transfer-risk ratings for cross-border exposures. Examiners should use the guidelines in this uniform agreement rather than ICERC transfer-risk ratings in assigning security classifications, except when the ICERC ratings result in a more-severe classification.

CREDIT-RISK-MANAGEMENT FRAMEWORK FOR SECURITIES

When an institution has developed an accurate, robust, and documented credit-risk-management framework to analyze its securities holdings, examiners may choose to depart from the general debt security classification guidelines in favor of individual asset review in determining whether to classify those holdings. A robust credit-risk-management framework entails appropriate pre-acquisition credit due diligence by qualified staff that grades a security's credit risk based on an analysis of the repayment capacity of the issuer and the structure and features of the security. It also involves the ongoing monitoring of holdings to ensure that risk ratings are reviewed regularly and updated in a timely fashion when significant new information is received.

The credit analysis of securities should vary based on the structural complexity of the security, the type of collateral, and external ratings. The credit-risk-management framework should reflect the size, complexity, quality, and risk characteristics of the securities portfolio; the risk appetite and policies of the institution; and the quality of its credit-risk-management staff, and should reflect changes to these factors over time. Policies and procedures should identify the extent of credit analysis and documentation required to satisfy sound credit-risk-management standards.

TRANSFERS OF LOW-QUALITY SECURITIES AND ASSETS

The purchase of low-quality assets by a bank from an affiliated bank or nonbank affiliate is a violation of section 23A of the Federal Reserve Act and Regulation W. The transfer of low-quality securities from one depository institution to another may be done to avoid detection and classification dur-ing regulatory examinations; this type of transfer may be accomplished through participations, purchases or sales, and asset swaps with other affiliated or nonaffiliated financial institutions. Broadly defined, low-quality securities include depreciated or sub-investment-quality securities. Situations in which an institution appears to be concealing low-quality securities to avoid examination scrutiny and possible classification represent an unsafe and unsound activity.

Any situations involving the transfer of low-quality or questionable securities should be brought to the attention of Reserve Bank supervisory personnel who, in turn, should notify the local office of the primary federal regulator of the other depository institution involved in the transaction. For example, if an examiner determines that a state member bank or holding company has transferred or intends to transfer low-quality securities to another depository institution, the Reserve Bank should notify the recipient institution's primary federal regulator of the transfer. The same notification requirement holds true if an examiner determines that a state member bank or holding company has acquired or intends to acquire low-quality securities from another depository institution. This procedure applies to transfers involving savings associations and savings banks, as well as commercial banking organizations.

Situations may arise when transfers of securities are undertaken for legitimate reasons. In these cases, the securities should be properly recorded on the books of the acquiring institution at their fair value on the date of transfer. If the transfer was with the parent holding company or a nonbank affiliate, the records of the affiliate should be reviewed as well.

PERMISSIBLE STOCK HOLDINGS

The purchase of securities convertible into stock at the option of the issuer is prohibited (12 CFR 1.6). Other than as specified in table 4, banks are prohibited from investing in stock.

Table 4—Permitted Stock Holdings by Member Banks*

Type of stock	*Authorizing statute and limitation*
Federal Reserve Bank	Federal Reserve Act, sections 2 and 9 (12 USC 282 and 321) and Regulation I (12 CFR 209). Subscription must equal 6 percent of the bank's capital and surplus, 3 percent paid in.
Safe deposit corporation	12 USC 24. 15 percent of capital and surplus.
Corporation holding bank premises	Federal Reserve Act, section 24A (12 USC 371(d)). 100 percent of capital stock. Limitation includes total direct and indirect investment in bank premises in any form (such as loans). Maximum limitation may be exceeded with permission of the Federal Reserve Bank for state member banks and the Comptroller of the Currency for national banks.
Small business investment company	Small Business Investment Act of August 21, 1958, section 302(b) (15 USC 682(b)). Banks are prohibited from acquiring shares of such a corporation if, upon making the acquisition, the aggregate amount of shares in small business investment companies then held by the bank would exceed 5 percent of its capital and surplus.
Edge Act and agreement corporations and foreign banks	Federal Reserve Act, sections 25 and 25A (12 USC 601 and 618). The aggregate amount of stock held in all such corporations may not exceed 10 percent of the member bank's capital and surplus. Also, the member bank must possess capital and surplus of $1 million or more before acquiring investments pursuant to section 25.
Bank service company	Bank Service Corporation Act of 1958, section 2 (12 USC 1861 and 1862). (Redesignated as Bank Service Company Act.) 10 percent of paid in and unimpaired capital and surplus. Limitation includes total direct and indirect investment in any form. No insured banks shall invest more than 5 percent of their total assets.
Federal National Mortgage Corporation	National Housing Mortgage Association Act of 1934, section 303(f) (12 USC 1718(f)). No limit.
Bank's own stock	12 USC 83. Shares of the bank's own stock may not be acquired or taken as security for loans, except as necessary to prevent loss from a debt previously contracted in good faith. Stock so acquired must be disposed of within six months of the date of acquisition.
Corporate stock acquired through debt previously contracted (DPC) transaction	Case law has established that stock of any corporation debt may be acquired to prevent loss from a debt previously contracted in good faith. See Oppenheimer v. Harriman National Bank & Trust Co. of the City of New York, 301 US 206 (1937). However, if the stock is not disposed of within a reasonable time period, it loses its status as a DPC transaction and becomes a prohibited holding under 12 USC 24(7).
Operations subsidiaries	12 CFR 250.141. Permitted if the subsidiary is to perform, at locations at which the bank is authorized to engage in business, functions that the bank is empowered to perform directly.

Type of stock	*Authorizing statute and limitation*
State housing corporation incorporated in the state in which the bank is located	12 USC 24. 5 percent of its capital stock, paid in and unimpaired, plus 5 percent of its unimpaired surplus fund when considered together with loans and commitments made to the corporation.
Agricultural credit corporation	12 USC 24. 20 percent of capital and surplus unless the bank owns over 80 percent. No limit if the bank owns 80 percent or more.
Government National Mortgage Association	12 USC 24. No limit.
Student Loan Marketing Association	12 USC 24. No limit.
Bankers' banks	12 USC 24. 10 percent of capital stock and paid-in and unimpaired surplus. Bankers' banks must be insured by the FDIC, owned exclusively by depository institutions, and engaged solely in providing banking services to other depository institutions and their officers, directors, or employees. Ownership shall not result in any bank's acquiring more than 5 percent of any class of voting securities of the bankers' bank.
Mutual funds	12 USC 24(7). Banks may invest in mutual funds as long as the underlying securities are permissible investments for a bank.
Community development corporation	Federal Reserve Act, section 9, paragraph 23 (12 USC 338a). Up to 10 percent of capital stock and surplus[1] subject to 12 CFR 208.22.

* This information precedes November 2004.

1. Section 208.2(d) of Regulation H defines "capital stock and surplus" to mean tier 1 and tier 2 capital included in a member bank's risk-based capital and the balance of a member bank's allowance for loan and lease losses *not included in its tier 2 capital for calculation of risk-based capital,* based on the bank's most recent consolidated Report of Condition and Income. Section 9 of the Federal Reserve Act (12 USC 338a) provides that the Board has the authority under this law to approve public-welfare or other such investments, up to the sum of 5 percent of paid-in and unimpaired capital stock and 5 percent of unimpaired surplus, unless the Board determines by order that the higher amount will pose no significant risk to the affected deposit insurance fund, and the bank is adequately capitalized. In no case may the aggregate of such investments exceed 10 percent of the bank's combined capital stock and surplus.

LIMITED EQUITY INVESTMENTS

Investing in the equity of nonfinancial companies and lending to private-equity-financed companies (that is, companies financed by private equity) have emerged as increasingly important sources of earnings and business relationships at a number of banking organizations (BOs). In this guidance, the term *private equity* refers to shared-risk investments outside of publicly quoted securities and also covers activities such as venture capital, leveraged buyouts, mezzanine financing, and holdings of publicly quoted securities obtained through these activities. While private equity securities can contribute substantially to earnings, these activities can give rise to increased volatility of both earnings and capital. The supervisory guidance in SR-00-9 on private equity investments and merchant banking activities is concerned with a BO's proper risk-focused management of its private equity investment activities so that these investments do not adversely affect the safety and soundness of the affiliated insured depository institutions.

An institution's board of directors and senior management are responsible for ensuring that the risks associated with private equity activities do not adversely affect the safety and soundness of the banking organization or any other affiliated insured depository institutions. To this end, sound investment and risk-management practices and strong capital positions are critical elements in the prudent conduct of these activities.

Legal and Regulatory Authority

Depository institutions are able to make limited equity investments under the following statutory and regulatory authorities:

- Depository institutions may make equity investments through small business investment corporations (SBICs). Investments made by SBIC subsidiaries are allowed up to a total of 50 percent of a portfolio company's outstanding shares, but can only be made in companies defined as a small business, according to SBIC rules. A bank's aggregate investment in the stock of SBICs is limited to 5 percent of the bank's capital and surplus.
- Under Regulation K, which implements sections 25 and 25A of the Federal Reserve Act (FRA) and section 4(c)(13) of the Bank Holding Company Act of 1956 (BHC Act), a depository institution may make portfolio investments in foreign companies, provided the investments do not in the aggregate exceed 25 percent of the tier 1 capital of the bank holding company. In addition, individual investments must not exceed 19.9 percent of a portfolio company's voting shares or 40 percent of the portfolio company's total equity.[17]

Equity investments made under the authorities listed above may be in publicly traded securities or privately held equity interests. The investment may be made as a direct investment in a specific portfolio company, or it may be made indirectly through a pooled investment vehicle, such as a private equity fund.[18] In general, private equity funds are investment companies, typically organized as limited partnerships, that pool capital from third-party investors to invest in shares, assets, and ownership interests in companies for resale or other disposition. Private-equity-fund investments may provide seed or early-stage investment funds to start-up companies or may finance changes in ownership, middle-market business expansions, and mergers and acquisitions.

17. Shares of a corporation held in trading or dealing accounts or under any other authority are also included in the calculation of a depository institution's investment. Portfolio investments of $25 million or less can be made without prior notice to the Board. See Regulation K for more detailed information.

18. For additional stock holdings that state member banks are authorized to hold, see table 4.

Oversight by the Board of Directors and Senior Management

Equity investment activities require the active oversight of the board of directors and senior management of the depository institution that is conducting the private equity investment activities. The board should approve portfolio objectives, overall investment strategies, and general investment policies that are consistent with the institution's financial condition, risk profile, and risk tolerance. Portfolio objectives should address the types of investments, expected business returns, desired holding periods, diversification parameters, and other elements of sound investment-management oversight. Board-approved objectives, strategies, policies, and procedures should be documented and clearly communicated to all the personnel involved in their implementation. The board should actively monitor the performance and risk profile of equity investment business lines in light of the established objectives, strategies, and policies.

The board also should ensure that there is an effective management structure for conducting the institution's equity activities, including adequate systems for measuring, monitoring, controlling, and reporting on the risks of equity investments. The board should approve policies that specify lines of authority and responsibility for both acquisitions and sales of investments. The board should also approve (1) limits on aggregate investment and exposure amounts; (2) the types of investments (for example, direct and indirect, mezzanine financing, start-ups, seed financing); and (3) appropriate diversification-related aspects of equity investments such as industry, sector, and geographic concentrations.

For its part, senior management must ensure that there are adequate policies, procedures, and management information systems for managing equity investment activities on a day-to-day and longer-term basis. Management should set clear lines of authority and responsibility for making and monitoring investments and for managing risk. Management should ensure that an institution's equity investment activities are conducted by competent staff whose technical knowledge and experience are consistent with the scope of the institution's activities.

Management of the Investment Process

Depository institutions engaging in equity investment activities should have a sound process for executing all elements of investment management, including initial due diligence, periodic reviews of holdings, investment valuation, and realization of returns. This process requires appropriate policies, procedures, and management information systems, the formality of which should be commensurate with the scope, complexity, and nature of an institution's equity investment activities. The supervisory review should be risk-focused, taking into account the institution's stated tolerance for risk, the ability of senior management to govern these activities effectively, the materiality of activities in comparison to the institution's risk profile, and the capital position of the institution.

Depository institutions engaging in equity investment activities require effective policies that (1) govern the types and amounts of investments that may be made, (2) provide guidelines on appropriate holding periods for different types of investments, and (3) establish parameters for portfolio diversification. Investment strategies and permissible types of investments should be clearly identified. Portfolio-diversification policies should identify factors pertinent to the risk profile of the investments being made, such as industry, sector, geographic, and market factors. Policies establishing expected holding periods should specify the general criteria for liquidation of investments and guidelines for the divestiture of an underperforming investment. Decisions to liquidate underperforming investments are necessarily made on a case-by-case basis considering all relevant factors. Policies and procedures, however, should require more frequent review and analysis for investments that are performing poorly or that have been in a portfolio for a considerable length of time, as compared with the other investments overall.

Policies and Limits

Policies should identify the aggregate exposure that the institution is willing to accept, by type and nature of investment (for example, direct or indirect, industry sectors). The limits should include funded and unfunded commitments. Formal and clearly articulated hedging policies and strategies should identify limits on hedged exposures and permissible hedging instruments.

Procedures

Management and staff compensation play a critical role in providing incentives and controlling risks within a private equity business line. Clear policies should govern compensation arrangements, including co-investment structures and staff sales of portfolio company interests.

Institutions have different procedures for assessing, approving, and reviewing investments based on the size, nature, and risk profile of an investment. The procedures used for direct investments may be different than those used for indirect investments made through private equity funds. For example, different levels of due diligence and senior management approvals may be required. When constructing management infrastructures for conducting these investment activities, management should ensure that operating procedures and internal controls appropriately reflect the diversity of investments.

The potential diversity in investment practice should be recognized when conducting supervisory reviews of the equity investment process. The supervisory focus should be on the appropriateness of the process employed relative to the risk of the investments made and on the materiality of this business line to the overall soundness of the depository institution, as well as the potential impact on affiliated depository institutions. The procedures employed should include the following:

- *Investment analysis and approvals, including well-founded analytical assessments of investment opportunities and formal investment-approval processes.*
  The methods and types of analyses conducted should be appropriately structured to adequately assess the specific risk profile, industry dynamics, management, specific terms and conditions of the investment opportunity, and other relevant factors. All elements of the analytical and approval processes, from initial review through the formal investment decision, should be documented and clearly

understood by the staff conducting these activities.

The evaluation of existing and potential investments in private equity funds should involve an assessment of the adequacy of a fund's structure. Consideration should be given to the (1) management fees, (2) carried interest and its computation on an aggregate portfolio basis,[19] (3) sufficiency of capital commitments that are provided by the general partners in providing management incentives, (4) contingent liabilities of the general partner, (5) distribution policies and wind-down provisions, and (6) performance benchmarks and return-calculation methodologies.

- *Investment-risk ratings.*
  Internal risk ratings should assign each investment a rating based on factors such as the nature of the company, strength of management, industry dynamics, financial condition, operating results, expected exit strategies, market conditions, and other pertinent factors. Different rating factors may be appropriate for indirect investments and direct investments.
- *Periodic and timely investment strategy and performance (best, worst, and probable case assessment) reviews of equity investments, conducted at the individual and portfolio levels.*
  Management should ensure that periodic and timely review of the institution's equity investments takes place at both individual-investment and portfolio levels. Depending on the size, complexity, and risk profile of the investment, reviews should, when appropriate, include factors such as—
  — the history of the investment, including the total funds approved;
  — commitment amounts, principal-cash-investment amounts, cost basis, carrying value, major-investment cash flows, and supporting information including valuation rationales and methodologies;
  — the current actual percentage of ownership in the portfolio company on both a diluted and undiluted basis;
  — a summary of recent events and current outlook;
  — the recent financial performance of portfolio companies, including summary compilations of performance and forecasts, historical financial results, current and future plans, key performance metrics, and other relevant items;
  — internal investment-risk ratings and rating-change triggers;
  — exit strategies, both primary and contingent, and expected internal rates of return upon exit; and
  — other pertinent information for assessing the appropriateness, performance, and expected returns of investments.

  Portfolio reviews should include an aggregation of individual investment-risk and performance ratings; an analysis of appropriate industry, sector, geographic, and other pertinent concentrations; and total portfolio valuations. Portfolio reports that contain the cost basis, carrying values, estimated fair values, valuation discounts, and other factors summarizing the status of individual investments are integral tools for conducting effective portfolio reviews. Reports containing the results of all reviews should be available to supervisors for their inspection.

  Given the inherent uncertainties in equity investment activities, institutions should include in their periodic reviews consideration of the best case, worst case, and probable case assessments of investment performance. These reviews should evaluate changes in market conditions and the alternative assumptions used to value investments—including expected and contingent exit strategies. Major assumptions used in valuing investments and forecasting performance should be identified. These assessments need not be confined to quantitative analyses of potential losses, but may also include qualitative analyses. The formality and sophistication of investment reviews should be appropriate for the overall level of risk the depository institution incurs from this business line.
- *Assessment of the equity investment valuation and accounting policies and the procedures used, their impact on earnings, and the extent of their compliance with generally accepted accounting principles (GAAP).*
  Valuation and accounting policies and procedures can have a significant impact on the earnings of institutions engaged in equity investment activities. Many equity investments are made in privately held companies, for which independent price quotations are either unavailable or not available in sufficient volume to provide meaningful liquidity or a

19. The carried interest is the share of a partnership's return that is received by the general partners or investment advisers.

market valuation. Valuations of some equity investments may involve a high degree of judgment on the part of management or the skillful use of peer comparisons. Similar circumstances may exist for publicly traded securities that are thinly traded or subject to resale and holding-period restrictions, or when the institution holds a significant block of a company's shares. It is of paramount importance that an institution's policies and procedures on accounting and valuation methodologies for equity investments be clearly articulated.

Under GAAP, equity investments held by investment companies, held by broker-dealers, or maintained in the trading account are reported at fair value, with any unrealized appreciation or depreciation included in earnings and flowing to tier 1 capital. For some holdings, fair value may reflect adjustments for liquidity and other factors.

Equity investments that are not held in investment companies, by broker-dealers, or in the trading account and that have a readily determinable fair value (quoted market price) are generally reported as available-for-sale (AFS). They are marked to market with unrealized appreciation or depreciation recognized in GAAP-defined "comprehensive income" but not earnings. Appreciation or depreciation flows to equity, but, for regulatory capital purposes only, depreciation is included in tier 1 capital.[20] Equity investments without readily determinable fair values generally are held at cost, subject to write-downs for impairments to the value of the asset. Impairments of value should be promptly and appropriately recognized and written down.

In determining fair value, the valuation methodology plays a critical role. Formal valuation and accounting policies should be established for investments in public companies; direct private investments; indirect fund investments; and, where appropriate, other types of investments with special characteristics. When establishing valuation policies, institutions should consider market conditions, taking account of lockout provisions, the restrictions of Securities and Exchange Commission Rule 144, liquidity features, the dilutive effects of warrants and options, and industry characteristics and dynamics.

Accounting and valuation of equity investments should be subject to regular periodic review. In all cases, valuation reviews should produce documented audit trails that are available to supervisors and auditors. These reviews should assess the consistency of the methodologies used in estimating fair value.

Accounting and valuation treatments should be assessed in light of their potential for abuse, such as through the inappropriate management or manipulation of reported earnings on equity investments. For example, high valuations may produce overstatements of earnings through gains and losses on investments reported at "fair value." On the other hand, inappropriately understated valuations can provide vehicles for smoothing earnings by recognizing gains on profitable investments when an institution's earnings are otherwise under stress. While reasonable people may disagree on valuations given to illiquid private equity investments, institutions should have rigorous valuation procedures that are applied consistently.

Increasingly, equity investments are contributing to an institution's earnings. The potential impact of these investments on the composition, quality, and sustainability of overall earnings should be appropriately recognized and assessed by both management andsupervisors.

- *A review of assumed and actual equity-investment exit strategies and the extent of their impact on the returns and reported earnings.*
  The principal means of exiting an equity investment in a privately held company include initial public stock offerings, sales to other investors, and share repurchases. An institution's assumptions on exit strategies can significantly affect the valuation of the investment. Management should periodically review investment exit strategies, with particular focus on larger or less-liquid investments.

- *Policies and procedures governing the sale, exchange, transfer, or other disposition of equity investments.*
  Policies and procedures to govern the sale, exchange, transfer, or other disposition of the institution's investments should state clearly the levels of management or board approval required for the disposition of investments.

20. Under the risk-based capital rule, supplementary (tier 2) capital may include up to 45 percent of pretax unrealized holding gains (that is, the excess, if any, of the fair value over historical cost) on AFS equity securities with readily determinable fair values.

- *Internal methods for allocating capital based on the risk inherent in the equity investment activities, including the methods for identifying all material risks and their potential impact on the safety and soundness of the institution.*
  Consistent with SR-99-18, depository institutions that are conducting material equity investment activities should have internal methods for allocating economic capital. These methods should be based on the risk inherent in the equity investment activities, including the identification of all material risks and their potential impact on the institution. Organizations that are substantially engaged in these investment activities should have strong capital positions supporting their equity investments. The economic capital that organizations allocate to their equity investments should be well in excess of the current regulatory minimums applied to lending activities. The amount of percentage of capital dedicated to the equity investment business line should be appropriate to the size, complexity, and financial condition of the institution. Assessments of capital adequacy should cover not only the institution's compliance with regulatory capital requirements and the quality of regulatory capital, but should also include an institution's methodologies for internally allocating economic capital to this business line.

Internal Controls

An adequate system of internal controls, with appropriate checks and balances and clear audit trails, is critical to conducting equity investment activities effectively. Appropriate internal controls should address all the elements of the investment-management process. The internal controls should focus on the appropriateness of existing policies and procedures; adherence to policies and procedures; and the integrity and adequacy of investment valuations, risk identification, regulatory compliance, and management reporting. Any departures from policies and procedures should be documented and reviewed by senior management, and this documentation should be available for examiner review.

As with other financial activities, the assessments of an organization's compliance with both written and implied policies and procedures should be independent of line decision-making functions to the fullest extent possible. When fully independent reviews are not possible in smaller, less-complex institutions, alternative checks and balances should be established. These alternatives may include random internal audits, reviews by senior management who are independent of the function, or the use of outside third parties.

Documentation

Documentation of key elements of the investment process, including initial due diligence, approval reviews, valuations, and dispositions, is an integral part of any private equity investment internal control system. This documentation should be accessible to supervisors.

Legal Compliance

An institution's internal controls should focus on compliance with all federal laws and regulations that are applicable to the institution's investment activities. Regulatory compliance requirements, in particular, should be incorporated into internal controls so managers outside of the compliance or legal functions understand the parameters of permissible investment activities.

To ensure compliance with federal securities laws, institutions should establish policies, procedures, and other controls addressing insider trading. A "restricted list" of securities for which the institution has inside information is one example of a widely used method for controlling the risk of insider trading. In addition, control procedures should be in place to ensure that appropriate reports are filed with functional regulators.

The limitations in sections 23A and 23B of the FRA, which deal with transactions between a depository institution and its affiliates, are presumed by the Gramm-Leach-Bliley Act (GLB Act) to apply to certain transactions between a depository institution and any portfolio company in which an affiliate of the institution owns at least a 15 percent equity interest. This ownership threshold is lower than the ordinary definition of an affiliate, which is typically 25 percent.

Compensation

Often, key employees in the private equity investment units of banking organizations may co-invest in the direct or fund investments made by the unit. These co-investment arrangements can be an important incentive and risk-control technique, and they can help to attract and retain qualified management. However, "cherry picking," or selecting only certain investments for employee participation while excluding others, should be discouraged.

The employees' co-investment may be funded through loans from the depository institution or its affiliates, which, in turn, would hold a lien against the employees' interests. The administration of the compensation plan should be appropriately governed pursuant to formal agreements, policies, and procedures. Among other matters, policies and procedures should address the terms and conditions of employee loans and the sales of participants' interests before the release of the lien.

Disclosure of Equity Investment Activities

Given the important role that market discipline plays in controlling risk, institutions should ensure that they adequately disclose the information necessary for the markets to assess the institution's risk profile and performance in this business line. Indeed, it is in the institution's interest, as well as that of its creditors and shareholders, to publicly disclose information about earnings and risk profiles. Institutions are encouraged to disclose in public filings information on the type and nature of investments, portfolio concentrations, returns, and their contributions to reported earnings and capital. Supervisors should fully review and use these disclosures, as well as periodic regulatory reports filed by publicly held banking organizations, as part of the information they review routinely. The following topics are relevant for public disclosure, though disclosures on each of these topics may not be appropriate, relevant, or sufficient in every case:

- the size of the portfolio
- the types and nature of investments (for example, direct or indirect, domestic or international, public or private, equity or debt with conversion rights)
- initial cost, carrying value, and fair value of investments and, when applicable, comparisons to publicly quoted share values of portfolio companies
- the accounting techniques and valuation methodologies, including key assumptions and practices affecting valuation and changes in those practices
- the realized gains (or losses) arising from sales and unrealized gains (or losses)
- insights regarding the potential performance of equity investments under alternative market conditions

Lending to or Engaging in Other Transactions with Portfolio Companies

Additional risk-management issues may arise when a depository institution or an affiliate lends to or has other business relationships with (1) a company in which the depository institution or an affiliate has invested (that is, a portfolio company), (2) the general partner or manager of a private equity fund that has also invested in a portfolio company, or (3) a private-equity-financed company in which the banking institution does not hold a direct or indirect ownership interest but which is an investment or portfolio company of a general partner or fund manager with which the banking organization has other investments. Given the potentially higher-than-normal risk attributes of these lending relationships, institutions should devote special attention to ensuring that the terms and conditions of such relationships are at arm's length and are consistent with the lending policies and procedures of the institution. Similar issues may arise in the context of derivatives transactions with or guaranteed by portfolio companies and general partners. Lending and other business transactions between an insured depository institution and a portfolio company that meet the definition of an affiliate must be negotiated on an arm's-length basis, in accordance with section 23B of the FRA.

When a depository institution lends to a private-equity-financed company in which it has no equity interest but in which the borrowing company is a portfolio investment of private equity fund managers or general partners with which the institution may have other private-equity-related relationships, care must be taken to ensure that the extension of credit is conducted on reasonable terms. In some cases, lenders may wrongly assume that the general partners or another third party implicitly guarantees or stands behind such credits. Reliance on implicit guarantees or comfort letters should not substitute for reliance on a sound borrower that is expected to service its debt with its own resources. As with any type of credit extension, absent a written contractual guarantee, the credit quality of a private equity fund manager, general partner, or other third party should not be used to upgrade the internal credit-risk rating of the borrower company or to prevent the classification or special mention of a loan.

When an institution lends to a portfolio company in which it has a direct or an indirect interest, implications arise under sections 23A and 23B of the FRA, which govern credit-related transactions and asset purchases between a depository institution and its affiliates. Section 23A applies to transactions between a depository institution and any company in which the institution's holding company or shareholders own at least 25 percent of the company's voting shares. The GLB Act extends this coverage by establishing a presumption that a portfolio company is an affiliate of a depository institution if the financial holding company (FHC) uses the merchant banking authority of the GLB Act to own or control more than 15 percent of the equity of the company. Institutions should obtain the assistance of counsel in determining whether such issues exist or would exist if loans were extended to a portfolio company, general partner, or manager. Supervisors, including examiners, should ensure that the institution has conducted a proper review of these issues to avoid violations of law or regulations.

INVESTMENT SECURITIES' RISKS

Market Risk

Market risk is the exposure of an institution's financial condition to adverse movements in the market rates or prices of its holdings before such holdings can be liquidated or expeditiously offset. It is measured by assessing the effect of changing rates or prices on either the earnings or economic value of an individual instrument, a portfolio, or the entire institution. Although many banking institutions focus on carrying values and reported earnings when assessing market risk at the institutional level, other measures focusing on total returns and changes in economic or fair values better reflect the potential market-risk exposure of institutions, portfolios, and individual instruments. Changes in fair values and total returns directly measure the effect of market movements on the economic value of an institution's capital and provide significant insights into their ultimate effects on the institution's long-term earnings. Institutions should manage and control their market risks using both an earnings and an economic-value approach, and at least on an economic or fair-value basis.

When evaluating capital adequacy, examiners should consider the effect of changes in market rates and prices on the economic value of the institution by evaluating any unrealized losses in an institution's securities or derivative positions. This evaluation should assess the ability of the institution to hold its positions and function as a going concern if recognition of unrealized losses would significantly affect the institution's capital ratios. Examiners also should consider the impact that liquidating positions with unrealized losses may have on the institution's prompt-corrective-action capital category.

Market-risk limits should be established for both the acquisition and ongoing management of an institution's securities and derivative holdings and, as appropriate, should address exposures for individual instruments, instrument types, and portfolios. These limits should be integrated fully with limits established for the entire institution. At the institutional level, the board of directors should approve market-risk exposure limits that specify percentage changes in the economic value of capital and, when applicable, in the projected earnings of the institution under various market scenarios. Similar and complementary limits on the volatility of prices or fair value should be established at the appropriate instrument, product-type, and portfolio levels, based on the institution's willingness to accept market risk. Limits on the variability of effective maturities may also be desirable for certain types of instruments or portfolios.

The scenarios an institution specifies for assessing the market risk of its securities and derivative products should be sufficiently rigorous to capture all meaningful effects of any options. For example, in assessing interest-rate risk, scenarios such as 100, 200, and 300 basis point parallel shifts in yield curves should be considered as well as appropriate nonparallel shifts in structure to evaluate potential basis, volatility, and yield curve risks.

Accurately measuring an institution's market risk requires timely information about the current carrying and market values of its securities and derivative holdings. Accordingly, institutions should have market-risk measurement systems commensurate with the size and nature of these holdings. Institutions with significant holdings of highly complex instruments should ensure that they have independent means to value their positions. Institutions using internal models to measure risk should validate the models according to the standards in SR-11-7. This should include a periodic review of all elements of the modeling process, including its assumptions and risk-measurement techniques. Institutions relying on third parties for market-risk measurement systems and analyses should fully understand the assumptions and techniques used by the third party.

Institutions should evaluate the market-risk exposures of their securities and derivative positions and report this information to their boards of directors regularly, not less frequently than each quarter. These evaluations should assess trends in aggregate market-risk exposure and the performance of portfolios relative to their established objectives and risk constraints. They also should identify compliance with board-approved limits and identify any exceptions to established standards. Examiners should ensure that institutions have mechanisms to detect and adequately address exceptions to limits and guidelines. Examiners should also determine that management reporting on market risk appropriately addresses potential exposures to basis risk, yield curve changes, and other factors pertinent to the institution's holdings. In this connection, examiners should assess an institution's compliance with broader guidance for managing interest-rate risk in a consolidated organization.

Complex and illiquid instruments often involve greater market risk than broadly traded, more liquid securities. Often, this higher potential market risk arising from illiquidity is not captured by standardized financial-modeling techniques. This type of risk is particularly acute for instruments that are highly leveraged or that are designed to benefit from specific, narrowly defined market shifts. If market prices or rates do not move as expected, the demand for these instruments can evaporate. When examiners encounter such instruments, they should review how adequately the institution has assessed its potential market risks. If the risks from these instruments are material, the institution should have a well-documented process for stress testing their value and liquidity assumptions under a variety of market scenarios.

Liquidity Risk

Banks face two types of liquidity risk in their securities and derivative activities: risks related to specific products or markets and risks related to the general funding of their activities. The former, market-liquidity risk, is the risk that an institution cannot easily unwind or offset a particular position at or near the previous market price because of inadequate market depth or disruptions in the marketplace. The latter, funding-liquidity risk, is the risk that the bank will be unable to meet its payment obligations on settlement dates. Since neither type of liquidity risk is unique to securities and derivative activities, management should evaluate these risks in the broader context of the institution's overall liquidity.

When specifying permissible securities and derivative instruments to accomplish established objectives, institutions should take into account the size, depth, and liquidity of the markets for specific instruments, and the effect these characteristics may have on achieving an objective. The market liquidity of certain types of instruments may make them entirely inappropriate for achieving certain objectives. Moreover, institutions should consider the effects that market risk can have on the liquidity of different types of instruments. For example, some government-agency securities may have embedded options that make them highly illiquid during periods of market volatility and stress, despite their high credit rating. Accordingly, institutions should clearly articulate the market-liquidity characteristics of instruments to be used in accomplishing institutional objectives.

Operating and Legal Risks

Operating risk is the risk that deficiencies in information systems or internal controls will result in unexpected loss. Some specific sources of operating risk include inadequate procedures, human error, system failure, or fraud. Inaccurately assessing or controlling operating risks is one of the more likely sources of problems facing institutions involved in securities and derivative activities.

Adequate internal controls are the first line of defense in controlling the operating risks involved in an institution's securities and derivative activities. Of particular importance are internal controls to ensure that persons executing transactions are separated from those individuals responsible for processing contracts, confirming transactions, controlling various clearing accounts, approving the accounting methodology or entries, and performing revaluations.

Institutions should have approved policies, consistent with legal requirements and internal policies, that specify documentation requirements for transactions and formal procedures for saving and safeguarding important documents. Relevant personnel should fully understand the requirements. Examiners should also consider the extent to which institutions evaluate and control operating risks through internal audits, stress testing, contingency planning, and other managerial and analytical techniques.

An institution's operating policies should establish appropriate procedures to obtain and maintain possession or control of instruments purchased. Institutions should ensure that transactions consummated orally are confirmed as soon as possible. As noted earlier in this section, banking organizations should, to the extent possible, seek to diversify the firms used for their safekeeping arrangements to avoid concentrations of assets or other types of risk.

Legal risk is the risk that contracts are not legally enforceable or documented correctly. This risk should be limited and managed through policies developed by the institution's legal counsel. At a minimum, guidelines and processes should be in place to ensure the enforceability of counterparty agreements. Examiners should determine whether an institution is adequately evaluating the enforceability of its agreements before individual transactions are consummated. Institutions should also ensure that the counterparty has sufficient authority to enter into the transaction and that the terms of the agreement are legally sound. Institutions should further ascertain that their netting agreements are adequately documented, have been executed properly, and are enforceable in all relevant jurisdictions. Institutions should know relevant tax laws and interpretations governing the use of netting instruments.

An institution's policies should also provide conflict-of-interest guidelines for employees who are directly involved in purchasing securities from and selling securities to securities dealers on behalf of their institution. These guidelines should ensure that all directors, officers, and employees act in the best interest of the institution. The board of directors may wish to adopt policies prohibiting these employees from engaging in personal securities transactions with the same securities firms the institution uses without the specific prior approval of the board. The board of directors may also wish to adopt a policy applicable to directors, officers, and employees that restricts or prohibits them from receiving gifts, gratuities, or travel expenses from approved securities dealer firms and their personnel.

INTERNATIONAL DIVISION INVESTMENTS

The same types of instruments exist in international banking as in domestic banking. Securities and derivative contracts may be acquired by a bank's international division and overseas branches for its own account, and foreign equity investments may be held by the bank directly or through Edge Act corporations. The investments held by most international divisions are predominately securities issued by various governmental entities of the countries in which the bank's foreign branches are located. These investments are held for a variety of purposes:

- They are required by various local laws.
- They are used to meet foreign reserve requirements.
- They result in reduced tax liabilities.
- They enable the bank to use new or increased re-discount facilities or benefit from greater deposit or lending authorities.
- They are used by the bank as an expression of "goodwill" toward a country.

The examiner should be familiar with the applicable sections of Regulation K (12 CFR 211) governing a member bank's international investment holdings, as well as other regulations discussed in this section. Because of the mandatory investment requirements of some countries, securities held cannot always be as "liquid" and "readily marketable" as required in domestic banking. However, the amount of a bank's "mandatory" holdings will normally be a relatively small amount of its total investments or capital funds.

A bank's international division may also hold securities strictly for investment purposes; these are expected to provide a reasonable rate of return commensurate with safety considerations. As with domestic investment securities, the bank's safety must take precedence, followed by liquidity and marketability. Securities held by international divisions are considered to be liquid if they are readily convertible into cash at their approximate carrying value. They are marketable if they can be sold in a very short time at a price commensurate with yield and quality. Speculation in marginal foreign securities to generate more favorable yields is an unsound banking practice and should be discouraged.

Banks are generally prohibited from investing in stocks. However, a number of exceptions (detailed earlier in this section) are often applicable to the international division. For example, the bank may, under section 24A of the Federal Reserve Act (12 USC 371d), hold stock in overseas corporations that hold title to foreign bank premises. Both stock and other securities holdings are permissible under certain circumstances and in limited amounts under section 211.4 of Regulation K—Permissible Activities and Investments of Foreign Branches of Member Banks (12 CFR 211). Other sections of Regulation K permit the bank to make equity investments in Edge Act and agreement corporations and in foreign banks, subject to certain limitations.

Standard & Poor's, Moody's, and other publications from U.S. rating-services rate Canadian and other selected foreign securities that are authorized for U.S. commercial bank investment purposes under 12 USC 24 (Seventh). However, in many other countries, securities-rating services are limited or nonexistent. When they do exist, the ratings are only indicative and should be supplemented with additional information on legality, credit soundness, marketability, and foreign-exchange and country-risk factors. The opinions of local attorneys are often the best source of determining whether a particular foreign security has the full faith and credit backing of a country's government.

Sufficient analytical data must be provided to the bank's board of directors and senior management so they can make informed judgments about the effectiveness of the international division's investment policy and procedures. The institution's international securities and derivative contracts should be included on all board and senior management reports detailing domestic securities and derivative contracts received. These reports should be timely and sufficiently detailed to allow the board of directors and senior management to understand and assess the credit, market, and liquidity risks facing the institution and its securities and derivative positions.

ACCOUNTING FOR SECURITIES PORTFOLIOS

A single class of a financial instrument that can meet trading, investment, or hedging objectives may have a different accounting treatment applied to it, depending on management's purpose for holding it. Therefore, an examiner reviewing investment or trading activities should be familiar with the different accounting methods to ensure that the particular accounting treatment being used is appropriate for the purpose of holding a financial instrument and the economic substance of the related transaction.

The accounting principles that apply to securities portfolios, including trading accounts, and to derivative instruments are complex and have evolved over time—both with regard to authoritative standards and related banking practices. Examiners should consult the sources of generally accepted accounting principles (GAAP); FASB ASC 320, Investments—Debt and Equity Securities; and the reporting requirements in the bank Call Report (referred to in this section) for more detailed guidance in these areas.

Examiners should be aware that accounting practices in foreign countries may differ from the accounting principles followed in the United States. Nevertheless, foreign institutions are required to submit regulatory reports prepared in accordance with U.S. banking agency regulatory reporting instructions, which incorporate GAAP.

Treatment under FASB ASC TOPIC 320, formerly FASB Statement No. 115

In May 1993, the Financial Accounting Standards Board issued Statement of Financial

Accounting Standards No. 115, "Accounting for Certain Investments in Debt and Equity Securities."[21] FASB 115 supersedes FASB 12, "Accounting for Certain Marketable Securities," and related interpretations. It also amends other standards, including FASB 65, "Accounting for Certain Mortgage-Banking Activities," to eliminate mortgage-backed securities from that statement's scope. FASB 115 addresses investments in equity securities that have readily determinable fair values and all investments in debt securities.[22] The accounting standard was effective for fiscal years beginning after December 15, 1993, for regulatory reporting and financial reporting purposes. It was to be initially applied as of the beginning of an institution's fiscal year and cannot be applied retroactively to prior years' financial statements. Investments subject to the standard are to be classified in three categories and accounted for as follows:

- *Held-to-maturity account*. Debt securities that the institution has the positive intent and ability to hold to maturity are classified as held-to-maturity securities and reported at amortized cost.
- *Trading account*. Debt and equity securities that are bought and held principally for the purpose of selling them in the near term are classified as trading securities and reported at fair value, with unrealized gains and losses included in earnings. Trading generally reflects active and frequent buying and selling, and trading securities are generally used with the objective of generating profits on short-term differences in price.
- *Available-for-sale account*. Debt and equity securities not classified as either held-to-maturity securities or trading securities are classified as available-for-sale securities and reported at fair value, with unrealized gains and losses excluded from earnings and reported as a net amount in a separate component of shareholders' equity.

Under FASB 115, mortgage-backed securities that are held for sale in conjunction with mortgage-banking activities should be reported at fair value in the trading account. The standard does not apply to loans, including mortgage loans, that have not been securitized.

Upon the acquisition of a debt or equity security, an institution must place the security into one of the above three categories. At each reporting date, the institution must reassess whether the balance-sheet designation continues to be appropriate. Proper classification of securities is a key examination issue. (See SR-94-25 and SR-93-72; see also SR-96-32.)

FASB 115 recognizes that certain changes in circumstances may cause the institution to change its intent to hold a certain security to maturity without calling into question its intent to hold other debt securities to maturity in the future. Thus, the sale or transfer of a held-to-maturity security due to one of the following changes in circumstances will not be viewed as inconsistent with its original balance-sheet classification:

- evidence of a significant deterioration in the issuer's creditworthiness
- a change in tax law that eliminates or reduces the tax-exempt status of interest on the debt security (but not a change in tax law that revises the marginal tax rates applicable to interest income)
- a major business combination or major disposition (such as the sale of a segment) that necessitates the sale or transfer of held-to-maturity securities to maintain the institution's existing interest-rate risk position or credit-risk policy
- a change in statutory or regulatory requirements that significantly modifies either what constitutes a permissible investment or the maximum level of investments in certain kinds

21. FASB 115 does not apply to investments in equity securities accounted for under the equity method or to investments in consolidated subsidiaries. This statement does not apply to institutions whose specialized accounting practices include accounting for substantially all investments in debt and equity securities at market value or fair value, with changes in value recognized in earnings (income) or in the change in net assets. Examples of those institutions are brokers and dealers in securities, defined-benefit pension plans, and investment companies.

22. FASB 115 states that the fair value of an equity security is readily determinable if sales prices or bid-asked quotations are currently available on a securities exchange registered with the SEC or in the over-the-counter market, provided that those prices or quotations for the over-the-counter market are publicly reported by the FINRA Automated Quotations systems or by the National Quotation Bureau, Inc. Restricted stock does not meet that definition.

The fair value of an equity security traded only in a foreign market is readily determinable if that foreign market is of a breadth and scope comparable to one of the U.S. markets referred to above. The fair value of an investment in a mutual fund is readily determinable if the fair value per share (unit) is determined and published and is the basis for current transactions.

of securities, thereby causing an institution to dispose of a held-to-maturity security
- a significant increase by the regulator in the industry's capital requirements that causes the institution to downsize by selling held-to-maturity securities
- a significant increase in the risk weights of debt securities used for regulatory risk-based capital purposes

Furthermore, FASB 115 recognizes that other events that are isolated, nonrecurring, and unusual for the reporting institution and could not have been reasonably anticipated may cause the institution to sell or transfer a held-to-maturity security without necessarily calling into question its intent to hold other debt securities to maturity. However, all sales and transfers of held-to-maturity securities must be disclosed in the footnotes to the financial statements.

An institution must not designate a debt security as held-to-maturity if the institution has the intent to hold the security for only an indefinite period. Consequently, a debt security should not, for example, be designated as held-to-maturity if the banking organization or other company anticipates that the security would be available to be sold in response to—

- changes in market interest rates and related changes in the security's prepayment risk,
- needs for liquidity (for example, due to the withdrawal of deposits, increased demand for loans, surrender of insurance policies, or payment of insurance claims),
- changes in the availability of and the yield on alternative investments,
- changes in funding sources and terms, or
- changes in foreign-currency risk.

According to FASB 115, an institution's asset-liability management may take into consideration the maturity and repricing characteristics of all investments in debt securities, including those held to maturity or available for sale, without tainting or casting doubt on the standard's criterion that there be a "positive intent to hold until maturity."[23] However, securities should not be designated as held-to-maturity if they may be sold. Further, liquidity can be derived from the held-to-maturity category by the use of repurchase agreements that are designated as financings, but not sales.

Transfers of a security between investment categories should be accounted for at fair value. FASB 115 requires that at the date of the transfer, the security's unrealized holding gain or loss must be accounted for as follows:

- For a security transferred from the trading category, the unrealized holding gain or loss at the date of the transfer will have already been recognized in earnings and should not be reversed.
- For a security transferred into the trading category, the unrealized holding gain or loss at the date of the transfer should be recognized in earnings immediately.
- For a debt security transferred into the available-for-sale category from the held-to-maturity category, the unrealized holding gain or loss at the date of the transfer should be recognized in a separate component of shareholders' equity.
- For a debt security transferred into the held-to-maturity category from the available-for-sale category, the unrealized holding gain or loss at the date of the transfer should continue to be reported in a separate component of shareholders' equity but should be amortized over the remaining life of the security as an adjustment of its yield in a manner consistent with the amortization of any premium or discount.

Transfers from the held-to-maturity category should be rare, except for transfers due to the changes in circumstances that were discussed above. Transfers from the held-to-maturity account not meeting the exceptions indicated above may call into question management's intent to hold other securities to maturity. According to the standard, transfers into or from the trading category should also be rare.

FASB 115 requires that institutions determine whether a decline in fair value below the amortized cost for individual securities in the available-for-sale or held-to-maturity accounts

23. In summary, under FASB 115, sales of debt securities that meet either of the following two conditions may be considered as "maturities" for purposes of the balance-sheet classification of securities: (i) The sale of a security occurs near enough to its maturity date (or call date if exercise of the call is probable)—for example, within three months—that interest-rate risk has been substantially eliminated as a pricing factor. (ii) The sale of a security occurs after the institution has already collected at least 85 percent of the principal outstanding at acquisition from either prepayments or scheduled payments.

is "other than temporary" (that is, whether this decline results from permanent impairment). For example, if it is probable that the investor will be unable to collect all amounts due according to the contractual terms of a debt security that was not impaired at acquisition, an other-than-temporary impairment should be considered to have occurred. If the decline in fair value is judged to be other than temporary, the cost basis of the individual security should be written down to its fair value, and the write-down should be accounted in earnings as a realized loss. This new cost basis should not be written up if there are any subsequent recoveries in fair value.

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Securities and Derivatives

Investing in Securities without Reliance on Ratings of Nationally Recognized Statistical Rating Organizations

Effective date April 2013

Section 2510.1

On November 15, 2012, state member banks were advised, effective January 1, 2013, that they may no longer rely solely on credit ratings issued by nationally recognized statistical rating organizations (NRSROs) or external credit ratings to determine whether a particular security is an ''investment security'' that is permissible for investment by a state member bank. Under the regulations of the Office of the Comptroller of the Currency (OCC), securities qualify for investment by national banks only if they are determined by the bank to be ''investment grade'' and not predominantly speculative in nature. (See SR-12-15 and its attachment.) The basic sound risk-management principles of this policy and other referenced guidance that follows also applies to bank holding companies (BHCs) and savings and loan holding companies (SLHCs). They should manage and control their risk exposures on a consolidated basis and give recognition to the legal distinctions and potential obstacles to the cash movements among their financial institution subsidiaries. Since a BHC's structure can include national banks, state member banks, and other financial institution subsidiaries, the referenced statutory, regulatory, and supervisory guidance is provided.

Under the Federal Reserve Act (12 USC 335) and the Federal Reserve (FR)'s Regulation H (12 CFR 208.21), state member banks are subject to the same limitations and conditions with respect to the purchasing, selling, underwriting, and holding of investment securities and stock as national banks under the National Banking Act (12 USC 24 (Seventh)). Therefore, when investing in securities, state member banks must comply with the provisions of the National Banking Act and the OCC's regulations in 12 CFR part 1. In addition to this federal requirement, a state member bank may purchase, sell, underwrite, or hold securities and stock only to the extent permitted under applicable state law.

National banks are to assess a security's creditworthiness to determine if it is ''investment grade.'' A security meets the ''investment grade'' test only if the issuer has an adequate capacity to meet its financial commitments under the security for the projected life of the asset or exposure. Under this definition, the issuer has an adequate capacity to meet financial commitments if (1) the risk of default by the obligor is low and (2) the full and timely repayment of principal and interest is expected.[1] National banks are expected to consider a number of factors, to the extent appropriate in making this determination. While a national bank may continue to take into account external credit ratings and assessments as a valuable source of information, the bank is expected to supplement these ratings with a degree of due diligence processes and additional analyses appropriate for the bank's risk profile and for the size and complexity of the instrument.[2]

The OCC issued guidance, effective January 1, 2013 (OCC investment guidance), to clarify regulatory expectations with respect to investment purchase decisions and ongoing portfolio due diligence processes. See appendix 1 below. The guidance clarifies that generally, investment securities are expected to have good to very strong credit quality. In the case of structured securities, this determination may be influenced more by the quality of the underlying collateral, the cash flow rules, and the structure of the security itself than by the condition of the issuer.

The OCC also expects national banks to conduct an appropriate level of due diligence to understand the inherent risks of a security and determine that it is a permissible investment. The extent of the due diligence should be sufficient to support the institution's conclusion that a security meets the ''investment-grade'' standards. The depth of the due diligence should be a function of the security's credit quality, the complexity of the structure, and the size of the investment. Third-party analytics may be part of this analysis, although the national bank's management remains responsible for the investment decision and should ensure that prospective third parties are independent, reliable, and qualified. The guidance also sets forth an expectation that the board of directors should oversee management to make sure appropriate decisionmaking processes are in place.[3]

Investment in securities and stock by state member banks are required under the Federal Reserve Act and Regulation H to comply with the revised 12 CFR part 1 and should meet the supervisory expectations set forth in the OCC's

1. See 77 *Fed. Reg.* 35257 (June 13, 2012).
2. See 77 *Fed. Reg.* 35254 (June 13, 2012).
3. See 77 *Fed. Reg.* 35259 (June 13, 2012).

investment guidance and this FR guidance. In addition, state member banks are expected to continue to meet long-established supervisory expectations for risk-management processes to ensure that the credit risk of the bank, including the credit risk of the investment portfolio, is effectively identified, measured, monitored, and controlled.

APPENDIX 1—OCC GUIDANCE ON DUE DILIGENCE REQUIREMENTS IN DETERMINING WHETHER SECURITIES ARE ELIGIBLE FOR INVESTMENT

The guidance below was issued by the Office of the Comptroller of the Currency (OCC) on June 13, 2012, and is being included for ease of reference. The official guidance was published in the Federal Register (77 Fed. Reg. 35259), and is available as an attachment to OCC Bulletin 2012-18. As discussed in SR-12-15, the Federal Reserve also expects that state member banks (SMBs) will meet the supervisory expectations set forth in the OCC guidance as this guidance provides further clarification to the OCC rule with which SMBs must comply. (See 12 CFR part 1, and 77 Fed. Reg. 35253, June 13, 2012.)

Purpose

The OCC has issued final rules to revise the definition of ''investment grade,'' as that term is used in 12 CFR parts 1 and 160 in order to comply with section 939A of the Dodd-Frank Act. Institutions, effective January 1, 2013, are to ensure that existing investments comply with the revised ''investment grade'' standard, as applicable based on investment type, and safety and soundness practices described in 12 CFR 1.5 and this guidance. This implementation period also will provide management with time to evaluate and amend existing policies and practices to ensure new purchases comply with the final rules and guidance. National banks that have established due diligence review processes, and that have not relied exclusively on external credit ratings, should not have difficulty establishing compliance with the new standard.

The OCC is issuing this guidance (Guidance) to clarify steps national banks ordinarily are expected to take to demonstrate they have properly verified their investments meet the newly established credit-quality standards under 12 CFR part 1 and steps national banks are expected to take to demonstrate they are in compliance with due diligence requirements when purchasing investment securities and conducting ongoing reviews of their investment portfolios. The standards below describe how national banks may purchase, sell, deal in, underwrite, and hold securities consistent with the authority contained in 12 USC 24 (Seventh). The activities of national banks must be consistent with safe and sound banking practices, and this Guidance reminds national banks of the supervisory risk-management expectations associated with permissible investment portfolio holdings under parts 1 and 160.

Background

Parts 1 and 160 provide standards for determining whether securities have appropriate credit quality and marketability characteristics to be purchased and held by national banks. These requirements also establish limits on the amount of investment securities an institution may hold for its own account. As defined in 12 CFR part 1, an ''investment security'' must be ''investment grade.'' For the purpose of part 1, ''investment grade'' securities are those where the issuer has an adequate capacity to meet the financial commitments under the security for the projected life of the investment. An issuer has an adequate capacity to meet financial commitments if the risk of default by the obligor is low and the full and timely repayment of principal and interest is expected. Generally, securities with good to very strong credit quality will meet this standard. In the case of a structured security (that is, a security that relies primarily on the cash flows and performance of underlying collateral for repayment, rather than the credit of the entity that is the issuer), the determination that full and timely repayment of principal and interest is expected may be influenced more by the quality of the underlying collateral, the cash flow rules, and the structure of the security itself than by the condition of the issuer.

National banks must be able to demonstrate that their investment securities meet applicable credit-quality standards. This Guidance provides criteria that national banks can use in meeting part 1 credit-quality standards and that national banks can use in meeting due diligence requirements.

Determining Whether Securities Are Permissible Prior to Purchase

The OCC's elimination of references to credit ratings in its regulations, in accordance with the Dodd-Frank Act, does not substantively change the standards institutions should use when deciding whether securities are eligible for purchase under part 1. The OCC's investment securities regulations generally require a national bank to determine whether or not a security is "investment grade" in order to determine whether purchasing the security is permissible. Investments are considered "investment grade" if they meet the regulatory standard for credit quality. To meet this standard, a national bank must be able to determine that the security has (1) low risk of default by the obligor and (2) the expectation of full and timely repayment of principal and interest over the expected life of the investment.

For national banks, Type I securities, as defined in part 1, generally are government obligations and are not subject to investment grade criteria for determining eligibility to purchase. Typical Type I obligations include U.S. Treasuries, agencies, municipal government general obligations, and for well-capitalized institutions, municipal revenue bonds. While Type I obligations do not have to meet the investment grade criteria to be eligible for purchase, all investment activities should comply with safe and sound banking practices as stated in 12 CFR 1.5 and in previous regulatory guidance. Under OCC rules, Treasury and agency obligations do not require individual credit analysis, but bank management should consider how those securities fit into the overall purpose, plans, and risk and concentration limitations of the investment policies established by the board of directors. Municipal bonds should be subject to an initial credit assessment and then ongoing review consistent with the risk characteristics of the bonds and the overall risk of the portfolio.

Financial institutions should be well acquainted with fundamental credit analysis, as this is central to a well-managed loan portfolio. The foundation of a fundamental credit analysis-character, capacity, collateral, and covenants-applies to investment securities just as it does to the loan portfolio. Accordingly, the OCC expects national banks to conduct an appropriate level of due diligence to understand the inherent risks and determine that a security is a permissible investment. The extent of the due diligence should be sufficient to support the institution's conclusion that a security meets the investment grade standards. This may include consideration of internal analyses, third party research and analytics including external credit ratings, internal risk ratings, default statistics, and other sources of information as appropriate for the particular security. Some institutions may have the resources to do most or all of the analytical work internally. Some, however, may choose to rely on third parties for much of the analytical work. While analytical support may be delegated to third parties, management may not delegate its responsibility for decisionmaking and should ensure that prospective third parties are independent, reliable, and qualified. The board of directors should oversee management to assure that an appropriate decisionmaking process is in place.

The depth of the due diligence should be a function of the security's credit quality, the complexity of the structure, and the size of the investment. The more complex a security's structure, the more credit-related due diligence an institution should perform, even when the credit quality is perceived to be very high. Management should ensure it understands the security's structure and how the security may perform in different default environments, and should be particularly diligent when purchasing structured securities.[4] The OCC expects national banks to consider a variety of factors relevant to the particular security when determining whether a security is a permissible and sound investment. The range and type of specific factors an institution should consider will vary depending on the particular type and nature of the securities. As a general matter, a national bank will have a greater burden to support its determination if one factor is contradicted by a finding under another factor.

The following matrix provides examples of factors for national banks to consider as part of

4. For example, a national bank should be able to demonstrate an understanding of the effects on cash flows of a structured security assuming varying default levels in the underlying assets.

a robust credit-risk assessment framework for designated types of instruments. The types of securities included in the matrix require a credit-focused pre-purchase analysis to meet the investment grade standard or safety and soundness standards. Again, the matrix is provided as a guide to better inform the credit-risk assessment process. Individual purchases may require more or less analysis dependent on the security's risk characteristics, as previously described.

Key factors	Corporate bonds	Municipal government general obligations	Revenue bonds	Structured securities
Confirm spread to U.S. Treasuries is consistent with bonds of similar credit quality	X	X	X	X
Confirm risk of default is low and consistent with bonds of similar credit quality	X	X	X	X
Confirm capacity to pay and assess operating and financial performance levels and trends through internal credit analysis and/or other third party analytics, as appropriate for the particular security	X	X	X	X
Evaluate the soundness of a municipal's budgetary position and stability of its tax revenues. Consider debt profile and level of unfunded liabilities, diversity of revenue sources, taxing authority, and management experience		X		
Understand local demographics/economics. Consider unemployment data, local employers, income indices, and home values		X	X	
Assess the source and strength of revenue structure for municipal authorities. Consider obligor's financial condition and reserve levels, annual debt service and debt coverage ratio, credit enhancement, legal covenants, and nature of project			X	
Understand the class or tranche and its relative position in the securitization structure				X
Assess the position in the cash flow waterfall				X
Understand loss allocation rules, specific definition of default, the potential impact of performance and market value triggers, and support provided by credit and/or liquidity enhancements				X
Evaluate and understand the quality of the underwriting of the underlying collateral as well as any risk concentrations				X
Determine whether current underwriting is consistent with the original underwriting underlying the historical performance of the collateral and consider the effect of any changes				X

Key factors	Corporate bonds	Municipal government general obligations	Revenue bonds	Structured securities
Assess the structural subordination and determine if adequate given current underwriting standards				X
Analyze and understand the impact of collateral deterioration on tranche performance and potential credit losses under adverse economic conditions				X

Additional Guidance on Structured Securities Analysis

The creditworthiness assessment for an investment security that relies on the cash flows and collateral of the underlying assets for repayment (i.e., a structured security) is inherently different from a security that relies on the financial capacity of the issuer for repayment. Therefore, a financial institution should demonstrate an understanding of the features of a structured security that would materially affect its performance and that its risk of loss is low even under adverse economic conditions. Management's assessment of key factors, such as those provided in this guidance, will be considered a critical component of any structured security evaluation. Existing OCC guidance, including OCC Bulletin 2002-19, "Supplemental Guidance, Unsafe and Unsound Investment Portfolio Practices," states that it is unsafe and unsound to purchase a complex high-yield security without an understanding of the security's structure and performing a scenario analysis that evaluates how the security will perform in different default environments. Policies that specifically permit this type of investment should establish appropriate limits, and prepurchase due diligence processes should consider the impact of such purchases on capital and earnings under a variety of possible scenarios. The OCC expects institutions to understand the effect economic stresses may have on an investment's cash flows. Various factors can be used to define the stress scenarios. For example, an institution could evaluate the potential impact of changes in economic growth, stock market movements, unemployment, and home values on default and recovery rates. Some institutions have the resources to perform this type of analytical work internally. Generally, analyses of the application of various stress scenarios to a structured security's cash flow are widely available from third parties. Many of these analyses evaluate the performance of the security in a base case and a moderate and severe stress case environment. Even under severe stress conditions, the stress scenario analysis should determine that the risk of loss is low and full and timely repayment of principal and interest is expected.

Maintaining an Appropriate and Effective Portfolio Risk-Management Framework

The OCC has had a long-standing expectation that national banks implement a risk-management process to ensure credit risk, including credit risk in the investment portfolio, is effectively identified, measured, monitored, and controlled. The *1998 Interagency Supervisory Policy Statement on Investment Securities and End-User Derivatives Activities* (Policy Statement) contains risk-management standards for the investment activities of banks and savings associations.[5] The Policy Statement emphasizes the importance of establishing and maintaining risk processes to manage the market, credit, liquidity, legal, operational, and other risks of investment securities. Other previously issued guidance that supplements OCC investment standards are OCC 2009-15, "Risk Management and Lessons Learned" (which highlights lessons learned during the market disruption and re-emphasizes the key principles discussed in previously issued OCC guidance on portfolio risk management); OCC 2004-25, "Uniform Agreement on the Classification of Securities" (which describes

5. On April 23, 1998, the FRB, FDIC, NCUA, and OCC issued the "Supervisory Policy Statement on Investment Securities and End-User Derivatives Activities."

the importance of management's credit-risk analysis and its use in examiner decisions concerning investment security risk ratings and classifications); and OCC 2002-19, "Supplemental Guidance, Unsafe and Unsound Investment Portfolio Practices" (which alerts banks to the potential risk to future earnings and capital from poor investment decisions made during periods of low levels of interest rates and emphasizes the importance of maintaining prudent credit, interest rate, and liquidity risk-management practices to control risk in the investment portfolio).

National banks must have in place an appropriate risk-management framework for the level of risk in their investment portfolios. Failure to maintain an adequate investment portfolio risk-management process, which includes understanding key portfolio risks, is considered an unsafe and unsound practice.

Having a strong and robust risk-management framework appropriate for the level of risk in an institution's investment portfolio is particularly critical for managing portfolio credit risk. A key role for management in the oversight process is to translate the board of directors' tolerance for risk into a set of internal operating policies and procedures that govern the institution's investment activities. Policies should be consistent with the organization's broader business strategies, capital adequacy, technical expertise, and risk tolerance. Institutions should ensure that they identify and measure the risks associated with individual transactions prior to acquisition and periodically after purchase. This can be done at the institutional, portfolio, or individual instrument level. Investment policies also should provide credit-risk concentration limits. Such limits may apply to concentrations relating to a single or related issuer, a geographical area, and obligations with similar characteristics. Safety-and-soundness principles warrant effective concentration risk-management programs to ensure that credit exposures do not reach an excessive level.

The aforementioned risk-management policies, principles, and due diligence processes should be commensurate with the complexity of the investment portfolio and the materiality of the portfolio to the financial performance and capital position of the institution. Investment review processes, following the pre-purchase analysis, may vary from institution to institution based on the individual characteristics of the portfolio, the nature and level of risk involved, and how that risk fits into the overall risk profile and operation of the institution. Investment portfolio reviews may be risk-based and focus on material positions or specific groups of investments or stratifications to enable analysis and review of similar risk positions.

As with pre-purchase analytics, some institutions may have the resources necessary to do most or all of their portfolio reviews internally. However, some may choose to rely on third parties for much of the analytical work. Third-party vendors offer risk analysis and data benchmarks that could be periodically reviewed against existing portfolio holdings to assess credit-quality changes over time. Holdings where current financial information or other key analytical data is unavailable should warrant more frequent analysis. High-quality investments generally will not require the same level of review as investments further down the credit-quality spectrum. However, any material positions or concentrations should be identified and assessed in more depth and more frequently, and any system should ensure an accurate and timely risk assessment and reporting process that informs the board of material changes to the risk profile and prompts action when needed. National banks should have investment portfolio review processes that effectively assess and manage the risks in the portfolio and ensure compliance with policies and risk limits. Institutions should reference existing regulatory guidance for additional supervisory expectations for investment portfolio risk-management practices.

INTRODUCTION

The Securities Act of 1933 requires that adequate and reliable information be made available about securities originally offered for sale to the public. The act requires registration of any securities sale with the Securities and Exchange Commission (SEC) unless it is specifically exempted. Section 4(2) of the act exempts "transactions by an issuer not involving any public offering" (referred to as a "private placement"). A private placement, also known as an unregistered offering, raises capital through the sale of securities to a single, or small number of, select investors.

Common participants in arranging a private placement include banks, mutual funds, insurance companies, pension funds, and hedge funds. The matching of a security issuer with investors is usually done by an individual, or firm, acting as either an agent or an adviser. In the agent relationship, the firm has authority to commit the security issuer. An adviser has no such power. Agents, usually investment bankers, participate in negotiations between the security issuer and investors, and their fee is dependent on their involvement. Agreements between the firm and all other parties to the transaction should specifically state with whom the firm is representing as an agent.

Regardless of whether the firm is agent or adviser, the firm should be aware of the SEC's Regulation D, "Rules Governing the Limited Offer and Sale of Securities Without Registration Under the Securities Act of 1933," (17 CFR 230.500). While the bank does not have to register private placement investments with the SEC, bank policies should address measures to comply with relevant SEC regulations, including Regulation D, which exempts certain transactions from the registration requirements of section 5 of the Securities Act of 1933.[1] Regulation D states

> Such transactions are not exempt from the antifraud, civil liability, or other provisions of the federal securities laws. Issuers are reminded of their obligation to provide such further material information, if any, as may be necessary to make the information required under Regulation D, in light of the circumstances under which it is furnished, not misleading.[2]

In addition, a bank's private placements policy should address any applicable state laws relating to the offer and sale of securities.

PRIVATE-PLACEMENT ACTIVITIES BY BANKS

Private placements have certain advantages and disadvantages for both investors and issuers. Compared to public offerings, private placements have fewer regulatory requirements. While private placements raise capital through the sale of securities, the issuer does not have to register the investment with the SEC. Therefore, the time and expense of registering a security with the SEC does not apply to private placements.

In a private placement, both investor and issuer can complete the transaction without being subject to regulatory and public scrutiny. Further, the process of underwriting the private placement is generally faster than a public offering, which allows the issuer to receive proceeds from the sale in less time. If an issuer is selling a bond, the issuer can bypass the expenses associated with obtaining a credit rating from a rating agency. Private placements are flexible, and investments can be tailored to meet the specific needs of the relevant parties. For example, an investor can make an investment for a specified length of time at a stated rate of return.

The major disadvantage of private placements to the investor is the general lack of a secondary market. Thus, the investor may be unable to liquidate the holding until maturity. Additionally, unlike registered offerings in which certain information is required to be disclosed, investors in private placements are generally on their own in obtaining the information they need to make an informed investment decision. Further, the SEC does not review private placements. For instance, a private placement does not require a prospectus and, in some cases, detailed financial information is not disclosed. Instead of a prospectus, a private placement memorandum can accompany a private placement. In general, the private placement memorandum is not publicly

1. 15 U.S.C. 77a et seq., as amended.

2. 17 CFR 230.500(a).

marketed. Given this lack of transparency in the private placement memorandum, investors need to recognize that the memo may not completely describe the investment and related risks. Therefore, investors need to fully understand the terms and risks of the investment. Thus, potential investors should perform their own risk assessment and request additional information as part of their pre-purchase due diligence.

There are also disadvantages to the issuer. A private placement may limit the amount of capital that may be raised since the number of potential investors is usually very small. Moreover, advisory and legal fees may also be high relative to the size of the issue.

In addition to investing in private placement securities, banks may also offer private placement services in either an agent or adviser capacity. In the "agent" relationship, the bank has authority to commit the issuer. Agents participate in negotiations between issuers and potential investors and assist in the actual placement of securities sold by the issuer. The agents often collect a fee based on a percentage of the securities placed. In contrast, in an "adviser" capacity, the bank does not have authority to commit the issuer. In general, advisers do not assist in the actual sale of the securities, their role being limited to advising the issuer on the structure and terms of the placement transaction.

RISK MANAGEMENT OF PRIVATE PLACEMENTS

A bank that offers private-placement services should establish risk management policies and procedures that address the types of risks arising from private placements. Like any other banking activity or function, a bank's board of directors has the responsibility for establishing the level of risk that the bank should take in engaging in private placements. Accordingly, the board of directors should approve the bank's overall business strategies and significant policies, including those related to managing risks. In turn, senior management is responsible for implementing strategies set by the board of directors in a manner that controls risks and that complies with statutes, and regulations on both a long-term and day-to-day basis. Once the risks are properly identified, the bank's policies and procedures should provide guidance on the day-to-day implementation of business strategies for private placement activity, including limits designed to prevent excessive and imprudent risks.

A bank's policy on private placements should cover the establishment of procedures, processes, and controls to mitigate fraudulent activities, self-dealing practices, or conflicts-of-interest. For example, a bank acting as adviser or agent assumes the risk of a potential conflict-of-interest charge whenever the proceeds from the placement are used to reduce a classified loan at the bank. Under this scenario, the bank should disclose relevant information about its business dealings with the issuer and financial condition of the issuer, especially if the issuer is borrowing from the bank and is experiencing financial difficulty. Although the bank may not commit funds in a private-placement transaction, the potential for financial loss or damage to its reputation does exist if the bank does not prudently deal with all parties to the transaction and fairly disclose all relevant information.

Banks engaged in private placement activities should establish procedures for conducting prudent pre-purchase analysis of securities. More information on conducting appropriate due diligence and pre-purchase analysis for investments to meet credit quality standards under 12 CFR part 1 are found in SR-12-15, "Investing in Securities without Reliance on Nationally Recognized Statistical Rating Organization Ratings."[3] Banks should develop procedures to provide timely ongoing monitoring of private-placement activities. Moreover, procedures should be established to detect any transactions that could have an adverse effect on the bank's other functions, such as loan or trust department activities.

SUPERVISORY CONSIDERATIONS

Examiners should understand the bank's involvement in private placement activities, determin-

3. Under the Federal Reserve Act (12 U.S.C. 335) and the Board's Regulation H (12 CFR 208.21), state member banks are subject to the same limitations and conditions with respect to the purchasing, selling, underwriting, and holding of investment securities and stock as national banks under the National Banking Act (12 U.S.C. 24 (Seventh)). When investing in securities, state member banks must comply with the provisions of the National Banking Act and the Office of the Comptroller of the Currency regulations in 12 CFR 1. In addition to this federal requirement, a state member bank may purchase, sell, underwrite, or hold securities and stock only to the extent permitted under applicable state law.

ing whether the bank acts as an investor, agent, or adviser. During the examination process, examiners should review and assess the adequacy of the bank's policies, practices, and procedures to manage private-placement activities. In reviewing the bank's private placement activities, examiners should assess bank staff's knowledge and expertise in this area. Examiners should also assess the bank's ability to comply with applicable statutes and regulations. In addition, examiners should determine whether the bank has incurred significant losses or has significant risk exposure as a result of participating in private placement activities.

1. To determine whether policies, procedures, and internal controls for private placement activities are appropriate.
2. To determine whether bank management implements the bank's policies and procedures.
3. To assess the adequacy of the bank's policies and procedures for pre-purchase and ongoing analysis of private placement activities.
4. To evaluate the overall effectiveness and quality of bank management in advising and completing private placements in compliance with statutes and regulations.
5. To initiate corrective action if policies, practices, procedures, or internal controls are deficient.

PRELIMINARY REVIEW

1. Based upon the evaluation of investment volume in private placements, or agent and advisory services, determine the scope of the examination.
2. Review prior examination reports, pre-examination memorandum, and file correspondence for an overview of any previously identified deficiencies.
3. Obtain a listing of any deficiencies noted in the latest review done by internal auditor, external auditors, other third parties, or regulators, and determine if corrections have been accomplished.
4. Obtain and review the following information from appropriate bank staff:
   - a list of the staff performing private placement agent or advisory services and their previous experience.
   - a list of investors that the bank normally deals with in placing private offerings and their stated investment requirements.
   - a copy of the bank's standard form agreements used in private placement transactions.
   - a list of private placements invested in, or served as agent or adviser for, by the bank since the last examination. Additional information includes
     — name of issuer;
     — name of investor(s), including banks;
     — fee and how it was determined; and
     — amount, rate, and maturity of issue.
   - a list of any funds managed by the bank or its trust department, subsidiaries or affiliates that have been used to purchase private placements advised by the bank or an affiliate.
   - a list of any borrowers whose loans were partially or fully repaid from the sale of private placements advised by the bank since the last examination.
   - a list of participations purchased or sold in loans that used funds from private placements advised by the bank.
5. Review the pertinent information obtained from the previous procedure and compare the information to the list of classified assets from the previous examination.
6. Review and assess the adequacy of applicable policies and procedures for private placement activities. Consider whether the policies and procedures
   - define objectives;
   - provide guidelines for fee determinations based on size and complexity of the transaction;
   - discuss payment of negotiated fees at various stages of the transaction;
   - define the capacity in which bank officers can act in negotiations (Note: An adviser will advise and assist a client, an agent has the authority to commit a client.)
   - recognize possible conflicts of interest and establish appropriate procedures regarding
     — the purchase of bank-advised private placements with funds managed by the bank or an advisory affiliate;
     — loans to investors to purchase private placements;
     — use of proceeds of an advised placement to repay the issuer's debts to the bank; and
     — dealings with unsophisticated investors who have other business relationships with the bank;
   - discuss bank management's level of review of each placement prior to completion;
   - direct officers to obtain certified financial statements from the seller and require distribution of certified financial statements to interested investors;
   - require officers to request a written statement of investment objectives or requirements from interested investors;
   - outline the need for management review to determine whether a placement is suitable for the investor; and
   - include appropriate pre-purchase and ongoing analysis of private placement securities purchased.
7. Assess the adequacy of pre-purchase and ongoing analysis conducted on private placement securities purchased.
8. Distribute the list of placements to the examiner assigned loan portfolio manage-

ment to determine whether any loans were made to fund the investment in the private placement.

9. Review files related to a representative sample of all placement transactions and determine if the bank evaluates both the issuer and investor in a private placement transaction, including the suitability of the investment to the stated investment requirements of the investor.
10. Determine whether potential conflicts of interest exist between bank-advised placements and interests of directors and principal officers. Consider whether former banking relationships exist for both issuer and investor and whether fees charged for loans or paid on deposits are within normal bank policy.
11. As appropriate, discuss with bank management and prepare summaries in appropriate report form of
    - deficiencies in policies, practices, and internal controls.
    - any placement activities that do not comply with statutes and regulations or compromise the bank's safety and soundness.
    - recommended corrective action.
12. Update examination work papers with any information that will facilitate future examinations.

3000—CAPITAL, EARNINGS, LIQUIDITY, AND SENSITIVITY TO MARKET RISK

The 3000 series of sections address the supervisory assessment of a state member bank's **C**apital, **E**arnings, **L**iquidity, and **S**ensitivity to market risk (CELS). In addition to the review of asset quality (see the 2000 series major heading), the CELS components represent the key areas that examiners review in assessing the overall financial condition of the bank.

PURPOSE OF CAPITAL

Although both bankers and bank regulators look carefully at the quality of bank assets and management and at the ability of the bank to control costs, evaluate risks, and maintain proper liquidity, capital adequacy is the area that triggers the most supervisory action, especially in view of the prompt-corrective-action (PCA) provision of section 38 of the Federal Deposit Insurance Act (FDIA), 12 U.S.C. 1831o. The primary function of capital is to fund the bank's operations, act as a cushion to absorb unanticipated losses and declines in asset values that may otherwise lead to material bank distress or failure, and provide protection to uninsured depositors and debt holders if the bank were to be placed in receivership. A bank's solvency promotes public confidence in the bank and the banking system as a whole by providing continued assurance that the bank will continue to honor its obligations and provide banking services. By exposing stockholders to a larger percentage of any potential loss, higher capital levels reduce the subsidy provided to banks by the federal safety net.

Capital regulation is particularly important because deposit insurance and other elements of the federal safety net provide banks with an incentive to increase their leverage beyond what the market—in the absence of depositor protection—would permit. Additionally, banks' higher capital levels can reduce the need for certain supervisory activities, thereby lowering the regulatory burden on supervised institutions.

OVERVIEW OF REGULATION Q (12 CFR Part 217)

In 2013, the Federal Reserve Board, the Federal Deposit Insurance Corporation (FDIC), and the Office of the Comptroller of the Currency (OCC) (collectively the agencies) adopted a rule replacing their general risk-based capital requirements, advanced approaches capital requirements, market risk capital requirements, and leverage capital requirements.[1] The Federal Reserve's capital rule, Regulation Q, addresses weaknesses highlighted during the 2008–09 financial crisis by helping to ensure that the banking system is better able to absorb losses and continue to lend in future periods of economic stress. In addition, Regulation Q implements certain federal laws related to capital requirements and international regulatory capital standards adopted by the Basel Committee on Banking Supervision (BCBS).

Applicability of Regulation Q

Regulation Q applies on a consolidated basis to every Board-regulated institution (referred to as a "banking organization" in this section) that is

- a state member bank;
- a bank holding company (BHC) domiciled in the United States that is not subject to 12 CFR part 225, appendix C,[2] or
- a covered savings and loan holding company (SLHC) domiciled in the United States.

Regulation Q does not apply to SLHCs substantially engaged in insurance underwriting or commercial activities, or to SLHCs that are insurance underwriting companies.

Components of Capital

Regulation Q provides a definition of capital and a framework for calculating risk-weighted assets

1. See 12 CFR part 217 (Regulation Q). For more information on the implementation of Regulation Q, see SR-15-6, "Frequently Asked Questions on the Regulatory Capital Rule" and the "New Capital Rule: Community Bank Guide" (July 2013).

2. 12 CFR part 225, appendix C is the "Small Bank Holding Company and Savings and Loan Holding Company Policy Statement," and it applies to BHCs with pro forma consolidated assets of less than $3 billion that (1) are not engaged in significant nonbanking activities either directly or through a nonbank subsidiary; (2) do not conduct significant off-balance-sheet activities (including securitization and asset management or administration) either directly or through a nonbank subsidiary; and (3) do not have a material amount of debt or equity securities outstanding (other than trust preferred securities) that are registered with the Securities and Exchange Commission. The Board may, in its discretion, exclude any BHC, regardless of asset size, from the policy statement if such action is warranted for supervisory purposes. With some exceptions, the policy statement applies to SLHCs as if they were BHCs. See the *Bank Holding Company Supervision Manual* for more information on the Small Bank Holding Company and Savings and Loan Holding Company Policy Statement. The Board may, by order, apply any or all of Regulation Q to any BHC, based on an institution's asset size, level of complexity, risk profile, scope of operations, or financial condition.

by assigning assets and off-balance-sheet items to broad categories of credit risk. A banking organization's risk-based capital ratio is calculated by dividing its qualifying capital (the numerator of the ratio) by its risk-weighted assets (the denominator). A summary of the components of qualifying capital is outlined below, as are the procedures for calculating risk-weighted assets. For more comprehensive information on the definition of capital and risk weighted assets, see the Federal Reserve's Regulation Q.

The risk-based capital requirements of Regulation Q are designed to be sensitive to differences in credit-risk profiles among banking organizations; factor off-balance-sheet exposures into the assessment of capital adequacy; minimize disincentives to holding liquid, low-risk assets; and achieve consistency in the evaluation of the capital adequacy of major banking organizations worldwide.

The three components of regulatory capital are (1) common equity tier 1 capital, (2) additional tier 1 capital, and (3) tier 2 capital.

Common Equity Tier 1 Capital

Common equity tier 1 capital is defined as the sum of a banking organization's outstanding common equity tier 1 capital instruments that satisfy the criteria set forth in Regulation Q (12 CFR 217.20(b)). Common equity tier 1 capital represents the highest-quality and most loss absorbing form of capital. The criteria for common equity tier 1 capital are designed to ensure that common equity tier 1 capital is available to absorb losses as they occur and that common equity tier 1 instruments do not possess features that would cause a banking organization's condition to weaken further during periods of economic and market stress. Common equity tier 1 capital is primarily composed of common stock and retained earnings, plus limited amounts of minority interest in the form of common stock, less certain regulatory adjustments and deductions (e.g., goodwill).

Under the standardized approach of Regulation Q, banking organizations are not required to include all components of accumulated other comprehensive income (AOCI) in common equity tier 1 capital. For advanced approaches banking organizations, most AOCI components are included in common equity tier 1 capital.

Additional Tier 1 Capital

Additional tier 1 capital includes instruments that satisfy the criteria set forth in Regulation Q (12 CFR 217.20(c)). Additional tier 1 capital also includes surplus related to the issuance of additional tier 1 capital instruments, and limited amounts of tier 1 minority interest that are not included in a banking organization's common equity tier 1 capital, less applicable regulatory adjustments and deductions. The eligibility criteria for additional tier 1 capital instruments are designed to ensure that additional tier 1 capital instruments would be available to absorb losses on a going-concern basis. Given the strict criteria, in the United States the only instrument includable in additional tier 1 capital is noncumulative perpetual preferred stock. Cumulative preferred stock and trust preferred securities are generally not included in additional tier 1 capital.

Tier 2 Capital

Tier 2 capital consists of instruments that satisfy the criteria set forth in Regulation Q (12 CFR 217.20(d)). Tier 2 capital also includes surplus related to the issuance of tier 2 capital instruments; limited amounts of total capital minority interest not included in a banking organization's tier 1 capital; and limited amounts of the allowance for loan and lease losses (ALLL),[3] or adjusted allowances for credit losses (AACL),[4] as applicable, less applicable regula-

3. ALLL means valuation allowances that have been established through a charge against earnings to cover estimated credit losses on loans, lease financing receivables, or other extensions of credit as determined in accordance with GAAP. ALLL excludes "allocated transfer risk reserves." For purposes of Regulation Q, ALLL includes allowances that have been established through a charge against earnings to cover estimated credit losses associated with off-balance-sheet credit exposures as determined in accordance with GAAP.

4. AACL means, with respect to a Board-regulated institution that has adopted current expected credit losses (CECL) methodology, valuation allowances that have been established through a charge against earnings or retained earnings for expected credit losses on financial assets measured at amortized cost and a lessor's net investment in leases that have been established to reduce the amortized cost basis of the assets to amounts expected to be collected as determined in accordance with GAAP. AACL includes allowances for expected credit losses on off-balance-sheet credit exposures not accounted for as insurance as determined in accordance with GAAP. AACL excludes "allocated transfer risk reserves" and allowances created that reflect credit losses on purchased credit deteriorated assets and available-for-sale debt securi-

tory adjustments and deductions. A banking organization calculating its total capital ratio using the standardized approach may include in tier 2 capital the amount of ALLL or AACL that does not exceed 1.25 percent of its standardized total risk-weighted assets.

A banking organization calculating its total capital ratio using the advanced approaches may include in tier 2 capital the excess of its eligible credit reserves over its total expected credit loss, provided the amount does not exceed 0.6 percent of its credit risk-weighted assets.

Deductions and Limits

Deductions from common equity tier 1 capital include goodwill and other intangibles (except mortgage servicing assets), deferred tax assets (DTAs) that arise from net operating loss and tax credit carryforwards (above certain levels), gains-on-sale in connection with a securitization, any defined benefit pension fund net asset (for banking organizations that are not insured depository institutions), investments in a banking organization's own capital instruments, mortgage servicing assets (above certain levels) and investments in the capital of unconsolidated financial institutions (above certain levels). Mortgage servicing assets, DTAs arising from temporary differences that the banking organization could not realize through net operating loss carrybacks, and certain investments in financial institutions are each limited to 10 percent of common equity tier 1 capital and in combination are limited to 15 percent of common equity tier 1 capital.

Risk-Weighted Assets

Regulation Q prescribes two approaches to risk weighting assets. The standardized approach is generally designed for smaller banking organizations, while the advanced approaches are used by larger, more complex institutions.

Standardized Approach

The standardized approach described in Regulation Q harmonizes the agencies' calculation of risk-weighted assets and addresses shortcomings in previous risk-based capital requirements by increasing the capital requirements for certain assets. In addition, the standardized approach serves as a floor pursuant to section 171 of the Dodd-Frank Wall Street Reform and Consumer Protection Act (the Dodd-Frank Act) with respect to risk-based capital requirements that the Federal Reserve may establish for BHCs, any nonbank financial company designated by the Financial Stability Oversight Council, SLHCs, and state member banks.

Under the standardized approach, higher risk weights generally apply to high volatility commercial real estate loans, past due loans, and certain equity and securitization exposures. The standardized approach also provides recognition of collateral and guarantees and incentives for derivatives and repo-style transactions cleared through central counterparties.

Below is a list of some key assets and exposures and the risk weights to which they are assigned under the standardized approach.

- *Public sector entities and U.S. government sponsored entities.* Exposures to the U.S. government generally receive a zero percent risk weight, and exposures to U.S. public-sector entities (PSEs), U.S. government-sponsored entities (GSEs), and U.S. depository institutions generally receive a 20 percent risk weight. Exposures conditionally guaranteed by the U.S. government and its agencies generally receive a 20 percent risk weight.

- *Exposures to sovereign entities.* Regulation Q provides that Organization for Economic Co-operation and Development (OECD) member countries without a country risk classifications (CRC) rating receive a risk weight of zero percent while nonmember countries without a CRC rating will receive a risk weight of 100 percent. Exposures to sovereign entities with a CRC rating are to be assigned the risk weight that corresponds to the CRC ratings. Additionally, if an event of sovereign default has occurred in the foreign bank's home country within the last five years, a banking organization must assign a 150 percent risk weight to the exposure.

ties. For more information on CECL, see this manual's section "Allowance for Credit Losses."

- *High volatility commercial real estate loans (HVCRE).*[5] In general, HVCRE exposures include any credit facility that finances or has financed the acquisition, development, or construction of real property, unless the facility finances one- to four-family residential mortgage property, loans to finance agricultural properties, or certain community development projects, or commercial real estate projects that meet certain prudential criteria, including the loan-to-value (LTV) ratio for a loan and capital contributions or expense contributions of the borrower. Supervisory experience has demonstrated that certain acquisition, development, and construction loans, which are a subset of commercial real estate exposures, present particular risks for banking organizations. Accordingly, HVCRE is assigned a 150 percent risk weight under Regulation Q.

- *Residential mortgage exposures.* One-to four-family residential mortgage exposures are generally assigned a 50 percent risk weight under Regulation Q provided the exposures are prudently underwritten first lien mortgage loans that are not past due, reported as nonaccrual, secured by a property that is either owner-occupied or rented, and has not been restructured or modified. A 100 percent risk weight is assigned for all other residential mortgages.

- *Structured securities and securitizations.* The securitization framework in Regulation Q addresses the credit risk of exposures that involve the tranching of credit risk of one or more underlying financial exposures. Regulation Q defines a securitization exposure as an on- or off-balance-sheet credit exposure (including credit-enhancing representations and warranties) that arises from a traditional or synthetic securitization (including a resecuritization), or an exposure that directly or indirectly references a securitization exposure.

Regulation Q establishes risk weight approaches for securitization exposures and structured security exposures that are retained on- or off-balance sheet. Typical examples of securitization exposures include private label collateralized mortgage obligations (CMOs), trust preferred collateralized debt obligations, and asset-backed securities, provided there is tranching of credit risk. Generally, pass-through and government agency CMOs are excluded from the securitization exposure risk weight approaches. In general, Regulation Q requires banking organizations to calculate the risk weight of securitization exposures using either the gross-up approach or the Simplified Supervisory Formula Approach (SSFA) consistently across all securitization exposures, except in certain cases. For instance, the bank can, at any time, risk-weight a securitization exposure at 1,250 percent.

The gross-up approach is similar to earlier risk-based capital rules, where capital is required on the credit exposure of the bank's investment in a specific tranche as well as its pro rata share of the more senior tranches that its tranche supports. A bank calculates its capital requirement based on the weighted-average risk weights of the underlying exposures in the securitization pool.

The SSFA is designed to assign a lower risk weight to more-senior-class securities and higher risk weights to supporting tranches. The SSFA is both risk-sensitive and forward-looking. The formula adjusts the risk weight for a security based on key risk factors such as incurred losses on the underlying assets, nonperforming loans, and the ability of subordinate tranches to absorb losses. In any case, a securitization exposure is assigned a risk weight of no lower than 20 percent.

- *Securitization due diligence.* During the 2008-09 financial crisis, many banking organizations relied exclusively on ratings issued by Nationally Recognized Statistical Rating Organizations (NRSROs) and did not perform internal credit analysis of their securitization exposures. Consistent with the Basel capital framework and the agencies' general expectations for investment analysis, Regulation Q outlines specific securitization exposure due diligence requirements for banking organiza-

5. Section 214 of the Economic Growth, Regulatory Relief, and Consumer Protection Act (EGRRCPA), Pub. L. No. 115-174, 132 Stat. 1296, 1321–22 (2018), addressed the treatment of HVCRE by adding section 51 to the Federal Deposit Insurance Act (FDIA), 12 U.S.C. 1831bb. FDIA section 51 provides a statutory definition of high volatility commercial real estate acquisition, development, or construction (HVCRE ADC) loans. Under FDIA section 51, the agencies may only require a depository institution to assign a heightened risk weight to a HVCRE exposure, as defined under the capital rule, if such exposure is an HVCRE ADC loan. This statutory change was effective upon enactment of EGRRCPA in May 2018. The agencies also amended their capital rules to reflect this statutory change. See 84 Fed. Reg. 68,019 (December 13, 2019).

tions. As stated in Regulation Q, a banking organization is required to demonstrate, to the satisfaction of its primary federal supervisor, a comprehensive understanding of the features of a securitization exposure that would materially affect its performance. The banking organization's analysis must be commensurate with the complexity of the exposure and the materiality of the exposure in relation to capital of the banking organization. On an ongoing basis (no less frequently than quarterly), the banking organization must evaluate, review, and update as appropriate the analysis required by Regulation Q (12 CFR 217.41(c)(1)) for each securitization exposure. The analysis of the risk characteristics of the exposure prior to acquisition, and periodically thereafter, need to consider:

— Structural features of the securitization that materially impact the performance of the exposure. For example, the contractual cash-flow waterfall, waterfall-related triggers, credit enhancements, liquidity enhancements, market value triggers, the performance of organizations that service the position, and deal-specific definitions of default;
— Relevant information regarding the performance of the underlying credit exposure(s). For example, the percentage of loans 30, 60, and 90 days past due; default rates; prepayment rates; loans in foreclosure; property types; occupancy; average credit score or other measures of creditworthiness; average LTV ratio; and industry and geographic diversification data on the underlying exposure(s);
— Relevant market data of the securitization. For example, bid-ask spread; most recent sales price and historical price volatility; trading volume; implied market rating; and size, depth, and concentration level of the market for the securitization; and
— For resecuritization exposures, performance information on the underlying securitization exposures. For example, the issuer name and credit quality, and the characteristics and performance of the exposures underlying the securitization exposures.

If a banking organization is not able to meet these due diligence requirements and demonstrate a comprehensive understanding of a securitization exposure to the satisfaction of its primary federal supervisor, the banking organization is required to assign a risk weight of 1,250 percent to the exposure.

- *Equity exposures to investment funds.* A banking organization determines the risk-weighted asset amount for equity exposures to investment funds using one of three approaches: (1) the full look-through approach, (2) the simple modified look-through approach, or (3) the alternative modified look-through approach, unless the equity exposure to an investment fund is a community development equity exposure. The risk-weighted asset amount for such community development equity exposures is the exposure's adjusted carrying value. If a banking organization does not use the full look-through approach, and an equity exposure to an investment fund is part of a hedge pair, a banking organization must use the ineffective portion of the hedge pair as the adjusted carrying value for the equity exposure to the investment fund. The risk-weighted asset amount of the effective portion of the hedge pair is equal to its adjusted carrying value. A banking organization may choose which approach to apply for each equity exposure to an investment fund.

  1. *Full Look-Through Approach.* A banking organization may use the full look-through approach only if the banking organization is able to calculate a risk-weighted asset amount for each of the exposures held by the investment fund. A banking organization using the full look-through approach is required to calculate the risk-weighted asset amount for its proportionate ownership share of each of the exposures held by the investment fund (as calculated under the standardized approach) as if the proportionate ownership share of the adjusted carrying value of each exposures were held directly by the banking organization. The banking organization's risk-weighted asset amount for the exposure to the fund is equal to (1) the aggregate risk-weighted asset amount of the exposures held by the fund as if they were held directly by the banking organization multiplied by (2) the banking organization's proportional ownership share of the fund.

2. *Simple Modified Look-Through Approach.* Under the simple modified look-through approach, a banking organization sets the risk-weighted asset amount for its equity exposure to an investment fund equal to the adjusted carrying value of the equity exposure multiplied by the highest applicable risk weight under the standardized approach to any exposure the fund is permitted to hold under the prospectus, partnership agreement, or similar agreement that defines the fund's permissible investments. The banking organization may exclude derivative contracts held by the fund that are used for hedging, rather than for speculative purposes, and do not constitute a material portion of the fund's exposures.

3. *Alternative Modified Look-Through Approach.* Under the alternative modified look-through approach, a banking organization may assign the adjusted carrying value of an equity exposure to an investment fund on a pro rata basis to different risk weight categories under the standardized approach based on the investment limits in the fund's prospectus, partnership agreement, or similar contract that defines the fund's permissible investments. The risk-weighted asset amount for the banking organization's equity exposure to the investment fund is equal to the sum of each portion of the adjusted carrying value assigned to an exposure type multiplied by the applicable risk weight. If the sum of the investment limits for all permissible investments within the fund exceeds 100 percent, the banking organization must assume that the fund invests to the maximum extent permitted under its investment limits in the exposure type with the highest applicable risk weight under the standardized approach and continues to make investments in the order of the exposure category with the next highest risk weight until the maximum total investment level is reached. If more than one exposure category applies to an exposure, the banking organization must use the highest applicable risk weight. A banking organization may exclude derivative contracts held by the fund that are used for hedging, rather than for speculative purposes, and do not constitute a material portion of the fund's exposures.

- *Collateralized transactions.* Regulation Q recognizes a range of financial collateral as credit risk mitigants that may reduce the risk-based capital requirements associated with a collateralized transaction. Financial collateral includes
  (1) cash on deposit with the banking organization (including cash held for the banking organization by a third-party custodian or trustee);
  (2) gold bullion;
  (3) short- and long-term debt securities that are not resecuritization exposures and that are investment grade;
  (4) equity securities that are publicly traded;
  (5) convertible bonds that are publicly traded; or
  (6) money market fund shares and other mutual fund shares if a price for the shares is publicly quoted daily.

  With the exception of cash on deposit, the banking organization is also required to have a perfected, first-priority security interest or, outside of the United States, the legal equivalent thereof, notwithstanding the prior security interest of any custodial agent. Even if a banking organization has the legal right, it still must ensure it monitors or has a freeze on the account to prevent a customer from withdrawing cash on deposit prior to defaulting. A banking organization is permitted to recognize partial collateralization of an exposure.

  Under Regulation Q, a banking organization may recognize the risk-mitigating effects of financial collateral using the "simple approach" for any exposure provided that the collateral meets certain requirements. For repo-style transactions, eligible margin loans, collateralized derivative contracts, and single-product netting sets of such transactions, a banking organization could alternatively use the "collateral haircut approach." Most institutions are likely to use the simple approach; however, regardless of the approach chosen, the institution must consistently apply its approach for similar exposures or transactions.

- *Simple approach.* In the simple approach described in Regulation Q, the collateralized portion of the exposure receives the risk weight applicable to the collateral. The collateral is required to meet the definition of financial collateral. For repurchase agreements, reverse repurchase agreements, and securities lending and borrowing transactions, the collateral would be the instruments, gold, and cash that a banking organization has borrowed, purchased subject to resale, or taken as collateral from the counterparty under the transaction. In all cases, (1) the collateral must be subject to a collateral agreement for at least the life of the exposure; (2) the banking organization must revalue the collateral at least every six months; and (3) the collateral (other than gold) and the exposure must be denominated in the same currency. Generally, the risk weight assigned to the collateralized portion of the exposure must be no less than 20 percent. However, the collateralized portion of an exposure may be assigned a risk weight of less than 20 percent in certain instances.

- *Collateral haircut approach.* A banking organization may use the collateral haircut approach to recognize the credit risk mitigation benefits of financial collateral that secures an eligible margin loan, repo-style transaction, collateralized derivative contract, or single-product netting set of such transactions. In addition, the banking organization may use the collateral haircut approach with respect to any collateral that secures a repo-style transaction that is included in the banking organization's value-at-risk (VaR)-based measure under the market risk rule, even if the collateral does not meet the definition of financial collateral. To apply the collateral haircut approach, a banking organization must determine the exposure amount and the relevant risk weight for the counterparty or guarantor. The exposure amount for an eligible margin loan, repo-style transaction, collateralized derivative contract, or a netting set of such transactions is equal to the greater of zero and the sum of the following three quantities as described in Regulation Q (12 CFR 217.37(c)): (1) the value of the exposure less the value of the collateral; (2) the absolute value of the net position in a given instrument or in gold; and (3) the absolute value of the net position of instruments and cash in a currency that is different from the settlement currency multiplied by the haircut appropriate to the currency mismatch.

  For purposes of the collateral haircut approach, a given instrument includes, for example, all securities with a single Committee on Uniform Securities Identification Procedures (CUSIP) number and would not include securities with different CUSIP numbers, even if issued by the same issuer with the same maturity date.

- *Treatment of Guarantees.* Under Regulation Q, banking organizations have the option to substitute the risk weight of an eligible guarantee or guarantor for the risk weight of the underlying exposure. For example, if the bank has a loan guaranteed by an eligible guarantor, the bank can use the risk weight of the guarantor. Eligible guarantors include entities such as depository institutions and holding companies, the International Monetary Fund, Federal Home Loan Banks, the Federal Agricultural Mortgage Corporation, entities with investment grade debt, sovereign entities, and foreign banks. An eligible guarantee must be written, be either unconditional or a contingent obligation of the U.S. government or its agencies, cover all or a pro rata share of all contractual payments, give the beneficiary a direct claim against the protection provider, and meet other requirements outlined in the definition of eligible guarantees in 12 CFR 217.2.

- *Off-Balance-Sheet Exposures.* Risk-weighted asset amounts for off-balance-sheet items are calculated using a two-step process: (1) Multiplying the amount of the off-balance-sheet exposure by a credit conversion factor to determine a credit equivalent amount, and (2) assigning the credit equivalent amount to a relevant risk-weight category. This treatment applies to all off-balance-sheet items, such as commitments, contingent items, guarantees, certain repo-style transactions, financial standby letters of credit, and forward agreements.

Table 1—SUMMARY OF STANDARDIZED APPROACH RISK WEIGHTS OF ASSETS IN 12 CFR 217

Category	*Risk weight*	*Section of the rule (12 CFR 217)*
Cash	0%	217.32(1)(1)
Direct and unconditional claims on the U.S. government, its agencies, and the Federal Reserve	0%	217.32(a)(1)(i)
Claims on certain supranational entities and multilateral development banks	0%	217.32(b)
Cash items in the process of collection	20%	217.32
Conditional claims on the U.S. government	20%	217.32(a)(1)(ii)
Claims on government-sponsored enterprises (GSEs)	20% on exposures other than equity exposures and preferred stock. 100% on GSE preferred stock.	217.32(c)
Claims on U.S. depository institutions and National Credit Union Administration-insured credit unions	20% 100% risk weight for an investment in an instrument included in another banking organization's regulatory capital unless the instrument is an equity exposure or required to be deducted.	217.32(d)(1) and (3)
Claims on U.S. public sector entities	20% for general obligations. 50% for revenue obligations.	217.32(e)(1)
Industrial development bonds	100%	217.32(l)(5)
Claims on qualifying securities firms	100% – See corporate exposures below.	217.32(f)
One- to four-family loans	50% if first lien, prudently underwritten, owner occupied or rented, not 90 days or more past due or carried in nonaccrual status, is not restructured or modified. 100% otherwise.	217.32(g)
One- to four-family loans modified under Home Affordable Modification Program	50% and 100% The banking organization must use the same risk weight assigned to the loan prior to the modification so long as the loan continues to meet other applicable prudential criteria.	217.32(g)(3)

Category	*Risk weight*	*Section of the rule (12 CFR 217)*
Loans to builders secured by one- to four-family properties presold under firm contracts	50% if the loan meets all criteria in the regulation. 100% if the contract is cancelled. 100% for loans not meeting the criteria.	217.32(h)
Loans on multifamily properties	50% if the loan meets all the criteria in the regulation for a statutory multifamily property; 100% otherwise.	217.32(i)
Corporate exposures and consumer loans	100% unless the exposure is an investment in an instrument included in the regulatory capital of another financial institution.	217.32(f)
Commercial real estate (CRE)	100% 150% for high volatility commercial real estate, which is, subject to certain exceptions, a credit facility secured by land or improved real property that primarily finances has financed, or refinances the acquisition, development, or construction of real property; has the purpose of providing financing to acquire, develop, or improve such real property into income-producing real property; and is dependent upon future income or sales proceeds from, or refinancing of, such real property for the repayment of such credit facility.	217.32(j) and (*l*)(5)
Past-due exposures	150% for the portion that is not guaranteed or secured (does not apply to sovereign exposures). However, one- to four-family loans that are past due 90 days or more are assigned a 100% risk weight.	217.32(k)
Assets not assigned to a risk weight category, including fixed assets, premises, and other real estate owned	100%	217.32(*l*)(5)
Mortgage-backed securities, asset-backed securities, and structured securities	Two general approaches—gross-up approach and simple supervisory formula approach. May also choose to risk weight a securitization exposure at 1,250%.	217.42, .43, and .44

Category	*Risk weight*	*Section of the rule (12 CFR 217)*
Equity exposures	Range of risk weights between 0% and 600%, depending on the entity and whether the equity is publicly traded	217.51 and .52
Equity exposures to investment funds	There is a 20% risk weight floor on investment fund holdings. The following approaches are available: 1. Risk weight is the same as the highest risk weight investment the fund is permitted to hold (called the Simple Modified Look-Through Approach). 2. A banking organization may assign risk weight on a pro rata basis based on the investment limits in the fund's prospectus (called the Alternative Modified Look-Through Approach). 3. A third treatment (called the Full Look-Through Approach) risk weights each asset of the fund (as if owned directly) and multiplies by the banking organization's proportional ownership in the fund.	217.53
Claims on foreign governments and their central banks, foreign banking organizations, and foreign public sector entities	Risk weight depends on Country Risk Classification (CRC) applicable to the sovereign, the sovereign's OECD status, and whether the sovereign entity has defaulted within the previous five years.	217.32(a)(2) to (6), (d)(2) and (e)(2) to (6)

Advanced Approaches

The advanced approaches framework[6] provides a risk-based and leverage capital framework that permit certain banking organizations to use an internal risk measurement approach to calculate capital requirements and advanced measurement approaches in order to calculate regulatory operational-risk capital requirements. An advanced approaches banking organization must calculate its risk-based capital ratios using both the standardized and advanced approaches and meet each minimum requirement with the lower of the two ratios. The advanced approaches are supplemented by the market risk capital requirement.

The advanced approaches in Regulation Q (12 CFR part 217) apply to a top-tier U.S. bank holding companies or savings and loan holding company that is identified as a global systemically important bank holding company and a Category II banking organization as described in the Federal Reserve's Regulation YY (12 CFR 252.5) or Regulation LL (12 CFR 238.10). The advanced approaches also apply to a state member bank that is a subsidiary of a global systemically important bank holding company, a Category II Board-regulated institution; or a

6. See 12 CFR part 217 subpart E.

subsidiary of a bank, bank holding company, or savings and loan holding company that uses the advanced approaches to calculate its risk-based capital requirements. Advanced approaches banking organizations also include those banking organizations that have elected to use the advanced approaches to calculate their total risk-weighted assets.

Market Risk Capital Requirement

The market risk capital requirement[7] applies to banking organizations with significant trading activities to calculate regulatory capital requirements for market risk. The purpose of the market risk capital requirement is to establish risk-based capital requirements for Board-regulated institutions with significant exposure to market risk, provide methods for these Board-regulated institutions to calculate their standardized measure for market risk and, if applicable, advanced measure for market risk, and establish public disclosure requirements. The market risk capital requirement applies to any Board- regulated institution with aggregate trading assets and trading liabilities equal to 10 percent or more of total assets or $1 billion or more.[8] On a case-by-case basis, the Federal Reserve may require an institution that does not meet these criteria to comply with the market risk capital requirement if deemed necessary for safety-and-soundness reasons. The Federal Reserve may also exclude an institution that meets the criteria if such exclusion is deemed to be consistent with safe and sound banking practices.

Minimum Regulatory Capital Ratios

All banking organizations covered under Regulation Q are subject to the following minimum regulatory capital requirements: a common equity tier 1 capital ratio of 4.5 percent, a tier 1 capital ratio of 6 percent, a total capital ratio of 8 percent of risk-weighted assets, and a leverage ratio of 4 percent.[9] See table 2 for more information on the calculation of these ratios.

Most banking organizations are expected to operate with capital levels above the minimum ratios. Banking organizations that are undertaking significant expansion or that are exposed to high or unusual levels of risk are expected to maintain capital well above the minimum ratios; in such cases, the Federal Reserve may specify a higher minimum requirement.

In implementing Regulation Q, the Federal Reserve has reserved the authority to require banking organizations to hold more capital if the minimum requirements are not commensurate with the bank's credit, market, operational, or other risks (see 12 CFR 217.1(d)). This is a formal process that requires Federal Reserve approval, and an examiner alone cannot provide this directive. Examiners may use the Matters Requiring Attention or Matters Requiring Immediate Attention section of the examination report to require a bank to maintain an appropriate capital policy or plan that includes capital limits that are consistent with the bank's risk profile.

Community Bank Leverage Ratio Framework

In 2019, the agencies adopted a final rule[10] that provides for a simple measure of capital adequacy for certain community banking organizations, consistent with section 201 of the EGRRCPA. This final rule established the community bank leverage ratio (CBLR) framework, which provides an optional measure of capital adequacy for depository institutions and depository institution holding companies with the following characteristics:

- leverage ratio greater than 9 percent[11]
- less than $10 billion in average total consolidated assets
- off-balance-sheet exposures of 25 percent or less of total consolidated assets
- trading assets plus trading liabilities of 5 percent or less of total consolidated assets
- not an advanced approaches banking organization.[12]

7. See 12 CFR part 217 subpart F.
8. As reported in the Board-regulated institution's most recent quarterly Call Report, for a state member bank, or Form FR Y-9C, for a BHC or SLHC, as applicable, any SLHC that does not file the Form FR Y-9C should follow the instructions to the Form FR Y-9C.
9. Tier 1 capital is equal to the sum of common equity tier 1 capital and additional tier 1 capital. Total capital is the sum of common equity tier 1, additional tier 1, and tier 2 capital.
10. See 84 Fed. Reg. 61,797 (November 13, 2019) and 12 CFR 217.12.
11. From April 23, 2020, through December 31, 2021, a lower leverage ratio criterion applies. See 12 CFR 217.304.
12. For more detailed information on the applicability of

TABLE 2—CAPITAL RATIO CALCULATIONS AND MINIMUM RATIOS

Ratio	Calculation	Minimum
Common equity tier 1 capital ratio	$\frac{\text{common equity tier 1 capital}}{\text{standardized total risk-weighted assets}}$	4.5%
Tier 1 capital ratio	$\frac{\text{tier 1 capital}}{\text{standardized total risk-weighted assets}}$	6%
Total capital ratio	$\frac{\text{total capital}}{\text{standardized total risk-weighted assets}}$	8%
Leverage ratio	$\frac{\text{tier 1 capital}}{\text{average total consolidated assets}}$	4%

A qualifying banking organization may opt into the CBLR framework by completing the associated reporting line items that are required for such firms on its Call Report and/or Form FR Y–9C, as applicable. A qualifying banking organization that elects to use the CBLR framework and that maintains a leverage ratio of greater than 9 percent will be considered to have satisfied the generally applicable risk-based and leverage capital requirements in the agencies' capital rules (generally applicable requirement). If applicable, the qualifying banking organization will be considered to have met the well-capitalized ratio requirements for prompt corrective action purposes.[13]

A banking organization may opt out of the CBLR framework and become subject to the generally applicable requirement by completing the associated reporting requirements on its Call Report and/or Form FR Y–9C, as applicable. A banking organization can opt out of the CBLR framework between reporting periods by providing its capital ratios under the generally applicable requirement to its appropriate regulators at that time.

Calculation of the CBLR is as follows:

$$\frac{\text{Tier 1 capital}}{\text{Average total consolidated assets}}$$

The calculation of a Board-regulated institution's leverage ratio is described in the generally applicable requirement.[14] However, the calculation of tier 1 capital for purposes of the CBLR differs from the generally applicable requirement. Because the CBLR framework does not have a total capital requirement, an electing banking organization is neither required to calculate tier 2 capital nor make any deductions that would have been taken from tier 2 capital under the generally applicable requirement.

Grace Period

If an electing banking organization fails to satisfy one or more of the qualifying criteria but maintains a leverage ratio of greater than 8 percent, that banking organization has a "grace period" of up to two quarters during which it could continue to use the CBLR framework and be deemed to meet the "well capitalized" capital ratio requirements.[15] As long as the banking organization is able to return to compliance with all the qualifying criteria within two quarters, it continues to be deemed to meet the "well

the CBLR framework, see 12 CFR 217.12(a)(2).

13. See FDIA section 38, 12 U.S.C. 1831o, and the Board's Regulation H, 12 CFR part 208.

14. 12 CFR 217.10.

15. From April 23, 2020, through December 31, 2021, lower grace period thresholds apply. See 12 CFR 217.304.

capitalized" ratio requirements and to be in compliance with the generally applicable requirement.

A banking organization is required to comply with and report under the generally applicable requirement and file the relevant regulatory reports if the banking organization (1) is unable to restore compliance with all qualifying criteria during the two-quarter grace period (including reporting a leverage ratio greater than 9 percent), (2) has a leverage ratio of 8 percent or less, or (3) ceases to satisfy the qualifying criteria due to consummation of a merger transaction.[16]

Supplementary Leverage Ratio

The supplementary leverage ratio measures tier 1 capital relative to total leverage exposure, which includes on-balance sheet assets (including deposits at central banks) and certain off-balance sheet exposures.[17]

Advanced approaches banking organizations and Category III Board-regulated institutions are also subject to a minimum supplementary leverage ratio of 3 percent. The denominator of the supplementary leverage ratio incorporates certain off-balance-sheet exposures such as commitments and derivative exposures. The Federal Reserve applies this to advanced approaches banking organizations and Category III Board-regulated institutions because these firms typically hold higher levels of off-balance-sheet exposure that are not captured by the leverage ratio. The supplementary leverage ratio also factors into a covered institution's PCA capital ratio framework.

In January 2020, the Federal Reserve issued a final rule to implement EGRRCPA section 402, which requires the agencies to amend the supplementary leverage ratio.[18] Under EGRRCPA section 402, the supplementary leverage ratio must not take into account funds of a custodial bank that are deposited with certain central banks, provided that any amount that exceeds the value of deposits of the custodial bank that are linked to fiduciary or custodial and safekeeping accounts must be taken into account when calculating the supplementary leverage ratio as applied to the custodial bank. Custody, safekeeping, and asset servicing activities generally involve holding securities or other assets on behalf of clients, as well as activities such as transaction settlement, income processing, and related record keeping and operational services. To qualify as a custodial banking organization, a depository institution holding company is required to have a ratio of assets under custody-to-total assets of at least 30:1, calculated as an average over the prior four calendar quarters.

Enhanced Supplementary Leverage Ratio

In 2015, the Federal Reserve implemented an enhanced supplemental leverage ratio requirement.[19] Banking organizations subject to Category I standards, which are the global systemically important bank holding companies (U.S. G-SIBs), as well as their depository institution subsidiaries, are subject to enhanced supplementary leverage ratio standards. The enhanced supplementary ratio standards require each U.S. G-SIB to maintain a supplementary leverage ratio above 5 percent to avoid limitations on the firm's distributions and certain discretionary bonus payments and also require each of its insured depository institutions to maintain a supplementary leverage ratio of at least 6 percent to be deemed "well capitalized" under the prompt corrective action framework of each agency. The leverage buffer functions like the capital conservation buffer for the risk-based capital ratios, which is described in greater detail below.

De Novo Bank Leverage Ratio

SR-20-16, "Supervision of De Novo State Member Banks," provides additional supervisory guidance on leverage ratio expectations for de novo state member banks (de novo bank). As noted in SR-20-16, an insured depository institution is considered to be in the de novo stage until it has been operating for at least three years. A de novo bank should maintain capital ratios commensurate with its risk profile and, generally, well in excess of regulatory minimums. Typically, as a condition of membership, the Federal Reserve requires each de novo bank to maintain a Tier 1 leverage ratio of at least

16. From April 23, 2020, through December 31, 2021, lower grace period thresholds apply. See 12 CFR 217.304.
17. 12 CFR 217.10(a)(5) and (c)(4).
18. 85 Fed. Reg. 4569 (January 27, 2020).
19. 80 Fed. Reg. 49,082 (August 14, 2015).

8 percent for the first three years of its existence.[20] The Reserve Bank should consult Board supervision staff when the Tier 1 leverage ratio of a de novo falls below 8 percent. Examiners should also scrutinize de novo banks that rely on additional capital infusions to meet this minimum requirement and understand the stability of the capital source.

Stress Capital Buffer

During the 2008–09 financial crisis, some banking organizations continued to pay dividends and substantial discretionary bonuses even as their financial condition weakened. Such capital distributions had a significant negative impact on the overall strength of the banking sector. To encourage better capital conservation and to enhance the resilience of the banking system, Regulation Q limits capital distributions and discretionary bonus payments for banking organizations that do not hold a specified amount of common equity tier 1 capital in addition to the amount of regulatory capital necessary to meet the minimum risk-based capital requirements (capital conservation buffer).

On March 4, 2020, the Federal Reserve approved a final rule establishing a stress capital buffer for bank holding companies and U.S. intermediate holding companies of foreign banking organizations that have $100 billion or more in total consolidated assets. The stress capital buffer rule integrates the Federal Reserve's stress test results with its non-stress capital requirements.[21] More specifically, the stress capital buffer rule integrates the Comprehensive Capital Analysis and Review (CCAR) with the capital rule. Under the stress capital buffer requirement, the Federal Reserve uses the results of its supervisory stress test to establish the size of a firm's stress capital buffer requirement, which replaces the static 2.5 percent of risk-weighted assets component of a firm's capital conservation buffer requirement. A firm's stress capital buffer requirement varies based on a firm's risk. A firm that does not maintain capital ratios above its minimums plus its buffer requirements faces restrictions on its capital distributions and discretionary bonus payments.

Countercyclical Capital Buffer

The countercyclical capital buffer (CCyB) is a supplemental policy tool that the Federal Reserve can increase during periods of rising vulnerabilities in the financial system and reduce when vulnerabilities recede. It is designed to increase the resilience of advanced approaches banking organizations or Category III Board-regulated institutions when there is an elevated risk of above-normal losses. Increasing the resilience of such organizations will, in turn, improve the resilience of the broader financial system. The circumstances in which the Federal Reserve would most likely begin to increase the CCyB above zero percent to augment minimum capital requirements and other capital buffers would be when systemic vulnerabilities are meaningfully above normal. By requiring large banking organizations to hold additional capital during a period of excess and removing the requirement to hold additional capital when the vulnerabilities have diminished, the CCyB is expected to moderate fluctuations in the supply of credit over time.

A CCyB, if applicable, would expand the capital conservation buffer by up to 2.5 percent of a banking organization's total risk-weighted assets for advanced approaches banking organizations or Category III Board-regulated institutions. The amount of the CCyB amount is determined by a country's bank supervisor and will differ by jurisdiction . At any point in time, a country's bank supervisor determines the degree of excessive credit growth in its jurisdictions. An advanced approaches Board-regulated institution or a Category III Board-regulated institution must calculate a countercyclical capital buffer amount in accordance with Regulation Q (12 CFR 217.11(b)) for purposes of determining its maximum payout ratio. The payout ratio is set forth in Regulation Q as well as this manual's section entitled "Dividends."

PROMPT CORRECTIVE ACTION

In 1991, Congress enacted a regulatory framework to address the problems associated with troubled insured depository institutions with the intent of minimizing the long-term cost to the

20. Refer to 12 CFR 217.10(a). This expectation does not prevent a de novo that is a qualifying community banking organization from electing to be subject to the community bank leverage ratio framework. See also 12 CFR 217.12.

21. 85 Fed. Reg. 15,576 (March 18, 2020).

Deposit Insurance Fund. This legislation, the Federal Deposit Insurance Corporation Improvement Act of 1991, added section 38 to the Federal Deposit Insurance Act (FDIA), codified at 12 U.S.C. 1831o; FDIA section 38 is known as the PCA statute. The Federal Reserve has implemented PCA as applicable to state member banks in subpart D of Regulation H (12 CFR 208.40 to 208.45). PCA uses the total risk-based capital measure, tier 1 risk-based capital measure, common equity tier 1 risk-based capital measure, leverage ratio, supplementary leverage ratio, and tangible equity to total assets ratio for assigning state member banks to the five capital categories. These five PCA categories under FDIA section 38 and the PCA regulations are "well capitalized," "adequately capitalized," "undercapitalized," "significantly undercapitalized," and "critically undercapitalized." A qualifying community banking organization that has elected to use the community bank leverage ratio framework under 12 CFR 217.12 is considered to have met the capital ratio requirements for the well capitalized capital category. The capital ratios trigger specific actions that are designed to restore a bank to financial health. See the "Prompt Corrective Action" section for more information on PCA.

EVALUATING CAPITAL ADEQUACY

Overall Assessment of Capital Adequacy

The following factors should be taken into account in assessing the overall capital adequacy of a bank.

Regulatory Capital Ratios

Capital ratios should be compared with regulatory minimums and with peer-group averages. Banking organizations are expected to maintain minimum capital ratios described above. However, because risk-based capital does not take explicit account of the quality of a bank's asset portfolios or its risk exposures, such as interest-rate, liquidity, market, or operational risks, banking organizations are generally expected to operate with capital positions above the minimum ratios. Institutions with high or inordinate levels of risk are also expected to maintain capital well above the minimum levels.

Impact of Management

Strategic capital planning. One of management's most important functions is to lead the organization by designing and implementing an effective strategic plan that addresses the bank's capital requirements to support its business goals and objectives. The strategic plan should clearly outline the bank's capital base, anticipated capital expenditures, desirable capital level, and external capital sources.[22] Effective strategic planning allows the institution to be proactive in addressing market changes and emerging risks and, therefore, enables an institution to plan for its capital needs. Strategic capital planning should address both a bank's short-term and long-term capital needs in relation to its asset deployment, funding sources, capital formation, management, marketing, operations, and information systems.

Growth. Capital is necessary to support a bank's growth, and, therefore, a bank needs to monitor its capital ratios in relation to its strategic plan. Because a bank has to maintain a minimum ratio of capital to assets, there are limitations on a bank's ability to grow. For example, a rapid growth in a bank's loan portfolio may be a cause of concern, for it could indicate that a bank is altering its risk profile by reducing its underwriting standards.

Dividends. State member banks are subject to legal restrictions on reductions in capital resulting from cash dividends, including out of the capital surplus account, under 12 U.S.C. 324 and 12 CFR 208.5. The Federal Reserve has a long-standing policy statement on the payment of cash dividends by state member banks and BHCs that are experiencing financial difficulties. The policy statement addresses the following practices that raises supervisory concerns when an institution is experiencing earnings

22. For more information about capital planning at the holding company level, see SR-09-4, "Applying Supervisory Guidance and Regulations on the Payment of Dividends, Stock Redemptions, and Stock Repurchases at Bank Holding Companies," and the Board's Regulation Y on capital planning and stress capital buffer requirements (12 CFR 225.8).

weaknesses, or has other serious problems or inadequate capital:

- the payment of dividends not covered by earnings,
- the payment of dividends from borrowed funds, and
- the payment of dividends from unusual or nonrecurring gains, such as the sale of property or other assets.

When a bank is experiencing earnings weaknesses or other financial pressures, the Federal Reserve's view is that

- a bank's level of cash dividends should not exceed its net income;
- dividends should be consistent with the organization's capital position, and
- dividends should only be funded in ways that do not weaken the organization's financial health.

In some instances, it may be appropriate to eliminate cash dividends altogether.[23]

Examiners should review historical and planned cash-dividend payout ratios to determine whether dividend payments are impairing capital adequacy. Excessive dividend payouts may result from several sources:

- If the bank is owned by a holding company, the holding company may be requiring excessive dividend payments from the bank to fund the holding company's debt-repayment program, expansion goals, or other cash needs.
- The bank's board of directors may be under pressure from individual shareholders to provide funds to repay bank stock debt or to use for other purposes.
- Dividends may be paid or promised to support a proposed equity offering.[24]

Access to additional capital. Banks that do not generate sufficient capital internally may require external sources of capital. Large, independent institutions may seek additional funding from the capital markets. Smaller institutions may rely on its parent holding company, a principal shareholder, or a control group to provide additional funds, or may rely on the issuance of new capital instruments to existing or new investors. Current shareholders may resist efforts to issue new capital instruments because of the diluting effect of the new capital. In deciding whether to raise additional capital in this manner, shareholders should weigh the dilution against the possibility that, without the additional funds, the institution may fail.

Under the FDI Act, a depository institution holding company is required to serve as a source of strength to its subsidiary depository institutions.[25] A holding company can fulfill this obligation by having enough liquidity to inject funds into the depository institution or by having access to the same sources of additional capital, that is, current or existing shareholders, as outlined above.

Financial Considerations

Financial information can be found on Schedule RC-R of the Report of Condition and Income (Call Report) for banks; however, risks may not always be reflected in the current financial condition. Therefore, examiners should not rely solely on an institution's current financial condition when determining capital adequacy and should assess management's ability to identify, measure, monitor, and control all material risks that may affect capital. Examiners should evaluate a bank's capital levels and ratios in view of the bank's overall financial condition, including the following areas:

Asset quality. Examiners' supervisory assessment on a bank's capital adequacy may differ from conclusions based solely from the level of a bank's risk-based capital ratio. Generally, the main reason for this difference is the evaluation of asset quality. An examiner's assessment a bank's capital adequacy takes into account examination findings, particularly the severity of problem and classified assets and investment or loan portfolio concentrations as well as he adequacy of the bank's allowance for loan and lease losses or adjusted allowance for credit losses.

23. For the complete text of the policy statement on the payment of cash dividends by state member banks and BHCs that are experiencing financial difficulties see the *Bank Holding Company Supervision Manual* and Attachment B to SR-09-4.

24. For more information, see the "Dividends" section of this manual.

25. For more information, see the "Supervision of Subsidiaries" section in the *Bank Holding Company Supervision Manual*.

Balance-sheet composition. A bank whose earning assets are not diversified or whose credit culture is more risk-tolerant is generally expected to operate with higher capital levels than a similar-sized institution with well-diversified, less-risky investments.

Earnings. A bank's earnings performance should enable it to fund growth, compete in the marketplace, and support its risk profile. An adequately capitalized, growing bank should have a consistent pattern of capital augmentation by earnings retention. Poor earnings can have a negative effect on bank's capital adequacy in two ways. First, any losses absorbed by capital reduce the ability of the remaining capital to absorb future losses. Second, the impact of losses on capital is magnified by the fact that a bank generating losses is incapable of replenishing its capital accounts internally.

Funds management. A bank with undue levels of interest-rate risk may need to strengthen its capital positions, even though it may meet the minimum risk-based capital standards. The adequacy and effectiveness of an institution's interest-rate risk management process and the level of its interest-rate risk exposure are critical factors in the examiners' evaluation of an institution's sensitivity to changes in interest rates and capital adequacy. Examiners consider how a bank manages its interest-rate exposures. A bank's funds management systems should be commensurate with its earnings and capital levels, complexity, business model, risk profile, and scope of operations. If a bank determines that its core earnings and capital are insufficient to support its level of interest-rate risk, a bank should take steps to mitigate its risk exposure or increase its capital, or take both steps. See SR-10-1, "Interagency Advisory on Interest Rate Risk," for more information.

Off-balance-sheet items and activities. Once funded, off-balance-sheet items become subject to the same capital requirements as on-balance-sheet items. A bank's capital levels should be sufficient to support the quality and quantity of assets that would result from a significant portion of these items being funded within a short time.

Inadequate Allowance for Loan and Lease Losses or Adjusted Allowances for Credit Losses. An inadequate ALLL or AACL will require an additional charge to current income. Any charge to current income will reduce the amount of earnings available to supplement tier 1 capital. Because the amount of the ALLL or AACL that can be included in tier 2 capital is limited to 1.25 percent of gross risk-weighted assets, an additional provision may increase the ALLL or AACL level above this limit, thereby resulting in the excess portion being excluded from tier 2 capital.

Ineligible Collateral and Guarantees. Regulation Q recognizes only limited types of collateral and guarantees. Other types of collateral and guarantees may support a bank's asset mix, particularly within its loan portfolio. Such collateral or guarantees may serve to improve substantially the overall quality of a loan portfolio and other credit exposures and should be considered by examiners in their overall assessment of a bank's capital adequacy.

Market Value of Bank Stock. Examiners should review trends in the market price of a bank's stock and whether its stock is trading at a reasonable multiple of earnings or a reasonable percentage (or multiple) of book value. A bank's low stock price may merely be an indication that it is undervalued, or it may be indicative of regional or industry-wide problems. However, a low-valued stock may also indicate that investors lack confidence in the institution; such lack of support could impair the bank's ability to raise additional capital in the capital markets.

Other Real Estate Reserves. Other real estate reserves, whether considered general or specific reserves, are not recognized as a component of regulatory capital. However, examiners should consider these reserves when classifying an other real estate (ORE) asset as a Loss. Examiners should consider the existence of any general ORE reserves when determining the amount of the loss on an ORE asset. To the extent that ORE reserves adequately cover the risks inherent in the ORE portfolio as a whole, including any individual ORE assets classified Loss, there would not be a deduction from common equity tier 1 capital. The ORE Loss in excess of ORE reserves should be deducted from common equity tier 1 capital under assets other than held-for-investment loans and leases classified loss.

Unrealized Asset Values. Banks often have assets on their books that are carried at significant discounts below current market values. The excess of the market value over the book value (historical cost or acquisition value) of assets such as investment securities or banking premises may represent capital to the bank. These unrealized asset values are not included in the risk-based capital calculation; however, examiners should consider these assets when assessing a bank's capital adequacy. Further, as part of this assessment, examiners should consider the nature of the asset, the reasonableness of its valuation, its marketability, and the likelihood of its sale.

Stress Testing and Capital Adequacy

Stress testing is a tool that helps both bank supervisors and certain firms measure the sufficiency of capital available to support the firm's operations throughout periods of stress. The Federal Reserve and the other federal banking agencies have highlighted the use of stress testing as a means to better understand the range of a financial company's potential risk exposures. While stress tests are a valuable tool for assessing the capital adequacy of a firm, stress tests may not necessarily capture a company's full range of risks, exposures, activities, and vulnerabilities that have a potential effect on capital adequacy.

The Federal Reserve has established frameworks and programs for the supervision of its largest and most complex financial institutions to achieve its supervisory objectives, incorporating lessons learned from the 2008–09 financial crisis and in the period since. As part of these supervisory frameworks and programs, the Federal Reserve assesses whether bank holding companies with $100 billion or more in total consolidated assets and U.S. intermediate holding companies are sufficiently capitalized to absorb losses during stressful conditions while meeting obligations to creditors and counterparties and continuing to be able to lend to households and businesses. On October 10, 2019, the Federal Reserve amended its prudential standards to exempt firms with total consolidated assets of less than $100 billion from the supervisory stress test and to subject certain firms with total consolidated assets between $100 billion and $250 billion to the supervisory stress test requirements on a two-year cycle.[26] Bank holding companies and intermediate holding companies with $250 billion or more in total consolidated assets or material levels of other risk factors remain subject to the supervisory stress test requirements on an annual basis.

RATING THE CAPITAL FACTOR FOR STATE MEMBER BANKS

As stated in the Uniform Financial Institutions Rating System[27] for commercial banks and thrifts, a financial institution is expected to maintain capital commensurate with the nature and extent of risks to the institution and the ability of management to identify, measure, monitor, and control these risks. Examiners should consider the effect of credit, market, and other risks on the institution's financial condition when evaluating the adequacy of capital. The types and quantity of risk inherent in an institution's activities will determine the extent to which it may be necessary for an institution to maintain capital at levels above required regulatory minimums in order to reflect properly the potentially adverse consequences that these risks may have on the institution's capital.

Examiners rate an institution's capital adequacy based upon, but not limited to, an assessment of the following evaluation factors:

- The level and quality of capital and the institution's overall financial condition.
- The ability of management to address emerging needs for additional capital.
- The nature, trend, and volume of problem assets, and the adequacy of allowances for loan and lease losses, adjusted allowances for credit losses, and other valuation reserves.
- Balance sheet composition, including the nature and amount of intangible assets, market risk, concentration risk, and risks associated with nontraditional activities.
- Risk exposure represented by off-balance-sheet activities.
- The quality and strength of earnings, and the reasonableness of dividends.
- Prospects and plans for growth as well as the institution's past experience in managing growth.

26. 84 Fed. Reg. 59,032 (November 1, 2019).
27. 61 Fed. Reg. 67,021 (December 19, 1996).

- Access to capital markets and other sources of capital, including support provided by a parent holding company.

Ratings

1. A rating of “1” indicates a strong capital level relative to the institution’s risk profile.
2. A rating of “2” indicates a satisfactory capital level relative to the financial institution’s risk profile.
3. A rating of “3” indicates a less than satisfactory level of capital that does not fully support the institution’s risk profile. The rating indicates a need for improvement, even if the institution’s capital level exceeds minimum regulatory and statutory requirements.
4. A rating of “4” indicates a deficient level of capital. In light of the institution’s risk profile, viability of the institution may be threatened. Assistance from shareholders or other external sources of financial support may be required.
5. A rating of “5” indicates a critically deficient level of capital such that the institution’s viability is threatened. Immediate assistance from shareholders or other external sources of financial support is required.

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Capital

Dividends are distributions of earnings to owners.[1] Dividends can influence an investor's willingness to purchase corporate stock since the investor generally expects reasonable investment returns. Although dividends usually are declared and paid in either cash or stock, occasionally they are used to distribute real or personal property. Dividend payments may reduce capital in some banks to the point of supervisory concern. As a result, certain statutory limitations apply to the payment of dividends.

If a bank is a subsidiary of a bank holding company, examiners should also be aware of a bank's parent company cash-flow needs. In addition to the payment of dividends, the parent company may need cash for debt service or to fund its operations. Parent company debt generally is primarily serviced through dividend payments by the subsidiary bank. When establishing dividend levels from a bank subsidiary, the parent company should not set a dividend rate that will place undue pressure on the bank's ability to maintain an adequate level of capital.

Declaration of a dividend requires formal action by the board of directors to designate the medium of payment, dividend rate, shareholder record date, and date of payment. Dividends may be declared at the discretion of the board.[2] The bank should conduct appropriate capital planning and due diligence to ensure the dividend payments will not place undue pressure on the bank's current and future capital levels.

Dividends are recorded by debiting "retained earnings" and crediting "dividends declared not yet payable," which is to be reported in other liabilities. Upon payment of the dividend, "dividends declared not yet payable" is debited for the amount of the cash dividend with an offsetting credit, normally in an equal amount, to "dividend checks outstanding" which is reportable in the "demand deposits" category of the bank's deposit liabilities. For more information, see the Call Report Instructions.

SUPERVISORY GUIDANCE ON DIVIDENDS

In addition to statutory limitations of the payment of dividends, on November 14, 1985, the Federal Reserve Board issued a policy statement on the payment of dividends by state member banks and bank holding companies. The complete statement is available in the Federal Reserve Regulatory Service at 4–877, section 2020.5, "Intercompany Transactions (Dividends)," in the *Bank Holding Company Supervision Manual*. A summary of the 1985 policy statement on the payment of dividends is provided below.

In 2009, the Federal Reserve issued SR letter 09-4, "Applying Supervisory Guidance and Regulations on the Payment of Dividends, Stock Redemptions, and Stock Repurchases at Bank Holding Companies," which provides guidance on the declaration and payment of dividends, capital redemptions, and capital repurchases by bank holding companies in the context of their capital planning processes. While SR-09-4 applies to bank holding companies, its principles are also broadly relevant to state member banks. In 2015, the Federal Reserve issued SR letter 15-18, "Federal Reserve Supervisory Assessment of Capital Planning and Positions for LISCC Firms and Large and Complex Firms," and SR letter 15-19, "Federal Reserve Supervisory Assessment of Capital Planning and Positions for Large and Noncomplex Firms." While SR-15-18 and SR-15-19 generally apply to the largest bank holding companies, the principles of the 1985 Policy Statement on the Payment of Dividends are incorporated into these SR letters. Specifically, firms should have comprehensive policies on dividend payments that clearly articulate their objectives and approaches for maintaining a strong capital position and achieving the principles of the policy statement.

1. Other payments not called dividends may also be distributions of earnings to owners. These distributions or "constructive dividends" may be termed fees, bonuses, or other payments. Constructive dividends are distinct from legitimate fees, bonuses, and other payments, which are reasonable, adequately documented, and for valuable goods and services provided to the bank. Constructive dividends may create a potential tax liability and indicate control issues or insider self-dealing, and they may portend shareholder lawsuits against insiders, board members, and the bank.

2. At a minimum, board of directors minutes approving declaration and payment of a dividend should include three components: (1) the "as of" date to identify shareholders of record to receive the dividend (date of record), (2) an amount or description of the dividend, and (3) identification of the date on which the dividend payment is to take place (date of payment). There may also be additional legal requirements that should be documented, depending on state laws and the nature of the dividend.

SUMMARY OF POLICY STATEMENT ON PAYMENT OF DIVIDENDS

Adequate capital is critical to the health of individual banking organizations and to the safety and stability of the banking system. A major determinant of a financial institution's capital adequacy is earnings strength and whether earnings are retained or paid to shareholders as dividends. Dividends are a primary way that banking organizations provide return to shareholders on their investment.

During profitable periods, dividends represent a return of a portion of a banking organization's net earnings to its shareholders. During less profitable periods, dividend rates are often reduced or sometimes eliminated. The payment of cash dividends that are not fully covered by earnings, in effect, represents the return of a portion of an organization's capital at a time when circumstances may indicate instead the need to strengthen capital and concentrate financial resources on resolving the organization's problems.

Therefore, as a matter of prudent banking it is generally only appropriate for a bank or bank holding company to continue its existing rate of cash dividends on common stock only if

- the organization's net income available to common shareholders over the past year has been sufficient to fully fund the dividends; and
- the prospective rate of earnings retention appears consistent with the organization's capital needs, asset quality, and overall financial condition.

Any banking organization whose cash dividends are inconsistent with either of these criteria should seriously consider reducing or eliminating its dividends. Such an action will help conserve the organization's capital base and help it weather a period of adversity.

It is generally inconsistent with prudent banking practices for a banking organization that is experiencing financial problems or that has inadequate capital to borrow to pay dividends; this would result in increased leverage at the very time the organization needs to reduce its debt or conserve its capital. Similarly, the payment of dividends based solely or largely on gains resulting from unusual or nonrecurring events may be imprudent. Unusual or nonrecurring events may include the sale of assets, the effects of accounting changes, the postponement of large expenses to future periods, or negative provisions to the allowance for loan and lease losses.

CAPITAL CONSERVATION BUFFER

The Board's Regulation Q (12 CFR 217) limits capital distributions and discretionary bonus payments for banking organizations that do not hold a specified amount of common equity tier 1 capital in addition to the amount of regulatory capital necessary to meet the minimum risk-based capital requirements (capital conservation buffer). A banking organization's capital conservation buffer must be greater than 2.5 percent of its total risk-weighted assets in order to avoid limitations on capital distributions and discretionary bonus payments.[3]

If a banking organization's capital conservation buffer falls below 2.5 percent, its maximum payout amount for capital distributions and discretionary payments declines to a set percentage of eligible retained income based on the size of the bank's buffer. Table 1 reflects the maximum payout ratio for the capital conservation buffer.

The types of payments subject to the restrictions include dividends, share buybacks, discretionary payments on capital instruments, and discretionary bonus payments. It is important to note that the Board may require a Board-regulated institution to hold an amount of regulatory capital greater than otherwise required if the Board determines that the banking organization's capital requirements are not commensurate with its credit, market, operational, or other risks. For more information, see this manual's section entitled, "Assessment of Capital Adequacy," and 12 CFR 217.11.

3. A banking organization may have a capital conservation buffer greater than 2.5 percent under certain circumstances. For example, a global systemically important bank holding company (G-SIB) is subject to a G-SIB surcharge that expands the capital conservation buffer applicable to the company. G-SIBs are also subject to a buffer over the supplementary leverage ratio that imposes limits very similar to the capital conservation buffer.

Table 1—Calculation of Maximum Payout Amount

Capital Conservation Buffer (as a percentage of risk weighted assets)	Maximum Payout Ratio (as a percentage of the previous four quarters of net income)
Greater than 2.5%	No payout ratio limitation applies.
Less than or equal to 2.5% and greater than 1.875%	60%
Less than or equal to 1.875% and greater than 1.25%	40%
Less than or equal to 1.25% and greater than 0.625%	20%
Less than or equal to 0.625%	0%

STATUTORY LIMITATIONS

Three major federal statutory limitations govern the payment of dividends by banks. These limitations, included in sections 1831o, 56, and 60 of title 12 of the United States Code (12 USC 1831o, 56, and 60), apply to cash dividends and non-stock property dividends. Common stock dividends (dividends payable in common stock to all the common shareholders of the bank) may be paid regardless of these statutory limitations since such dividends do not reduce the bank's capital. In addition, the examiner needs to be aware of any state laws governing dividend payments.

Prompt Corrective Action

Section 1831o, also referred to as the prompt-corrective-action (PCA) provision, was adopted in 1991 as part of the Federal Deposit Insurance Corporation Improvement Act. Section 1831o applies to all insured depository institutions, including state member banks, and is implemented through section 208.40 of Regulation H. This regulatory section prohibits the payment of dividends when a bank is deemed to be undercapitalized or when the payment of the dividend would make the bank undercapitalized in accordance with the PCA framework. An organization that is undercapitalized for purposes of PCA must cease paying dividends for as long as it is deemed to be undercapitalized. Once earnings have begun to improve and an adequate capital position has been restored, dividend payments may resume in accordance with federal and state statutory limitations and guidelines.

Sections 56 and 60

Sections 56 and 60 (sections 5204 and 5199 of the Revised Statutes) were first adopted as part of the National Bank Act more than a century ago. Although these sections were made applicable to national banks, they also apply to state member banks under the provisions of section 9 of the Federal Reserve Act.[4] These sections are implemented through section 208.5 of Regulation H.

Under section 56, prior regulatory and shareholder approval must be obtained if the dividend would exceed the bank's undivided profits (retained earnings), as reportable in its Reports of Condition and Income (Call Reports).[5] In addition, the bank may include amounts contained in its surplus account, if the amounts reflect transfers made in prior periods of undivided profits and if regulatory approval for the transfer back to undivided profits is obtained.

4. State-chartered banks that are not members of the Federal Reserve System (state nonmember banks) are not subject to sections 56 and 60. However, they may be subject to similar dividend restrictions under state law.

5. Although the language of section 56 could imply that a dividend cannot be declared in excess of the limit even if regulatory approval were obtained, a "return of capital" to shareholders is allowed under section 59 if the bank obtains prior regulatory approval and the approval of at least two-thirds of each class of shareholders.

Under section 60, prior regulatory approval to declare a dividend must be obtained if the total of all dividends declared during the calendar year, including the proposed dividend, exceeds the (1) sum of the net income earned during the year-to-date and (2) the retained net income of the prior two calendar years as reported in the bank's Call Reports. In determining this limitation, any dividends declared on common or preferred stock during the period and any required transfers to surplus or a fund for the retirement of any preferred stock must be deducted from net earnings to determine the net income and retained net income.[6]

The statutory limitations are tied to the declaration date of the dividend because, at that time, shareholders expect the dividends will be paid, a liability is recorded, and the bank's capital is reduced. If the bank's board of directors wishes to declare a dividend between Call Report dates, the earnings or losses incurred since the last Call Report date should be considered in the calculation. Thus, if a bank's dividend-paying capacity might be limited under sections 56 or 60, the bank should ensure it has sufficient capacity to declare the dividend by maintaining sufficient documentation to substantiate its earnings or losses on an accrual basis for the period since the last Call Report date.

6. In rare circumstances when the surplus of a state member bank is less than what applicable state law requires the bank to maintain relative to its capital stock account, the bank may be required to transfer amounts from its undivided profits account to surplus. This may arise, for example, because some states require surplus to equal or exceed 100 percent of the capital stock account. Such required transfers would reduce the section 60 calculation.

REQUEST FOR REGULATORY APPROVAL

When regulatory approval is required for dividend payments under section 56 or 60, the request should be submitted to the appropriate Federal Reserve Bank. In section 265.11(e)(4) of the Rules Regarding Delegation of Authority, the Reserve Banks have been delegated authority to permit a state member bank to declare dividends in excess of section 60 limits. Before approving the request, the Reserve Bank should consider if the proposed dividend is consistent with the bank's capital needs, asset quality, strength of management, and overall financial condition.

If applicable, examiners should verify that prior approval was obtained from the Federal Reserve Bank, and, if required, at least two-thirds of each class of stockholders before the dividend was paid. Violations of law or safety and soundness concerns arising from nonconformance with the Federal Reserve Board's policy statement should be discussed with bank management and noted in the examination report.

1. Evaluate the bank's dividend policies (which may be in the overall capital planning policy) and determine whether they provide appropriate guidance for managing the bank's dividends. Consider whether policies
   - are consistent with the board's risk appetite;
   - are reviewed and approved by the board at appropriate intervals;
   - require maintenance of adequate records and documentation of the stock accounts and shareholders, as applicable;
   - provide for compliance with applicable laws and regulations;
   - clearly and completely articulate the bank's objectives for maintaining a satisfactory capital position, including restricting dividends and other capital distributions when the bank does not, or may not, meet required capital levels or internal targets;
   - include appropriate targets, limits, or floors for dividends;
   - incorporate measures to ensure that sufficient capital remains after the payment of dividends to support the bank's business plans, growth, and business goals as stated in the bank's strategic or capital plans;
   - address the authorization of capital account and dividend transactions;
   - require adequate documentation of capital transactions with affiliates or related organizations;
   - address the employment of an independent stock registrar or stock transfer agent (e.g., review policies for third-party vendors), if applicable; and
   - address the selection and use of a third-party dividend paying agent, if applicable.
2. Determine whether policies establish limits on dividends and issuances of capital instruments, redemptions, or repurchases, and delineate prudent actions to be taken if the limits are exceeded. Consider whether policies
   - include sufficient standards for detecting and preventing activities that could materially affect the capital accounts, dividends, and capital adequacy;
   - provide guidelines for setting dividends at appropriate levels relative to the bank's financial position; and
   - include processes for reporting and remediating breaches of dividend.
3. Review any relevant work performed by internal or external auditors. If any deficiencies were noted in the latest internal or external auditor reports, determine if appropriate corrective action has been taken.
4. Review board or risk committee minutes for discussions regarding internal risk assessment activities that management uses to supervise dividends.
5. Determine whether board and senior management receives information about emerging issues in a timely manner.
6. Determine whether there is undue pressure to pay dividends. Items to consider include
   - the holding company's financial condition and contractual obligations,
   - the financial condition of affiliates,
   - stockholder or market pressure, and
   - capital distribution and bonus limitations under the capital conservation buffer.
7. Review historical and planned dividend payout ratios and other planned capital reductions. For planned capital stock retirements, ensure management requested prior regulatory approval. Also, determine whether management evaluated the impact of the capital conservation buffer.
8. Determine whether dividends are excessive compared to current earnings.
9. Determine whether the bank complies with applicable laws and regulations related to dividends.

10.a. If dividends were declared since the last examination, complete the dividend- limitations worksheets to determine whether the bank was in compliance with the following sections of the U.S. Revised Statutes, as they are interpreted by section 208.5 of Regulation H:

- section 5199 (12 USC 60), which establishes a restriction based on the current and prior two years' retained net income, as adjusted for required transfers to surplus or transfers to a fund for the retirement of any preferred stock. Table 1 on the next page may be used for the calculation.
- section 5204 (12 USC 56), which establishes a restriction on dividends based on the bank's retained earnings (undivided profits), as adjusted for any surplus transferred, with prior regulatory approval, as needed, back to undivided profits and the excess, if any, of credit losses or other losses derived from extensions of credit over the allowance for loan and lease losses (ALLL).[1]

b. For the calculations in table 1, determine whether the dividend exceeded the section 56 or 60 limits and, if so, whether the dividend received prior approval. Dividends declared in excess of the section 56 limitation must receive prior Federal Reserve approval and approval by at least two-thirds of the shares of each class of stock outstanding, pursuant to 12 USC 59. Dividends declared in excess of the section 60 limitation must receive prior Federal Reserve approval.

1. Although section 56 seems to indicate that a bank should deduct its credit losses from its undivided profits, this adjustment is not generally necessary. Under generally accepted accounting principles, banks reserve for bad debts in the ALLL, which reduces the bank's undivided profits. Banks should deduct only the credit losses in excess of the bank's ALLL, and such excess should rarely occur. The second part of table 1 illustrates the section 56 dividend-limitation calculation.

Table 1—Dividend-Limitation Computations

References to schedules in this table are to the schedules in the Consolidated Reports of Condition and Income (bank Call Reports).

Section 60 Computation

	Year			
	20__	*20__*	*20__*	*Total*
Net income (loss) (schedule RI, item 12)	___	___	___	___
Less: Required transfers to surplus under state law (generally zero) or transfers to a fund for the retirement of any preferred stock	___	___	___	___
Less: Common and preferred stock dividends declared (schedule RI-A, item 8 + item 9)	___	___	___	___
Retained net profits available for dividends before adjustments	___	___	___	___
Adjustments for dividends in excess of income (if any)[1]	___	___	___	___
Retained net profits available for dividends after adjustments	___	___	___	___[2]

1. Any excess may be attributed to the prior two years by first applying the excess to the earlier year, and then the immediately preceding year, net of any previous-year adjustments. See section 208.5 of Regulation H for further guidance.
2. This is the section 60 limitation.

Section 56 Computation

	Year
	20__
Retained earnings (undivided profits) (schedule RC, item 26a)	_____
Add: Surplus in excess of state regulatory requirements that was earned and is transferred, with prior regulatory approval, back to undivided profits	_____
Less: Loan losses or other losses derived from extensions of credit that are in excess of the allowance for loan and lease losses	_____
Section 56 limitation	_____

INTRODUCTION

Asset-backed commercial paper (ABCP) programs provide a means for corporations to obtain funding by selling or securitizing pools of homogenous assets (for example, trade receivables) to special-purpose entities (SPEs/ABCP programs). The ABCP program raises funds for purchase of these assets by issuing commercial paper into the marketplace. The commercial-paper investors are protected by structural enhancements provided by the seller (for example, overcollateralization, spread accounts, or early-amortization triggers) and by credit enhancements (for example, subordinated loans or guarantees) provided by banking organization sponsors of the ABCP program and by other third parties. In addition, liquidity facilities are also present to ensure the rapid and orderly repayment of commercial paper should cash-flow difficulties emerge. ABCP programs are nominally capitalized SPEs that issue commercial paper. A sponsoring banking organization establishes the ABCP program but usually does not own the conduit's equity, which is often held by unaffiliated third-party management companies that specialize in owning such entities, and are structured to be bankruptcy remote.

TYPICAL STRUCTURE

ABCP programs are funding vehicles that banking organizations and other intermediaries establish to provide an alternative source of funding to themselves or their customers. In contrast to term securitizations, which tend to be amortizing, ABCP programs are ongoing entities that usually issue new commercial paper to repay maturing commercial paper. The majority of ABCP programs in the capital markets are established and managed by major international commercial banking organizations. As with traditional commercial paper, which has a maximum maturity of 270 days, ABCP is short-term debt that may either pay interest or be issued at a discount.

TYPES OF ABCP PROGRAMS

Multi-seller programs generally provide working capital financing by purchasing or advancing against receivables generated by multiple corporate clients of the sponsoring banking organizations. These programs are generally well diversified across both sellers and asset types.

Single-seller programs are generally established to fund one or more types of assets originated by a single seller. The lack of diversification is generally compensated for by increased program-wide credit enhancement.

Loan-backed programs fund direct loans to corporate customers of the ABCP program's sponsoring banking organization. These loans are generally closely managed by the banking organization and have a variety of covenants designed to reduce credit risk.

Securities-arbitrage programs invest in securities that generally are rated AA- or higher. They generally have no additional credit enhancement at the seller/transaction level because the securities are highly rated. These programs are typically well diversified across security types. The arbitrage is mainly due to the difference between the yield on the securities and the funding cost of the commercial paper.

Structured investment vehicles (SIVs) are a form of a securities-arbitrage program. These ABCP programs invest in securities typically rated AA-or higher. SIVs operate on a market-value basis similar to market-value collateralized debt obligations in that they must maintain a dynamic overcollateralization ratio determined by analysis of the potential price volatility on securities held in the portfolio. SIVs are monitored daily and must meet strict liquidity, capitalization, leverage, and concentration guidelines established by the rating agencies.

KEY PARTIES AND ROLES

Key parties for an ABCP program include the following:

- program management/administrators
- credit-enhancement providers
- liquidity-facility providers
- seller/servicers
- commercial paper investors

Program Management

The sponsor of an ABCP program initiates the creation of the program but typically does not own the equity of the ABCP program, which is provided by unaffiliated third-party investors. Despite not owning the equity of the ABCP program, sponsors usually retain a financial stake in the program by providing credit enhancement, liquidity support, or both, and they play an active role in managing the program. Sponsors typically earn fees—such as credit-enhancement, liquidity-facility, and program-management fees—for services provided to their ABCP programs.

Typically, an ABCP program makes arrangements with various agents/servicers to conduct the administration and daily operation of the ABCP program. This includes such activities as purchasing and selling assets, maintaining operating accounts, and monitoring the ongoing performance of each transaction. The sponsor is also actively engaged in the management of the ABCP program, including underwriting the assets purchased by the ABCP program and the type/level of credit enhancements provided to the ABCP program.

Credit-Enhancement Providers

The sponsoring banking organization typically provides pool-specific and program-wide backup liquidity facilities, and program-wide credit enhancements, all of which are usually unrated (pool-specific credit enhancement, such as overcollateralization, is provided by the seller of the assets). These enhancements are fundamental for obtaining high investment-grade ratings on the commercial paper issued to the market by the ABCP program. Seller-provided credit enhancement may exist in various forms and is generally sized based on the type and credit quality of the underlying assets as well as the quality and financial strength of seller/servicers. Higher-quality assets may only need partial support to achieve a satisfactory rating for the commercial paper. Lower-quality assets may need full support.

Liquidity-Facility Providers

The sponsoring banking organization and, in some cases, unaffiliated third parties, provide pool-specific or program-wide liquidity facilities. These backup liquidity facilities ensure the timely repayment of commercial paper under certain conditions, such as when financial market disruptions or cash-flow timing mismatches were to occur, but generally not under conditions associated with the credit deterioration of the underlying assets or the seller/servicer to the extent that such deterioration is beyond what is permitted under the related asset-quality test.

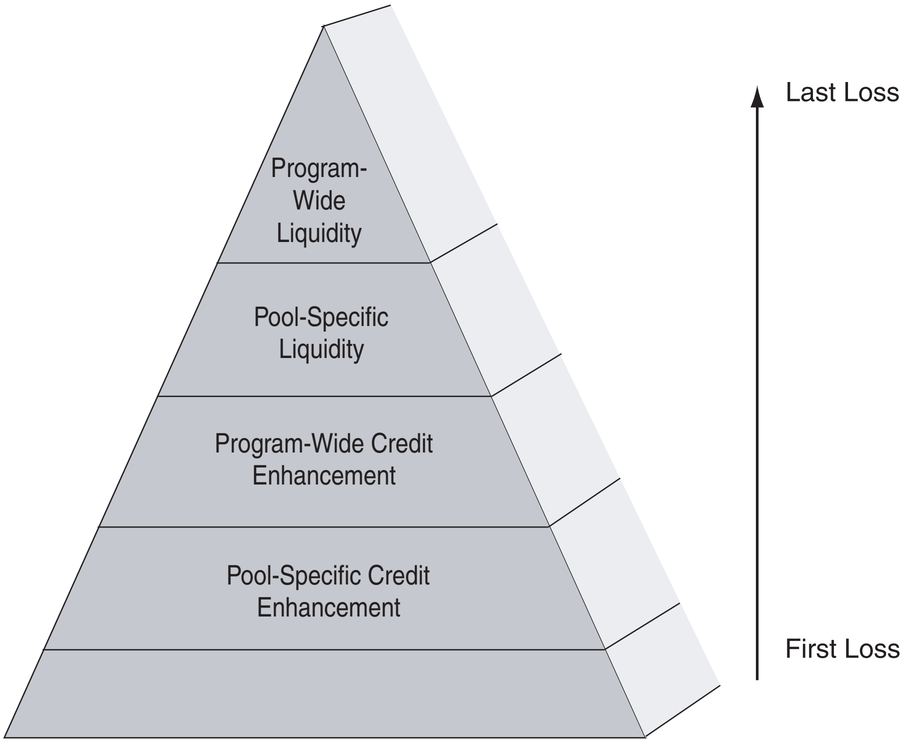
Commercial Paper Investors

Commercial paper investors are typically institutional investors, such as pension funds, money market mutual funds, bank trust departments, foreign banks, and investment companies. Commercial paper maturities range from 1 day to 270 days, but most frequently are issued for 30 days or less. There is a limited secondary market for commercial paper since issuers can closely match the maturity of the paper to the investors' needs. Commercial paper investors are generally repaid from the reissuance of new commercial paper or from cash flows stemming from the underlying asset pools purchased by the program. In addition, to ensure timely repayment in the event that new commercial paper cannot be issued or if anticipated cash flows from the underlying assets do not occur, ABCP programs utilize backup liquidity facilities. Furthermore, the banking organization can purchase the ABCP from the conduit if the commercial paper cannot be issued. Pool-specific and program-wide credit enhancements also protect commercial paper investors from deterioration of the underlying asset pools.

THE LOSS WATERFALL

The loss waterfall diagram (on the next page) for the exposures of a typical ABCP program generally has four legally distinct layers. However, most legal documents do not specify which form of credit or liquidity enhancement is in a priority position after pool-specific credit enhancement is exhausted due to defaults. For example, after becoming aware of weakness in the seller/servicer or in asset performance, an ABCP program sponsor may purchase assets out of the conduit using pool-specific liquidity. Liquidity agreements must be subject to a valid

The Loss Waterfall



asset-quality test that prevents the purchase of defaulted or highly delinquent assets. Liquidity facilities that are not limited by such an asset-quality test are to be viewed as credit enhancement and are subject to the risk-based capital requirements applicable to direct-credit substitutes.

Pool-Specific Credit Enhancement

The form and size of credit enhancement for each particular asset pool is dependent upon the nature and quality of the asset pool and the seller/servicer's risk profile. In determining the level of credit enhancement, consideration is given to the seller/servicer's financial strength, quality as a servicer, obligor concentrations, and obligor credit quality, as well as the historic performance of the asset pool. Credit enhancement is generally sized to cover a multiple level of historical losses and dilution for the particular asset pool. Pool-specific credit enhancement can take several forms, including overcollateralization, cash reserves, seller/servicer guarantees (for only highly rated seller/servicers), and subordination. Credit enhancement can be either dynamic (that is, increases as the asset pool's performance deteriorates) or static (that is, fixed percentage). Pool-specific credit enhancement is generally provided by the seller/servicer (or carved out of the asset pool in the case of overcollateralization) but may be provided by other third parties.

The ABCP program sponsor or administrator will generally set strict eligibility requirements for the receivables to be included in the purchased asset pool. For example, receivable eligibility requirements will establish minimum credit ratings or credit scores for the obligors and the maximum number of days the receivable can be past due.

Usually the purchased asset pools are structured (credit-enhanced) to achieve a credit-quality equivalent of investment grade (that is, BBB or higher). The sponsoring banking organization will typically utilize established rating agency criteria and structuring methodologies to achieve the desired internal rating level. In certain instances, such as when ABCP programs purchase asset-backed securities (ABS), the pool-specific credit enhancement is already built into the purchased ABS and is reflected in the security's credit rating. The internal rating on the pool-specific liquidity facility provided to support the purchased asset pool will reflect the inclusion of the pool-specific credit enhancement and other structuring protections.

Program-Wide Credit Enhancement

The second level of contractual credit protection is the program-wide credit enhancement, which may take the form of an irrevocable loan facility, a standby letter of credit, a surety bond from a monoline insurer, or an issuance of subordinated debt. Program-wide credit enhancement protects commercial paper investors if one or more of the underlying transactions exhaust the pool-specific credit enhancement and other structural protections. The sponsoring banking organization or third-party guarantors are providers of this type of credit protection. The program-wide credit enhancement is generally sized by the rating agencies to cover the potential of multiple defaults in the underlying portfolio of transactions within ABCP conduits and takes into account concentration risk among seller/servicers and industry sectors.

Pool-Specific Liquidity

Pool-specific liquidity facilities are an important structural feature in ABCP programs because they ensure timely payment on the issued commercial paper by smoothing timing differences in the payment of interest and principal on the pooled assets and ensuring payments in the event of market disruptions. The types of liquidity facilities may differ among various ABCP programs and may even differ among asset pools purchased by a single ABCP program. For instance, liquidity facilities may be structured in the form of either (1) an asset-purchase agreement, which provides liquidity to the ABCP program by purchasing nondefaulted assets from a specific asset pool, or (2) a loan to the ABCP program, which is repaid solely by the cash flows from the underlying assets.[1] Some older ABCP programs may have both pool-specific liquidity and program-wide liquidity coverage, while more-recent ABCP programs tend to utilize only pool-specific facilities. Typically, the seller-provided credit enhancement continues to provide credit protection on an asset pool that is purchased by a liquidity banking organization so that the institution is protected against credit losses that may arise due to subsequent deterioration of the pool.

Pool-specific liquidity, when drawn prior to the ABCP program's credit enhancements, is subject to the credit risk of the underlying asset pool. However, the liquidity facility does not provide direct credit enhancement to the commercial paper holders. Thus, the pool-specific liquidity facility generally is in an economic second-loss position after the seller-provided credit enhancements and prior to the program-wide credit enhancement even when the legal documents state that the program-wide credit enhancement would absorb losses prior to the pool-specific liquidity facilities. This is because the sponsor of the ABCP program would most likely manage the asset pools in such a way that deteriorating portfolios or assets would be put to the liquidity banking organizations prior to any defaults that would require a draw against the program-wide credit enhancement.[2] While the liquidity banking organization is exposed to the credit risk of the underlying asset pool, the risk is mitigated by the seller-provided credit enhancement and the asset-quality test.[3] At the time that the asset pool is put to the liquidity banking organization, the facility is usually fully drawn because the entire amount of the pool that qualifies under the asset-quality test is pur-

1. Direct-liquidity loans to an ABCP program may be termed a *commissioning agreement* (most likely in a foreign bank program) and may share in the security interest in the underlying assets when commercial paper ceases to be issued due to deterioration of the asset pool.

2. In fact, according to the contractual provisions of some conduits, a certain level of draws on the program-wide credit enhancement is a condition for unwinding the conduit program, which means that this enhancement is never meant to be used.

3. An asset-quality test or liquidity-funding formula determines how much funding the liquidity banking organization will extend to the conduit based on the quality of the underlying asset pool at the time of the draw. Typically, liquidity banking organizations will fund against the conduit's purchase price of the asset pool less the amount of defaulted assets in the pool.

chased by the banking organization. However, with respect to revolving transactions (such as credit card securitizations) it is possible to average less than 100 percent of the commitment.

Program-Wide Liquidity

The senior-most position in the waterfall, program-wide liquidity, is provided in an amount sufficient to support that portion of the face amount of all the commercial paper that is issued by the ABCP program that is necessary to achieve the desired external rating on the issued paper. Program-wide liquidity also provides liquidity in the event of a short-term disruption in the commercial paper market. In some cases, a liquidity banking organization that extends a direct liquidity loan to an ABCP program may be able to access the program-wide credit enhancement to cover losses while funding the underlying asset pool.

INTRODUCTION

In 1991, Congress enacted a regulatory framework to address the problems associated with troubled insured depository institutions with the intent of minimizing the long-term cost to the Deposit Insurance Fund. This legislation led to the enactment of the prompt-corrective-action (PCA) statute, which is contained in the Federal Deposit Insurance Corporation Improvement Act of 1991, and added section 38 to the Federal Deposit Insurance Act (FDIA), as amended (12 U.S.C. 1831*o*).

FDIA section 38 requires regulators to administer timely corrective action to insured depository institutions when their capital position declines or is deemed to have declined below certain threshold levels as a result of an unsafe or unsound condition or practice. The PCA framework specifies mandatory actions that regulators must take as well as discretionary actions they must consider taking.

In order to implement PCA as it applies to state member banks (bank), the Federal Reserve Board added subpart D to its Regulation H (12 CFR 208.40 to 208.45). While in practice this discussion refers to the Federal Reserve Board, actions taken within the PCA framework involve consultation between the Reserve Bank staff and the Federal Reserve Board staff. Therefore, inquiries relating to PCA should be directed to appropriate Federal Reserve Board staff. The Federal Reserve Board also added subpart E to its Rules of Practice for Hearings (12 CFR 263.80 to 263.85) to establish procedures for the issuance of notices, directives, and other actions authorized under FDIA section 38 and Regulation H.

PCA uses capital ratios to trigger specific actions that are designed to restore a bank to financial health. One of the primary sources of the financial information for these ratios is the Consolidated Reports of Condition and Income (Call Report). This gives added importance to the review of a bank's records for accuracy during an examination. Under the PCA statute a bank is assigned to one of five capital categories: (1) well capitalized, (2) adequately capitalized, (3) undercapitalized, (4) significantly undercapitalized, and (5) critically undercapitalized. See the table at the end of this section for a summary of framework definitions. As a bank is placed in progressively lower capital categories, FDIA provides for increasingly stringent corrective provisions. The Federal Reserve has maintained the general structure of the existing PCA framework while incorporating increased minimum capital requirements, including

- In 2013, when the Federal Reserve Board implemented higher minimum capital requirements and adjusted ratios in four of the five capital categories of the PCA framework.[1] The rule includes a common equity tier 1 capital requirement, and specifies criteria that instruments must meet in order to be considered common equity tier 1 capital, additional tier 1 capital, or tier 2 capital.
- In 2019, the Federal Reserve Board, Office of the Comptroller of the Currency, and Federal Deposit Insurance Corporation (FDIC) adopted a rule that provides for a simple measure of capital adequacy for certain community banking organizations, consistent with section 201 of the Economic Growth, Regulatory Relief, and Consumer Protection Act. This 2019 rule established the community bank leverage ratio (CBLR) framework. A depository institution or depository institution holding company that qualifies and opts into the CBLR framework (12 CFR 217.12) will be considered to have met the "well capitalized" ratio requirements for PCA purposes. For more information on the CBLR framework, see 84 *Federal Register* 61,797 (November 13, 2019) and this manual's section on "Assessment of Capital Adequacy."

PCA CATEGORIES

PCA uses the total risk-based capital measure, tier 1 risk-based capital measure, common equity tier 1 risk-based capital measure, leverage ratio, and tangible equity to total assets ratio for assigning banks to the five capital categories.[2]

---

1. See the Board's Regulation Q (12 CFR 217) and 78 Fed. Reg. 62,018 (October 11, 2013).
2. The total risk-based capital ratio is defined as the ratio of qualifying total capital to standardized total risk-weighted assets; the tier 1 capital ratio is the ratio of tier 1 capital to standardized total risk-weighted assets; the common equity tier 1 risk-based capital ratio is defined as the ratio of common equity tier 1 capital to standardized total risk-weighted assets; and the tier 1 leverage ratio is the ratio of tier 1 capital to total average consolidated assets (the Federal Reserve may use

These ratios are defined in the Federal Reserve Board's Regulation Q, "Capital Adequacy of Bank Holding Companies, Savings and Loan Holding Companies, and State Member Banks."[3]

A bank's PCA category is based upon capital ratios derived from items such as the Call Report, examination report, bank applications, and reports filed by the bank under banking or securities laws as well as other sources. In general, a bank is deemed to be notified of its PCA category based upon

- the Call Report: as of the date that a bank is required to file its Call Report,
- the Federal Reserve Board or state examination report: as of the third day following the date on the Federal Reserve or state transmittal letter to a bank that accompanies the examination report, and
- other information: the bank's receipt of written notice by the Federal Reserve Board that the bank's capital category has changed.

The Federal Reserve's notification to a bank of its PCA category is important since any bank assigned to the undercapitalized, significantly undercapitalized, or critically undercapitalized categories is subject to certain mandatory provisions, and may be subject to certain discretionary provisions, immediately upon notification. These mandatory and discretionary provisions are described in detail later.

The following are descriptions of the five PCA capital categories:

1. *Well capitalized.* The bank has a total risk-based capital ratio of 10.0 percent or greater, a tier 1 risk-based capital ratio of 8.0 percent or greater, a common equity tier 1 risk-based capital ratio of 6.5 percent or greater; *and* a leverage ratio of 5.0 percent or greater,[4] and the bank is not subject to an order, written agreement, capital directive, or PCA directive to meet and maintain a specific capital level for any capital measure. A qualifying community banking organization, as defined in 12 CFR 217.12, which has elected to use the CBLR framework is considered to have met the capital ratio requirements for the well capitalized capital category. In order to qualify for the CBLR framework, a depository institutions or depository institution holding company must have (among other things) a leverage ratio greater than 9.0 percent and less than $10 billion in average total consolidated assets.[5] For the complete list of qualifying criteria for the CBLR framework, see 12 CFR 217.12.
2. *Adequately capitalized.* The bank has a total risk-based capital ratio of 8.0 percent or greater, a tier 1 risk-based capital ratio of 6.0 percent or greater, a common equity tier 1 risk-based capital ratio of 4.5 percent or greater; *and* a leverage ratio of 4.0 percent or greater (or a leverage ratio of 3.0 percent or greater if the bank is rated composite 1 under the CAMELS rating system in its most recent report of examination), and the bank is not experiencing or anticipating significant growth and does not meet the definition of a "well-capitalized" bank.[6]
3. *Undercapitalized.* The bank has a total risk-based capital ratio that is less than 8.0 percent, tier 1 risk-based capital ratio that is less than 6.0 percent, a common equity tier 1 risk-based capital ratio that is less than 4.5 percent *or* a leverage ratio that is less than 4.0 percent (or a leverage ratio that is less than 3.0 percent if the bank is rated composite 1 under the CAMELS rating system in its most recent report of examination), and the bank is not experiencing or anticipating significant growth.[7]
4. *Significantly undercapitalized.* The bank has a total risk-based capital ratio that is less than

period-end total consolidated total assets whenever necessary, on a case-by-case basis). The tangible equity ratio is defined as core capital elements plus cumulative perpetual preferred stock, net of all intangible assets except those amounts of mortgage servicing assets allowable in tier 1 capital. See the Assessment of Capital Adequacy section of this manual for more detailed information.

3. See 12 CFR 217.

4. Beginning on January 1, 2018, any bank that is a subsidiary of a global systemically important bank holding company (referred to as a "G-SIB") under the definition of "subsidiary" in 12 CFR 217.2 has a supplementary leverage ratio of 6.0 percent or greater.

5. In March 2020, section 4012 of the Coronavirus Aid, Relief, and Economic Security Act provided the agencies with the authority to grant banks with temporary regulatory relief for certain provisions of the CBLR framework. The agencies issued an interim final rule to adopt these temporary regulatory changes. See 85 Fed. Reg. 22,924 (April 23, 2020) for the details and timeframe for this regulatory relief.

6. For an advanced approaches bank or bank that is a Category III Board-regulated institution (as defined in 12 CFR 217.2), a supplementary leverage ratio of 3.0 percent or greater.

7. For an advanced approaches bank or bank that is a Category III Board-regulated institution, a supplementary leverage ratio of less than 3.0 percent.

6.0 percent, a tier 1 risk-based capital ratio that is less than 4.0 percent, a common equity tier 1 risk-based capital ratio that is less than 3 percent *or* a leverage ratio that is less than 3.0 percent.
5. *Critically undercapitalized.* The bank has a ratio of tangible equity to total assets that is equal to or less than 2.0 percent.[8]

EXAMINATION CONSIDERATIONS

If a bank is deemed undercapitalized, significantly undercapitalized, or critically undercapitalized, examiners should discuss the PCA provisions with the institution's management during the examination. Additionally, examiners should caution a bank when its capital ratios approach those found in the undercapitalized category to ensure that proposed dividend or management fee payments do not cause the bank to violate the statute. Any PCA-related comments should be noted in the examination report. The comments should be limited to the mandatory provisions of the statute, reflect the immediacy of these provisions, and clearly indicate that the bank's receipt of the report of examination serves as notification that the bank is subject to PCA provisions.

Capital Adequacy Page

In the report of examination for most community banks, the PCA capital ratios appear on the "Capital Adequacy" section of the "Analysis of Financial Factors" page and are generally calculated using the bank's most recent Call Report. In situations where the impact of examination findings (for example, loan-loss-reserve adjustments or other losses) cause the bank to fall into a lower PCA category, the narrative portion of this examination report page should explicitly state the adjusted PCA ratios and reconcile the adjustments that examiners made.

RECLASSIFICATION

In the majority of cases, a bank's PCA category is defined by its capital ratios indicated in the preceding definitions. The finding of an unsafe or unsound *condition or practice,* however, may lead the Federal Reserve to reclassify a bank's PCA category to the next lower PCA category than the bank would otherwise qualify for based solely on its capital ratios.[9] In these circumstances, the Federal Reserve Board may

- reclassify a well-capitalized bank to the adequately capitalized category.
- require an adequately capitalized bank to comply with one or more supervisory actions specified by PCA as though the bank is an undercapitalized bank.
- impose one or more supervisory actions on an undercapitalized bank that would be authorized for a significantly undercapitalized bank.

While the latter two actions do not strictly represent reclassifications from one category to another, they are nonetheless collectively referred to as "reclassifications" for PCA purposes.

FDIA section 38 does not automatically subject a bank that has been reclassified to the next lower capital category to the mandatory restrictions of the lower category. These mandatory restrictions can only be imposed through the use of a PCA directive, and only those mandatory and discretionary provisions deemed appropriate by the Federal Reserve Board will be imposed. *A bank can only be reclassified to the next lower capital category and cannot be classified as critically undercapitalized on any basis other than its tangible equity ratio.*

The reclassification of a bank for PCA purposes may affect the bank's ability to accept brokered deposits. If a well- or adequately capitalized bank is reclassified, the bank must obtain an FDIC waiver to accept brokered deposits, regardless of its actual capital level. (This manual's Deposit Accounts section contains a detailed discussion on the capital requirements relating to brokered deposit activities.)

An "unsafe or unsound condition" is not defined in the PCA statute and assessment and, therefore is left to the discretion of the Federal Reserve Board. Banks determined by the Federal Reserve to be in an unsafe or unsound condition based on the results of the most recent

8. The Federal Reserve may, at its discretion, "calculate total assets using a bank's period-end assets rather than quarterly average assets." 12 CFR 208.41(m).

9. See 12 CFR 208.43(c).

report of examination or Call Report will be reclassified. Examiners should consider a bank for reclassification if the imposition of the available PCA provisions would assist the bank to return to a safe or sound condition or the bank to institute safe or sound practices. In addition, an "unsafe or unsound practice" is defined as a less-than-satisfactory rating for any of the AMELS ratings for the Asset quality, Management, Earnings, Liquidity or Sensitivity to market risk components of the CAMELS rating in the bank's most recent examination report and that has not been corrected since the examination.

The Federal Reserve Board recognizes that certain banks that are candidates for reclassification may have taken favorable actions that are consistent with the purposes of PCA.[10] In these cases, reclassification may not be warranted if

- the bank has raised or can demonstrate current efforts to raise enough capital to become and remain well capitalized for the foreseeable future, and
- the bank has attempted to be in substantial compliance with all provisions of any outstanding informal or formal enforcement action, management is addressing existing problems and is considered satisfactory, and the bank's condition is stable and shows signs of improvement.

Where reclassification is determined to be appropriate, the Federal Reserve Board will provide the bank with a written notice specifying its intention to reclassify the bank, along with an explanation of the reasons for the downgrade. The date of the reclassification and the required PCA provisions can be made effective either at a specified future date or, under certain circumstances, immediately, at the discretion of the Federal Reserve Board. A bank is entitled to appeal a reclassification, which includes the opportunity for an informal hearing, following the receipt of a written notice. The appeal and hearing procedures are set out in subpart H of the Federal Reserve Board's Rules of Practice for Hearings in section 263.203 (12 CFR 263.203).

10. FDIA section 38 explains that the purpose of PCA "is to resolve the problems of insured depository institutions at the least possible long-term loss to the Deposit Insurance Fund." 12 U.S.C. 1831o(a)(1).

PCA PROVISIONS

Provisions Applicable to All Banks

Two provisions are applicable to *all banks* (including well capitalized and adequately capitalized banks):

1. A bank may not pay dividends or make any other capital distributions that would leave it undercapitalized.[11]
2. A bank may not pay a management fee to a controlling person if, after paying the fee, the bank would be undercapitalized. Management fees subject to this restriction include those relating to supervisory, executive, managerial, or policymaking functions, other than compensation to an individual in the individual's capacity as an officer or employee of the bank. This does not include fees relating to nonmanagerial services provided by the controlling person, such as data processing, trust activities, mortgage services, audit and accounting, property management, or similar services.

Restrictions on Advertising

The Federal Reserve Board prohibits banks from advertising its PCA capital category.[12] However, banks are not restricted from advertising their capital levels or financial condition.

Provisions Applicable to Undercapitalized Banks

A bank categorized as undercapitalized is subject to several *mandatory* provisions that become effective upon the Federal Reserve Board noti-

11. FDIA section 38 (12 U.S.C. 1831o(d)(1)(B)) requires that the Federal Reserve Board consult with the FDIC before approving a capital distribution under this section. Section 38 also contains a limited exception to the restrictions on capital distributions for certain types of stock redemptions that (1) the Federal Reserve Board has approved, (2) are made in connection with an equivalent issue of additional shares or obligations, and (3) will improve the bank's financial condition. See 12 U.S.C. 1831o(d)(1)(B). The Federal Reserve Board may also impose restrictions on capital distributions on any company that controls a significantly undercapitalized bank.

12. See 12 CFR 208.40(d).

fying the bank. Under the mandatory provisions, an undercapitalized bank

- must cease paying dividends.
- is prohibited from paying management fees to a controlling person (see the previous subsection for exceptions).
- is subject to increased monitoring by the Federal Reserve Board and periodic review of the bank's efforts to restore its capital.
- must file and implement a capital restoration plan generally within 45 days. Undercapitalized banks that fail to submit or implement a capital restoration plan are also subject to the provisions applicable to significantly undercapitalized banks.
- may acquire interest in a company, open any new branch offices, or engage in a new line of business only if the following three requirements are met:
  - — the Federal Reserve Board has accepted its capital restoration plan,
  - — any increase in total assets is consistent with the capital restoration plan, and
  - — the bank's ratio of tangible equity to assets increases during the calendar quarter at a rate sufficient to enable the bank to become adequately capitalized within a reasonable time.

In addition to the mandatory provisions, a number of *discretionary* provisions may be imposed by the Federal Reserve Board on an undercapitalized bank. These include

- requiring recapitalization by doing one or more of the following:
  - — That the bank sell enough additional capital or debt to ensure that it would be adequately capitalized after the sale.
  - — That the aforementioned additional capital be voting shares.
  - — That the bank accept an offer to be acquired by another institution or company, or that any company that controls the bank be required to divest itself of the bank.
- restricting transactions between the bank and its affiliates.
- restricting the interest rates paid on deposits collected by the bank to the prevailing rates paid on comparable amounts in the region where the bank is located.
- restricting the bank's asset growth or requiring the bank to reduce its total assets.
- requiring the bank or any of its subsidiaries to terminate, reduce, or alter any activity determined by the Federal Reserve Board to pose excessive risk to the bank.
- ordering a new election of the board of directors, dismissing certain senior executive officers, or hiring new officers.
- prohibiting the acceptance, renewal, and rollover of deposits from correspondent depository institutions.
- prohibiting any bank holding company that controls the bank from making any capital distribution, including but not limited to dividend payment, without the prior approval of the Federal Reserve Board.
- requiring the bank to divest or liquidate any subsidiary that is in danger of becoming insolvent and that poses a significant risk to the bank, or is likely to cause significant dissipation of its assets or earnings.
- requiring any company that controls the bank to divest or liquidate any affiliate of the bank (other than another insured depository institution) if the Federal Reserve Board determines that the affiliate is in danger of becoming insolvent and poses a significant risk to the bank, or is likely to cause significant dissipation of the bank's assets or earnings.
- requiring the bank to take any other action that would more effectively carry out the purpose of PCA than the above actions.

Provisions Applicable to Significantly Undercapitalized Banks

The mandatory restrictions applicable to undercapitalized banks also apply to banks that are significantly undercapitalized. In addition, a significantly undercapitalized bank is restricted in paying bonuses or raises to senior executive officers of the bank unless it receives prior written approval from the Federal Reserve Board. If a bank fails to submit an acceptable capital restoration plan, however, no such bonuses or raises may be paid until an acceptable plan has been submitted.

The Federal Reserve Board must take the following actions unless it is determined that these actions would not further the purpose of PCA (resolution at the least possible long-term loss to the Deposit Insurance Fund):

- Require one or more of the following:

- — That the bank sell enough additional capital or debt to ensure that it would be adequately capitalized after the sale.
- — That the aforementioned additional capital be voting shares.
- — That the bank accept an offer to be acquired by another institution or company, or that any company that controls the bank be required to divest itself of the bank.
- Restrict the bank's transactions with affiliates.
- Restrict the interest rates paid on deposits collected by the bank to the prevailing rates paid on comparable amounts in the region where the bank is located.

In addition to these mandatory provisions, the Federal Reserve Board will impose one or more of the discretionary provisions for undercapitalized banks on a significantly undercapitalized bank. Moreover, other measures (including the provisions for critically undercapitalized banks) may be required if the Federal Reserve Board determines that such actions will advance the purpose of PCA.[13]

Provisions Applicable to Critically Undercapitalized Banks

A critically undercapitalized bank must be placed in conservatorship (with the concurrence of the FDIC) or receivership within 90 days, unless the Federal Reserve Board and the FDIC concur that other action would better achieve the purposes of PCA. The statute also addresses requirements in deferring the placing of a critically undercapitalized bank in conservatorship or receivership.[14]

A bank must be placed in receivership if it continues to be critically undercapitalized on average[15] during the fourth calendar quarter following the period that it initially became critically undercapitalized, unless the Federal Reserve Board, with the FDIC's concurrence, determines that

- the bank has a positive net worth.
- the bank has been in substantial compliance with its capital restoration plan since the date of the plan's approval.
- the bank is profitable or has a sustainable upward trend in earnings.
- the bank is reducing its ratio of nonperforming loans to total loans.
- the chair of the Federal Reserve Board and the chair of the FDIC both certify that the bank is viable and not expected to fail.

Beginning 60 days after becoming critically undercapitalized, critically undercapitalized banks are also prohibited from making any payment of principal or interest on subordinated debt issued by the bank without the prior approval of the FDIC. Unpaid interest, however, may continue to accrue on subordinated debt under the terms of the debt instrument. The FDIC is also required, at a minimum, to prohibit a critically undercapitalized bank from doing any of the following without the prior written approval of the FDIC:

- entering into any material transaction not in the usual course of business. Such activities include any investment, expansion, acquisition, sale of assets, or other similar action where the bank would have to notify the Federal Reserve.
- extending credit for any highly leveraged transaction.
- amending the bank's charter or bylaws, except to the extent necessary to carry out any other requirement of any law, regulation, or order.
- making any material change in accounting methods.
- engaging in any covered transaction under section 23A(b) of the Federal Reserve Act.
- paying excessive compensation or bonuses.
- paying interest on new or renewed liabilities that would increase the bank's weighted average cost of funds to a level significantly exceeding the prevailing rates of interest paid on insured deposits in the bank's normal market area.

Capital Restoration Plans

A bank that is undercapitalized, significantly undercapitalized, or critically undercapitalized must submit an acceptable capital restoration

13. 12 U.S.C. 1831o(f)(3).
14. 12 U.S.C. 1831o(h)(3).
15. The average is determined by adding the sum of the total tangible equity ratio at the close of business on each day during the quarter and dividing that sum by the number of business days in that quarter.

plan to the Federal Reserve Board. This plan must be submitted in writing and specify—

- the steps the bank will take to become adequately capitalized;
- the levels of capital the bank expects to attain each year that the plan is in effect;
- how the bank will comply with the restrictions and requirements imposed on it under FDIA section 38;
- the types and levels of activities in which the bank will engage; and
- any other information required by the Federal Reserve Board.

The Federal Reserve Board *cannot accept* a capital restoration plan *unless* the plan

- contains the information required in the preceding five points;
- is based on realistic assumptions and is likely to succeed in restoring the bank's capital;
- would not appreciably increase the risk (including credit risk, interest-rate risk, and other types of risk) to which the bank is exposed; and
- contains a guarantee from each company that controls the bank, specifying that the bank will comply with the plan until it has been adequately capitalized on average during each of four consecutive calendar quarters, and each company has provided appropriate assurances of performance. (See the subsequent subsection, "Capital Restoration Plan Guarantee," for additional information.)

Submission and Review of Capital Plans

The Federal Reserve Board has established rules regarding a uniform schedule for the filing and review of capital restoration plans. These rules require a bank to submit a capital restoration plan within 45 days after the bank has received notice, or has been deemed to have been notified, that it is undercapitalized, significantly undercapitalized, or critically undercapitalized. The Federal Reserve Board may change this period in individual cases, provided it notifies the bank that a different schedule has been adopted. The Federal Reserve Board must also

- review each capital restoration plan within 60 days of the bank's submission of the plan unless it extends the review time;
- provide written notice to the bank about whether it has approved or rejected the capital plan; and
- provide a copy of each acceptable capital restoration plan, and amendments thereto, to the FDIC within 45 days of accepting the plan.

There are two cases where a capital restoration plan may not be required:

1. When a bank has capital ratios consistent with those corresponding to the adequately capitalized category but, due to unsafe or unsound conditions or practices, has been reclassified to the undercapitalized category. (If the Federal Reserve requires a plan solely due to such a reclassification, the plan should specify the steps the bank will take to correct the unsafe or unsound condition or practice.)
2. When a bank's capital category changes, but the bank is already operating under a capital restoration plan accepted by the Federal Reserve.

The Federal Reserve Board will examine the circumstances of each of the above cases to determine whether a bank must submit a revised plan.

Capital Restoration Plan Guarantee

The Federal Reserve Board cannot approve a capital restoration plan unless each company that controls the bank has guaranteed the bank's compliance with the plan and has provided reasonable assurances of performance. The Federal Reserve Board will consider on a case-by-case basis the appropriate type of guarantee for multi-tier holding companies, or parent holding companies that are shell companies or that have limited resources. A guarantee that is backed by a contractual pledge of resources from a parent company may satisfy the requirements of FDIA section 38, particularly in situations involving the ownership of an insured bank by a foreign holding company through a wholly owned domestic shell holding. In other situations, a third-party guarantee made by a party with adequate financial resources may be satisfactory.

PCA also contains several provisions that clarify the capital restoration plan guarantee:

- *Limitation on liability.* The aggregate amount of liability under the guarantee for all companies that control a specific bank is limited to the lesser of (1) an amount equal to 5 percent of the bank's total assets, or (2) the amount necessary to restore the relevant capital ratios of the bank to the level required for the bank to be categorized as adequately capitalized.
- *Limitation on duration.* The guarantee and limit on liability expires after the Federal Reserve Board notifies the bank that it has remained adequately capitalized for each of the previous four consecutive calendar quarters.
- *Collection of guarantee.* Each company that controls a given bank is jointly and severally liable for the guarantee.
- *Failure to provide a guarantee.* A bank will be treated as if it had not submitted an acceptable capital restoration plan if its capital plan does not contain the required guarantee.
- *Failure to perform under a guarantee.* A bank will be treated as if it failed to implement the capital restoration plan if any company that controls the bank fails to perform its guarantee.

Failure to Submit an Acceptable Capital Plan

An undercapitalized bank that fails to submit or implement, in any material respect, an acceptable capital restoration plan within the required period is subject to the same provisions applicable to a bank that is significantly undercapitalized. If a bank's capital restoration plan is rejected by the Federal Reserve Board, the bank is required to submit a new capital plan within the time period specified by the Federal Reserve Board. During the period following notice of the rejection, and before Federal Reserve Board approval of a new or revised capital plan, the bank is treated in the same manner as a significantly undercapitalized bank.

ISSUANCE OF PCA DIRECTIVES

The Federal Reserve Board must provide a bank, or company controlling a bank (company), a written notice of proposed action under FDIA section 38 (referred to as a directive), unless the circumstances of a particular case indicate that immediate action is necessary to serve the purpose of PCA. These directives are issued for reasons such as reclassifying a bank and implementing discretionary provisions, the latter of which includes the dismissal of directors or senior executive officers.

A notice of intent to issue a directive should include

- a statement of the bank's capital measures and levels;
- a description of the restrictions, prohibitions, or affirmative actions that the Federal Reserve Board proposes to impose or require;
- the proposed date when such restrictions or prohibitions would be effective or the proposed date for completion of such affirmative actions; and
- the date by which the bank or company subject to the directive may file with the Federal Reserve Board a written response to the notice.

When a directive becomes effective at a future date, the Federal Reserve Board must provide the bank or company an opportunity to appeal the directive before taking final action. This requires the bank to submit information relevant to the decision within the time period set by the Federal Reserve Board, which must be at least 14 calendar days from the date of the notice, unless the Federal Reserve Board determines that a shorter period is appropriate in light of the financial condition of the bank or other relevant circumstances.

In the case of a directive that is immediately effective upon notification of the bank, the Federal Reserve Board's rules provide an opportunity for the bank or company to seek an expedited modification or rescission of the directive. A bank or company that appeals a directive effective immediately is required to file a written appeal within 14 days of receiving the notice, and the Federal Reserve Board will consider the appeal within 60 days of receiving it. During the period that the appeal is under review the directive remains in effect, unless the Federal Reserve Board stays the effectiveness of the directive.

Dismissal of Directors or Senior Executive Officers

The Federal Reserve Board's rules establish a special procedure permitting an opportunity for senior executive officers and directors dismissed from a bank as a result of a PCA directive to petition the Federal Reserve Board for reinstatement. A director or senior executive officer who is required to be dismissed in compliance with a Federal Reserve Board directive may have the dismissal reviewed by filing, within 10 days, a request for reinstatement with the Federal Reserve Board. The respondent will also be given the opportunity to submit written materials in support of the petition and to appear at an informal hearing before representatives of the Federal Reserve Board. Unless otherwise ordered by the Federal Reserve Board, the dismissal remains in effect while a request for reinstatement is pending. No later than 60 calendar days after the date the record is closed or the date of the response in a case where no hearing was requested, the Federal Reserve Board shall grant or deny the request for reinstatement and notify the respondent of the Federal Reserve Board's decision. The date for the hearing and for the ultimate decision follows the same timeframe as that indicated for the appeals process in the preceding paragraph.

Enforcement of Directives

PCA directives may be enforced in the federal courts, and may also subject any bank, company, or institution-affiliated party that violates the directive to civil money penalties or other enforcement actions. The failure of a bank to implement a capital restoration plan, or the failure of a company having control of a state member bank to fulfill a guarantee that the company has given in connection with a capital plan accepted by the Federal Reserve Board, could subject the bank or company or any of their institution-affiliated parties to a civil money penalty assessment.

TABLE 1—SUMMARY OF SPECIFICATIONS OF CAPITAL CATEGORIES FOR PROMPT CORRECTIVE ACTION FOR INSTITUTIONS NOT SUBJECT TO THE COMMUNITY BANK LEVERAGE RATIO FRAMEWORK

Capital Category	Total Risk-Based Capital (RBC) Measure	Tier 1 RBC Measure	Common Equity Tier 1 RBC Measure	Leverage Measure
Well Capitalized	10% or more and	8% or more and	6.5% or more and	5% or more* and
Adequately Capitalized	8% or more and	6% or more and	4.5% or more and	4% or more**
Under-capitalized	less than 8% or	less than 6% or	less than 4.5% or	less than 4%**
Significantly Under-capitalized	less than 6% or	less than 4% or	less than 3% or	less than 3%
Critically Under-capitalized	tangible equity to total assets ratio of 2% or less			

* For a bank that is a subsidiary of a G-SIB, a supplementary leverage ratio of 6.0 percent or more.
** For an advanced approaches bank or bank that is a Category III Board-regulated institution, a supplementary leverage ratio of 3.0 percent or more.

1. To assess whether prompt-corrective-action (PCA) provisions are necessary.
2. To assess whether the policies, practices, and procedures are in place to ensure compliance with PCA mandatory and discretionary provisions.
3. To verify that undercapitalized, significantly undercapitalized, and critically undercapitalized banks have effective capital restoration plans that comply with PCA.

1. During on-site examinations, validate the state member bank's capital levels, risk-weighted assets, and capital ratios in compliance with primary capital provisions of section 38 of the Federal Deposit Insurance Act (FDIA) and the Federal Reserve's respective capital adequacy rules. (See this manual's section on the Assessment of Capital Adequacy and 12 CFR 217.) Verify that the bank's
   a. capital instruments are appropriate for inclusion in common equity tier 1, tier 1, or tier 2 capital.
   b. assets were properly risk-weighted and that the appropriate credit equivalent measure (for example, the credit-conversion factors, credit-rating factors) were assigned for the bank's off-balance-sheet assets or transactions.
2. When a state member bank is considered undercapitalized, significantly undercapitalized, or critically undercapitalized, discuss with the bank's management the prompt corrective action restrictions under FDIA section 38 and the Board's Regulation H (12 CFR 208, subpart D).
3. When a state member bank is operating with an amount of consolidated capital that is near the undercapitalized levels, caution the board of directors and senior management about their ensuring that any proposed dividend or management fee payments do not cause the bank to violate FDIA section 38.
4. When the impact of the bank's examination findings (for example, loan-loss-reserve adjustments or other losses) will cause the bank to fall into a lower prompt-corrective-action category, explicitly state in the narrative portion of the capital examination report page the adjusted prompt-corrective-action capital ratios with a clear account of the adjustments that were made to the quarter-end or period-end ratios.
5. Include in the appropriate report page of the state member bank examination report any comments regarding the applicability of FDIA section 38 and Regulation H pertaining to prompt corrective action. With regard to prompt corrective action, limit the comments to the mandatory restrictions of the statute and the immediacy of those provisions. State that the receipt of the state member bank examination report serves as notification that the bank is subject to prompt corrective action.

INTRODUCTION

From a regulator's standpoint, the essential purpose of bank earnings, both current and accumulated, is to absorb losses and augment capital. Earnings is the initial safeguard against the risks that a bank incurs in the course of doing business, and represents a bank's first line of defense against capital depletion resulting from a decline in the value of its assets. This section is designed to provide a high-level overview for examiners in assessing a bank's earning through the use of analytical review techniques. Examiners need to remain cognizant of the inextricable links among capital, asset quality, earnings, liquidity, and market risk sensitivity.

GENERAL EXAMINATION APPROACH

As part of the off-site preparation for an on-site examination, examiners review and analyze a bank's financial condition. (See the manual sections entitled, "Examination Strategy and Risk-Focused Examinations" and "Federal Reserve System Bank Surveillance Program.") This analysis is meant to identify potential problem areas and to develop the examination scope so that proper staff levels and appropriate examination procedures can be used.

The analysis of earnings includes all bank operations and activities. When evaluating earnings, examiners should develop an understanding of the bank's core business activities. Core activities are those operations that are part of a bank's normal or continuing business. Examiners should understand a bank's composition of earnings and sustainability of the various earnings components. This would include balance-sheet composition, particularly the volume and type of earning assets and off-balance-sheet items, if applicable.

ANALYTICAL REVIEW

In performing the analytical review of a bank, examiners should use the most recent Uniform Bank Performance Report (UBPR) as well as the most recent financial statements and other related financial information that supports the source and trend in the bank's earnings. A well-performed analytical review provides examiners with an understanding of the bank's operations. An analytical review of bank earnings highlights matters of interest and potential problem situations which, examiners will need to address with the bank. In reviewing and assessing a bank's earning, examiners perform level and trend analysis of financial report data and ratios as well as reviewing other metrics. Analytical review is based on the assumption that period-to-period balances and ratios are free from significant error considering the procedures relating to income and expenses, and regulatory reports conducted by internal or external auditors. (See the manual section entitled, "Internal Control and Audit Function, Oversight, and Outsourcing," for a discussion of factors to consider in reviewing the audit work of others.)

Analytical Tools

The UBPR and the bank's financial statements are key sources of analysis for examination staff. Bank-prepared statements and supplemental schedules, if available, facilitate an in-depth analytical review. The information from those schedules may give examiners considerable insight into the interpretation of the bank's basic financial statements. To properly understand and interpret a particular bank's financial and statistical data, examiners should be familiar with current economic and industry conditions, including any idiosyncratic cyclical or seasonal factors in the nation, region, and local area that may have an affect on the bank's earnings. Economic and industry information, reports, and journals are useful informational sources of industry conditions and trends. Finally, examiners should be knowledgeable about new banking laws and new accounting standards or methodologies that could have a material effect on financial institutions' business and earnings.

UBPR

The information used to prepare UBPRs are largely based on the Consolidated Reports of

Condition and Income (Call Report). Each UBPR also contains corresponding average data for the bank's peer group (a group of banks of similar asset size and reporting characteristics) and percentile rankings for most ratios. The UBPR facilitates the evaluation of a bank's current condition, trends in its financial performance, and comparisons with the performance of its peer group.

The user's guide for the UBPR explains how a structured approach to financial analysis should be followed.[1] This approach breaks down a bank's income stream into its major components of interest margin performance, overhead, non-interest income, loan-loss provisions, tax factors, and extraordinary items. These major components can then be broken down into various subcomponents. Also, examiners should analyze the balance-sheet composition along with economic conditions to understand the source and future variability of a bank's income stream.

The dollar amounts displayed for most income and expense items in the UBPR are shown for the year-to-date period. However, to allow comparison of ratios between quarters, income and expense and related data used in certain ratios are annualized for interim reporting periods. Thus, the income or expense item is multiplied by the indicated factor listed below before dividing it by the corresponding asset or liability. The UBPR annualization factors are

- March 4.0,
- June 2.0, and
- September 1.3333.

Income and expense information reported on the December 31 Call Report is not annualized. Since the year-end UBPR represents a full fiscal year.

Frequently, examiners need a more detailed and current review of a bank's financial condition than that provided by the UBPR. Under certain circumstances, UBPR procedures may need to be supplemented because—

- asset-quality information must be linked to the income stream;
- more detailed information is necessary on asset-liability maturities and matching;
- more detailed information is necessary on other liquidity aspects, as they may affect earnings;
- yield or cost information, which may be difficult to interpret from the report, is needed;
- certain income or expense items may need clarification, as well as normal examination validation;
- volume information, such as the number of demand deposits, certificates of deposit, and other accounts, is not reported, and vulnerability in a bank subject to concentrations normally should be considered;
- components of interest and fees on loans are not reported separately by category of loan; thus, adverse trends in the loan portfolio may not be detected (for example, the yield of a particular bank's loan portfolio may be similar to those of its peer group, but examiners may detect an upward trend in yields for a specific category of loans. That upward trend might be partially or wholly offset by a downward trend of yields in another category of loans, and examiners should consider further investigating the circumstances applicable to each of those loan categories. A change in yields could be a result of a change in the bank's business model or risk "appetite" for certain types of loans or may indicate a change in loan underwriting standards.); or
- income or expense resulting from a change in the bank's operations, such as the opening of a new branch or starting of a mortgage banking activity or trust department, may skew performance ratios. (When there has been a significant change in a bank's operations, examiners should analyze the potential impact of the change on future bank earnings.)

Review of Management's Budget and Financial Statements

In addition to UBPR analysis, examiners should incorporate a review of management's budget and/or financial projections. In reviewing a bank's projections and individual variances from its operating budget, examiners should be able to identify the sources and trends in the bank's prior and future earnings. Examiners should also verify the reasonableness of the budgeted amounts, frequency of budget review by bank management and the board of directors, and level of involvement of key bank personnel in the budget process.

1. The Federal Financial Institutions Examination Council (FFIEC) provides additional information on the UBPR, including the UBPR User's Guide at www.ffiec.gov/ubpr.htm.

In reviewing a bank's financial statements, examiners should be cognizant of new accounting standards or changes in accounting methodologies. In addition, alternative accounting treatments for similar transactions among peer banks also should be considered because they may produce significantly different results. The analytical review must be based on figures derived under valid accounting practices consistently applied, particularly in the accrual areas. Accordingly, during the analytical review, examiners should work with Reserve Bank accounting specialists to determine any material inconsistencies in the application of accounting principles.

Review of Nonrecurring and Extraordinary Items

When assessing earnings, examiners should be aware of nonrecurring events or actions that have affected a bank's earnings performance, positively or negatively, and should adjust earnings on a tax equivalent (TE) basis for comparison purposes. Although the analysis should reflect adjustments for non-recurring events, examiners should also include within their analysis the impact that these items had on overall earnings performance. Examples of events that may affect earnings include adoption of new accounting standards, extraordinary items, or other actions taken by management that are not considered part of a bank's normal operations such as sales of securities for tax purposes or for some other reason unrelated to active management of the securities portfolio.

The exclusion of nonrecurring events from the analysis allows examiners to analyze the profitability of a bank's core operations without the distortions caused by non-recurring items. By adjusting for these distortions, examiners are better able to compare a bank's current earnings performance against the bank's past performance and industry norms (for example, peer group data).

Compliance with Laws and Regulations Relating to Earnings and Dividends

Examiners should consider the interrelationships that exist among the dividend-payout ratio, the rate of growth of retained earnings, and the bank's ability to cover losses and maintain adequate capital. A bank's earnings should also be more than sufficiently adequate in relation to its current dividend rate. In particular, examiners should consider whether a bank's dividend rate is prudent relative to its financial position and not based on overly optimistic earnings scenarios. See SR-09-4, "Applying Supervisory Guidance and Regulations on the Payment of Dividends, Stock Redemptions, and Stock Repurchases at Bank Holding Companies."[2] Prudent management dictates that a bank should consider the curtailment of the dividend rate if capital is inadequate and greater earnings retention is required. If it appears that a bank's dividend payout isexcessive or that there is a record of recent operating losses, examiners should refer to sections 5199(b) and 5204 of the United States Revised Statutes and section 208.19 of Regulation H which restrict state member bank dividends. See also this manual's section entitled, "Dividends."

ASSIGNING THE EARNINGS RATING

After performing the appropriate examination procedures and documenting the supervisory assessment of a bank, examiners assign a component Uniform Financial Institution Ratings System rating based on an evaluation of a banks earnings. Examiners assign a rating that addresses the quantity and trend of a bank's earnings, as well as factors that may affect the sustainability or quality of earnings. The quantity as well as the quality of a bank's earnings can be affected by excessive or inadequately managed credit risk that may result in loan losses and require additions to the allowance for loan and lease losses, or by high levels of market risk that may unduly expose an institution's earnings to volatility in interest rates.[3] The quality of earnings may also be diminished by undue reliance on extraordinary gains, nonrecurring events, or favorable tax effects. Future earnings may be adversely affected by an inabil-

2. See also the *Bank Holding Company Supervision Manual* for a discussion of the Board's "Policy Statement on the Payment of Cash Dividends by State Member Banks and Bank Holding Companies."

3. See this manual's section entitled, "Allowance for Loan and Lease Losses," for more information.

ity to forecast or control funding and operating expenses, improperly executed or ill-advised business strategies, or poorly managed or uncontrolled exposure to other risks.

Examiners base their rating of a bank's earnings based upon, but not limited to, an assessment of the following evaluation factors:

- the level of earnings, including trends and stability
- the bank's ability to provide for adequate capital through retained earnings
- the quality and sources of earnings
- the level of expenses in relation to the bank's operations
- the adequacy of the bank's budgeting systems, forecasting processes, and management information systems in general
- the adequacy of the bank's provisions for the allowance for loan and lease losses and other valuation allowance accounts
- the earnings exposure to market risk such as interest rate, foreign exchange, and price risks

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Earnings

FACTORS INFLUENCING LIQUIDITY MANAGEMENT AND TYPES OF LIQUIDITY RISK

Liquidity is a financial institution's capacity to meet its cash and collateral obligations without incurring unacceptable losses. Adequate liquidity is dependent upon the institution's ability to efficiently meet both expected and unexpected cash flows and collateral needs without adversely affecting either daily operations or the financial condition of the institution. An institution's obligations and the funding sources used to meet them depend significantly on its business mix, balance-sheet structure, and the cash-flow profiles of its on- and off-balance-sheet obligations. In managing their cash flows, institutions confront various situations that can give rise to increased liquidity risk. These include funding mismatches, market constraints on the ability to convert assets into cash or in accessing sources of funds (i.e., market liquidity), and contingent liquidity events. Changes in economic conditions or exposure to credit, market, operation, legal, and reputation risks also can affect an institution's liquidity-risk profile and should be considered in the assessment of liquidity and asset/liability management.

Liquidity risk is the risk to an institution's financial condition or safety and soundness arising from its inability (whether real or perceived) to meet its contractual obligations. Because banking organizations employ a significant amount of leverage in their business activities—and need to meet contractual obligations in order to maintain the confidence of customers and fund providers—adequate liquidity is critical to an institution's ongoing operation, profitability, and safety and soundness.

To ensure it has adequate liquidity, an institution must balance the costs and benefits of liquidity: Too little liquidity can expose an institution to an array of significant negative repercussions arising from its inability to meet contractual obligations. Conversely, too much liquidity can entail substantial opportunity costs and have a negative impact on the firm's profitability.

Note: The guidance complements existing guidance in the *Bank Holding Company Supervision Manual* (section 4010.2) and various SR-letters (see the "References" section).

Effective liquidity management entails the following three elements:

- assessing, on an ongoing basis, the current and expected future needs for funds, and ensuring that sufficient funds or access to funds exists to meet those needs at the appropriate time
- providing for an adequate cushion of liquidity with a stock of liquid assets to meet unanticipated cash-flow needs that may arise from a continuum of potential adverse circumstances that can range from high-probability/low-severity events that occur in daily operations to low-probability/high-severity events that occur less frequently but could significantly affect an institution's safety and soundness
- striking an appropriate balance between the benefits of providing for adequate liquidity to mitigate potential adverse events and the cost of that liquidity

The primary role of liquidity-risk management is to (1) prospectively assess the need for funds to meet obligations and (2) ensure the availability of cash or collateral to fulfill those needs at the appropriate time by coordinating the various sources of funds available to the institution under normal and stressed conditions. Funds needs arise from the myriad of banking activities and financial transactions that create contractual obligations to deliver funds, including business initiatives for asset growth, the provision of various financial products and transaction services, and expected and unexpected changes in assets and the liabilities used to fund assets. Liquidity managers have an array of alternative sources of funds to meet their liquidity needs. These sources generally fall within one of four broad categories:

- net operating cash flows
- the liquidation of assets
- the generation of liabilities
- an increase in capital funds

Funds obtained from operating cash flows arise from net interest payments on assets; net principal payments related to the amortization and maturity of assets; and the receipt of funds from various types of liabilities, transactions, and service fees. Institutions obtain liquidity from operating cash flows by managing the timing and maturity of their asset and liability cash flows, including their ongoing borrowing and debt-issuance programs.

Funds can also be obtained by reducing or liquidating assets. Most institutions incorporate scheduled asset maturities and liquidations as part of their ongoing management of operating cash flows. They also use the potential liquidation of a portion of their assets (generally a portion of the investment portfolio) as a contingent source of funds to meet cash needs under adverse liquidity circumstances. Such contingent funds need to be unencumbered for the purposes of selling or lending the assets and are often termed *liquidity reserves* or *liquidity warehouses* and are a critical element of safe and sound liquidity management. Assessments of the value of unencumbered assets should represent the amount of cash that can be obtained from monetized assets under normal as well as stressed conditions.

Asset securitization is another method that some institutions use to fund assets. Securitization involves the transformation of on-balance-sheet loans (e.g., auto, credit card, commercial, student, home equity, and mortgage loans) into packaged groups of loans in various forms, which are subsequently sold to investors. Depending on the business model employed, securitization proceeds can be both a material source of ongoing funding and a significant tool for meeting future funding needs. Securitization markets may provide a good source of funding; however, institutions should be cautious in relying too heavily on this market as it has been known to shutdown under market stress situations.

Funds are also generated through deposit-taking activities, borrowings, and overall liability management. Borrowed funds may include secured lending and unsecured debt obligations across the maturity spectrum. In the short term, borrowed funds may include purchased fed funds and securities sold under agreements to repurchase (repos). Longer-term borrowed funds may include various types of deposit products, collateralized loans, and the issuance of corporate debt. Depending on their contractual characteristics and the behavior of fund providers, borrowed funds can vary in maturity and availability because of their sensitivity to general market trends in interest rates and various other market factors. Considerations specific to the borrowing institution also affect the maturity and availability of borrowed funds.

External Factors and Exposure to Other Risks

The liquidity needs of a financial institution and the sources of liquidity available to meet those needs depend significantly on the institution's business mix and balance-sheet structure, as well as on the cash-flow profiles of its on- and off-balance-sheet obligations. While management largely determines these internal attributes, external factors and the institution's exposure to various types of financial and operating risks, including interest-rate, credit, operational, legal, and reputational risks, also influence its liquidity profile. As a result, an institution should assess and manage liquidity needs and sources by considering the potential consequences of changes in external factors *along with* the institution-specific determinants of its liquidity profile.

Changes in Interest Rates

The level of prevailing market interest rates, the term structure of interest rates, and changes in both the level and term structure of rates can significantly affect the cash-flow characteristics and costs of, and an institution's demand for, assets, liabilities, and off-balance-sheet (OBS) positions. In turn, these factors significantly affect an institution's funding structure or liquidity needs, as well as the relative attractiveness or price of alternative sources of liquidity available to it. Changes in the level of market interest rates can also result in the acceleration or deceleration of loan prepayments and deposit flows. The availability of different types of funds may also be affected, as a result of options embedded in the contractual structure of assets, liabilities, and financial transactions.

Economic Conditions

Cyclical and seasonal economic conditions can also have an impact on the volume of an institution's assets, liabilities, and OBS positions—and, accordingly, its cash-flow and liquidity profile. For example, during recessions, business demand for credit may decline, which affects the growth of an organization and its liquidity needs. At the same time, subpar economic growth and its impact on employment, bankruptcies, and business failures often create direct and indirect incentives for retail customers to reduce their deposits; a recession may also lead to higher loan delinquencies for financial institutions. All of these conditions have negative implications for an institution's cash flow and overall liquidity. On the other hand, periods of economic growth may spur asset or deposit growth, thus introducing different liquidity challenges.

Credit-Risk Exposures of an Institution

An institution's exposure to credit risk can have a material impact on its liquidity. Nonperforming loans directly reduce otherwise expected cash inflows. The reduced credit quality of problem assets impairs their marketability and potential use as a source of liquidity (either by selling the assets or using them as collateral). Moreover, problem assets have a negative impact on overall cash flows by increasing the costs of loan-collection and -workout efforts.

In addition, the price that a bank pays for funds, especially wholesale and brokered borrowed funds and deposits, will reflect the institution's perceived level of risk exposure in the marketplace. Fund suppliers use a variety of credit-quality indicators to judge credit risk and determine the returns they require for the risk to be undertaken. Such indicators include an institution's loan-growth rates; the relative size of its loan portfolio; and the levels of delinquent loans, nonperforming loans, and loan losses. For institutions that have issued public debt, the credit ratings of nationally recognized statistical rating organizations (NRSOs) are particularly critical.

Other Risk Exposures of an Institution

Importantly, exposures to operational, legal, reputational, and other risks can lead to adverse liquidity conditions. Operating risks can materially disrupt the dispersal and receipt of obligated cash flows and give rise to significant liquidity needs. Exposure to legal and reputational risks can lead fund providers to question an institution's overall credit risk, safety and soundness, and ability to meet its obligations in the future. A bank's reputation for operating in a safe and sound manner, particularly its ability to meet its contractual obligations, is an important determinant in its costs of funds and overall liquidity-risk profile.

Given the critical importance of liquidity to financial institutions and the potential impact that other risk exposures and external factors have on liquidity, effective liquidity managers ensure that liquidity management is fully integrated into the institution's overall enterprise-wide risk-management activities. Liquidity management is therefore an important part of an institution's strategic and tactical planning.

Types of Liquidity Risk

Banking organizations encounter the following three broad types of liquidity risk:

- mismatch risk
- market liquidity risk
- contingent liquidity risk

Mismatch risk is the risk that an institution will not have sufficient cash to meet obligations in the normal course of business, as a result of ineffective matches between cash inflows and outflows. The management and control of funding mismatches depend greatly on the daily projections of operational cash flow, including those cash flows that may arise from seasonal business fluctuations, unanticipated new business, and other everyday situations. To accurately project operational cash flows, an institution needs to estimate its expected cash-flow needs and ensure it has adequate liquidity to meet small variations to those expectations. Occurrences of funding mismatches may be frequent. If adequately managed, these mismatches may have little to no impact on the financial health of the firm.

Market liquidity risk is the risk that an institution will encounter market constraints in its efforts to convert assets into cash or to access financial market sources of funds.

The planned conversion of assets into cash is an important element in an institution's ongoing management of funding cash-flow mismatches. In addition, converting assets into cash is often a key strategic tool for addressing contingent liquidity events. As a result, market constraints on achieving planned, strategic, or contingent conversions of assets into cash can exacerbate the severity of potential funding mismatches and contingent liquidity problems.

Contingent liquidity risk is the risk that arises when unexpected events cause an institution to have insufficient funds to meet its obligations. Unexpected events may be firm-specific or arise from external factors. External factors may be geographic, such as local economic factors that affect the premiums required on deposits with certain local, state, or commercial areas, or they may be market-oriented, such as increases in the price volatility of certain types of securities in response to financial market developments. External factors may also be systemic, such as a payment-system disruption or major changes in economic or financial market conditions.

The nature and severity of contingent liquidity events vary substantially. At one extreme, contingent liquidity risk may arise from the need to fund unexpected asset growth as a result of commitment requests or the unexpected runoff of liabilities that occurs in the normal course of business. At the other extreme, institution-specific issues, such as the lowering of a public debt rating or general financial market stress, may have a significant impact on an institution's liquidity and safety and soundness. As a result, managing contingent liquidity risk requires an ongoing assessment of potential future events and circumstances in order to ensure that obligations are met and adequate sources of standby liquidity and/or liquidity reserves are readily available and easily converted to cash.

Diversification plays an important role in managing liquidity and its various component risks. Concentrations in particular types of assets, liabilities, OBS positions, or business activities that give rise to unique types of funding needs or create an undue reliance on specific types of funding sources can unduly expose an institution to the risks of funding mismatches, contingent events, and market liquidity constraints. Therefore, diversification of both the sources and uses of liquidity is a critical component of sound liquidity-risk management.

SOUND LIQUIDITY-RISK MANAGEMENT PRACTICES

Like the management of any type of risk, sound liquidity-risk management involves effective oversight of a comprehensive process that adequately identifies, measures, monitors, and controls risk exposure. This process includes oversight of exposures to funding mismatches, market liquidity constraints, and contingent liquidity events. Both international and U.S. banking supervisors have issued supervisory guidance on safe and sound practices for managing the liquidity risk of banking organizations. Guidance on liquidity risk management was published by the Basel Committee on Banking Supervision, Bank for International Settlements, "Principles for Sound Liquidity Risk Management and Supervision," in September 2008.[1] The U.S. regulatory agencies implemented these principles, jointly agreeing to incorporate those principles into their existing guidance. The revised guidance, "Interagency Policy Statement on Funding and Liquidity Risk Management" was issued on March 10, 2010 (see SR-10-6 and its attachment).

In summary, the critical elements of a sound liquidity-risk management process are—

- Effective corporate governance consisting of oversight by the board of directors and active involvement by management in an institution's control of liquidity risk.
- Appropriate strategies, policies, procedures, and limits used to manage and mitigate liquidity risk.
- Comprehensive liquidity-risk measurement and monitoring systems (including assessments of the current and prospective cash flows or sources and uses of funds) that are commensurate with the complexity and business activities of the institution.
- Active management of intraday liquidity and collateral.
- An appropriately diverse mix of existing and potential future funding sources.
- Adequate levels of highly liquid marketable securities free of legal, regulatory, or operational impediments that can be used to meet liquidity needs in stressful situations.
- Comprehensive contingency funding plans (CFPs) that sufficiently address potential adverse liquidity events and emergency cash flow requirements.
- Internal controls and internal audit processes sufficient to determine the adequacy of the institution's liquidity-risk-management process.

1. Basel Committee on Banking Supervision, "Principles for Sound Liquidity Risk Management and Supervision," September 2008. See www.bis.org/publ/bcbs144.htm.

Each of these elements should be customized to account for the sophistication, complexity, and business activities of an institution. The following sections discuss supervisory expectations for each of these critical elements.

Corporate Governance and Oversight

Effective liquidity-risk management requires the coordinated efforts of both an informed board of directors and capable senior management. The board should establish and communicate the institution's liquidity-risk tolerance in such a manner that all levels of management clearly understand the institution's approach to managing the trade-offs between management of liquidity risk and short-term profits. The board should ensure that the organizational structures and staffing levels are appropriate, given the institution's activities and the risks they present.

Involvement of the Board of Directors

The board of directors is ultimately responsible for the liquidity risk assumed by the institution. The board should understand and guide the strategic direction of liquidity-risk management. Specifically, the board of directors or a delegated committee of board members should oversee the establishment and approval of liquidity management strategies, policies and procedures, and review them at least annually. In addition, the board should ensure that it

- understands the nature of the institution's liquidity risks and periodically reviews information necessary to maintain this understanding;
- understands and approves those elements of liquidity-risk management policies that articulate the institution's general strategy for managing liquidity risk, and establishes acceptable risk tolerances;
- establishes executive-level lines of authority and responsibility for managing the institution's liquidity risk;
- enforces management's duties to identify, measure, monitor, and control liquidity risk.
- understands and periodically reviews the institution's CFP for handling potential adverse liquidity events; and
- understands the liquidity-risk profile of important subsidiaries and affiliates and their influence on the overall liquidity of the financial institution, as appropriate.

Role of Senior Management

Senior management should ensure that liquidity-risk management strategies, policies, and procedures are adequate for the sophistication and complexity of the institution. Management should ensure that these policies and procedures are appropriately executed on both a long-term and day-to-day basis, in accordance with board delegations. Management should oversee the development and implementation of—

- an appropriate risk-measurement system and standards for measuring the institution's liquidity risk;
- a comprehensive liquidity-risk reporting and monitoring process;
- establishment and monitoring of liquid asset buffers of unencumbered marketable securities;
- effective internal controls and review processes for the management of liquidity risk; and
- monitoring of liquidity risks for each entity across the institution on an on-going basis and;
- an appropriate CFP, including (1) adequate assessments of the institution's contingent liquidity risks under adverse circumstances and (2) fully developed strategies and plans for managing such events.

Senior management should periodically review the organization's liquidity-risk management strategies, policies, and procedures, as well as its CFP, to ensure that they remain appropriate and sound. Management should also coordinate the institution's liquidity-risk management with its efforts for disaster, contingency, and strategic planning, as well as with its business and risk-management objectives, strategies, and tactics. Senior management is also responsible for regularly reporting to the board of directors on the liquidity-risk profile of the institution.

Strategies, Policies, Procedures, and Risk Tolerances

Institutions should have documented strategies for managing liquidity and have formal written policies and procedures for limiting and controlling risk exposures. Strategies, policies, and procedures should translate the board's goals, objectives, and risk tolerances into operating standards that are well understood by institutional personnel and that are consistent with the board's intended risk tolerances. Policies should also ensure that responsibility for managing liquidity is assigned throughout the corporate structure of the institution, including separate legal entities and relevant operating subsidiaries and affiliates, where appropriate. Strategies set out the institution's general approach for managing liquidity, articulate its liquidity-risk tolerances, and address the extent to which key elements of funds management are centralized or delegated throughout the institution. Strategies also communicate how much emphasis the institution places on using asset liquidity, liabilities, and operating cash flows to meet its day-to-day and contingent funding needs. Quantitative and qualitative targets, such as the following, may also be included in policies:

- guidelines or limits on the composition of assets and liabilities
- the relative reliance on certain funding sources, both on an ongoing basis and under contingent liquidity scenarios
- the marketability of assets to be used as contingent sources of liquidity

An institution's strategies and policies should identify the primary objectives and methods for (1) managing daily operating cash flows, (2) providing for seasonal and cyclical cash-flow fluctuations, and (3) addressing various adverse liquidity scenarios. The latter includes formulating plans and courses of actions for dealing with potential temporary, intermediate-term, and long-term liquidity disruptions. Policies and procedures should formally document—

- lines of authority and responsibility for managing liquidity risk,
- liquidity-risk limits and guidelines,
- the institution's measurement and reporting systems, and
- elements of the institution's comprehensive CFP.

Incorporating these elements of liquidity-risk management into policies and procedures helps internal control and internal audit fulfill their oversight role in the liquidity-risk management process. Policies, procedures, and limits should address liquidity separately for individual currencies, where appropriate and material. All liquidity-risk policies, procedures, and limits should be reviewed periodically and revised as needed.

Delineating Clear Lines of Authority and Responsibility

Through formal written policies or clear operating procedures, management should delineate managerial responsibilities and oversight, including lines of authority and responsibility for the following:

- developing liquidity-risk management policies, procedures, and limits
- developing and implementing strategies and tactics for managing liquidity risk
- conducting day-to-day management of the institution's liquidity
- establishing and maintaining liquidity-risk measurement and monitoring systems
- authorizing exceptions to policies and limits
- identifying the potential liquidity risk associated with the introduction of new products and activities

Institutions should clearly identify the individuals or committees responsible for liquidity-risk decisions. Less complex institutions often assign such responsibilities to the CFO or an equivalent senior management official. Other institutions assign responsibility for liquidity-risk management to a committee of senior managers, sometimes called a finance committee or an asset/liability committee (ALCO). Policies should clearly identify individual or committee duties and responsibilities, the extent of the decision-making authority, and the form and frequency of periodic reports to senior management and the board of directors. In general, an ALCO (or a similar senior-level committee) is responsible for ensuring that (1) measurement systems adequately identify and quantify the institution's liquidity-risk exposure and (2) reporting systems communicate accurate and relevant information about the level and sources of that exposure.

When an institution uses an ALCO or other senior management committee, the committee should actively monitor the liquidity profile of the institution and should have sufficiently broad representation from the major institutional functions that influence liquidity risk (e.g., the lending, investment, deposit, or funding functions). Committee members should include senior managers who have authority over the units responsible for executing transactions and other activities that can affect liquidity. In addition, the committee should ensure that (1) the risk-measurement system adequately identifies and quantifies risk exposure and (2) the reporting process communicates accurate, timely, and relevant information about the level and sources of risk exposure.

In general, committees overseeing liquidity-risk management delegate the day-to-day responsibilities to the institution's treasury department or, at less complex institutions, to the CFO, treasurer, or other appropriate staff. The personnel charged with measuring and monitoring the day-to-day management of liquidity risk should have a well-founded understanding of all aspects of the institution's liquidity-risk profile. While the day-to-day management of liquidity may be delegated, the oversight committee should not be precluded from aggressively monitoring liquidity management.

In more-complex institutions that have separate legal entities and operating subsidiaries or affiliates, effective liquidity-risk management requires senior managers and other key personnel to have an understanding of the funding position and liquidity of any member of the corporate group that might provide or absorb liquid resources from another member. Centralized liquidity-risk assessment and management can provide significant operating efficiencies and comprehensive views of the liquidity-risk profile of the integrated corporate entity as well as members of the corporate group—including depository institutions. This integrated view is particularly important for understanding the impact other members of the group may have on insured depository entities. However, legal and regulatory restrictions on the flow of funds among members of a corporate group, in addition to differences in the liquidity characteristics and dynamics of managing the liquidity of different types of entities within a group, may call for decentralizing various elements of liquidity-risk management. Such delegation and associated strategies, policies, and procedures should be clearly articulated and understood throughout the organization. Policies, procedures, and limits should also address liquidity separately for individual currencies, legal entities, and business lines, when appropriate and material, as well as allow for legal, regulatory, and operational limits for the transferability of liquidity.

Diversified Funding

An institution should establish a funding strategy that provides effective diversification in the sources and tenor of funding. It should maintain an ongoing presence in its chosen funding markets and strong relationships with funds providers to promote effective diversification of funding sources. An institution should regularly gauge its capacity to raise funds quickly from each source. It should identify the main factors that affect its ability to raise funds and monitor those factors closely to ensure that estimates of fund raising capacity remain valid.

An institution should diversify available funding sources in the short-, medium- and long-term. Diversification targets should be part of the medium- to long-term funding plans and should be aligned with the budgeting and business planning process. Funding plans should take into account correlations between sources of funds and market conditions. Funding should also be diversified across a full range of retail as well as secured and unsecured wholesale sources of funds, consistent with the institution's sophistication and complexity. Management should also consider the funding implications of any government programs or guarantees it utilizes. As with wholesale funding, the potential unavailability of government programs over the intermediate- and long-term should be fully considered in the development of liquidity risk management strategies, tactics, and risk tolerances. Funding diversification should be implemented using limits addressing counterparties, secured versus unsecured market funding, instrument type, securitization vehicle, and geographic market. In general, funding concentrations should be avoided. Undue over reliance on any one source of funding is considered an unsafe and unsound practice.

An essential component of ensuring funding diversity is maintaining market access. Market access is critical for effective liquidity risk management, as it affects both the ability to raise new funds and to liquidate assets. Senior management should ensure that market access is being actively managed, monitored, and tested by the appropriate staff. Such efforts should be consistent with the institution's liquidity-risk profile and sources of funding. For example, access to the capital markets is an important consideration for most large complex institutions, whereas the availability of correspondent lines of credit and other sources of whole funds are critical for smaller, less complex institutions.

An institution needs to identify alternative sources of funding that strengthen its capacity to withstand a variety of severe institution-specific and market-wide liquidity shocks. Depending upon the nature, severity, and duration of the liquidity shock, potential sources of funding include, but are not limited to, the following:

- Deposit growth.
- Lengthening maturities of liabilities.
- Issuance of debt instruments.
- Sale of subsidiaries or lines of business.
- Asset securitization.
- Sale (either outright or through repurchase agreements) or pledging of liquid assets.
- Drawing-down committed facilities.
- Borrowing.

Liquidity-Risk Limits and Guidelines

Liquidity-risk tolerances or limits should be appropriate for the complexity and liquidity-risk profile of an institution. They should employ both quantitative targets and qualitative guidelines and should be consistent with the institution's overall approach and strategy for measuring and managing liquidity. Policies should clearly articulate a liquidity-risk tolerance that is appropriate for the business strategy of the institution, considering its complexity, business mix, liquidity-risk profile, and its role in the financial system. Policies should also contain provisions for documenting and periodically reviewing assumptions used in liquidity projections. Policy guidelines should employ both quantitative targets and qualitative guidelines. These measurements, limits, and guidelines may be specified in terms of the following measures and conditions, as applicable:

- *Discrete or cumulative cash-flow mismatches or gaps (sources and uses of funds) over specified future short- and long-term time horizons under both expected and adverse business conditions.* Often, these are expressed as cash-flow coverage ratios or as specific aggregate amounts.
- *Target amounts of unpledged liquid-asset reserves sufficient to meet liquidity needs under normal and reasonably anticipated adverse business conditions.* These targets are often expressed as aggregate amounts or as ratios calculated in relation to, for example, total assets, short-term assets, various types of liabilities, or projected-scenario liquidity needs.
- *Volatile liability dependence and liquid-asset coverage of volatile liabilities under both normal and stress conditions.* These guidelines, for example, may include amounts of potentially volatile wholesale funding to total liabilities, volatile retail (e.g., high-cost or out-of-market) deposits to total deposits, potentially volatile deposit-dependency measures, or short-term borrowings as a percent of total funding.
- *Asset concentrations that could increase liquidity risk through a limited ability to convert to cash* (e.g., complex financial instruments, bank-owned (corporate-owned) life insurance, and less-marketable loan portfolios).
- *Funding concentrations that address diversification issues, such as a large liability and dependency on borrowed funds, concentrations of single funds providers, funds providers by market segments, and types of volatile deposit or volatile wholesale funding dependency.* For small community banks, funding concentrations may be difficult to avoid. However, banks that rely on just a few primary sources should have appropriate systems in place to manage the concentrations of funding liquidity, including limit structures and reporting mechanisms.
- *Funding concentrations that address the term, re-pricing, and market characteristics of funding sources.* This may include diversification targets for short-, medium-, and long-term funding, instrument type and securitization vehicles, and guidance on concentrations for currencies and geographical markets.
- *Contingent liabilities, such as unfunded loan commitments and lines of credit supporting asset sales or securitizations, and collateral*

requirements for derivatives transactions and various types of secured lending.

- *The minimum and maximum average maturity of different categories of assets and liabilities.*

Institutions may use other risk indicators to specify their risk tolerances. Some institutions may use ratios such as loans to deposits, loans to equity capital, purchased funds to total assets, or other common measures. However, when developing and using such measures, institutions should be fully aware that some measures may not appropriately assess the timing and scenario-specific characteristics of the institution's liquidity-risk profile. *Liquidity-risk measures that are constructed using static balance-sheet amounts may hide significant liquidity risk that can occur in the future under both normal and adverse business conditions. As a result, institutions should not rely solely on these static measures to monitor and manage liquidity.*

Policies on Measuring and Managing Reporting Systems

Policies and procedures should also identify the methods used to measure liquidity risk, as well as the form and frequency of reports to various levels of management and the board of directors. Policies should identify the nature and form of cash-flow projections and other liquidity measures to be used. Policies should provide for the categorization, measurement, and monitoring of both stable and potentially volatile sources of funds. Policies should also provide guidance on the types of business-condition scenarios used to construct cash-flow projections and should contain provisions for documenting and periodically reviewing the assumptions used in liquidity projections.

Moreover, policies should explicitly provide for more-frequent reporting under adverse business or liquidity conditions. Under normal business conditions, senior managers should receive liquidity-risk reports at least monthly, while the board of directors should receive liquidity-risk reports at least quarterly. If the risk exposure is more complex, the reports should be more frequent. These reports should tell senior management and the board how much liquidity risk the bank is assuming, whether management is complying with risk limits, and whether management's strategies are consistent with the board's expressed risk tolerance.

Policies on Contingency Funding Plans

Policies should also provide for senior management to develop and maintain a written, comprehensive, and up-to-date liquidity CFP. Policies should also ensure that, as part of ongoing liquidity-risk management, senior management is alerted to early-warning indicators or triggers of potential liquidity problems.

Compliance with Laws and Regulations

Institutions should ensure that their policies and procedures take into account compliance with appropriate laws and regulations that can have an impact on an institution's liquidity-risk management and liquidity-risk profile. These laws and regulations include the Federal Deposit Insurance Corporation Improvement Act (FDICIA) and its constraints on an institution's use of brokered deposits, as well as pertinent sections of Federal Reserve regulations A, D, F, and W. (See appendix 2, for a summary of some of the pertinent legal and regulatory issues that should be factored into the management of liquidity risk.)

Liquidity-Risk Measurement Systems

The analysis and measurement of liquidity risk should be tailored to the complexity and risk profile of an institution, incorporating the cash flows and liquidity implications of all the institution's material assets, liabilities, off-balance-sheet positions, and major business activities. Liquidity-risk analysis should consider what effect options embedded in the institution's sources and uses of funds may have on its cash flows and liquidity-risk measures. The analysis of liquidity risk should also be forward-looking and strive to identify potential future funding mismatches as well as current imbalances. Liquidity-risk measures should advance management's understanding of the institution's exposure to mismatch, market, and contingent liquidity risks. Measures should also assess the institution's liquidity sources and needs in relation to the specific business environments it operates in and the time frames involved in securing and using funds.

Adequate liquidity-risk measurement requires the ongoing review of an institution's sources and uses of funds and generally includes analysis of the following:

- trends in balance-sheet structure and funding vehicles
- pro forma cash-flow statements and funding mismatch gaps over varying time horizons
- trends and expectations in the volume and pricing trends for assets, liabilities, and off-balance-sheet items that can have a significant impact on the institution's liquidity
- trends in the relative costs of funds required by existing and alternative funds providers
- the diversification of funding sources and trends in funding concentrations
- the adequacy of asset liquidity reserves, trends in these reserves, and the market dynamics that could influence their market liquidity
- the sensitivity of funds providers to both financial market and institution-specific trends and events
- the institution's exposure to both broad-based market and institution-specific contingent liquidity events

The formality and sophistication of liquidity-risk measurement, and the policies and procedures used to govern the measurement process, depend on the sophistication of the institution, the nature and complexity of its funding structures and activities, and its overall liquidity-risk profile.

(See appendix 1, for background information on the types of liquidity analysis and measures of liquidity risk used by effective liquidity-risk managers. The appendix also discusses the considerations for evaluating the liquidity-risk characteristics of various assets, liabilities, OBS positions, and other activities, such as asset securitization, that can influence an institution's liquidity.)

Pro Forma Cash-Flow Analysis

Regardless of the size and complexity of an institution, pro forma cash-flow statements are a critical tool for adequately managing liquidity risk. In the normal course of measuring and managing liquidity risk and analyzing their institution's sources and uses of funds, effective liquidity managers project cash flows under expected and alternative liquidity scenarios. Such cash-flow-projection statements range from simple spreadsheets to very detailed reports, depending on the complexity and sophistication of the institution and its liquidity-risk profile.

A sound practice is to project, on an ongoing basis, an institution's cash flows under normal business-as-usual conditions, incorporating appropriate seasonal and business-growth considerations over varying time horizons. This cash-flow projection should be regularly reviewed under both short-term and intermediate- to long-term institution-specific contingent scenarios. Institutions that have more-complex liquidity-risk profiles should also assess their exposure to broad systemic and adverse financial market events, as appropriate to their business mix and overall liquidity-risk profile (e.g., securitization, derivatives, trading, processing, international, and other activities).

The construction of pro forma cash-flow statements under alternative scenarios and the ongoing monitoring of an institution's liquidity-risk profile depend importantly on liquidity management's review of trends in the institution's balance-sheet structure and its funding sources. This review should consider past experience and include expectations for the volume and pricing of assets, liabilities, and off-balance-sheet items that may significantly affect the institution's liquidity.

Effective liquidity-risk monitoring systems should assess (1) trends in the relative cost of funds, as required by the institution's existing and alternative funds providers; (2) the diversification or concentration of funding sources; (3) the adequacy of the institution's asset liquidity reserves; and (4) the sensitivity of funds providers to both financial market and institution-specific trends and events. *Detailed examples and further discussion of cash-flows are included in appendix 1, section I, "Basic Cash-Flow Projections."*

Assumptions

Given the critical importance of assumptions in constructing liquidity-risk measures and projections of future cash flows, institutions should ensure that all their assumptions are reasonable and appropriate. Institutions should document and periodically review and approve key assumptions. Assumptions used in assessing the liquidity risk of complex instruments and assets; liabilities; and OBS positions that have uncertain cash flows, market value, or maturities should be subject to rigorous documentation and review.

Assumptions about the stability or volatility of retail deposits, brokered deposits, wholesale or secondary-market borrowings, and other funding sources with uncertain cash flows are particularly important—especially when such assumptions are used to evaluate alternative sources of funds under adverse contingent liquidity scenarios (such as a deterioration in asset quality or capital). When assumptions about the performance of deposits and other sources of funds are used in the computation of liquidity measures, these assumptions should be based on reasoned analysis considering such factors as the following:

- the historical behavior of deposit customers and funds providers
- how current or future business conditions may change the historical responses and behaviors of customers and other funds providers
- the general conditions and characteristics of the institution's market for various types of funds, including the degree of competition
- the anticipated pricing behavior of funds providers (for instance, wholesale or retail) under the scenario investigated
- haircuts (that is, the reduction from the stated value of an asset) applied to assets earmarked as contingent liquidity reserves

Further discussion of liquidity characteristics of assets, liabilities, and off-balance-sheet items is included in appendix 1, section III, "Liquidity Characteristics of Assets, Liabilities, Off-Balance-Sheet Positions, and Various Types of Banking Activities." Institutions that have complex liquidity profiles should perform sensitivity tests to determine what effect any changes to its material assumptions will have on its liquidity.

Institutions should ensure that assets are properly valued according to relevant financial reporting and supervisory standards. An institution should fully factor into its risk management the consideration that valuations may deteriorate under market stress and take this into account in assessing the feasibility and impact of asset sales on its liquidity position during stress events.

Institutions should ensure that their vulnerabilities to changing liquidity needs and liquidity capacities are appropriately assessed within meaningful time horizons, including intraday, day-to-day, short-term weekly and monthly horizons, medium-term horizons of up to one year, and longer-term liquidity needs over one year. These assessments should include vulnerabilities to events, activities, and strategies that can significantly strain the capability to generate internal cash.

Stress Testing

Once normal operating cash-flow statements are established then those tools can be used to generate stress tests. Stress assumptions are simply layered on top of the normal operating cash-flow projections. The quantitative results provided by the stress test also serve as a key component within the CFP.

Institutions should conduct stress tests on a regular basis for a variety of institution-specific and market-wide events across multiple time horizons. The magnitude and frequency of stress testing should be commensurate with the complexity of the financial institution and the level of its risk exposures. Stress test outcomes should be used to identify and quantify sources of potential liquidity strain and to analyze possible impacts on the institution's cash flows, liquidity position, profitability, and solvency.

Stress tests should also be used to ensure that current exposures are consistent with the financial institution's established liquidity-risk tolerance. The stress test serves as a key component of the CFP and the quantification of the risk to which the institution may be exposed. Management's active involvement and support is critical to the effectiveness of the stress-testing process. Management should discuss the results of stress tests and take remedial or mitigating actions to limit the institution's exposures, build up a liquidity cushion, and adjust its liquidity profile to fit its risk tolerance. The results of stress tests therefore play a key role in determining the amount of buffer assets the institution should maintain.

Cushion of Liquid Assets

Liquid assets are an important source of both primary (operating liquidity) and secondary (contingent liquidity) funding at many institutions. Indeed, a critical component of an institution's ability to effectively respond to potential liquidity stress is the availability of a cushion of highly liquid assets without legal, regulatory, or operational impediments (i.e., unencumbered) that can be sold or pledged to obtain funds in a range of stress scenarios. These assets should be held as insurance against a range of liquidity stress scenarios, including those that involve the loss or impairment of typically available unsecured and/or secured funding sources. The size of the cushion of such high-quality liquid assets should be supported by estimates of liquidity needs performed under an institution's stress testing as well as aligned with the risk tolerance and risk profile of the institution. Management estimates of liquidity needs during periods of stress should incorporate both contractual and non-contractual cash flows, including the possibility of funds being withdrawn. Such estimates should also assume the inability to obtain unsecured funding as well as the loss or impairment of access to funds secured by assets other than the safest, most liquid assets.

Management should ensure that unencumbered, highly liquid assets are readily available and are not pledged to payment systems or clearing houses. The quality of unencumbered liquid assets is important as it will ensure accessibility during the time of most need. For example, an institution could utilize its holdings of high-quality U.S. Treasury securities, or similar instruments, and enter into repurchase agreements in response to the most severe stress scenarios.

Liquidity-Risk Monitoring and Reporting Systems

Methods used to monitor and measure liquidity risk should be sufficiently robust and flexible to allow for the timely computation of the metrics an institution uses in its ongoing liquidity-risk management. Risk monitoring and reporting systems should regularly provide information on day-to-day liquidity management and risk control; this information should also be readily available during contingent liquidity events.

In keeping with the other elements of sound liquidity-risk management, the complexity and sophistication of management reporting and management information systems (MIS) should be consistent with the liquidity profile of the institution. For example, complex institutions that are highly dependent on wholesale funds may need daily reports on the use of various funding sources, maturities of various instruments, and rollover rates. Less complex institutions may require only simple maturity-gap or cash-flow reports that depict rollovers and mismatch risks; these reports may also include pertinent liquidity ratios. Liquidity-risk reports can be customized to provide management with aggregate information that includes sufficient supporting detail to enable them to assess the sensitivity of the institution to changes in market conditions, its own financial performance, and other important risk factors. Reportable items may include, but are not limited to—

- cash-flow gap-projection reports and forward-looking summary measures that assess both business-as-usual and contingent liquidity scenarios;
- asset and funding concentrations that highlight the institution's dependence on funds that may be highly sensitive to institution-specific contingent liquidity or market liquidity risk (including information on the types and amounts of negotiable certificates of deposit (CDs) and other bank obligations, as well as information on major liquidity funds providers);
- critical assumptions used in cash-flow projections and other measures;
- the status of key early-warning signals or risk indicators;
- funding availability;
- reports on the impact of new products and activities;
- reports documenting compliance with established policies and procedures; and
- where appropriate, both consolidated and unconsolidated reports for institutions that have multiple offices, international branches, affiliates, or subsidiaries.
- Institutions should also report on the use of and availability of government support, such as lending and guarantee programs, and implications on liquidity positions, particularly since these programs are generally temporary or reserved as a source for contingent funding.

The types of reports or information and their timing should be tailored to the institution's funding strategies and will vary according to the complexity of the institution's operations and risk profile. For example, institutions relying on investment securities for their primary source of contingent liquidity should employ reports on the quality, pledging status, and maturity distribution of those assets. Similarly, institutions conducting securitization activities, or placing significant emphasis on the sale of loans to meet contingent liquidity needs, should customize their liquidity reports to target these activities.

Collateral-Position Management

An institution should have the ability to calculate all of its collateral positions in a timely manner, including assets currently pledged relative to the amount of security required and unencumbered assets available to be pledged. An institution's level of available collateral should be monitored by legal entity, by jurisdiction, and by currency exposure. Systems should be capable of monitoring shifts between intraday and overnight or term-collateral usage. An institution should be aware of the operational and timing requirements associated with accessing the collateral given its physical location (i.e., the custodian institution or securities settlement system with which the collateral is held). Institutions should also fully understand the potential demand on required and available collateral arising from various types of contractual contingencies during periods of both market-wide and institution-specific stress.

Liquidity Across Legal Entities, and Business Lines

An institution should actively monitor and control liquidity-risk exposures and funding needs within and across legal entities and business lines, taking into account legal, regulatory, and operational limitations to the transferability of liquidity. Separately regulated entities will need to maintain liquidity commensurate with their own risk profiles on a stand-alone basis.

Regardless of its organizational structure, it is important that an institution actively monitor and control liquidity risks at the level of individual legal entities, and the group as a whole, incorporating processes that aggregate data across multiple systems in order to develop a group-wide view of liquidity-risk exposures and identify constraints on the transfer of liquidity within the group.

Assumptions regarding the transferability of funds and collateral should be described in liquidity-risk management plans.

Intraday Liquidity Position Management

Intraday liquidity monitoring is an important component of the liquidity-risk management process for institutions engaged in significant payment, settlement, and clearing activities. An institution's failure to manage intraday liquidity effectively, under normal and stressed conditions, could leave it unable to meet payment and settlement obligations in a timely manner, adversely affecting its own liquidity position and that of its counterparties. Among large, complex organizations, the interdependencies that exist among payment systems and the inability to meet certain critical payments has the potential to lead to systemic disruptions that can prevent the smooth functioning of all payment systems and money markets. Therefore, institutions with material payment, settlement and clearing activities should actively manage their intraday liquidity positions and risks to meet payment and settlement obligations on a timely basis under both normal and stressed conditions. Senior management should develop and adopt an intraday liquidity strategy that allows the institution to

- monitor and measure expected daily gross liquidity inflows and outflows.
- manage and mobilize collateral when necessary to obtain intraday credit.
- identify and prioritize time-specific and other critical obligations in order to meet them when expected.
- settle other less critical obligations as soon as possible.
- control credit to customers when necessary.

Contingency Funding Plans

A CFP is a compilation of policies, procedures, and action plans for responding to contingent liquidity events. It is a sound practice for all institutions, regardless of size and complexity, to engage in comprehensive contingent liquidity planning. The objectives of the CFP are to provide a plan for responding to a liquidity crisis, identify a menu of contingent liquidity sources that the institution can use under adverse liquidity circumstances, and describe steps that should be taken to ensure that the institution's sources of liquidity are sufficient to fund scheduled operating requirements and meet the institution's commitments with minimal costs and disruption. CFPs should be commensurate with an institution's complexity, risk profile, and scope of operations.

Contingent liquidity events are unexpected situations or business conditions that may increase the risk that an institution will not have sufficient funds to meet liquidity needs. These events can negatively affect any institution, regardless of its size and complexity, by

- interfering with or preventing the funding of asset growth,
- disrupting the institution's ability to renew or replace maturing funds.

Contingent liquidity events may be institution-specific or arise from external factors. Institution-specific risks are determined by the risk profile and business activities of the institution. They generally are a result of unique credit, market, operational, and strategic risks taken by the institution. A potential result of this type of event would be customers unexpectedly exercising options to withdraw deposits or exercise off-balance-sheet (OBS) commitments.

In contrast, external contingent events may be systemic financial-market occurrences, such as

- increases or decreases in the price volatility of certain types of securities in response to market events;
- major changes in economic conditions, market perception, or dislocations in financial markets;
- disturbances in payment and settlement systems due to operational or local disasters.

Contingent liquidity events range from high-probability/low-impact events that occur during the normal course of business to low-probability/high-impact events that may have an adverse impact on an institution's safety and soundness. Institutions should incorporate planning for high-probability/low-impact liquidity risks into their daily management of the sources and uses of their funds. This objective is best accomplished by assessing possible variations in expected cash-flow projections and provisioning for adequate liquidity reserves in the normal course of business.

Liquidity risks driven by lower-probability, higher-impact events should be addressed in the CFP, which should—

- identify reasonably plausible stress events;
- evaluate those stress events under different levels of severity;
- make a quantitative assessment of funding needs under the stress events;
- identify potential funding sources in response to a stress event; and
- provide for commensurate management processes, reporting, and external communication throughout a stress event.

The CFP should address both the severity and duration of contingent liquidity events. The liquidity pressures resulting from low-probability, high-impact events may be immediate and short term, or they may present sustained situations that have long-term liquidity implications. The potential length of an event should factor into decisions about sources of contingent liquidity.

Identifying Liquidity Stress Events

Stress events are those events that may have a significant impact on an institution's liquidity, given its specific balance-sheet structure, business lines, organizational structure, and other characteristics. Possible stress events include changes in credit ratings, a deterioration in asset quality, a prompt-corrective-action (PCA) downgrade, and CAMELS ratings downgrade widening of credit default spreads, operating losses, negative press coverage, or other events that call into question an institution's ability to meet its obligations.

An institution should customize its CFP. Separate CFPs may be required for the parent company and the consolidated banks in a multibank holding company, for separate subsidiaries (when appropriate), or for each significant foreign currency and global political entity, as necessary. These separate CFPs may be necessary because of legal requirements and restrictions, or the lack thereof. Institutions that have significant payment-system operations should have a formal, written plan in place for managing the risk of both intraday and end-of-day funding failures. Failures may occur as a result of system failure at the institution or at an institution from which payments are expected. Clear, formal communication channels should be established between the institution's operational areas responsible for handling payment-system operations.

Assessing Levels of Severity and Timing

The CFP should delineate the various levels of stress severity that can occur during a contingent liquidity event and, for each type of event, identify the institution's response plan at each stage of an event. (As an event unfolds, it often progresses through various stages and levels of severity.) The events, stages, and severity levels identified should include those that cause temporary disruptions, as well as those that may cause intermediate- or longer-term disruptions. Institutions can use the different stages or levels of severity to design early-warning indicators, assess potential funding needs at various points during a developing crisis, and specify comprehensive action plans.

Assessing Funding Needs and Sources of Liquidity

A critical element of the CFP is an institution's quantitative projection and evaluation of its expected funding needs and funding capacity during a stress event. The institution should identify the sequence of responses that it will mobilize during a stress event and commit sources of funds for contingent needs well in advance of a stress-related event. To accomplish this objective, the institution needs to analyze potential erosion in its funding at alternative stages or severity levels of the stress event, as well as analyze the potential cash-flow mismatches that may occur during the various stress scenarios and levels. Institutions should base their analyses on realistic assessments of the behavior of funds providers during the event; they should also incorporate alternative contingency funding sources into their plans. The analysis should also include all material on- and OBS cash flows and their related effects, which should result in a realistic analysis of the institution's cash inflows, outflows, and funds availability at different time intervals throughout the potential liquidity stress event—and allow the institution to measure its ability to fund operations over an extended period.

Common tools to assess funding mismatches include

- *Liquidity-gap analysis*—A cash-flow report that essentially represents a base case estimate of where funding surpluses and shortfalls will occur over various future timeframes.
- *Stress tests*—A pro forma cash-flow report with the ability to estimate future funding surpluses and shortfalls under various liquidity stress scenarios and the institution's ability to fund expected asset growth projections or sustain an orderly liquidation of assets under various stress events.

Identify Potential Funding Sources

Because of the potential for liquidity pressures to spread from one source of funding to another during a significant liquidity event, institutions should identify, well in advance, alternative sources of liquidity and ensure that they have ready access to contingent funding sources. These funding sources will rarely be used in the normal course of business. Therefore, institutions should conduct advance planning to ensure that contingent funding sources are readily available. For example, the sale, securitization, or pledging of assets as collateral requires a review of these assets to determine the appropriate haircuts and to ensure compliance with the standards required for executing the strategy. Administrative procedures and agreements should also be in place before the institution needs to access the planned source of liquidity. Institutions should identify what advance steps they need to take to promote the readiness of each of their sources of standby liquidity.

Processes for Managing Liquidity Events

The CFP should identify a reliable crisis-management team and an administrative structure for responding to a liquidity crisis, including realistic action plans executing each element of the plan for each level of a stress event. Frequent communication and reporting among crisis team members, the board of directors, and other affected managers optimizes the effectiveness of a contingency plan by ensuring that business decisions are coordinated to minimize further liquidity disruptions. Effective management of a stress event requires the daily computation of regular liquidity-risk reports and supplemental information. The CFP should provide for more-frequent and more-detailed reporting as a stress situation intensifies. Reports that should be available in a funding crisis include—

- a CD breakage report to identify early redemptions of CDs;
- funding-concentration reports;
- cash-flow projections and run-off reports;
- funding-availability or -capacity reports, by types of funding; and
- reports on the status of contingent funding sources.

Framework for Monitoring Contingent Events

Financial institutions should monitor for potential liquidity stress events by using early-warning indicators and event triggers. These indicators should be tailored to an institution's specific liquidity-risk profile. By recognizing potential stress events early, the institution can proactively position itself into progressive states of readiness as an event evolves. This proactive stance also provides the institution with a framework for reporting or communicating among different institutional levels and to outside parties. Early-warning signals may include but are not limited to—

- rapid asset growth that is funded with potentially volatile liabilities;
- growing concentrations in assets or liabilities;
- negative trends or heightened risk associated with a particular product line;
- rating-agency actions (e.g., agencies watch-listing the institution or downgrading its credit rating);
- negative publicity;
- significant deterioration in the institution's earnings, asset quality, and overall financial condition;
- widening debt or credit-default-swap spreads;
- difficulty accessing longer-term funding;
- increasing collateral margin requirements;
- rising funding costs in a stable market;
- increasing redemptions of CDs before maturity;
- counterparty resistance to OBS products;
- counterparties that begin requesting backup collateral for credit exposures; and
- correspondent banks that eliminate or decrease their credit lines.

To mitigate the potential for reputation contagion when liquidity problems arise, effective communication with counterparties, credit-rating agencies, and other stakeholders is of vital importance. Smaller institutions that rarely interact with the media should have plans in place for how they will manage press inquiries that may arise during a liquidity event. In addition, group-wide CFPs, liquidity cushions, and multiple sources of funding are mechanisms that may mitigate reputation concerns.

In addition to early-warning indicators, institutions that issue public debt, use warehouse financing, securitize assets, or engage in material OTC derivative transactions typically have exposure to event triggers that are embedded in the legal documentation governing these transactions. These triggers protect the investor or counterparty if the institution, instrument, or underlying asset portfolio does not perform at certain predetermined levels. Institutions that rely upon brokered deposits should also incorporate PCA-related downgrade triggers into their CFPs since a change in PCA status could have a material bearing on the availability of this funding source. Contingent event triggers should be an integral part of the liquidity-risk monitoring system.

Asset-securitization programs pose heightened liquidity concerns because an early-amortization event could produce unexpected funding needs. Liquidity contingency plans should address this risk, if it is material to the institution. The unexpected funding needs associated with an early amortization of a securitization event pose liquidity concerns for the originating bank. The triggering of an early-amortization event can result in the securitization trust immediately passing principal payments through to investors. As the holder of the underlying assets, the originating institution is responsible for funding new charges that would normally have been purchased by the trust. Financial institutions that engage in asset securitization should have liquidity contingency plans that address this potential unexpected funding requirement. Management should receive and review reports showing the performance of the securitized portfolio in relation to the early-amortization triggers.[2]

Securitization covenants that cite supervisory thresholds or adverse supervisory actions as triggers for early-amortization events are considered an unsafe and unsound banking practice that undermines the objective of supervisory actions. An early amortization triggered by a supervisory action can create or exacerbate liquidity and earnings problems that can lead to further deterioration in the financial condition of the banking organization.[3]

Securitizations of asset-backed commercial paper programs (ABCPs) are generally supported by a liquidity facility or commitment to purchase assets from the trust if funds are needed to repay the underlying obligations. Liquidity needs can result from either cash-flow mismatches between the underlying assets and scheduled payments of the overriding security or from credit-quality deterioration of the underlying asset pool. Therefore, the use of liquidity facilities introduces additional risk to the institution, and a commensurate capital charge is required.[4]

Institutions that rely upon secured funding sources also are subject to potentially higher margin or collateral requirements that may be triggered upon the deterioration of a specific portfolio of exposures or the overall financial condition of the institution. The ability of a financially stressed institution to meet calls for additional collateral should be considered in the CFP. Potential collateral values also should be subject to stress tests since devaluations or market uncertainty could reduce the amount of contingent funding that can be obtained from pledging a given asset.

Testing the CFP

Periodic testing of the operational elements of the CFP is an important part of liquidity-risk management. By testing the various operational elements of the CFP, institutions can prevent unexpected impediments or complications in accessing standby sources of liquidity during a contingent liquidity event. It is prudent to test the operational elements of a CFP that are associated with the securitization of assets, repurchase lines, Federal Reserve discount window borrowings, or other borrowings, since efficient collateral processing during a crisis is especially important for such sources. Institutions should carefully consider whether to include unsecured funding lines in their CFPs, since these lines may be unavailable during a crisis.

Larger, more-complex institutions can benefit from operational simulations that test communications, coordination, and decision-making of managers who have different responsibilities, who are in different geographic locations, or who are located at different operating subsidiaries. Simulations or tests run late in the day can highlight specific problems, such as late-day staffing deficiencies or difficulty selling assets or borrowing new funds near the closing time of the financial markets.

Larger, more-complex institutions can benefit from operational simulations that test communications, coordination, and decisionmaking of managers who have different responsibilities, who are in different geographic locations, or who are located at different operating subsidiaries. Simulations or tests run late in the day can highlight specific problems, such as late-day staffing deficiencies or difficulty selling assets or borrowing new funds near the closing time of the financial markets.

Internal Controls

An institution's internal controls consist of policies, procedures, approval processes, reconciliations, reviews, and other types of controls to provide assurances that the institution manages liquidity risk in accordance with the board's strategic objectives and risk tolerances. Appropriate internal controls should address relevant elements of the risk-management process, including the institution's adherence to policies and procedures; the adequacy of its risk identification, risk measurement, and risk reporting; and its compliance with applicable rules and regulations. The results of reviews of the liquidity-risk management process, along with any recommendations for improvement, should be reported to the board of directors, which should take appropriate and timely action.

2. See sections 2130.1, 3020.1, and 4030.1, and the *OCC Handbook on Credit Card Lending*, October 1996.

3. SR-02-14, "Covenants in Securitization Documents Linked to Supervisory Actions or Thresholds."

4. SR-05-13, "Interagency Guidance on the Eligibility of ABCP Liquidity Facilities and the Resulting Risk-Based Capital Treatment."

An important element of a bank's internal controls is management's comprehensive evaluation and review. Management should ensure that an independent party regularly reviews and evaluates the components of the institution's liquidity-risk management process. These reviews should assess the extent to which the institution's liquidity-risk management complies with both supervisory guidance and industry sound practices, taking into account the level of sophistication and complexity of the institution's liquidity-risk profile. In larger, complex institutions, an internal audit function usually performs this review. Smaller, less complex institutions may assign the responsibility for conducting an independent evaluation and review to qualified individuals who are independent of the function they are assigned to review. The independent review should report key issues requiring attention, including instances of noncompliance, to the appropriate level of management to initiate a prompt correction of the issues, consistent with approved policies.

Periodic reviews of the liquidity-risk management process should address any significant changes that have occurred since the last review, such as changes in the institution's types or characteristics of funding sources, limits, and internal controls. Reviews of liquidity-risk measurement systems should include assessments of the assumptions, parameters, and methodologies used. These reviews should also seek to understand, test, and document the current risk-measurement process; evaluate the system's accuracy; and recommend solutions to any identified weaknesses.

Controls for changes to the assumptions the institution uses to make cash-flow projections should require that the assumptions not be altered without clear justification consistent with approved strategies. The name of the individual authorizing the change, along with the date of the change, the nature of the change, and justification for each change, should be fully documented. Documentation for all assumptions used in cash-flow projections should be maintained in a readily accessible, understandable, and auditable form. Because liquidity-risk measurement systems may incorporate one or more subsidiary systems or processes, institutions should ensure that multiple component systems are well integrated and consistent with each other.

LIQUIDITY-RISK MANAGEMENT FOR BANK HOLDING COMPANIES

Bank holding companies (BHCs) should develop and maintain liquidity-risk management processes and funding programs that are consistent with their level of sophistication and complexity. For BHCs (includes financial holding companies, which are BHCs) see the *Bank Holding Company Supervision Manual*, section 4066, *"Funding and Liquidity Risk Management,"* and sections 1050.0 and 1050.1, that discuss the consolidated supervision of BHCs. See also SR-10-6, "Interagency Policy Statement on Funding and Liquidity Risk Management." Also see sections 4010.0, "Parent Only—Debt Servicing Capacity/Cash Flow" and 4010.2 "Parent Only—Liquidity."

SUPERVISORY PROCESS FOR EVALUATING LIQUIDITY RISK

Liquidity risk is a primary concern for all banking organizations and is an integral component of the CAMELS rating system. Examiners should consider liquidity risk during the preparation and performance of all on-site safety-and-soundness examinations as well as during targeted supervisory reviews. To meet examination objectives efficiently and effectively and remain sensitive to potential burdens imposed on institutions, examiners should follow a structured, risk-focused approach for the examination of liquidity risk. Key elements of this examination process include off-site monitoring and a risk assessment of the institution's liquidity-risk profile. These elements will help the examiner develop an appropriate plan and scope for the on-site examination, thus ensuring the exam is as efficient and productive as possible. A fundamental tenet of the risk-focused examination approach is the targeting of supervisory resources at functions, activities, and holdings that pose the most risk to the safety and soundness of an institution.

For smaller institutions that have less complex liquidity profiles, stable funding sources, and low exposures to contingent liquidity circumstances, the liquidity element of an examination may be relatively simple and straightforward. On the other hand, if an institution is experiencing significant asset and product growth;

is highly dependent on potentially volatile funds; or has a complex business mix, balance-sheet structure, or liquidity-risk profile that exposes the institution to contingent liquidity risks, that institution should generally receive greater supervisory attention. Given the contingent nature of liquidity risk, institutions whose corporate structure gives rise to inherent operational risk, or institutions encountering difficulties associated with their earnings, asset quality, capital adequacy, or market sensitivity, should be especially targeted for review of the adequacy of their liquidity-risk management.

Off-Site Risk Assessment

In off-site monitoring and analysis, a preliminary view, or *risk assessment,* is developed before initiating an on-site examination. Both the inherent level of an institution's liquidity-risk exposure and the quality of its liquidity-risk management should be assessed to the fullest extent possible during the off-site phase of the examination process. The following information can be helpful in this assessment:

- organizational charts and policies that identify authorities and responsibilities for managing liquidity risk
- liquidity policies, procedures, and limits
- ALCO committee minutes and reports (minutes and reports issued since the last examination or going back at least six to twelve months before the examination)
- board of directors reports on liquidity-risk exposures
- audit reports (both internal and external)
- other available internal liquidity-risk management reports, including cash-flow projections that detail key assumptions
- internal reports outlining funding concentrations, the marketability of assets, analysis that identifies the relative stability or volatility of various types of liabilities, and various cash-flow coverage ratios projected under adverse liquidity scenarios
- supervisory surveillance reports and supervisory screens
- external public debt ratings (if available)

Quantitative liquidity exposure should be assessed by conducting as much of the supervisory review off-site as practicable. This off-site work includes assessing the bank's overall liquidity-risk profile and the potential for other risk exposures, such as credit, market, operational, legal, and reputational risks, that may have a negative impact on the institution's liquidity under adverse circumstances. These assessments can be conducted on a preliminary basis using supervisory screens, examiner-constructed measures, internal bank measures, and cash-flow projections obtained from management reports received before the on-site engagement. Additional factors to be incorporated in the off-site risk assessment include the institution's balance-sheet composition and the existence of funding concentrations, the marketability of its assets (in the context of liquidation, securitization, or use of collateral), and the institution's access to secondary markets of liquidity.

The key to assessing the quality of management is an organized discovery process aimed at determining whether appropriate corporate-governance structures, policies, procedures, limits, reporting systems, CFPs, and internal controls are in place. This discovery process should, in particular, ascertain whether all the elements of sound liquidity-risk management are applied consistently. The results and reports of prior examinations, in addition to internal management reports, provide important information about the adequacy of the institution's risk management.

Examination Scope

The off-site risk assessment provides the examiner with a preliminary view of both the adequacy of liquidity management and the magnitude of the institution's exposure. The scope of the on-site liquidity-risk examination should be designed to confirm or reject the off-site hypothesis and should target specific areas of interest or concern. In this way, on-site examination procedures are tailored to the institution's activities and risk profile and use flexible and targeted work-documentation programs. In general, if liquidity-risk management is identified as adequate, examiners can rely more heavily on a bank's internal liquidity measures for assessing its inherent liquidity risk.

The examination scope for assessing liquidity risk should be commensurate with the complexity of the institution and consistent with the off-site risk assessment. For example, only baseline examination procedures would be used for institutions whose off-site risk assessment indicates that they have adequate liquidity-risk management processes and low levels of inherent liquidity exposure. These institutions include those that have noncomplex balance-sheet structures and banking activities and that also meet the following criteria:

- well capitalized; minimal issues with asset quality, earnings, and market-risk-sensitive activities
- adequate reserves of marketable securities that can serve as standby sources of liquidity
- minimal funding concentrations
- funding structures that are principally composed of stable liabilities
- few OBS items, such as loan commitments, that represent contingent liquidity draws
- minimal potential exposure to legal and reputational risk
- formal adoption of well-documented liquidity-management policies, procedures, and CFPs

For these and other institutions identified as potentially low risk, the scope of the on-site examination would consist of only those examination procedures necessary to confirm the risk-assessment hypothesis. The adequacy of liquidity-risk management could be verified through a basic review of the appropriateness of the institution's policies, internal reports, and controls and its adherence to them. The integrity and reliability of the information used to assess the quantitative level of risk could be confirmed through limited sampling and testing. In general, if basic examination procedures validate the risk assessment, the examiner may conclude the examination process.

High levels of inherent liquidity risk may arise if an institution has concentrations in specific business activities, products, and sectors, or if it has balance-sheet risks, such as unstable liabilities, risky assets, or planned asset growth without an adequate plan for funding the asset growth. OBS items that have uncertain cash inflows may also be a source of inherent liquidity risk. Institutions for which a risk assessment indicated high levels of inherent liquidity-risk exposure and strong liquidity management may require a more extensive examination scope to confirm the assessment. These expanded procedures may entail more analysis of the institution's liquidity-risk measurement system and its liquidity-risk profile. When high levels of liquidity-risk exposure are found, examiners should focus special attention on the sources of this risk. When a risk assessment indicates an institution has high exposure and weak risk-management systems, an extensive work-documentation program is required. The institution's internal measures should be used cautiously, if at all.

Regardless of the sophistication or complexity of an institution, examiners must use care during the on-site phase of an examination to confirm the off-site risk assessment and identify issues that may have escaped off-site analysis. Accordingly, the examination scope should be adjusted as on-site findings dictate.

Assessing CAMELS "L" Ratings

The assignment of the "L" rating is integral to the CAMELS ratings process for commercial banks. Examination findings on both (1) the inherent level of an institution's liquidity risk and (2) the adequacy of its liquidity-risk management process should be incorporated in the assignment of the "L" rating. Findings on the adequacy of liquidity-risk management should also be reflected in the CAMELS "M" rating for risk management.

Examiners can develop an overall assessment of an institution's liquidity-risk exposure by reviewing the various characteristics of its assets, liabilities, OBS instruments, and material business activities. An institution's asset credit quality, earnings integrity, and market risk may also have significant implications for its liquidity-risk exposure. Importantly, assessments of the adequacy of an institution's liquidity-management practices may affect the assessment of its inherent level of liquidity risk. For institutions judged to have sound and timely liquidity-risk measurement and reporting systems and CFPs, examiners may use the results of the institution's adverse-scenario cash-flow projections in order to gain insight into its level of inherent exposure. Institutions that have less-than-adequate measurement and reporting systems and CFPs may have higher exposure to liquidity risk as a result of their potential inability to respond to adverse liquidity events.

Elements of strong liquidity-risk management are particularly important during stress events and include many of the items discussed previously: communication among the departments responsible for managing liquidity, reports that indicate a diversity of funding sources, standby funding sources, cash-flow analyses, liquidity stress tests, and CFPs. Liquidity-risk management should also manage the ongoing costs of maintaining liquidity.

Liquidity risk should be rated in accordance with the Uniform Financial Institutions Rating System (UFIRS).[5] The assessment of the adequacy of liquidity-risk management should provide the primary basis for reaching an overall assessment on the "L" component rating since it is a leading indicator of potential liquidity-risk exposure. Accordingly, overall ratings for liquidity-risk sensitivity should be no greater than the rating given to liquidity-risk management.

In evaluating the adequacy of a financial institution's liquidity position, consideration should be given to the current level and prospective sources of liquidity compared with funding needs, as well as to the adequacy of funds-management practices relative to the institution's size, complexity, and risk profile. In general, funds-management practices should ensure that an institution is able to maintain a level of liquidity sufficient to meet its financial obligations in a timely manner and to fulfill the legitimate banking needs of its community. Practices should reflect the ability of the institution to manage unplanned changes in funding sources, as well as react to changes in market conditions that affect the ability to quickly liquidate assets with minimal loss. In addition, funds-management practices should ensure that liquidity is not maintained at a high cost or through undue reliance on funding sources that may not be available in times of financial stress or adverse changes in market conditions.

Liquidity is rated based upon, but not limited to, an assessment of the following evaluation factors:

- the adequacy of liquidity sources compared with present and future needs and the ability of the institution to meet liquidity needs without adversely affecting its operations or condition
- the availability of assets readily convertible to cash without undue loss
- access to money markets and other sources of funding
- the level of diversification of funding sources, both on- and off-balance-sheet
- the degree of reliance on short-term, volatile sources of funds, including borrowings and brokered deposits, to fund longer-term assets
- the trend and stability of deposits
- the ability to securitize and sell certain pools of assets
- the capability of management to properly identify, measure, monitor, and control the institution's liquidity position, including the effectiveness of funds-management strategies, liquidity policies, management information systems, and CFPs

Ratings of liquidity-risk management should follow the general framework used to rate overall risk management:

- A rating of 1 indicates strong liquidity levels and well-developed funds-management practices. The institution has reliable access to sufficient sources of funds on favorable terms to meet present and anticipated liquidity needs.
- A rating of 2 indicates satisfactory liquidity levels and funds-management practices. The institution has access to sufficient sources of funds on acceptable terms to meet present and anticipated liquidity needs. Modest weaknesses may be evident in funds-management practices.
- A rating of 3 indicates liquidity levels or funds-management practices in need of improvement. Institutions rated 3 may lack ready access to funds on reasonable terms or may evidence significant weaknesses in funds-management practices.
- A rating of 4 indicates deficient liquidity levels or inadequate funds-management practices. Institutions rated 4 may not have or be able to obtain a sufficient volume of funds on reasonable terms to meet liquidity needs.
- A rating of 5 indicates liquidity levels or funds-management practices so critically deficient that the continued viability of the institution is threatened. Institutions rated 5 require immediate external financial assistance to meet maturing obligations or other liquidity needs.

Unsafe liquidity-risk exposures and weaknesses in managing liquidity risk should be fully reflected in the overall liquidity-risk ratings.

5. SR-96-38, "Uniform Financial Institutions Rating System" and section A.5020.1.

Unsafe exposures and unsound management practices that are not resolved during the on-site examination should be addressed through subsequent follow-up actions by the examiner and other supervisory personnel.

APPENDIX 1—FUNDAMENTALS OF LIQUIDITY-RISK MEASUREMENT

Measuring a financial institution's liquidity-risk profile and identifying alternative sources of funds to meet cash-flow needs are critical elements of sound liquidity-risk management. The liquidity-measurement techniques and the liquidity measures employed by depository institutions vary across a continuum of granularity, specificity, and complexity, depending on the specific characteristics of the institution and the intended users of the information. At one extreme, highly granular cash-flow projections under alternative scenarios are used by both complex and noncomplex firms to manage their day-to-day funding mismatches in the normal course of business and for assessing their contingent liquidity-risk exposures. At the other end of the measurement spectrum, aggregate measures and various types of liquidity ratios are often employed to convey summary views of an institution's liquidity-risk profile to various levels of management, the board of directors, and other stakeholders. As a result of this broad continuum, effective managers generally use a combination of cash-flow analysis and summary liquidity-risk measures in managing their liquidity-risk exposures, since no one measure or measurement technique can adequately capture the full dynamics of a financial institution's liquidity-risk exposure.

This appendix provides background material on the basic elements of liquidity-risk measurement and is intended to enhance examiners' understanding of the key elements of liquidity-risk management. First, the fundamental structure of cash-flow-projection worksheets and their use in assessing cash-flow mismatches under both normal business conditions and contingent liquidity events are discussed. The appendix then discusses the key liquidity characteristics of common depository institution assets, liabilities, off-balance-sheet (OBS) items, and other activities. These discussions also present key management considerations surrounding various sources and uses of liquidity in constructing cash-flow worksheets and addressing funding gaps under both normal and adverse conditions. Finally, commonly used summary liquidity measures and ratios are discussed, along with special considerations that should enter into the construction and use of these summary measures.[6]

I. Basic Cash-Flow Projections

In measuring an institution's liquidity-risk profile, effective liquidity managers estimate cash inflows and cash outflows over future periods. For day-to-day operational purposes, cash-flow projections for the next day and subsequent days out over the coming week are used in order to ensure that contractual obligations are met on time. Such daily projections can be extended out beyond a one-week horizon, although it should be recognized that the further out such projections are made, the more susceptible they become to error arising from unexpected changes.

For planning purposes, effective liquidity managers project cash flows out for longer time horizons, employing various incremental time periods, or "buckets," over a chosen horizon. Such buckets may encompass forward weeks, months, quarters, and, in some cases, years. For example, an institution may plan its cash inflows and outflows on a daily basis for the next 5–10 business days, on a weekly basis over the coming month or quarter, on a monthly basis over the coming quarter or quarters, and on a quarterly basis over the next half-year or year. Such cash-flow bucketing is usually compiled into a single cash-flow-projection worksheet or report that represents cash flows under a specific future scenario. The goal of this bucketing approach is a measurement system with sufficient granularity to (1) reveal the time dimension of the needs and sources of liquidity and (2) identify potential liquidity-risk exposure to contingent events.

In its most basic form, a cash-flow-projection worksheet is a table with columns denoting the selected time periods or buckets for which cash flows are to be projected. The rows of this table consist of various types of assets, liabilities, and OBS items, often grouped by their cash-flow characteristics. Different groupings may be used to achieve different objectives of the cash-flow projection. For each row, net cash flows arising from the particular asset, liability, or OBS activity are projected across the time buckets.

The detail and granularity of the rows, and thus the projections, depend on the sophistication and complexity of the institution. Complex banks generally favor more detail, while less complex banks may use higher levels of aggregation. Static projections based only on the contractual cash flows of assets, liabilities, and OBS items as of a point in time are helpful for identifying gaps between needs and sources of liquidity. However, static projections may inadequately quantify important aspects of potential liquidity risk because they ignore new business, funding renewals, customer options, and other potential events that may have a significant impact on the institution's liquidity profile. Since liquidity managers are generally interested in evaluating how available liquidity sources may cover both expected and potential unexpected liquidity needs, a dynamic analysis that includes management's projected changes in cash flows is normally far more useful than a static projection based only on contractual cash flows as of a given projection date.

In developing a cash-flow-projection worksheet, cash inflows occurring within a given time horizon or time bucket are represented as positive numbers, while outflows are represented as negative numbers. Cash inflows include increases in liabilities as well as decreases in assets, and cash outflows include decreases in liabilities as well as increases in assets. For each type of asset, liability, or OBS item, and in each time bucket, the values shown in the cells of the projected worksheet are net cash-flow numbers. One format for a cash-flow-projection worksheet arrays sources of net cash inflows (such as loans and securities) in one group and sources of net cash outflows (such as deposit runoffs) in another. For example, the entries across time buckets for a loan or loan category would net the positives (cash inflows) of projected interest, scheduled principal payments, and prepayments with the negatives (cash outflows) of customer draws on existing commitments and new loan growth in each appropriate time bucket. Summing the net cash flows within a given column or time bucket identifies the extent of maturity mismatches that may exist. Funding shortfalls caused by mismatches in particular time frames

6. Material presented in this appendix draws from the OCC *Liquidity Handbook,* FDIC guidance, Federal Reserve guidance, findings from Federal Reserve supervision reviews, and other material developed for the Federal Reserve by consultants and other outside parties.

are revealed as a ‘‘negative gap,’’ while excess funds within a time bucket denote a ‘‘positive gap.’’ Identifying such gaps early can help managers take the appropriate action to either fill a negative gap or reduce a positive gap. The subtotals of the net inflows and net outflows may also be used to construct net cash-flow coverage ratios or the ratio of net cash inflows to net cash outflows.

The specific worksheet formats used to array sources and uses of cash can be customized to achieve multiple objectives. Exhibit 1 provides an example of one possible form of a cash-flow-projection worksheet. The time buckets (columns) and sources and uses (rows) are selected for illustrative purposes, as the specific selection will depend on the purpose of the particular cash-flow projection. In this example, assets and liabilities are grouped into two broad categories: those labeled ‘‘customer-driven cash flows’’ and those labeled ‘‘management-controlled cash flows.’’ This grouping arrays projected cash flows on the basis of the relative extent to which funding managers may have control over changes in the cash flows of various assets, liabilities, OBS items, and other activities that have an impact on cash flow. For example, managers generally have less control over loan and deposit cash flows (e.g., changes arising from either growth or attrition) and more control over such items as fed funds sold, investment securities, and borrowings.

The net cash-flow gap illustrated in the next-to-the-last row of exhibit 1 is the sum of the net cash flows in each time-bucket column and reflects the funding gap that will have to be financed in that time period. For the daily time buckets, this gap represents the net overnight position that needs to be funded in the unsecured short-term (e.g., fed funds) market. The final row of the exhibit identifies a cumulative net cash-flow gap, which is constructed as the sum of the net cash flows in that particular time bucket and all previous time buckets. It provides a running picture across time of the cumulative funding sources and needs of the institution. The worksheet presented in exhibit 1 is only one of many alternative formats that can be used in measuring liquidity gaps.

II. Scenario Dependency of Cash-Flow Projections

Cash-flow-projection worksheets describe an institution’s liquidity profile under an established set of assumptions about the future.

The set of assumptions used in the cash-flow projection constitutes a specific scenario customized to meet the liquidity manager’s objective for the forecast. Effective liquidity managers generally use multiple forecasts and scenarios to achieve an array of objectives over planning time horizons. For example, they may use three broad types of scenarios every time they make cash-flow projections: normal-course-of-business scenarios; short-term, institution-specific stress scenarios; and more-severe, intermediate-term, institution-specific stress scenarios. Larger, more complex institutions that engage in significant capital-markets and derivatives activities also routinely project cash flows for various systemic scenarios that may have an impact on the firm. Each scenario requires the liquidity manager to assess and plan for potential funding shortfalls. Importantly, no single cash-flow projection reflects the range of liquidity sources and needs required for advance planning.

Normal-course-of-business scenarios establish benchmarks for the ‘‘normal’’ behavior of cash flows of the institution. The cash flows projected for such scenarios are those the institution expects under benign conditions and should reflect seasonal fluctuations in loans or deposit flows. In addition, expected growth in assets and liabilities is generally incorporated to provide a dynamic view of the institution’s liquidity needs under normal conditions.

Adverse, institution-specific scenarios are those that subject the institution to constrained liquidity conditions. Such scenarios are generally defined by first specifying the type of liquidity event to be considered and then identifying various levels or stages of severity for that type of event. For example, institutions that do not have publicly rated debt generally employ scenarios that entail a significant deterioration in the credit quality of their loan and security holdings. Institutions that have publicly rated debt generally include a debt-rating downgrade scenario in their CFPs. The downgrade of an institution’s public debt rating might be specified as one type of event, with successively lower ratings grades, including below-investment-grade ratings, to identify increasing

levels of severity. Each level of severity can be viewed as an individual scenario for planning purposes. Effective liquidity managers ensure that they choose potential adverse liquidity scenarios that entail appropriate degrees of severity and model cash flows consistent with each level of stress. Events that limit access to important sources of funding are the most common institution-specific scenarios used.

The same type of cash-flow-projection worksheet format shown in exhibit 1 can be used for adverse, institution-specific scenarios. However, in making such cash-flow projections, some institutions find it useful to organize the accounts differently to accommodate a set of very different assumptions from those used in the normal-course-of-business scenarios. Exhibit 2 presents a format in which accounts are organized by those involving potential cash outflows and cash inflows. This format focuses the analysis first on liability erosion and potential off-balance-sheet draws, followed by an evaluation of the bank's ability to cover potential runoff, primarily from assets that can be sold or pledged. Funding sources are arranged by their sensitivity to the chosen scenario. For example, deposits may be segregated into insured and uninsured portions. The time buckets used are generally of a shorter

term than those used under business-as-usual scenarios, reflecting the speed at which deteriorating conditions can affect cash flows.

A key goal of creating adverse-situation cash-flow projections is to alert management as to whether incremental funding resources available under the constraints of each scenario are sufficient to meet the incremental funding needs that result from that scenario. To the extent that projected funding deficits are larger than (or projected funding surpluses are smaller than) desired levels, management has the opportunity to adjust its liquidity position or develop strategies to bring the institution back within an acceptable level of risk.

Adverse systemic scenarios entail macroeconomic, financial market, or organizational events that can have an adverse impact on the institution and its funding needs and sources. Such scenarios are generally customized to the individual institution's funding characteristics and business activities. For example, an institution involved in clearing and settlement activities may choose to model a payments-system disruption, while a bank heavily involved in capital-markets transactions may choose to model a capital-markets disruption.

The number of cash-flow projections necessary to fully assess potential adverse liquidity scenarios can result in a wealth of information that often requires summarization in order to appropriately communicate contingent liquidity-risk exposure to various levels of management. Exhibit 3 presents an example of a report format that assesses available sources of liquidity under alternative scenarios. The worksheet shows the amount of anticipated funds erosion and potential sources of funds under a number of stress scenarios, for a given time bucket (e.g., overnight, one week, one month, etc.). In this example, two rating-downgrade scenarios of different severity are used, along with a scenario built on low-earnings projections and a potential reputational-risk scenario.

Exhibit 4 shows an alternative format for summarizing the results of multiple scenarios. In this case, summary funding gaps are presented across various time horizons (columns) for each scenario (rows). Actual reports used should be tailored to the specific liquidity-risk profile and other institution-specific characteristics.

III. Liquidity Characteristics of Assets, Liabilities, Off-Balance-Sheet Positions, and Various Types of Banking Activities

A full understanding of the liquidity and cash-flow characteristics of the institution's assets, liabilities, OBS items, and banking activities is critical to the identification and management of mismatch risk, contingent liquidity risk, and market liquidity risk. This understanding is required for constructing meaningful cash-flow-projection worksheets under alternative scenarios, for developing and executing strategies used in managing mismatches, and for customizing summary liquidity measures or ratios.

A. Assets

The generation of assets is one of the primary uses of funds at banking organizations. Once acquired, assets provide cash inflows through principal and interest payments. Moreover, the liquidation of assets or their use as collateral for borrowing purposes makes them an important source of funds and, therefore, an integral tool in managing liquidity risk. As a result, the objectives underlying an institution's holdings of various types of assets range along a continuum that balances the tradeoffs between maximizing risk-adjusted returns and ensuring the fulfillment of an institution's contractual obligations to deliver funds (ultimately in the form of cash). Assets vary by structure, maturity, credit quality, marketability, and other characteristics that generally reflect their relative ability to be convertible into cash.

Cash operating accounts that include vault cash, cash items in process, correspondent accounts, accounts with the Federal Reserve, and other cash or "near-cash" instruments are the primary tools institutions use to execute their immediate cash-transaction obligations. They are generally not regarded as sources of additional or incremental liquidity but act as the operating levels of cash necessary for executing day-to-day transactions. Accordingly, well-managed institutions maintain ongoing balances in such accounts to meet daily business transactions. Because they generate no or very low interest earnings, such holdings are generally maintained at the minimum levels necessary to meet day-to-day transaction needs.

Beyond cash and near-cash instruments, the extent to which assets contribute to an institution's liquidity profile and the management of liquidity risk depends heavily on the contractual and structural features that determine an asset's cash-flow profile, its marketability, and its ability to be pledged to secure borrowings. The following sections discuss important aspects of these asset characteristics that effective managers factor into their management of liquidity risk on an ongoing basis and during adverse liquidity events.

Structural cash-flow attributes of assets. Knowledge and understanding of the contractual and structural features of assets, such as their maturity, interest and amortization payment schedules, and any options (either explicit or embedded) that might affect contractual cash flows under alternative scenarios, is critical for the adequate measurement and management of liquidity risk. Clearly, the maturity of assets is a key input in cash-flow analysis. Indeed, the management of asset maturities is a critical tool used in matching expected cash outflows and inflows. This matching is generally accomplished by "laddering" asset maturities in order to meet scheduled cash needs out through short and intermediate time horizons.

Short-term money market assets (MMAs) are the primary "laddering" tools used to meet funding gaps over short-term time horizons. They provide vehicles for institutions to ensure future cash availability while earning a return. Given the relatively low return on such assets, managers face important tradeoffs between earnings and the provision of liquidity in deploying such assets. In general, larger institutions employ a variety of MMAs in making such tradeoffs, while smaller community organizations face fewer potential sources of short-term investments.

The contractual and structural features, such as the maturity and payment streams of all financial assets, should be factored into both cash-flow projections and the strategies developed for filling negative funding gaps. This practice includes the assessment of embedded options in assets that can materially affect an asset's cash flow. Effective liquidity managers incorporate the expected exercise of options in projecting cash flows for the various scenarios they use in measuring liquidity risk. For example, normal "business as usual" projections may include an estimate of the expected amount of loan and security principal prepayments under prevailing market interest rates, while alternative-scenario projections may employ estimates of expected increases in prepayments (and cash flows) arising from declining interest rates and expected declines in prepayments or "maturity extensions" resulting from rising market interest rates.

Market liquidity, or the "marketability" of assets. Marketability is the ability to convert an asset into cash through a quick "sale" and at a fair price. This ability is determined by the market in which the sale transaction is conducted. In general, investment-grade securities are more marketable than loans or other assets. Institutions generally view holdings of investment securities as a first line of defense for contingency purposes, but banks need to fully assess the marketability of these holdings. The availability and size of a bid-asked spread for an asset provides a general indication of the market liquidity of that asset. The narrower the spread, and the deeper and more liquid the market, the more likely a seller will find a willing buyer at or near the asked price. Importantly, however, the market liquidity of an asset is not a static attribute but is a function of conditions prevailing in the secondary markets for the particular asset. Bid-asked spreads, when they exist, generally vary with the volume and frequency of transactions in the particular type of assets. Larger volumes and greater frequency of transactions are generally associated with narrower bid-asked spreads. However, disruptions in the marketplace, contractions in the number of market makers, the execution of large block transactions in the asset, and other market factors may result in the widening of the bid-asked spread—and thus reduce the market liquidity of an instrument. Large transactions, in particular, can constrain the market liquidity of an asset, especially if the market for the asset is not deep.

The marketability of assets may also be constrained by the volatility of overall market prices and the underlying rates, which may cause widening bid-asked spreads on marketable assets. Some assets may be more subject to this type of market volatility than others. For example, securities that have inherent credit or interest-rate risk can become more difficult to trade during times when market participants have a low tolerance for these risks. This may be the case when market uncertainties prompt investors to shun risky securities in favor of more-stable investments, resulting in a so-called flight to quality. In a flight to quality, investors become much more willing to sacrifice yield in exchange for safety and liquidity.

In addition to reacting to prevailing market conditions, the market liquidity of an asset can be affected by other factors specific to individual investment positions. Small pieces of security issues, security issues from nonrated and obscure issuers, and other inactively traded securities may not be as liquid as other investments. While brokers and dealers buy and sell inactive securities, price quotations may not be readily available, or when they are, bid-asked spreads may be relatively wide. Bids for such securities are unlikely to be as high as the bids for similar but actively traded securities. Therefore, even though sparsely traded securities can almost always be sold, an unattractive price can make the seller unenthusiastic about selling or result in potential losses in order to raise cash through the sale of an asset.

Accounting conventions can also affect the market liquidity of assets. For example, Accounting Standards Codification (ASC) 320, "Investments—Debt and Equity Securities," (or

Statement of Financial Accounting Standards No. 115 (FAS 115)) requires investment securities to be categorized as held-to-maturity (HTM), available-for-sale (AFS), or trading, significantly affects the liquidity characteristics of investment holdings. Of the three categories, securities categorized as HTM provide the least liquidity, as they cannot be sold to meet liquidity needs without potentially onerous repercussions.[7]

Securities categorized as AFS can be sold at any time to meet liquidity needs, but care must be taken to avoid large swings in earnings or triggering impairment recognition of securities with unrealized losses.

Trading account securities are generally considered the most marketable from an accounting standpoint, since selling a trading account investment has little or no income effect.

While securities are generally considered to have greater market liquidity than loans and other assets, liquidity-risk managers increasingly consider the ability to obtain cash from the sale of loans as a potential source of liquidity. Many types of bank loans can be sold, securitized, or pledged as collateral for borrowings. For example, the portions of loans that are insured or guaranteed by the U.S. government or by U.S. government–sponsored enterprises are readily saleable under most market conditions. From a market liquidity perspective, the primary difference between loans and securities is that the process of turning loans into cash can be less efficient and more time-consuming. While securitizations of loan portfolios (discussed below) are more common in practice, commercial loans and portfolios of mortgages or retail loans can be, and often are, bought and sold by banking organizations. However, the due diligence and other requirements of these transactions generally take weeks or even months to complete, depending on the size and complexity of the loans being sold. Liquidity-risk managers may include selling marketable loans as a potential source of cash in their liquidity analyses, but they must be careful to realistically time the expected receipt of cash and should carefully consider past experience and market conditions at the expected time of sale. Institutions that do not have prior experience selling a loan or a mortgage portfolio often need more time to close a loan sale than does an institution that makes such transactions regularly. Additionally, in systemic liquidity or institution-specific credit-quality stress scenarios, the ability to sell loans outright may not be a realistic assumption.

Securitization can be a valuable method for converting otherwise illiquid assets into cash. Advances in the capital markets have made residential mortgage, credit card, student, home equity, automobile, and other loan types increasingly amenable to securitization. As a result, the securitization of loans has become an important funds-management tool at many depository institutions. Many institutions have business lines that originate assets specifically for securitization in the capital markets. However, while securitization can play an important role in managing liquidity, it can also increase liquidity risk—especially when excessive reliance is placed on securitization as a single source of funding.

Securitization can be regarded as an ongoing, reliable source of liquidity only for institutions that have experience in securitizing the specific type of loans under consideration. The time and effort involved in structuring loan securitizations make them difficult to use as a source of asset liquidity for institutions that have limited experience with this activity. Moreover, peculiarities involved in the structures used to securitize certain types of assets may introduce added complexity in managing an institution's cash flows. For example, the securitization of certain retail-credit receivables requires planning for the possible return of receivable balances arising from scheduled or early amortization, which may entail the funding of sizable balances at unexpected or inopportune times. Institutions using securitization as a source of funding should have adequate monitoring systems and ensure that such activities are fully incorporated into all aspects of their liquidity-risk management processes—which includes assessing the liquidity impact of securitizations under adverse scenarios. This assessment is especially important for institutions that originate assets specifically for securitization since market disruptions have the potential to impose the need for significant contingent liquidity if securitizations cannot be executed. As a result, effective liquidity managers ensure that the implications of securitization activities are fully considered in both their day-to-day liquidity management and their liquidity contingency planning.

7. HTM securities can be pledged, however, so they do still provide a potential source of liquidity. Furthermore, since the HTM-sale restriction is only an accounting standard (FAS 115)—not a market limitation—HTM securities can be sold in cases of extreme need.

Pledging of assets to secure borrowings. The potential to pledge securities, loans, or other assets to obtain funds is another important tool for converting assets into cash to meet funding needs. Since the market liquidity of assets is a significant concern to the lender of secured funds, assets with greater market liquidity are more easily pledged than less marketable assets. An institution that has a largely unpledged investment-securities portfolio has access to liquidity either through selling the investments outright or through pledging the investments as collateral for borrowings or public deposits. However, once pledged, assets are generally unavailable for supplying contingent liquidity through their sale. When preparing cash-flow projections, liquidity-risk managers do not classify pledged assets as "liquid assets" that can be sold to generate cash since the liquidity available from these assets has already been "consumed" by the institution. Accordingly, when computing liquidity measures, effective liquidity managers avoid double-counting unpledged securities as both a source of cash from the potential sale of the asset and as a source of new liabilities from the potential collateralization of the same security. In more-sophisticated cash-flow projections, the tying of the pledged asset to the funding is made explicit.

Similar to the pledging of securities, many investments can be sold under an agreement to repurchase. This agreement provides the institution with temporary cash without having to sell the investment outright and avoids the potential earnings volatility and transaction costs that buying and selling securities would entail.

Use of haircuts in measuring the funds that can be raised through asset sales, securitizations, or repurchase agreements. The planned use of asset sales, asset securitizations, or collateralized borrowings to meet liquidity needs necessarily involves some estimation of the value of the asset at the future point in time when the asset is anticipated to be converted into cash. Based on changes in market factors, future asset values may be more or less than current values. As a result, liquidity managers generally apply discounts, or *haircuts,* to the current value of assets to represent a conservative estimate of the anticipated proceeds available from asset sales or securitization in the capital markets. Similarly, lenders in secured borrowings also apply haircuts to determine the amount to lend against pledged collateral as protection if the value of that collateral declines. In this case, the haircut represents, in addition to other factors, the portion of asset value that cannot be converted to cash because secured lenders wish to have a collateral-protection margin.

When computing cash-flow projections under alternative scenarios and developing plans to meet cash shortfalls, liquidity managers ensure that they incorporate haircuts in order to reflect the market liquidity of their assets. Such haircuts are applied consistent with both the relative market liquidity of the assets and the specific scenario utilized. In general, longer-term, riskier assets, as well as assets with less liquid markets, are assigned larger haircuts than are shorter-term, less risky assets. For example, within the securities portfolio, different haircuts might be assigned to short-term and long-term Treasuries, rated and unrated municipal bonds, and different types of mortgage securities (e.g., pass-throughs versus CMOs). When available and appropriate, historical price changes over specified time horizons equal to the time until anticipated liquidation or the term of a borrowing are used by liquidity-risk managers to establish such haircuts. Haircuts used by nationally recognized statistical ratings organizations (NRSROs) are a starting point for such calculations but should not be unduly relied on since institution- and scenario-specific considerations may have important implications.

Haircuts should be customized to the particular projected or planned scenario. For example, adverse scenarios that hypothesize a capital-markets disruption would be expected to use larger haircuts than those used in projections assuming normal markets. Under institution-specific, adverse scenarios, certain assets, such as loans anticipated for sale, securitization, or pledging, may merit higher haircuts than those used under normal business scenarios. Institutions should fully document the haircuts they use to estimate the marketability of their assets.

Bank-owned life insurance (BOLI) is a popular instrument offering tax benefits as well as life insurance on bank employees. Some BOLI policies are structured to provide liquidity; however, most BOLI policies only generate cash in the event of a covered person's death and impose substantial fees if redeemed. In general, BOLI should not be considered a liquid asset. If it is included as a potential source of funds in a cash-flow analysis, a severe haircut reflecting the terms of the BOLI contract and current market conditions should be applied.

Liquid assets and liquidity reserves. Sound practices for managing liquidity risk call for institutions to maintain an adequate reserve of liquid assets to meet both normal and adverse liquidity situations. Such reserves should be structured consistent with the considerations discussed above regarding the marketability of different types of assets. Many institutions identify a specific portion of their investment account to serve as a liquidity reserve, or *liquidity warehouse*. The size of liquidity reserves should be based on the institution's assessments of its liquidity-risk profile and potential liquidity needs under alternative scenarios, giving full consideration to the costs of maintaining those assets. In general, the amount of liquid assets held will be a function of the stability of the institution's funding structures and the potential for rapid loan growth. If the sources of funds are stable, if adverse-scenario cash-flow projections indicate adequate sources of contingent liquidity (including sufficient sources of unused borrowing capacity), and if asset growth is predictable, then a relatively low asset liquidity reserve may be required. The availability of the liquidity reserves should be tested from time to time. Of course, liquidity reserves should be actively managed to reflect the liquidity-risk profile of the institution and current trends that might have a negative impact on the institution's liquidity, such as—

- trading market, national, or financial market trends that might lead rate-sensitive customers to pursue investment alternatives away from the institution;
- significant actual or planned growth in assets;
- trends evidencing a reduction in large liability accounts;
- a substantial portion of liabilities from rate-sensitive and credit-quality-sensitive customers;
- significant liability concentrations by product type or by large deposit account holders;
- a loan portfolio consisting of illiquid, nonmarketable, or unpledgeable loans;
- expectations for substantial draws on loan commitments by customers;
- significant loan concentrations by product, industry, customer, and location;
- significant portions of assets pledged against wholesale borrowings; and
- impaired access to the capital markets.

B. Liabilities

Similar to its assets, a depository institution's liabilities present a complicated array of liquidity characteristics. Banking organizations obtain funds from a wide variety of sources using an array of financial instruments. The primary characteristics that determine a liability's liquidity-risk profile include its term, optionality, and counterparty risk tolerance (which includes the counterparty's need for insurance or collateral). These features help to determine if an individual liability can be considered as stable or volatile. A stable liability is a reliable source of funds that is likely to remain available in adverse circumstances. A volatile liability is a less stable source of funds that may disappear or be unavailable to the institution under heavy price competition, deteriorating credit or market- risk conditions, and other possible adverse events. Developing assumptions on the relative stability or volatility of liabilities is a crucial step in forecasting a bank's future cash flows under various scenarios and in constructing various summary liquidity measures. As a result, effective liquidity managers segment their liabilities into volatile and stable components on the basis of the characteristics of the liability and on the risk tolerance of the counterparty. These funds may be characterized as credit-sensitive, rate-sensitive, or both.

Characteristics of stability and risk tolerance. The stability of an individual bank liability is closely related to the customer's or counterparty's risk tolerance, or its willingness and ability to lend or deposit money for a given risk and reward. Several factors affect the stability and risk tolerance of funds providers, including the fiduciary responsibilities and obligations of funds providers to their customers, the availability of insurance on the funds advanced by customers to banking organizations, the reliance of customers on public debt ratings, and the relationships funds providers have with the institution.

Institutional providers of funds to banking organizations, such as money market funds, mutual funds, trust funds, public entities, and other types of investment managers, have fiduciary obligations and responsibilities to adequately assess and monitor the relative risk-and-reward tradeoffs of the investments they make for their customers, participants, or constituencies. These fund providers are especially sensitive to receiving higher returns for higher risk, and they are more apt to withdraw funds if they sense that an institution has a deteriorating financial condition. In general, funds from sources that lend or deposit money on behalf of others are less stable than funds from sources that lend their own funds. For example, a mutual fund purchaser of an institution's negotiable CD may be expected to be less stable than a local customer buying the same CD.

Institutionally placed funds and other funds providers often depend on the published evaluations or ratings of NRSROs. Indeed, many such funds providers may have bylaws or internal guidelines that prohibit placing funds with institutions that have low ratings or, in the absence of actual guidelines, may simply be averse to retaining funds at an institution whose rating is poor or whose financial condition shows deterioration. As a result, funds provided by such investors can be highly unstable in adverse liquidity environments.

The availability of insurance on deposits or collateral on borrowed funds are also important considerations in gauging the stability of funds provided. Insured or collateralized funds are usually more stable than uninsured or unsecured funds since the funds provider ultimately relies on a third party or the value of collateral to protect its investment.

Clearly, the nature of a customer's relationship with an institution has significant implications for the potential stability or volatility of various sources of funds. Customers who have a long-standing relationship with an institution and a variety of accounts, or who otherwise use multiple banking services at the institution, are usually more stable than other types of customers.

Finally, the sensitivity of a funds provider to the rates paid on the specific instrument or transaction used by the banking organization to access funds is also critical for the appropriate assessment of the stability or volatility of funds. Customers that are very rate-driven are more likely not to advance funds or remove existing funds from an institution if more competitive rates are available elsewhere.

All of these factors should be analyzed for the more common types of depositors and funds providers and for the instruments they use to place funds with the institution. Such assessments lead to general conclusions regarding each type of customer's or counterparty's risk sensitivity and the stability of the funds provided by the instruments they use to place funds with the institution. Exhibit 5 provides a heuristic schematic of how effective liquidity-risk managers conduct such an assessment regarding the array of their different funds providers. It uses a continuum to indicate the general level of risk sensitivity (and thus the expected stability of funds) expected for each type of depositor, customer, or investor in an institution's debt obligations. Of course, individual customers and counterparties may have various degrees of such concerns, and greater granularity is generally required in practice. An additional instrument assessment of the stability or volatility of funds raised using that instrument from each type of fund provider is a logical next step in the process of evaluating the relative stability of various sources of funds to an institution.

There are a variety of methods used to assess the relative stability of funds providers. Effective liquidity managers generally review deposit accounts by counterparty type, e.g., consumer, small business, or municipality. For each type, an effective liquidity manager evaluates the applicability of risk or stability factors, such as whether the depositor has other relationships with the institution, whether the depositor owns the funds on deposit or is acting as an agent or manager, or whether the depositor is likely to be more aware of and concerned by adverse news reports. The depositors and counterparties considered to have a significant relationship with the institution and who are less sensitive to market interest rates can be viewed as providing *stable* funding. Statistical analysis of funds volatility is often used to separate total volumes into stable and nonstable segments. While such analysis can be very helpful, it is important to be mindful that historical volatility is unlikely to include a period of acute liquidity stress.

The following discussions identify important considerations that should be factored into the assessment of the relative stability of various sources of funds utilized by banking organizations.

Maturity of liabilities used to gather funds. An important factor in assessing the stability of funds sources is the remaining contractual life of the liability. Longer-maturity liabilities obvi-

Exhibit 5—General Characteristics of Stable and Volatile Liabilities

	Characteristics of funds providers that affect the stability/volatility of the funds provided				
Types of funds providers	*Fiduciary agent or own funds*	*Insured or secured*	*Reliance on public information*	*Relationship*	*Stability assessment*
Consumers	owner	yes	low	high	high
Small business	owner	in part	low	high	medium
Large corporate	owner	no	medium	medium	low
Banks	agent	no	high	medium	medium
Municipalities	agent	in part	high	medium	medium

Other	___	___	___	___	___

ously provide more-stable funding than do shorter maturities. Extending liability maturities to reduce liquidity risk is a common management technique and an important sound practice used by most depository institutions. It is also a major part of the cost of liquidity management, since longer-term liabilities generally require higher interest rates than are required for similar short-term liabilities.

Indeterminate maturity deposits. Evaluations of the stability of deposits with indeterminate maturities, such as various types of transaction accounts (e.g., demand deposits, negotiable order of withdrawal accounts (NOWs) or money market demand accounts (MMDAs), and savings accounts) can be made using criteria similar to those shown in exhibit 5. In doing so, effective liquidity managers recognize that the relative stability or volatility of these accounts derives from the underlying characteristics of the customers that use them and not on the account type itself. As a result, most institutions delineate the relative volatility or stability of various subgroups of these account types on the basis of customer characteristics. For example, MMDA deposits of customers who have fiduciary obligations may be less stable than those of individual retail customers. Additionally, funds acquired through a higher pricing strategy for these types of deposit accounts are generally less stable than are deposits from customers who have long-standing relationships with the institution. Increasingly, liquidity managers recognize that traditional measures of "core" deposits may be inappropriate, and thus these deposits require more in-depth analysis to determine their relative stability.

Assessment of the relative stability or volatility of deposits that have indeterminate maturities can be qualitative as well as quantitative, consistent with the size, complexity, and sophistication of the institution. For example, at larger institutions, models based on statistical analysis can be used to estimate the stability of various subsets of such funds under alternative liquidity environments. Such models can be used to formulate expected behaviors in reaction to rate changes and other more-typical financial events. As they do when using models to manage any type of risk, institutions should fully document and understand the assumptions and methodologies used. This is especially the case when external parties conduct such analysis. Effective liquidity managers aggressively avoid "black-box" estimates of funding behaviors.

In most cases, insured deposits from consumers may be less likely to leave the institution under many liquidity circumstances than are funds supplied by more-institutional funds providers. Absent extenuating circumstances (e.g., the deposit contract prohibits early withdrawal), funds provided by agents and fiduciaries are generally treated by banking organizations as volatile liabilities.

Certificates of deposit and time deposits. At maturity, certificates of deposit (CDs) and time deposits are subject to the general factors regarding stability and volatility discussed above, including rate sensitivity and relationship factors. Nonrelationship and highly-rate-sensitive deposits tend to be less stable than deposits placed by less-rate-sensitive customers who have close relationships with the institution. Insured CDs are generally considered more stable than uninsured "jumbo" CDs in denominations of more than $100,000. In general, jumbo CDs and negotiable CDs are more volatile sources of funds—especially during times of stress—since they may be less relationship-driven and have a higher sensitivity to potential credit problems.

Brokered deposits and other rate-sensitive deposits. Brokered deposits are funds a bank obtains, directly or indirectly, by or through any deposit broker, for deposit into one or more accounts. Thus, brokered deposits include both those in which the entire beneficial interest in a given bank deposit account or instrument is held by a single depositor and those in which the deposit broker pools funds from more than one investor for deposit in a given bank deposit account. Rates paid on brokered deposits are often higher than those paid for local-market-area retail deposits since brokered-deposit customers are generally focused on obtaining the highest FDIC-insured rate available. These rate-sensitive customers have easy access to, and are frequently well informed about, alternative markets and investments, and they may have no other relationship with or loyalty to the bank. If market conditions change or more-attractive returns become available, these customers may rapidly transfer their funds to new institutions or investments. Accordingly, these rate-sensitive depositors may exhibit characteristics more typical of wholesale investors, and liquidity-risk managers should model brokered deposits accordingly.

The use of brokered deposits is governed by law and covered by the 2001 Joint Agency Advisory on Brokered and Rate-Sensitive Deposits.[8] Under 12 USC 1831f and 12 CFR 337.6, determination of "brokered" status is based initially on whether a bank actually obtains a deposit directly or indirectly through a deposit broker. Banks that are considered only "adequately capitalized" under the "prompt corrective action" (PCA) standard must receive a waiver from the FDIC before they can accept, renew, or roll over any brokered deposit. They are also restricted in the rates they may offer on such deposits. Banks falling below the adequately capitalized range may not accept, renew, or roll over any brokered deposit, nor solicit deposits with an effective yield more than 75 basis points above the "national rate." The national rate is defined as "a simple average of rates paid by all insured depository institutions and branches for which data are available." On a weekly basis, the "national rate" is posted on the FDIC's website. If a depository institution believes that the "national rate" does not correspond to the actual prevailing rate in the applicable market, the institution may seek a determination from the FDIC that the institution is operating in a "high-rate area." If the FDIC makes such a determination, the bank will be allowed to offer the actual prevailing rate plus 75 basis points. In any event, for deposits accepted outside the applicable market area, the bank will not be allowed to offer rates in excess of the "national rate" plus 75 basis points.

These restrictions will reduce the availability of funding alternatives as a bank's condition deteriorates. The FDIC is not authorized to grant waivers for banks that are less than adequately capitalized. Bank managers who use brokered deposits should be familiar with the regulations governing brokered deposits and understand the requirements for requesting a waiver. Further detailed information regarding brokered deposits can be found in the FDIC's Financial Institution Letter (FIL), 69-2009.

Deposits attracted over the Internet, through CD listing services, or through special advertising programs that offer premium rates to customers who do not have another banking relationship with the institution also require special monitoring. Although these deposits may not fall within the technical definition of "brokered" in 12 USC 1831f and 12 CFR 337.6, their inherent risk characteristics may be similar to those of brokered deposits. That is, such deposits are typically attractive to rate-sensitive customers who may not have significant loyalty to the bank. Extensive reliance on funding products of this type, especially those obtained from outside a bank's geographic market area, has the potential to weaken a bank's funding position in times of stress.

Under the 2001 joint agency advisory, banks are expected to perform adequate due diligence before entering any business relationship with a deposit broker; assess the potential risks to earnings and capital associated with brokered deposits; and fully incorporate the assessment

8. Board of Governors of the Federal Reserve System, Office of the Comptroller of the Currency, Federal Deposit Insurance Corporation, and Office of Thrift Supervision. May 11, 2001. See SR-01-14.

and control of brokered deposits into all elements of their liquidity-risk management processes, including CFPs.

Public or government deposits. Public funds generally represent deposits of the U.S. government, state governments, and local political subdivisions; they typically require collateral to be pledged against them in the form of securities. In most banks, deposits from the U.S. government represent a much smaller portion of total public funds than that of funds obtained from states and local political subdivisions. Liquidity-risk managers generally consider the secured nature of these deposits as being a double-edged sword. On the one hand, they reduce contingent liquidity risk because secured funds providers are less credit-sensitive, and therefore their deposits may be more stable than those of unsecured funds providers. On the other hand, such deposits reduce standby liquidity by "consuming" the potential liquidity in the pledged collateral.

Rather than pledge assets as collateral for public deposits, banks may also purchase an insurance company's surety bond as coverage for public funds in excess of FDIC insurance limits. Here, the bank would not pledge assets to secure deposits, and the purchase of surety bonds would not affect the availability of funds to all depositors in the event of insolvency. The costs associated with the purchase of a surety bond must be taken into consideration when using this alternative.

Deposits from taxing authorities (most school districts and municipalities) also tend to be highly seasonal. The volume of public funds rises around tax due dates and falls near the end of the period before the next tax due date. This fluctuation is clearly a consideration for liquidity managers projecting cash flows for normal operations. State and local governments tend to be very rate-sensitive. Effective liquidity managers fully consider the contingent liquidity risk these deposits entail, that is, the risk that the deposits will not be maintained, renewed, or replaced unless the bank is willing to offer very competitive rates.

Eurodollar deposits. Eurodollar time deposits are certificates of deposit issued by banks outside of the United States. Large, internationally active U.S. banks may obtain Eurodollar funding through their foreign branches—including offshore branches in the Cayman Islands or other similar locales. Eurodollar deposits are usually negotiable CDs issued in amounts of $100,000 or more, with rates tied to LIBOR. Because they are negotiable, the considerations applicable to negotiable CDs set forth above also apply to Eurodollar deposits.

Federal funds purchased. Federal funds (fed funds) are excess reserves held at Federal Reserve Banks. The most common type of federal funds transaction is an overnight, unsecured loan. Transactions that are for a period longer than one day are called *term fed funds.* The day-to-day use of fed funds is a common occurrence, and fed funds are considered an important money market instrument used in managing daily liquidity needs and sources.

Many regional and money-center banks, acting in the capacity of correspondents to smaller community banks, function as both providers and purchasers of federal funds. Overnight fed funds purchased can pose a contingent liquidity risk, particularly if a bank is unable to roll over or replace the maturing borrowing under stress conditions. Term fed funds pose almost the same risk since the term is usually just a week or two. Fed funds purchased should generally be treated as a volatile source of funds.

Loans from correspondent banks. Small and medium-sized banks often negotiate loans from their principal correspondent banks. The loans are usually for short periods and may be secured or unsecured. Correspondent banks are usually moderately credit-sensitive. Accordingly, cash-flow projections for normal business conditions and mild adverse scenarios may often treat these funds as stable. However, given the credit sensitivity of such funds, projections computed for severe adverse liquidity scenarios should treat these funds as volatile.

FHLB borrowings. The Federal Home Loan Banks (FHLBs) provide loans, referred to as *advances,* to members. Advances must be secured by collateral acceptable to the FHLB, such as residential mortgage loans and mortgage-backed securities. Both short-term and long-term FHLB borrowings, with maturities ranging from overnight to 10 years, are available to member institutions at generally competitive interest rates. For some small and medium-sized banks, long-term FHLB advances may be a significant or the only source of long-term funding.

It should be noted that FHLBs may also sell their excess cash into the market in the form of fed funds. This is a transaction where the FHLB is managing its excess funding and has chosen to invest that excess in short-term unsecured fed funds. This transaction is executed through the capital markets and is not done with specific members of the FHLB.

Some FHLB advances contain embedded options or other features that may increase funding risk. For example, some types of advances, such as putable and convertible advances, provide the FHLB with the option to either recall the advance or change the interest rate on an advance from a fixed rate to a floating rate under specified conditions. When such optionality exists, institutions should fully assess the implications of this optionality on the liquidity-risk profile of the institution.

In general, an FHLB establishes a line of credit for each of its members. Members are required to purchase FHLB stock before a line of credit is established, and the FHLB has the ability to restrict the redemption of its stock. An FHLB may also limit or deny a member's request for an advance if the member engages in any unsafe or unsound practice, is inadequately capitalized, sustains operating losses, is deficient with respect to financial or managerial resources, or is otherwise deficient.

Because FHLB advances are secured by collateral, the unused FHLB borrowing capacity of a bank is a function of both its eligible, unpledged collateral and its unused line of credit with its FHLB.

FHLBs have access to bank regulatory information not available to other lenders. The composite rating of an institution is a factor in the approval for obtaining an FHLB advance, as well as the level of collateral required and the continuance of line availability. Because of this access to regulatory data, an FHLB can react quickly to reduce its exposure to a troubled institution by exercising options or not rolling over unsecured lines of credit. Depending on the severity of a troubled institution's condition, an FHLB has the right to increase collateral requirements or to discontinue or withdraw (at maturity) its collateralized funding program because of concerns about the quality or reliability of the collateral or other credit-related concerns. On the one hand, this right may create liquidity problems for an institution, especially if it has large amounts of short-term FHLB funding. At the same time, because FHLB advances are fully collateralized, the various FHLBs have historically worked with regulators prior to exercising their option to fully withdraw funding from members. To this extent, FHLB borrowings are viewed by many liquidity managers as a relatively stable source of funding, barring the most severe of adverse funding situations.

Sound liquidity-risk management practices call for institutions to fully document the purpose of any FHLB-borrowing transaction. Each transaction should be analyzed on an ongoing basis to determine whether the arrangement achieves the stated purpose or whether the borrowings are a sign of liquidity deficiencies. Some banks may use their FHLB line of credit to secure public funds; however, doing so will reduce their available funds and may present problems if the FHLB reduces the institution's credit line. Additionally, the institution should periodically review its borrowing agreement with the FHLB to determine the assets collateralizing the borrowings and the potential risks presented by the agreement. In some instances, the borrowing agreement may provide for collateralization by all assets not already pledged for other purposes.

Repurchase agreements and dollar rolls. The terms *repurchase agreement*[9] (repo) and *reverse repurchase agreement* refer to transactions in which a bank acquires funds by selling securities and simultaneously agreeing to repurchase the securities after a specified time at a given price, which typically includes interest at an agreed-on rate. A transaction is considered a repo when viewed from the perspective of the supplier of the securities (the borrower) and a reverse repo or matched sale–purchase agreement when described from the point of view of the supplier of funds (the lender).

A repo commonly has a near-term maturity (overnight or a few days) with tenors rarely exceeding three months. Repos are also usually arranged in large dollar amounts. Repos may be used to temporarily finance the purchase of securities and dealer securities inventories. Banking organizations also use repos as a substitute for direct borrowings. Bank securities holdings as well as loans are often sold under repurchase agreements to generate temporary working funds. These types of agreements are often used because the rate on this

9. See section 3010.1.

type of borrowing is less than the rate on unsecured borrowings, such as federal funds purchased.

U.S. government and agency securities are the most common type of instruments sold under repurchase agreements, since they are exempt from reserve requirements. However, market participants sometimes alter various contract provisions to accommodate specific investment needs or to provide flexibility in the designation of collateral. For example, some repo contracts allow substitutions of the securities subject to the repurchase commitment. These transactions are often referred to as *dollar repurchase agreements* (dollar rolls), and the initial seller's obligation is to repurchase securities that are substantially similar, but not identical, to the securities originally sold. To qualify as a financing, these agreements require the return of "substantially similar securities" and cannot exceed 12 months from the initiation of the transaction. The dollar-roll market primarily consists of agreements that involve mortgage-backed securities.

Another common repo arrangement is called an *open repo*, which provides a flexible term to maturity. An open repo is a term agreement between a dealer and a major customer in which the customer buys securities from the dealer and may sell some of them back before the final maturity date.

Effective liquidity-risk managers ensure that they are aware of special considerations and potential risks of repurchase agreements, especially when the bank enters into large-dollar-volume transactions with institutional investors or brokers. It is a fairly common practice to adjust the collateral value of the underlying securities daily to reflect changes in market prices and to maintain the agreed-on margin. Accordingly, if the market value of the repo-ed securities declines appreciably, the borrower may be asked to provide additional collateral. Conversely, if the market value of the securities rises substantially, the lender may be required to return the excess collateral to the borrower. If the value of the underlying securities exceeds the price at which the repurchase agreement was sold, the bank could be exposed to the risk of loss if the buyer is unable to perform and return the securities. This risk would increase if the securities were physically transferred to the institution or broker with which the bank has entered into the repurchase agreement.

Because these instruments are usually very short-term transactions, institutions using them incur contingent liquidity risk. Accordingly, cash-flow projections for normal and mild scenarios usually treat these funds as stable. However, projections computed for severe scenarios generally treat these funds as volatile.

International borrowings. International borrowings may be direct or indirect. Common forms of direct international borrowings include loans and short-term call money from foreign banks, borrowings from the Export-Import Bank of the United States, and overdrawn nostro accounts (due from foreign bank demand accounts). Indirect forms of borrowing include notes and trade bills rediscounted with the central banks of various countries; notes, acceptances, import drafts, or trade bills sold with the bank's endorsement or guarantee; notes and other obligations sold subject to repurchase agreements; and acceptance pool participations. In general, these borrowings are often considered to be highly volatile, nonstable sources of funds.

Federal Reserve Bank borrowings. In 2003, the Federal Reserve Board revised Regulation A to provide for primary and secondary credit programs at the discount window.[10] (See section 4025.1.) Reserve Banks will extend primary credit at a rate above the target fed funds rate on a short-term basis (typically, overnight) to eligible depository institutions, and acceptable collateral is required to secure all obligations. Discount window borrowings can be secured with an array of collateral, including consumer and commercial loans. Eligibility for primary credit is based largely on an institution's examination rating and capital status. In general, institutions with composite CAMELS ratings of 1, 2, or 3 that are at least adequately capitalized are eligible for primary credit unless supplementary information indicates their condition is not generally sound. Other conditions exist to determine eligibility for 4- and 5-rated institutions.

An institution eligible for primary credit need not exhaust other sources of funds before coming to the discount window. However, because

10. See the "Interagency Advisory on the Use of the Federal Reserve's Primary Credit Program in Effective Liquidity Management," Board of Governors of the Federal Reserve System, Office of the Comptroller of the Currency, Federal Deposit Insurance Corporation, and Office of Thrift Supervision, July 25, 2003, and SR-03-15. See also section 3010.1.

of the above-market price of primary credit, the Reserve Banks expect institutions to mainly use the discount window as a backup source of liquidity rather than as a routine source. Generally, Reserve Banks extend primary credit on an overnight basis with minimal administrative requirements to eligible institutions. Reserve Banks may also extend primary credit to eligible institutions for periods of up to several weeks if funding is not available from other sources. These longer extensions of credit are subject to greater administrative oversight. Reserve Banks also offer secondary credit to institutions that do not qualify for primary credit. Secondary credit is another short-term backup source of liquidity, although its availability is more limited and is generally used for emergency backup purposes. Reserve Banks extend secondary credit to assist in an institution's timely return to a reliance on traditional funding sources or in the resolution of severe financial difficulties. This program entails a higher level of Reserve Bank administration and oversight than primary credit.

Treasury Tax and Loan deposits. Treasury Tax and Loan accounts (TT&L accounts) are maintained at banks by the U.S. Treasury to facilitate payments of federal withholding taxes. Banks may select either the "remittance-option" or the "note-option" method of forwarding deposited funds to the U.S. Treasury. In the remittance option, the bank remits the TT&L account deposits to the Federal Reserve Bank the next business day after deposit, and the remittance portion is not interest-bearing. The note option permits the bank to retain the TT&L deposits. In the note option, the bank debits the TT&L remittance account for the amount of the previous day's deposit and simultaneously credits the note-option account. Note-option accounts are interest-bearing and can grow to a substantial size.

TT&L funds are considered purchased funds, evidenced by an interest-bearing, variable-rate, open-ended, secured note callable on demand by Treasury. As per 31 CFR 203.24, the TT&L balance requires pledged collateral, usually from the bank's investment portfolio. Because they are secured, TT&L balances reduce standby liquidity from investments, and because they are callable, TT&L balances are considered to be volatile and they must be carefully monitored. However, in most banks, TT&L deposits constitute only a minor portion of total liabilities.

C. Off-Balance-Sheet Obligations

Off-balance-sheet transactions have been one of the fastest-growing areas of banking activity. While these activities may not be reflected on the balance sheet, they must be thoroughly reviewed in assessing an institution's liquidity-risk profile, as they can expose the institution to significant contingent liquidity risk. Effective liquidity-risk managers pay particular attention to potential liquidity risks in loan commitments, lines of credit, performance guarantees, and financial guarantees. Banks should estimate both the amount and the timing of potential cash flows from off-balance-sheet claims.

Effective liquidity managers ensure that they consider the correlation of draws on various types of commitments that can trend with macroeconomic conditions. For example, standby letters of credit issued in lieu of construction completion bonds are often drawn when builders cannot fulfill their contracts. Some types of credit lines, such as those used to provide working capital to businesses, are most heavily used when either the borrower's accounts receivable or inventory is accumulating faster than its collections of accounts payable or sales. Liquidity-risk managers should work with the appropriate lending managers to track such trends.

In addition, funding requirements arising from some types of commitments can be highly correlated with the counterparty's credit quality. Financial standby letters of credit (SBLOCs) are often used to back the counterparty's direct financial obligations, such as commercial paper, tax-exempt securities, or the margin requirements of securities and derivatives exchanges. At some institutions, a major portion of off-balance-sheet claims consists of SBLOCs supporting commercial paper. If the institution's customer issues commercial paper supported by an SBLOC and if the customer is unable to repay the commercial paper at maturity, the holder of the commercial paper will request that the institution perform under the SBLOC. Liquidity-risk managers should work with the appropriate lending manager to (1) monitor the credit grade or default probability of such counterparties and (2) manage the industry diversification of these commitments in order to reduce the probability that multiple counterparties will be forced to draw against the bank's commitments at the same time.

Funding under some types of commitments can also be highly correlated with changes in the institution's own financial condition or perceived credit quality. Commitments supporting various types of asset-backed securities, asset-backed commercial paper, and derivatives can be subject to such contingent liquidity risk. The securitization of assets generally requires some form of credit enhancement, which can take many forms, including SBLOCs or other types of guarantees issued by a bank. Similarly, many structures employ *special-purpose entities* (SPEs) that own the collateral securing the asset-backed paper. Bank SBLOCs or guarantees often support those SPEs. As long as the institution's credit quality remains above defined minimums, which are usually based on ratings from NRSROs, few or none of the SBLOCs will fund. However, if the institution's credit rating falls below the minimum, a significant amount or all of such commitments may fund at the same time.

Financial derivatives can also give rise to contingent liquidity risk arising from financial market disruptions and deteriorating credit quality of the banking organization. Derivatives contracts should be reviewed, and their potential for early termination should be assessed and quantified, to determine the adequacy of the institution's available liquidity. Many forms of standardized derivatives contracts allow counterparties to request collateral or to terminate contracts early if the institution experiences an adverse credit event or deterioration in its financial condition. In addition, under situations of market stress, a customer may ask for early termination of some contracts. In such circumstances, an institution that owes money on derivatives transactions may be required to deliver collateral or settle a contract early, when the institution is encountering additional funding and liquidity pressures. Early terminations may also create additional, unintended market exposures. Management and directors should be aware of these potential liquidity risks and address them in the institution's CFP. All off-balance-sheet commitments and obligations should receive the focused attention of liquidity-risk managers throughout the liquidity-risk management process.

D. Specialized Business Activities

Institutions that engage in specialized banking activities should ensure that all elements of these activities are fully incorporated into their assessment of liquidity-risk exposure and their ongoing management of the firm's liquidity. Such activities may include mortgage servicing, trading and dealer activities, and various types of fee-income-generating businesses.

Institutions engaged in significant payment, clearing, and settlement activities face particular challenges. Institutions that are active in payment, settlement, or clearing activities should ensure that they have mechanisms for measuring, monitoring, and identifying the amount of liquidity they may need to settle obligations in normal as well as stressed environments. These institutions should fully consider the unique risks that may result from their participation in different payment-system activities and factor these risks into their liquidity contingency planning. Factors that banks should consider when developing liquidity plans related to payment activities include—

- the impact of pay-in rules of individual payment systems, which may result in short-notice payment adjustments and the need to assess peak pay-in requirements that could result from the failure of another participant;
- the potential impact of operational disruptions at a payment utility and the potential need to move activity to another venue in which settlement is gross rather than net, thereby increasing liquidity requirements to settle;
- the impact that the deteriorating credit quality of the institution may have on collateral requirements, changes in intraday lending limits, and the institution's intraday funding needs; and
- for clearing and nostro service providers, the impact of potential funding needs that could be generated by their clearing customers in addition to the bank's own needs.

IV. Summary Measures of Liquidity-Risk Exposure

Cash-flow projections constructed assuming normal and adverse conditions provide a wealth of information about the liquidity profile of an institution. However, liquidity managers, bank supervisors, rating agencies, and other interested parties use a myriad of summary measures of liquidity to identify potential liquidity risk. These measures include various types of financial ratios. Many of these measures attempt to achieve some of the same insights provided by comprehensive cash-flow scenario analyses but use significantly less data. When calculated using standard definitions and comparable data, such measures provide the ability to track trends over time and facilitate comparisons across peers. At the same time, however, many summary measures necessarily entail simplifying assumptions regarding the liquidity of assets, the relative stability or volatility of liabilities, and the ability of the institution to meet potential funding needs. Supervisors, management, and other stakeholders that use these summary measures should fully understand the effect of these assumptions and the limitations associated with summary measures.

Although general industry conventions may be used to compute various summary measures, liquidity managers should ensure that the specific measures they use for internal purposes are suitably customized for their particular institution. Importantly, effective liquidity managers recognize that no single summary measure or ratio captures all of the available sources and uses of liquidity for all situations and for all time periods. Different ratios capture different facets of liquidity and liquidity risk. Moreover, the same summary measure or ratio calculated using different assumptions can also capture different facets of liquidity. This is an especially important point since, by definition, many liquidity ratios are scenario-specific. Measures constructed using normal-course-of-business assumptions can portray liquidity profiles that are significantly different from those constructed assuming stress contingency events. Indeed, many liquidity managers use the same summary measures and financial ratios computed under alternative scenarios and assumptions to evaluate and communicate to senior management and the board of directors the institution's liquidity-risk profile and the adequacy of its CFPs.

A. Cash-Flow Ratios

Cash-flow ratios are especially valuable summary liquidity measures. These measures summarize the information contained in detailed cash-flow projections and forecasts. They are generally constructed as the ratio of total projected cash inflows divided by total projected cash outflows for a particular time period or cash-flow-projection time bucket. The ratio for a given time bucket indicates the relative amount by which the projected sources of liquidity cover projected needs. For example, a ratio of 1.20 indicates a liquidity "surplus" equal to 20 percent of projected outflows. In general, such coverage ratios are compiled for each time bucket in the cash-flow projections used to assess both normal and adverse liquidity circumstances.

Some institutions also employ cumulative cash-flow ratios that are computed as the ratio of the cumulative sum of cash inflows to the cumulative sum of cash outflows for all time buckets up to a given time bucket. However, care should be taken to recognize that cumulative cash-flow ratios used alone and without the benefit of assessing the individual time-period exposures for each of their component time buckets may mask liquidity-risk exposures that can exist at intervals up to the cumulative time horizons chosen.

B. Other Summary Liquidity Measures

Other common summary liquidity measures employ assumptions about, and depend heavily on, the assessment and characterization of the relative marketability and liquidity of assets and the relative stability or volatility of funding needs and sources, consistent with the considerations discussed in the prior section. Liquidity managers use these other measures to review historical trends, summarize their projections of potential liquidity-risk exposures under adverse liquidity conditions, and develop strategies to address contingent liquidity events. In selecting from the myriad of available measures, effective liquidity managers focus primarily on those measures that are most related to the liquidity-management strategies pursued by the institution. For example, institutions that focus on managing asset liquidity place greater emphasis on measures that gauge such conditions, while institutions placing greater emphasis on managing liability liquidity emphasize measures that address those aspects of their liquidity-risk profile.

The following discussions briefly describe some of the more common summary measures of liquidity and liquidity risk. Some of these measures are employed by liquidity managers, rating agencies, and supervisors using definitions and calculation methods amenable to publicly available Call Report or BHC Performance Report data. Because such data require the use of assumptions on the liquidity of broad classes of assets and on the stability of various types of aggregated liabilities, liquidity managers and supervisors should take full advantage of the available granularity of internal data to customize the summary measures they are using. Incorporating internal data ensures that summary measures fit the specific liquidity profile of the institution. Such customization permits a more robust assessment of the institution's liquidity-risk profile.

In general, most common summary measures of liquidity and liquidity risk can be grouped into the following three broad categories:

1. those that portray the array of assets along a continuum of liquidity and cash-flow characteristics for normal and potentially adverse circumstances
2. those that portray the array of liabilities along a continuum of potential volatility and stability characteristics under normal and potentially adverse circumstances
3. those that assess the balance between funding needs and sources based on assumptions about both the relative liquidity of assets and the relative stability of liabilities

Relative liquidity of assets. Summary measures that address the liquidity of assets usually start with assessments of the maturity or type of assets in an effort to gauge their contributions to actual cash inflows over various time horizons. In general, they represent an attempt to summarize and characterize the expected cash inflows from assets that are estimated in more-detailed cash-flow-projection worksheets assuming normal business conditions. Summary measures assessing the liquidity of assets include such measures as—

- short-term investments (defined as maturing within a specified time period, such as 3 months, 6 months, or 1 year) as a percent of total investments, and
- short-term assets (defined as maturing within a specified time period) as a percent of total assets.

Other measures within this category attempt to assess the expected time period over which longer-term, illiquid assets may need to be funded. These measures, which use broad asset categories and employ strong assumptions on the liquidity of these assets, include—

- loans and leases as a percent of total assets, and
- long-term assets (defined as maturing beyond a specified time period) as a percent of total assets.

To better gauge the potential for assets to be used as sources of liquidity to meet uncertain future cash needs, effective liquidity managers use additional "liquid asset" summary measures that are customized to take into account the ability (or inability) to convert assets into cash or borrowed funds. Such measures attempt to summarize the potential for sale, securitization, or use as collateral of different types of assets, subject to appropriate scenario-specific haircuts. Such measures also attempt to recognize the constraints on potential securitization and on those assets that have already been pledged as collateral for existing borrowings. Examples of these measures include—

- marketable securities (as determined by the assessment of cash-flow, accounting, and haircut considerations discussed in the previous section) to total securities;
- marketable securities as a percent of total assets;
- marketable assets (as determined by the assessment of cash-flow, accounting, and haircut considerations discussed in the previous section) to total assets;
- pledgable assets (e.g., unpledged securities and loans) as a percent of total assets;
- pledged securities (or pledged assets) to total pledgable securities (or pledgable assets);
- securitizable assets to total assets (sometimes computed to include some assessment of the time frame that may be involved); and
- liquid assets to total assets with the measure of liquid assets being some combination of short-term assets, marketable securities, and securitizable and pledgable assets (ensuring that any pledged assets are not double-counted).

Relative stability or volatility of liabilities as a source of funding. Summary measures used to assess the relative stability or volatility of liabilities as sources of funding often start with assessments of the maturity of liabilities and their ability to be "rolled-over" or renewed under both normal business and potentially adverse circumstances. These measures also represent an attempt to summarize and characterize the use of actual and potential sources of funds, which are estimated in more-detailed cash-flow-projection worksheets. In fact, proper construction of many of these summary measures requires the same analytical assessments required for cash-flow projections. Such measures attempt to gauge and array the relative sensitivity and availability of different sources of funds on the basis of the anticipated behavior of various types of transactions, business activities, funds providers, or other attributes.

Given the difficulties involved in portraying funding sources across the entire continuum of stability and volatility characteristics, along with the complexity of overlaying alternative contingent scenarios on such portrayals, some common summary measures attempt to group funding sources as falling on one side or the other of this continuum. Financial ratios that attempt to portray the extent to which an institution's funding sources are stable include—

- total deposits as a percent of total liabilities or total assets;
- insured deposits as a percent of total deposits;
- deposits with indeterminate maturities as a percent of total deposits; and
- long-term liabilities (defined as maturing beyond a specified time period) to total liabilities.

These measures necessarily employ assumptions about the stability of an institution's deposit base in an attempt to define a set of relatively stable or core funding sources. Liquidity managers and examiners should take care in constructing their estimates of stable or core liabilities for use in such measures. This caution has become especially important as changes in customer sophistication and interest-rate sensitivity have altered behavioral patterns and, therefore, the stability characteristics traditionally assumed for retail and other types of deposits traditionally termed "core." As a result, examiners, liquidity managers, and other parties should use more-granular breakouts of funding sources to assess the relative stability of deposits and should not place undue reliance on standardized traditional measures of core deposits. Breakouts that use such a greater granularity include—

- various breakouts of retail deposits to total deposits based on product type (MMDA, demand deposit, savings account, etc.) and customer segmentation to total deposits or liabilities;
- breakouts of various types of institutional deposits (e.g., collateralized deposits of municipal and government entities) as a percent of deposits; and
- various breakouts of brokered deposits (by size, types of fund providers, and maturity).

At the other end of the stability/volatility continuum, some summary measures focus on identifying those sources of funding that need to be rolled over in the short term under normal business conditions and those whose rollover or usage in the future may be especially sensitive to institution-specific contingent liquidity events. These measures include—

- short-term liabilities (defined as fund sources maturing within a specified time period, such as 3 months, 6 months, or 1 year) as a percent of total liabilities;
- short-term brokered deposits as a percent of total deposits;
- insured short-term brokered deposits as a percent of total deposits;
- purchased funds (including short-term liabilities such as fed funds purchased, repos, FHLB borrowings, and other funds raised in secondary markets) as a percent of total liabilities;
- uncollateralized purchased funds as a percent of total liabilities; and
- short-term purchased funds to total purchased funds.

When computing measures to assess the availability of potential sources of funds under contingent liquidity scenarios, institutions may adjust the carrying values of their liabilities in order to develop best estimates of available funding sources. Similar to the haircuts applied when assessing marketable securities and liquid assets, such adjustments endeavor to identify more-realistic rollover rates on current and potential funding sources.

Balance between funding needs and sources. Measures used to assess the relationship between actual or potential funding needs and funding sources are constructed across a continuum that arrays both the tenor or relative liquidity of assets and the potential volatility or stability of liabilities. Many of these measures use concepts discussed earlier regarding the liquidity of assets and the relative stability or volatility of liabilities as funding sources. Some measures express various definitions of short-term liquid assets to total liabilities or alternative definitions of volatile or stable liabilities to total assets. Such measures may include—

- net short-term liabilities (short-term liabilities minus short-term assets) as a percent of total assets;
- stable deposits as a percent of total assets;
- total purchased funds as a percent of total assets;
- uncollateralized borrowings as a percent of total assets; and
- liquid assets as a percent of total liabilities.

Other measures attempt to identify the relationships between different classifications of liquid or illiquid assets and stable or volatile liabilities. Exhibit 6 provides a conceptual schematic of the range of relationships that are often addressed in such assessments.

Some commonly used summary liquidity measures and ratios focus on the amount of different types of liquid assets that are funded by various types of short-term and potentially volatile liabilities (upper-left quadrant of exhibit 6). One of the most common measures of this type is the "net short-term position" (used by some NRSROs). Liquidity managers, bank supervisors, and rating agencies use this measure to assess an institution's ability to meet its potential cash obligations over a specified period of time. It is computed as an institution's liquid assets (incorporating appropriate haircuts on marketable assets) minus the potential cash obligations expected over the specified time period (e.g., 3 months, 6 months, or 1 year). Other measures used to assess the relationship or coverage of potentially volatile liabilities by liquid assets include—

- short-term investments (defined as investments maturing within a specified time period, such as 3 months, 6 months, or 1 year) as a percent of short-term and potentially volatile liabilities; and
- short-term investments (defined as investments maturing within a specified time period, such as 3 months, 6 months, or 1 year) as a percent of short-term liabilities (defined as liabilities maturing within a specified time period, such as 3 months, 6 months, or 1 year).

Other summary liquidity measures take a more expansive approach to assessing the continuum of liquid assets and volatile liabilities by including more items or expanding the breadth of analysis. Such measures include—

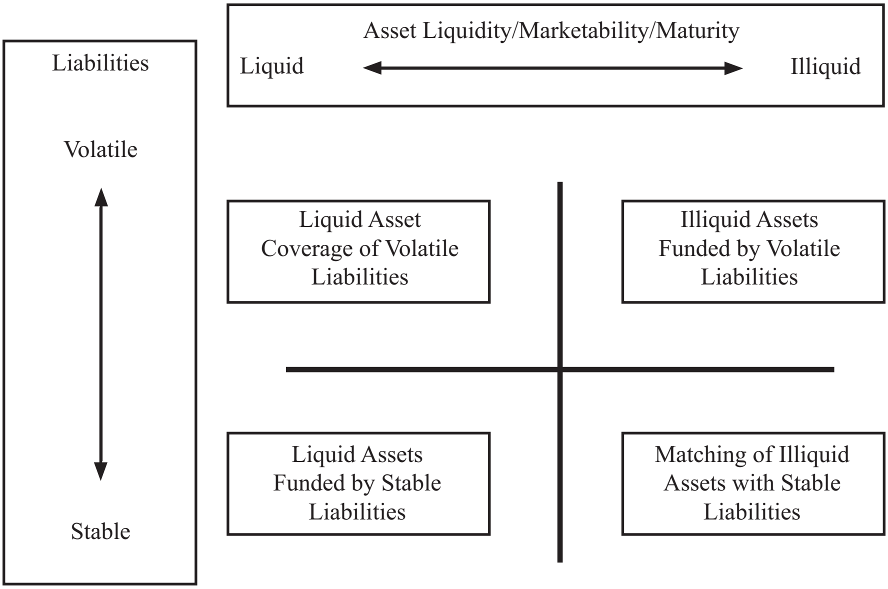
- liquid assets (defined as a combination of short-term assets, marketable securities, and securitizable and pledgable assets—ensuring that any pledged assets are not double-counted—over a certain specified time frame) as a percent of liabilities judged to be volatile (over the same time period);
- liquidity-surplus measures, such as liquid assets minus short-dated or volatile liabilities; and
- liquid assets as a percent of purchased funds.

Other common summary measures of liquidity focus on the potential mismatch of using short-term or potentially volatile liabilities to fund illiquid assets (upper-right-hand quadrant of exhibit 6). Often these measures factor only those volatile liabilities in excess of short-term and highly liquid assets or marketable investment securities into this assessment. Such volatile-liability-dependence measures provide insights as to the extent to which alternative funding sources might be needed to fund long-term liquidity needs under adverse liquidity conditions. These measures include—

- net short-term noncore-funding-dependence measures, such as short-term volatile funding minus short-term investments as a percent of illiquid assets; and
- net volatile-funding-dependence measures, such as volatile funding minus liquid assets as a percent of illiquid assets.

Another set of summary liquidity ratios can be constructed to focus on the extent to which illiquid assets are match-funded by stable liabilities (lower-right quadrant of exhibit 6). Common examples of such measures include traditional loan-to-deposit ratios (which incorrectly assume all deposits are stable) and loan-to-core-

Exhibit 6—Relationships Between Liquid or Illiquid Assets and Stable or Volatile Liabilities



deposit ratios (which often take a product-specific approach to defining the stability of certain types of deposits). However, since such traditional measures necessarily require the use of broad assumptions on the stability of deposits, they should not be relied on to provide meaningful insights regarding potential funding mismatches between stable funding sources and illiquid assets.

One meaningful measure used to gauge such relationships is the concept of "net cash capital" (which is also used by some NRSROs). This measure is the dollar amount by which stable sources of funds exceed illiquid assets; it can be computed as a percent of total assets to facilitate comparisons across institutions. In addition, it can be computed using customized assessments of the relative stability of different types of liabilities and the ability to convert assets into cash through sale, securitization, or collateralization. For example, firms may choose to exclude portions of loans sold regularly (e.g., loans conforming to secondary-market standards) as illiquid assets, or they may choose to include long-term debt as stable liabilities.

A final set of summary measures are used by liquidity managers to optimize the liquidity profiles of their institutions. These measures assess the extent to which relatively stable funding sources are used to fund short-term and liquid assets (lower-left quadrant of exhibit 6). Since short-term liquid assets generally entail relatively lower returns than longer-term less-liquid assets, measures assessing such potential mismatches focus liquidity managers on the cost of carrying liquid assets.

V. Liquidity-Measurement Considerations for Bank Holding Companies

Liquidity-risk measurement considerations for BHCs can be found in the *Bank Holding Company Supervision Manual*, sections 4000.1, 4010, and 4020.

APPENDIX 2—SUMMARY OF MAJOR LEGAL AND REGULATORY CONSIDERATIONS

The following discussions summarize some of the major legal and regulatory considerations that should be taken into account in managing the liquidity risk of banking organizations. The discussions are presented only to highlight potential issues and to direct bankers and supervisors to source documents on those issues.

A. Federal Reserve Regulation A

Federal Reserve Regulation A addresses borrowing from the discount window. Rules defining eligible collateral can be found in this regulation.

B. Federal Reserve Regulation D

Federal Reserve Regulation D addresses required reserves for deposits. One portion of the regulation, however, restricts the type of eligible collateral that can be pledged for repurchase-agreement borrowings.

C. Federal Reserve Regulation F

Federal Reserve Regulation F imposes limits on interbank liabilities. This regulation implements section 308 of the Federal Deposit Insurance Corporation Improvement Act (FDICIA). Banks that sell funds to other banks must have written policies to limit excessive exposure, must review the financial condition or credit rating of the debtor, must have internal limits on the size of exposures that are consistent with the credit risk, may not lend more than 25 percent of their capital to a single borrowing bank, and must undertake other steps.

Banks that borrow federal funds or other borrowings from correspondent banks may find, as a result of the seller's compliance with Regulation F, that the amount they may borrow has suddenly declined as a result of a reduction in their credit rating or credit quality. Regulation F may make it harder for a bank to use borrowings as a liquidity source for a bank-specific liquidity crisis.

D. Federal Reserve Regulation W

Federal Reserve Regulation W governs transactions between an insured bank or thrift and its affiliates. The regulation establishes a consistent and comprehensive compilation of requirements found in section 23A of the Federal Reserve Act, 70 years of Board interpretations of section 23A, section 23B of the Federal Reserve Act, and portions of the Gramm-Leach-Bliley Act of 1999. Covered transactions include purchases of assets from an affiliate, extensions of credit to an affiliate, investments in securities issued by an affiliate, guarantees on behalf of an affiliate, and certain other transactions that expose the member bank to an affiliate's credit or investment risk. Derivatives transactions and intraday extensions of credit are also covered.

The intentions of the regulation are (1) to protect the depository institution, (2) to ensure that all transactions between the bank and its affiliates are on terms and conditions that are consistent with safe and sound banking practices, and (3) to limit the ability of a depository institution to transfer to its affiliates the subsidy arising from the institution's access to the federal safety net. The regulation achieves these goals in four major ways:

1. It limits a member bank's covered transactions with any single affiliate to no more than 10 percent of the bank's capital stock and surplus, and limits transactions with all affiliates combined to no more than 20 percent of the bank's capital stock and surplus.
2. It requires all transactions between a member bank and its affiliates to be on terms and conditions that are consistent with safe and sound banking practices.
3. It prohibits a member bank from purchasing low-quality assets from its affiliates.
4. It requires that a member bank's extensions of credit to affiliates and guarantees on behalf of affiliates be appropriately secured by a statutorily defined amount of collateral.

Section 23B protects member banks by requiring that certain transactions between the bank and its affiliates occur on market terms, that is, on terms and under circumstances that are substantially the same, or at least as favorable to the bank, as those prevailing at the time for comparable transactions with unaffiliated companies. Section 23B applies the market-terms restriction to any covered transaction (as defined in section 23A) with an affiliate as well as certain other transactions, such as (1) any sale of assets by the member bank to an affiliate, (2) any payment of money or furnishing of services by the member bank to an affiliate, and (3) any transaction by the member bank with a third party if an affiliate has a financial interest in the third party or if an affiliate is a participant in the transaction.

Liquidity-risk managers working in banks that have affiliates must give careful attention to Regulation W, which addresses transactions between banks and their affiliates. In the normal course of business, the prohibition on unsecured funding can tie up collateral, complicate collateral management, and restrict the availability of funding from affiliates. In stressed conditions, all of those problems—plus the size limit and the prohibition on sales of low-quality assets to affiliates—effectively close down many transactions with affiliates.

E. Statutory Restriction of FHLB Advances

The Federal Home Loan Banks (FHLBs) provide a number of different advance programs with very attractive terms to member banks. Many banks now use the FHLBs for term funding. The FHLBs are very credit-sensitive lenders.

A federal regulation (12 CFR 935, Federal Housing Finance Board—Advances) requires the FHLBs to be credit-sensitive. In addition to monitoring the general financial condition of commercial banks and using rating information provided by bank rating agencies, the FHLBs have access to nonpublic regulatory information and supervisory actions taken against banks. The FHLBs often react quickly, sometimes before other funds providers, to reduce exposure to a troubled bank by not rolling over unsecured borrowing lines. Depending on the severity of a troubled bank's condition, even the collateralized funding program may be discontinued or withdrawn at maturity because of concerns about the quality or reliability of the collateral or other credit-related concerns. Contractual provisions requiring increases in collateral may also be invoked. Any of these changes in FHLB-loan availability or terms can create significant liquidity problems, especially in banks that use large amounts of short-term FHLB funding.

F. Statutory Restriction on the Use of Brokered Deposits

The use of brokered deposits is restricted by 12 CFR 337.6. Well-capitalized banks may accept brokered deposits without restriction. Adequately capitalized banks must obtain a waiver from the FDIC to solicit, renew, or roll over brokered deposits. Adequately capitalized banks must also comply with restrictions on the rates that they pay for these deposits. Banks that have capital levels below adequately capitalized are prohibited from using brokered deposits. In addition to these restrictions, banking regulators have also issued detailed guidance, discussed in section H below, on the use of brokered deposits.

G. Legal Restrictions on Dividends

A number of statutory restrictions limit the amount of dividends that a bank may pay to its stockholders. As a result, a bank holding company that depends on cash from its bank subsidiaries can find this source of funds limited or closed. This risk is particularly significant for bank holding companies with nonbank subsidiaries that require funding or debt service.

H. Restrictions on Investments That Affect Liquidity-Risk Management

Interagency guidance issued in 1998 by the FFIEC, "Supervisory Policy Statement on Investment Securities and End-User Activities," contains provisions that may affect liquidity and liquidity management. (See SR-98-12.) The following points summarize some of these potential impacts, although readers should review the entire rule for more-complete information.

1. When banks specify permissible instruments for accomplishing established objectives, they must take into account the liquidity of the market for those investments and the effect that liquidity may have on achieving their objective.
2. Banks are required to consider the effects that market risk can have on the liquidity of different types of instruments under various scenarios.

3. Banks are required to clearly articulate the liquidity characteristics of the instruments they use to accomplish institutional objectives.

In addition, the policy statement specifically highlights the greater liquidity risk inherent in complex and less actively traded instruments.

APPENDIX 3—INTERAGENCY GUIDANCE ON FUNDS TRANSFER PRICING RELATED TO FUNDING AND CONTINGENT LIQUIDITY RISKS

The Board of Governors of the Federal Reserve System (FRB), the Federal Deposit Insurance Corporation (FDIC), and the Office of the Comptroller of the Currency (OCC) issued this guidance on funds transfer pricing (FTP) practices related to funding risk (including interest rate and liquidity components) and contingent liquidity risk at large financial institutions (hereafter referred to as "firms") to address weaknesses observed in some firms' FTP practices.[11] The guidance builds on the principles of sound liquidity risk management described in the "Interagency Policy Statement on Funding and Liquidity Risk Management,"[12] and incorporates elements of the international statement issued by the Basel Committee on Banking Supervision titled "Principles for Sound Liquidity Risk Management and Supervision."[13]

For purposes of this guidance, FTP refers to a process performed by a firm's central management function that allocates costs and benefits associated with funding and contingent liquidity risks (FTP costs and benefits), as measured at transaction or trade inception, to a firm's business lines, products, and activities. While this guidance specifically addresses FTP practices related to funding and contingent liquidity risks, firms may incorporate other risks in their overall FTP frameworks.

FTP is an important tool for managing a firm's balance sheet structure and measuring risk-adjusted profitability. By allocating funding and contingent liquidity risks to business lines, products, and activities within a firm, FTP influences the volume and terms of new business and ongoing portfolio composition. This process helps align a firm's funding and contingent liquidity risk profile and risk appetite and complements, but does not replace, broader liquidity and interest rate risk-management programs (for example, stress testing) that a firm uses to capture certain risks (for example, basis risk). If done effectively, FTP promotes more resilient, sustainable business models. FTP is also an important tool for centralizing the management of funding and contingent liquidity risks for all exposures. Through FTP, a firm can transfer these risks to a central management function that can take advantage of natural offsets, centralized hedging activities, and a broader view of the firm.

Failure to consistently and effectively apply FTP can misalign the risk-taking incentives of individual business lines with the firm's risk appetite, resulting in a misallocation of financial resources. This misallocation can arise in new business and ongoing portfolio composition where the business metrics do not reflect risks taken, thereby undermining the business model. Examples include entering into excessive off-balance sheet commitments and on-balance sheet asset growth because of mispriced funding and contingent liquidity risks.

The 2008 financial crisis exposed weak risk-management practices for allocating liquidity costs and benefits across business lines. Several firms "acknowledged that if robust FTP practices had been in place earlier, and if the systems had charged not just for funding but for liquidity risks, they would not have carried the significant levels of illiquid assets and the significant risks that were held off-balance sheet that ultimately led to sizable losses."[14] Refer to SR-16-3.

11. For purposes of this guidance, large financial institutions includes national banks, federal savings associations and state-chartered banks with consolidated assets of $250 billion or more, domestic bank and savings and loan holding companies with consolidated assets of $250 billion or more or foreign exposure of $10 billion or more, and foreign banking organizations with combined U.S. assets of $250 billion or more.

12. Refer to FRB's SR-10-6, "Interagency Policy Statement on Funding and Liquidity Risk Management"; FDIC's FIL-13-2010, "Funding and Liquidity Risk Management Interagency Guidance"; and OCC Bulletin 2010-13, "Final Policy Statement: Interagency Policy Statement on Funding and Liquidity Management."

13. The Basel Committee on Banking Supervision statement on "Principles for Sound Liquidity Risk Management and Supervision" (September 2008) is available at www.bis.org/publ/bcbs144.htm.

14. Senior Supervisors Group report on "Risk Management Lessons from the Global Financial Crisis of 2008" (October 21, 2009) is available at www.newyorkfed.org/medialibrary/

Funds Transfer Pricing Principles

A firm should have an FTP framework to support its broader risk-management and governance processes that incorporates the general principles described in this section and is commensurate with its size, complexity, business activities, and overall risk profile. The framework should incorporate FTP costs and benefits into product pricing, business metrics, and new product approval for all material business lines, products, and activities to align risk-taking incentives with the firm's risk appetite.

Principle 1: A firm should allocate FTP costs and benefits based on funding risk and contingent liquidity risk.

A firm should have an FTP framework that allocates costs and benefits based on the following risks.

- *Funding risk,* measured as the cost or benefit (including liquidity and interest rate components) of raising funds to finance ongoing business operations, should be allocated based on the characteristics of the business lines, products, and activities that give rise to those costs or benefits (for example, higher costs allocated to assets that will be held over a longer time horizon and greater benefits allocated to stable sources of funding).
- *Contingent liquidity risk,* measured as the cost of holding standby liquidity composed of unencumbered, highly liquid assets, should be allocated to the business lines, products, and activities that pose risk of contingent funding needs during a stress event (for example, draws on credit commitments, collateral calls, deposit run-off, and increasing haircuts on secured funding).

media/newsevents/news/banking/2009/SSG_report.pdf.

Principle 2: A firm should have a consistent and transparent FTP framework for identifying and allocating FTP costs and benefits on a timely basis and at a sufficiently granular level, commensurate with the firm's size, complexity, business activities, and overall risk profile.

FTP costs and benefits should be allocated based on methodologies that are set forth by a firm's FTP framework. The methodologies should be transparent, repeatable, and sufficiently granular such that they align business decisions with the firm's desired funding and contingent liquidity risk appetite. To the extent a firm applies FTP at an aggregated level to similar products and activities, the firm should include the aggregating criteria in the report on FTP.[15] Additionally, the senior management group that oversees FTP should review the basis for the FTP methodologies. The attachment to this interagency guidance describes illustrative FTP methodologies that a firm may consider when implementing its FTP framework.[16]

A firm should allocate FTP costs and benefits, as measured at transaction or trade inception, to the appropriate business line, product, or activity. If a firm retains any FTP costs or benefits in a centrally managed pool pursuant to its FTP framework, it should analyze the implications of such decisions on business line incentives and the firm's overall risk profile. The firm customarily would include its findings in the report on FTP.

The FTP framework should be implemented consistently across the firm to appropriately align risk-taking incentives. While it is possible to apply different FTP methodologies within a firm due to, among other things, legal entity type or specific jurisdictional circumstances, a firm should generally implement the FTP framework in a consistent manner across its corporate structure to reduce the likelihood of misaligned incentives. If there are implementation differences across the firm, management should analyze the implications of such differences on business line incentives and the firm's overall funding and contingent liquidity risk profile.

15. See Principle 3 for a discussion of the report on FTP.
16. The FRB, the FDIC, and the OCC will monitor evolving FTP practices in the market and may update or add to the illustrative methodologies in the interagency guidance attachment.

The firm customarily would include its findings in the report on FTP.

A firm should allocate, report, and update data on FTP costs and benefits at a frequency that is appropriate for the business line, product, or activity. Allocating, reporting, and updating of data should occur more frequently for trading exposures (for example, on a daily basis). Infrequent allocation, reporting, or updating of data for trading exposures (for example, based on month-end positions) may not fully capture a firm's day-to-day funding and contingent liquidity risks. For example, a firm should monitor the age of its trading exposures, and those held longer than originally intended should be reassessed and FTP costs and benefits should be reallocated based on the modified holding period.

A firm's FTP framework should address derivative activities commensurate with the size and complexity of those activities. The FTP framework may consider the fair value of current positions, the rights of rehypothecation for collateral received, and contingent outflows that may occur during a stress event.

To avoid a misalignment of risk-taking incentives, a firm should adjust its FTP costs and benefits as appropriate based on both market-wide and idiosyncratic conditions, such as trapped liquidity, reserve requirements, regulatory requirements, illiquid currencies, and settlement or clearing costs. These idiosyncratic conditions should be contemplated in the FTP framework, and the firm customarily would include a discussion of the implications in the report on FTP.

Principle 3: A firm should have a robust governance structure for FTP, including the production of a report on FTP and oversight from a senior management group and central management function.

A firm should have a senior management group that oversees FTP, which should include a broad range of stakeholders, such as representatives from the firm's asset-liability committee (if separate from the senior management group), the treasury function, and business line and risk management functions. This group should develop the policy underlying the FTP framework, which should identify assumptions, responsibilities, procedures, and authorities for FTP. The policy should be reviewed and updated on a regular basis or when the firm's asset-liability structure or scope of activities undergoes a material change. Further, senior management with oversight responsibility for FTP should periodically, but no less frequently than quarterly, review the report on FTP to ensure that the established FTP framework is being properly implemented.

A firm should also establish a central management function tasked with implementing the FTP framework. The central management function should have visibility over the entire firm's on- and off-balance sheet exposures. Among its responsibilities, the central management function should regularly produce and analyze a report on FTP generated from accurate and reliable management information systems. The report on FTP should be at a sufficiently granular level to enable the senior management group and central management function to effectively monitor the FTP framework (for example, at the business line, product, or activity level, as appropriate). Among other items, all material approvals, such as those related to any exception to the FTP framework, including the reason for the exception, would customarily be documented in the report on FTP. The report on FTP may be standalone or included within a broader risk-management report.

Independent risk and control functions and internal audit should provide oversight of the FTP process and assess the report on FTP, which should be reviewed as appropriate to reflect changing business and financial market conditions and to maintain the appropriate alignment of incentives. Lastly, consistent with existing supervisory guidance on model risk management,[17] models used in FTP implementation should be independently validated and regularly reviewed to ensure that the models continue to perform as expected, that all assumptions remain appropriate, and that limitations are understood and appropriately mitigated.

17. Refer to FRB's SR-11-7, "Guidance on Model Risk Management" and OCC Bulletin 2011-12, "Supervisory Guidance on Model Risk Management."

Principle 4: A firm should align business incentives with risk-management and strategic objectives by incorporating FTP costs and benefits into product pricing, business metrics, and new product approval.

Through its FTP framework, a firm should incorporate FTP costs and benefits into product pricing, business metrics, and new product approval for all material business lines, products, and activities (both on- and off-balance sheet). The framework, the report on FTP, and any associated management information systems should be designed to provide decision makers sufficient and timely information about FTP costs and benefits so that risk-taking incentives align with the firm's strategic objectives.

The information may be either at the transaction level or, if the transactions have homogenous funding and contingent liquidity risk characteristics, at an aggregated level. In deciding whether to allocate FTP costs and benefits at the transaction or aggregated level, firms should consider advantages and disadvantages of both approaches when developing the FTP framework. Although transaction-level FTP allocations may add complexity and involve higher implementation and maintenance costs, such allocations may provide a more accurate measure of risk-adjusted profitability. A firm assigning FTP allocations at an aggregated level should have aggregation criteria based on funding and contingent liquidity risk characteristics that are transparent.

There should be ongoing dialogue between the business lines and the central function responsible for allocating FTP costs and benefits to ensure that funding and contingent liquidity risks are being captured and are well-understood for product pricing, business metrics, and new product approval. The business lines should understand the rationale for the FTP costs and benefits, and the central function should understand the funding and contingent liquidity risks implicated by the business lines' transactions. Decisions by senior management to incentivize certain behaviors through FTP costs and benefits customarily would be documented and included in the report on FTP.

Conclusion

A firm should use the principles laid out in this guidance to develop, implement, and maintain an effective FTP framework. In doing so, a firm's risk-taking incentives should better align with its risk-management and strategic objectives. The framework should be adequately tailored to a firm's size, complexity, business activities, and overall risk profile.

Interagency Guidance Attachment Illustrative Funds Transfer Pricing Methodologies

March 1, 2016

The FTP methodologies described below are intended for illustrative purposes only and provide examples for addressing principles set forth in the guidance. A firm's FTP framework should be commensurate with its size, complexity, business activities, and overall risk profile. In designing its FTP framework, a firm may utilize other methodologies that are consistent with the principles set forth in the guidance. Therefore, these illustrative methodologies should not be interpreted as directives for implementing any particular FTP methodology.

Non-Trading Exposures

For non-trading exposures, a firm's FTP methodology may vary based on its business activities and specific exposures. For example, certain firms may have higher concentrations of exposures that have less predictable time horizons, such as non-maturity loans and non-maturity deposits.

Matched-Maturity Marginal Cost of Funding

Matched-maturity marginal cost of funding is a commonly used methodology for non-trading exposures. Under this methodology, FTP costs and benefits are based on a firm's market cost of funds across the term structure (for example, wholesale long-term debt curve adjusted based on the composition of the firm's alternate sources of funding such as Federal Home Loan Bank advances and customer deposits). This methodology incentivizes business lines to generate stable funding (for example, core deposits) by crediting them the benefit or premium associated with such funding. It also ensures that business lines are appropriately charged the cost of funding for the life of longer-dated assets (for example, a five-year commercial loan). Given that funding costs can change over time, the market cost of funds across the term structure should be derived from reliable and readily available data sources and be well understood by FTP users.

FTP rates should, as closely as possible, match the characteristics of the transaction or the aggregated transactions to which they are applied. In determining the appropriate point on the derived FTP curve for a transaction or pool of transactions, a firm could consider a variety of characteristics, including the holding period, cash flow, re-pricing, prepayments, and expected life of the transaction or pool. For example, for a five-year commercial loan that has a rate that resets every three months and will be held to maturity, the interest rate component of the funding risk could be based on a three-month horizon for determining the FTP cost, and the liquidity component of the funding risk could be based on a five-year horizon for determining the FTP cost. Thus, the total FTP cost for holding the five-year commercial loan would be the combination of these two components.

Contingent Liquidity Risk

A firm may calculate the FTP cost related to non-trading exposure contingent liquidity risk using models based on behavioral assumptions. For example, charges for contingent commitments could be based on their modeled likelihood of drawdown, considering customer drawdown history, credit quality, and other factors; whereas, credits applied to deposits could be based on volatility and modeled behavioral maturity. A firm should document and include all modeling analyses and assumptions in the report on FTP. If behavioral assumptions used in a firm's FTP framework do not align with behavioral assumptions used in its internal stress test for similar types of non-trading exposures, the firm should document and include in the report on FTP these inconsistencies.

Trading Exposures

For trading exposures, a firm could consider a variety of factors, including the type of funding source (for example, secured or unsecured), the market liquidity of the exposure (for example, the size of the haircut relative to the overall exposure), the holding period of the position, the prevailing market conditions, and any potential impact the chosen approach could have on firm incentives and overall risk profile. If a firm's trading activities are not material, its FTP framework may require a less complex methodology for trading exposures. The following FTP methodologies have been observed for allocating FTP costs for trading exposures.

Weighted Average Cost of Debt (WACD)

WACD is the weighted average cost of outstanding firm debt, usually expressed as a spread over an index. Some firms' practices apply this rate to the amount of an asset expected to be funded unsecured (repurchase agreement market haircuts may be used to delineate between the amount being funded secured and the amount being funded unsecured). A firm using WACD should analyze whether the methodology misaligns risk-taking incentives and document such analyses in the report on FTP.

Marginal Cost of Funding

Marginal cost of funding sets the FTP costs at the appropriate incremental borrowing rate of a firm. Some firms' practices apply a marginal secured borrowing rate to the amount of an asset expected to be funded secured and a marginal unsecured borrowing rate to the amount of an asset expected to be funded unsecured (repurchase agreement market haircuts may be used to delineate between the amount being funded secured and the amount being funded unsecured). A firm using marginal cost of funding should analyze whether the methodology misaligns risk-taking incentives, considering current market rates compared to historical rates, and document such analyses in the report on FTP.

Contingent Liquidity Risk

A firm may calculate the FTP costs related to contingent liquidity risk from trading exposures by considering the unencumbered liquid assets that are held to cover the potential for widening haircuts of trading exposures that are funded secured. If haircuts used in a firm's FTP framework do not align with haircuts used in its internal stress test for similar types of trading exposures, the firm should document and include in the report on FTP these inconsistencies. Haircuts should be updated at a frequency that is appropriate for a firm's trading activities and market conditions.

A firm may also include the FTP costs related to contingent liquidity risk from potential derivative outflows in stressed market conditions, which may be due to, for example, credit rating downgrades, additional termination rights, or market shocks and volatility.

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Liquidity

DISCOUNT WINDOW OVERVIEW

Federal Reserve lending to depository institutions (referred to as the "discount window") plays an important role in supporting the liquidity and stability of the U.S. banking system and the effective implementation of monetary policy.[1] By providing ready access to funding, the discount window helps depository institutions manage their liquidity risks efficiently and avoid actions that have negative consequences for their customers, such as withdrawing credit during times of market stress. Thus, the discount window supports the smooth flow of credit to households and businesses. Providing liquidity in this way is one of the original purposes of the Federal Reserve System and other central banks around the world.

The Board's Regulation A (12 CFR pt. 201) governs the discount window. Under Regulation A, three credit programs are available to depository institutions:

1. Primary credit,
2. Secondary credit, and
3. Seasonal credit

Each credit program has its own interest rate ("discount rate"). Rates are established by each Reserve Bank's board of directors, subject to the review and determination of the Board of Governors of the Federal Reserve System. The rates for each of the three lending programs are the same across all Reserve Banks.

Depository institutions must have collateral available to pledge and meet certain eligibility criteria for primary credit at the discount window. The following assets are most commonly pledged to secure discount window advances:

- commercial, industrial, or agricultural loans
- consumer loans
- residential and commercial real estate loans
- corporate bonds and money market instruments
- obligations of U.S. government agencies and government-sponsored enterprises
- asset-backed securities
- collateralized mortgage obligations
- U.S. Treasury obligations
- state or political subdivision obligations

A Reserve Bank is not obligated to extend credit to any depository institution but may lend to a depository institution by making an advance secured by acceptable collateral as described in the Federal Reserve Act. Before lending to a depository institution, a Reserve Bank can require any information it believes is appropriate to ensure that the assets tendered as collateral are acceptable.

To access the discount window, depository institutions must deliver the necessary lending agreements and corporate resolutions under the terms set forth in the Federal Reserve's lending agreement. Operating Circular No. 10, "Lending," issued by each Reserve Bank, establishes the credit and security terms for borrowings from the Federal Reserve.[2]

DISCLOSURES

The Dodd-Frank Wall Street Reform and Consumer Protection Act,[3] which amended the Federal Reserve Act, requires the Federal Reserve to disclose certain discount window lending information. Effective for discount window loans (primary, secondary, and seasonal credit) extended on or after July 21, 2010, the Federal Reserve publicly discloses the following information, generally about two years after a discount window loan is extended to a depository institution:

- the name and identifying details of the depository institution;
- the amount borrowed by the depository institution;
- the interest rate paid by the depository institution; and
- information identifying the types and amounts of collateral pledged in connection with any discount window loan. This disclosure requirement does not apply to collateral pledged by depository institutions that do not borrow.

1. For more information, see the Board's website and the discount window website.

2. For more information on the Federal Reserve's Operating Circulars, see FRBservices.org.

3. Pub. L. No. 111-203.

The purpose of these disclosures is to promote public transparency, accountability, and legitimacy in the discount window process.

PRIMARY CREDIT, SECONDARY CREDIT, AND SEASONAL CREDIT

Primary Credit

The Federal Reserve's primary credit program offers depository institutions an additional source of available funds (at a rate above the target federal funds rate) for managing short-term liquidity risks.[4] Advances under primary credit may be made for a term of up to 90 days. Historically, advances under primary credit have been for very short terms, usually overnight. Primary credit is the principal safety valve for ensuring adequate liquidity in the banking system. There are no restrictions on borrowers' use of primary credit.

Depository institutions that are in "generally sound financial condition in the judgment of the Reserve Bank" are eligible for primary credit.[5] Sound financial condition typically means the depository institution has a CAMELS composite rating of "1," "2," or "3" and is adequately or well capitalized per prompt corrective action statutes (see table 1).

Table 1. General eligibility criteria for primary or secondary credit

Examination Rating (CAMELS or equivalent)	*Capital Designation*	*Generally Eligible For*
1, 2, or 3	Adequately or well capitalized	Primary Credit
4 or 5	Any	Secondary Credit
Any	Less than Adequately Capitalized	Secondary Credit

4. See the Board's Regulation A (12 CFR pt. 201) for additional information on the Federal Reserve's credit programs that are available to qualifying institutions.
5. 12 CFR 201.4(a).

Secondary Credit

Secondary credit is available to institutions that do not qualify for primary credit. Secondary credit is available as a backup source of liquidity on a very short-term basis, if, in the judgment of the Reserve Bank, the loan is consistent with the institution's timely return to a reliance on market sources of funds. If necessary for the orderly resolution of serious financial difficulties of an institution, a Reserve Bank may extend longer-term secondary credit. Any discount window loan, including a longer-term secondary credit loan, would have to comply with requirements for lending to undercapitalized and critically undercapitalized institutions. For more information, see the subsection below titled, "Lending to Undercapitalized and Critically Undercapitalized Depository Institutions." Secondary credit may not be used to fund an expansion of the institution's assets. Compared with the primary credit program, the secondary credit program entails a higher level of Reserve Bank administration and oversight. Reserve Banks will collect information to confirm the borrowing is consistent with the objectives of the program. Secondary credit is available at a rate above the primary credit rate.

Seasonal Credit

Under the seasonal lending program, a depository institution may qualify for funding for up to nine months during the calendar year, to meet seasonal borrowing needs of the communities it serves. The seasonal lending program is for institutions with demonstrated liquidity pressures of a seasonal nature and will not normally be available to institutions with deposits of $500 million or more. Institutions that experience fluctuations in deposits and loans—caused by construction, college, farming, resort, municipal financing, and other seasonal types of business—frequently qualify for the seasonal lending program. The interest rate charged on seasonal credit loans is a floating market rate comprised of the average of the federal funds rate and the rate on three-month certificate of deposits rounded to the nearest five basis points. The rate for seasonal credit can be lower than the rate applied to primary credit. Furthermore, the interest rate is reset every two weeks and applies to all outstanding seasonal credit loans.

LENDING TO UNDER-CAPITALIZED AND CRITICALLY UNDERCAPITALIZED DEPOSITORY INSTITUTIONS

Credit from any Reserve Bank to an "undercapitalized" institution may be extended or outstanding for no more than 60 days during any 120-day period in which the institution is undercapitalized.[6] An institution is considered undercapitalized if it is not critically undercapitalized under section 38 of the Federal Deposit Insurance Act (the FDI Act) but is either deemed undercapitalized under that provision and its implementing regulations or has received a composite CAMELS rating of "5" as of the most recent examination. A Reserve Bank may make or have outstanding advances or discounts to an institution that is deemed "critically undercapitalized" under section 38 of the FDI Act, and its implementing regulations, only during the five-day period beginning on the date the institution became critically undercapitalized or after consultation with the Board.

CONTINGENCY FUNDING AND THE FEDERAL RESERVE DISCOUNT WINDOW

As described in this manual's section on Liquidity Risk, a contingency funding plan provides a plan for responding to a liquidity crisis; identifies a menu of contingent liquidity sources that the institution can use under adverse liquidity circumstances; and describe steps that should be taken to ensure that the institution's sources of liquidity are sufficient to fund scheduled operating requirements and meet the institution's commitments with minimal costs and disruption. The Federal Reserve and other federal banking agencies encourage depository institutions to incorporate the discount window as part of their contingency funding plans. The following attributes make the primary credit program a viable source of backup or contingency funding at institutions for the short-term:

- Primary credit provides an accessible source of backup, short-term funding.
- Primary credit can enhance diversification in short-term funding sources that are part of contingency funding plans.
- Borrowings can be secured with an array of collateral, including consumer and commercial loans, in addition to many classes of fixed income securities and commercial paper.
- Requests for primary credit advances can be made anytime during the business day.[7]
- There are no restrictions on the borrowers' use of primary credit.

If the discount window is a part of a depository institution's contingency funding plan, the depository institution should establish and maintain operational readiness to borrow from the discount window.[8] Operational readiness includes establishing borrowing arrangements with the Reserve Bank and ensuring collateral is available for borrowing in an amount appropriate for a depository institution's potential contingency funding needs. If an institution incorporates primary credit into its contingency funding plan, management should

- ensure that they are familiar with the pledging process for different collateral types and be aware that pre-pledging collateral can be useful if liquidity needs arise quickly;
- consider regularly testing the institution's ability to borrow at the discount window. The goal of such testing is to ensure that there are no unexpected impediments or complications in the case that such contingency lines need to be used.
  - — Depository institutions should consider conducting small value transactions at regular intervals to ensure familiarity with discount window operations. Examination staff will not criticize institutions for testing discount window access;
- have viable short-term liquidity contingency sources that can replace primary credit at the discount window, if necessary; and

6. Generally, a Reserve Bank also may lend to an undercapitalized institution during 60 calendar days after receipt of a certificate of viability from the Chair of the Board of Governors or after consultation with the Board.

7. Advances generally are booked at the end of the business day.

8. For more information, see the Addendum to the Interagency Policy Statement on Funding and Liquidity Risk Management: Importance of Contingency Funding Plans (July 28, 2023).

- determine the institution's eligibility for primary credit under various stress scenarios, recognizing that if its financial condition were to deteriorate, primary credit may not be available. Under those scenarios, secondary credit may need to be accessed.

INTRODUCTION

Borrowed funds are a common and practical method for banks to manage their liquidity needs and to fund their operations. A bank's borrowings may exist in a number of forms. Sources of bank borrowings can include Federal Home Loan Bank (FHLB) credit lines, federal funds purchased, loans from correspondent banks, repurchase agreements, and the Federal Reserve discount window. Other borrowings include intraday credit from a Federal Reserve Bank, interest-bearing demand notes issued to the U.S. Treasury (the Treasury tax and loan note option account), mortgages payables, due-bills, and other types of borrowed securities. Borrowings can also include rediscounted customer paper and assets sold with the bank's endorsement or guarantee. For the purposes of this section, borrowings exclude long-term subordinated debt, such as capital notes and debentures.

Reasons a bank may borrow funds include the following:

- To meet the temporary or seasonal loan demand or deposit withdrawal needs of its customers.
- To meet large and unanticipated deposit withdrawals by its customers that may arise during periods of economic distress.
- To manage liabilities effectively.

For banks using borrowed funds as one of their sources for ongoing or contingent funding, bank management should

- address specific liquidity risks associated with borrowed funds in the bank's contingency funding planning;
- be aware of the operational steps required to obtain funding from contingency funding sources, including potential counterparties, contact details, and availability of collateral;[1]
- as applicable, fully understand the credit policies and standards of the entities lending to the bank; and
- estimate the amount of funding that would be available from funds providers under both normal and stress conditions, including if there are changes in the bank's financial condition.

Some of the more frequently used sources of borrowings are discussed below.

COMMON SOURCES OF BORROWINGS

FHLB Borrowings

The FHLB system was created by the Federal Home Loan Bank Act as a government-sponsored enterprise to support mortgage lending and related community investment. There are 11 regional FHLBs. The FHLB system originally served solely as a source of borrowings to savings and loan companies. With the implementation of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989, the FHLBs were permitted to lend to banks as well.

The FHLBs are a common funding source for many community and regional banks. The FHLBs provide banks short-term and long-term borrowings, with maturities ranging from overnight to 30 years, at generally competitive interest rates. The flexibility of an FHLB facility enables bank management to use this source of funds for the purpose of asset/liability management and contingency funding planning. FHLB facilities may allow bank management to secure a favorable interest rate spread. For example, FHLB borrowings may provide a lower-cost alternative to the conventional deposit, particularly in a highly competitive local market.

Bank management should understand the contracts associated with borrowing from an FHLB, including which assets collateralize the borrowings and the potential risks presented by the contract. For example, the FHLB borrowing agreement may require a bank to pledge all of its assets to the FHLB that have not already been pledged for other purposes (e.g., pledged as collateral to the Reserve Bank to secure discount window borrowings). Furthermore, a bank with negative tangible common equity could lose access to FHLB funding. Regulations governing the FHLBs' extensions of credit provide that an

1. See the July 2023, "Addendum to the Interagency Policy Statement on Funding and Liquidity Risk Management: Importance of Contingency Funding Plans."

FHLB shall not make new advances to a member that does not have positive tangible capital unless that member's appropriate federal banking agency or insurer requests in writing that the FHLB make such advance.[2]

Federal Funds Transactions

Federal funds transactions involve a bank's lending (federal funds sold) or borrowing (federal funds purchased) of immediately available funds under agreements or contracts that have an original maturity of one business day or roll over under a continuing contract. Federal funds may take the form of the following two types of transactions:

1. Unsecured loans (federal funds sold) or borrowings (federal funds purchased). In some market usage, the term "fed funds" or "pure fed funds" is confined to unsecured loans of immediately available balances.
2. Purchases (sales) of financial assets (other than securities) under agreements to resell (repurchase) that have original maturities of one business day (or are under continuing contracts) and are in immediately available funds.

Funds lent or borrowed in the form of securities resale or repurchase agreements, due-bills, borrowings from the discount window, deposits with and advances from a FHLB, and overnight loans for commercial and industrial purposes are excluded from federal funds.

For federal funds transactions, the rate is usually determined by overall money market rates as well as by the available supply and demand for funds. In some instances, when the selling and buying relationship between two banks is continuous, an effective line of credit may be established on a funds-availability basis. While federal funds transactions commonly are unsecured, the selling of funds can also be secured and can be for a longer period of time. Agency-based federal funds transactions are discussed in section 5230.1, "Bank Dealer Activities."

2. 12 CFR 1266.4.

Loans from Correspondent Banks

Small and medium-sized banks often negotiate loans from their principal correspondent banks to meet their funding needs. The loans are usually for a short period of time and may be secured or unsecured. For more information, see section 6006.1, "Regulation F: Correspondent Concentration Risks."

Repurchase Agreements and Associated Risks

A repurchase agreement or repo is a transaction involving the sale of financial assets by one party to another, subject to an agreement by the seller to repurchase the assets at a specified date or under specific circumstances. A reverse repurchase agreement or reverse repo is a transaction involving the purchase of financial assets by one party from another, subject to an agreement by the purchaser to resell the assets at a specified date or under specific circumstances. Such transactions are referred to as a repo when viewed from the perspective of the supplier of the securities, and a reverse repo or matched sale-purchase agreement when described from the point of view of the supplier of funds. For more information on repurchase agreements, see the instructions to the Call Report.

Both parties in a term repo arrangement are exposed to interest rate risk. To mitigate this risk, a common practice is to have the collateral value of the underlying securities adjusted daily to reflect changes in market prices and to maintain the agreed-on margin. Accordingly, if the market value of the repo securities declines appreciably, the borrower may be asked to provide additional collateral. Conversely, if the market value of the securities rises substantially, the lender may be required to return the excess collateral to the borrower. If the value of the underlying securities exceeds the price at which the repurchase agreement was sold, the bank could be exposed to the risk of loss if the buyer is unable to perform and return the securities. Moreover, if the securities are not returned, the bank could be exposed to the possibility of a significant write-off, to the extent that the book value of the securities exceeds the price at which the securities were originally sold under the repurchase agreement. For this reason, banks should avoid pledging excessive collateral and obtain sufficient financial information on and analyze the financial condition of those institutions and brokers with whom they engage in repurchase transactions.

Repurchase agreements are in many respects economically equivalent to short-term borrowings at market rates of interest. Therefore, banks engaging in repurchase agreements should carefully evaluate their interest-rate-risk exposure at various maturity levels, formulate policy objectives in light of the institution's entire asset and liability mix, and adopt procedures to control mismatches between assets and liabilities. The degree to which a bank borrows through repurchase agreements also should be analyzed with respect to its liquidity needs, and contingency funding plans should outline alternative funding sources.

Borrowings from the Federal Reserve

Federal Reserve lending to depository institutions (referred to as the "discount window") plays an important role in supporting the liquidity and stability of the banking system and the effective implementation of monetary policy. By providing ready access to funding, the discount window helps depository institutions manage their liquidity risks efficiently and avoid actions that have negative consequences for their customers, such as withdrawing credit during times of market stress. Thus, the discount window supports the smooth flow of credit to households and businesses.

Three types of credit are available from the Federal Reserve Banks: primary credit, secondary credit, and seasonal credit, each with its own interest rate. For more information about the discount widow, see section 3210.1, "The Discount Window and Liquidity Risk Management."

The Federal Reserve also has an important role in providing intraday balances and credit to foster the smooth functioning of the overall payment system. Federal Reserve Banks provide intraday credit (also known as daylight overdrafts) to eligible depository institutions with accounts at a Federal Reserve Bank. A daylight overdraft occurs when an institution's Federal Reserve Bank account is in a negative position at any point during the business day. For more information, see the Federal Reserve Policy on Payment Systems Risk.

SUPERVISORY CONSIDERATIONS WHEN ANALYZING BORROWINGS

Examiners should analyze the purpose, effectiveness, and stability of each bank's borrowings on their own merits. The review of bank borrowings generally contributes to the supervisory assessment of the institution's "Liquidity" rating. The "Liquidity" rating should be based on, among other things, the degree of the bank's reliance on short-term, volatile sources of funds, including borrowings and brokered deposits, that have been used to fund the bank's longer-term assets.

If a bank borrows extensively or in large amounts, examiners should appropriately analyze the bank's borrowing activity by

- reviewing the principal sources of its borrowings, range of amounts, frequency, length of time indebted, borrowing costs, and reasons for the borrowings;
- verifying the actual use of the borrowed funds;
- analyzing changes in a bank's borrowing position for signs of deterioration in its borrowing ability and overall creditworthiness. Possible signs of deterioration in borrowing ability include;
  - — The payment of large fees to money brokers to obtain funds because the bank is having difficulty obtaining access to conventional sources of borrowings. For more information about the risks associated with brokered deposits, see section 2330.1, "Deposit Accounts";
  - — Requests from the bank's lender for collateral on previously unsecured credit lines or increases in collateral margins;
  - — The payment of above-market interest rates; and
  - — A shortening of maturities that is inconsistent with management's articulated balance-sheet strategies and funding plans.

If a bank's borrowing position is not properly managed, examiners should include appropriate comments in the report of examination.

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Liquidity

INTRODUCTION

Market risk reflects the degree to which changes in interest rates, foreign exchange rates, commodity prices, or equity prices can adversely affect a financial institution's earnings or capital. For most community banks, market risk primarily reflects exposure to interest rate risk (IRR). While this risk is a normal part of banking and can be an important source of profitability and shareholder value, excessive levels of IRR can pose a significant threat to an institution's earnings and capital base. Accordingly, effective risk management that maintains IRR at prudent levels is essential to the safety and soundness of institutions.

The Interagency Guidelines Establishing Standards for Safety and Soundness (12 CFR 208, appendix D-1) require an institution to manage IRR in a manner that is appropriate to the size of the institution and the complexity of its assets and liabilities; and provide for periodic reporting to management and the board of directors regarding interest rate risk with adequate information for management and the board of directors to assess the level of risk. As a result, an important element of examinations and the supervisory process is the evaluation of an institution's exposure to changes in interest rates. Examiners evaluate both the adequacy of the management process used to control IRR and the quantitative level of exposure. In addition, examiners should assess the existing and potential future effects of changes in interest rates on an institution's financial condition, including the effect on the institution's capital adequacy, earnings, liquidity, and asset quality.

This section incorporates and builds upon the principles and guidance provided in four Supervision & Regulation (SR) letters:

- SR-93-69, "Examining Risk Management and Internal Controls for Trading Activities of Banking Organizations";
- SR-96-13, "Joint Policy Statement on Interest Rate Risk";[1]
- SR-10-1, "Interagency Advisory on Interest Rate Risk"; and
- SR-12-2, "Questions and Answers on Interagency Advisory on Interest Rate Risk Management."

1. See also 61 Fed. Reg. 33,166 (June 26, 1996).

TYPES AND SOURCES OF MARKET RISK

Market risk can arise from a variety of sources, including

- the overall structure of an institution's balance sheet, especially its loans, investments, and funding structure;
- its use of off-balance-sheet instruments (such as derivatives) for speculation; and
- its trading activities, if any.

While IRR is the most common form of market risk, market risk also arises from exposure to foreign exchange rates, commodity prices, and equity prices.

Foreign exchange risk surfaces when an institution, typically a larger or internationally active institution, performs foreign currency transactions on behalf of its customers, through either wire transfer activity or forward currency contracts. Institutions also may be exposed to currency fluctuations if they have a significant amount of investments denominated in foreign currencies. Institutions can be adversely affected when currencies in which they hold assets weaken or when currencies in which they have obligations strengthen. Foreign exchange risk also arises indirectly when changes in exchange rates affect the competitive position of an institution that operates in different countries.

Commodity price risk is similar to equity risk and encompasses the changes in an institution's earnings and asset values resulting from fluctuations in commodity prices. Some institutions are active in the commodity derivative market, offering derivative contracts linked to commodity prices. In addition, an institution's borrowers can be affected significantly by changes in commodity prices, such as the effect of fluctuating oil prices on airlines or in the realm of agricultural lending.

Equity price risk is the variation in profit or net worth caused by the changes in the prices of individual shares or the level of stock markets as a whole. Equity risk has both direct and indirect results. Fluctuations in stock prices will directly affect the value of shares, portfolios, and equity derivatives held by an institution. There also may be an indirect effect when declining equity prices affect the viability of a company to which the bank has loaned money. Banks generally do not hold equity investments.

TYPES OF INTEREST RATE RISK

As previously discussed, IRR is the most common form of market risk for banking institutions. IRR can arise from a variety of sources, including repricing risk, yield curve risk, basis risk, options risk, and price risk. Various assets and liabilities may be exposed to more than one type of IRR.

Repricing risk is the primary and most discussed source of IRR and is the risk that the institution's assets, liabilities, and off-balance-sheet (OBS) instruments will reprice at different times or amounts. Repricing mismatches are fundamental to the business of banking and generally occur from either short term liabilities funding longer-term assets or long term liabilities funding shorter-term assets. Institutions whose liabilities reprice faster than their assets reprice are considered to be liability sensitive. The earnings of a liability sensitive institution generally increase when interest rates fall and decrease when rates rise. Conversely, an asset sensitive institution's assets reprice more quickly than their liabilities. These institutions' earnings generally benefit from a rising rate environment and are harmed by a falling rate environment.

Yield curve risk is the relationship between changing rates for the same instrument across a spectrum of maturities. It arises when assets and funding sources are linked to similar indexes with different maturities and the shape or slope of the yield curve changes by flattening, steepening, or inverting. For example, a 30-year Treasury bond's yield may change by 200 basis points; however, the three-year Treasury note's yield only changed by 50 basis points during the same time period.

Basis risk arises from a change in the relationship or spread between different market indexes. It occurs when the market indexes used to price assets and liabilities change by different amounts or at different times. For example, assume an operator uses a Treasury bill (T-bill) to hedge an interest rate risk in Eurodollars. The interest rates for T-bills and Eurodollars do not always move exactly parallel to each other. The risk of this lack of parallel movement is basis risk. The second occurs when the period of time for which a financial risk exists is not identical with the period of time for which the hedge is arranged, for example, when a three-month interest risk in a revolving Eurodollar loan is hedged with a six-month futures contract in Eurodollars. A change in the shape of the yield curve can bring about nonparallel movements in interest rates for the two different maturities.

Options risk is the risk arising from the options in assets, liabilities, and OBS instruments. An option provides the holder with the right, but not the obligation, to buy, sell, or, in some manner, alter the cash flow of an instrument or financial contract. Options may be distinct instruments, such as exchange-traded and over-the-counter contracts, or they may be embedded within the contractual terms of other instruments. Instruments with embedded options include bonds and notes with call or put provisions (e.g., callable U.S. agency notes), loans that give borrowers the right to prepay balances without penalty (e.g., residential mortgage loans), and various types of non-maturity deposit instruments that give depositors the right to withdraw funds at any time without penalty (e.g., demand deposits).

Price risk is the risk that the fair value of financial instruments will change when interest rates change. For example, trading portfolios, held-for-sale loan portfolios, and mortgage servicing assets contain price risk.

EFFECTS OF INTEREST RATE RISK

IRR can expose an institution's earnings and capital to adverse changes in market interest rates.

In assessing the effects of changing rates on earnings, institutions' measurement systems may focus on either net interest income or net income. In general, institutions focus primarily on net interest income—the difference between total interest income and total interest expense. However, interest rates can affect other income components, especially fee-based income. In particular, non-interest income generated by loan servicing and various asset-securitization programs can be highly sensitive to changes in market interest rates. Institutions with significant non-interest income that is sensitive to changing rates should have measurement systems in place that focus on net income.

Market interest rates also affect the value of an institution's assets, liabilities, and OBS instruments and, thus, effect the value of an institution's equity capital. The economic value of an instrument is an assessment of the present value of its expected net future cash flows, discounted to reflect market rates.[2] Interest rate changes can have a material effect on the economic value of an instrument. For example, the economic value of a bond with a fixed coupon rate generally falls in a rising rate environment. By evaluating changes in the institution's economic value for a given change in interest rates, institution management can identify risk arising from long-term repricing or maturity gaps as the interest rate environment may affect the institution's future earnings or capital values.

Historically, banks have managed their IRR exposures adequately and few have failed solely as a result of adverse interest rate movements. Changes in interest rates can have negative effects on profitability and need to be carefully managed, especially given the rapid pace of financial innovation and the heightened level of competition among all types of financial institutions.

ORGANIZATIONAL PROCESSES AND CONTROLS FOR MANAGEMENT OF INTEREST RATE RISK

Risk-Management Framework

As is the case in managing other types of risk, sound IRR management involves effective oversight and a comprehensive risk-management process that includes the following elements:

- effective policies and procedures designed to control the nature and amount of IRR, including clearly defined IRR limits and lines of responsibility and authority;
- appropriate risk-measurement, monitoring, and reporting systems; and
- effective internal controls that include an independent review and/or audit of key elements of the risk-management process.

The formality and sophistication used in managing IRR often varies by size and sophistication of the institution, the nature and complexity of its holdings and activities, and the overall level of its IRR. Less complex practices may be adequate for well-managed institutions with noncomplex activities and holdings that present a low IRR profile.

More complex institutions and those with higher IRR exposures or holdings of complicated instruments likely require sophisticated and formal IRR management systems to address their broader range of financial activities. In addition, formal IRR management systems generally will provide an institution's senior management with the needed information to monitor and direct day-to-day activities. The more complex IRR management processes often employed at these institutions may warrant a more thorough independent review and validation process of the IRR model utilized.

Individuals involved in the risk-management process should be sufficiently independent of business lines to ensure adequate separation of duties and avoid potential conflicts of interest. The degree of autonomy these individuals have may be a function of the size and complexity of the institution. In smaller institutions with limited resources, it may not be possible to completely remove individuals with business-line responsibilities from the risk-management process. In these situations, and assuming the institution engages in less complex activities, the institution's focus should be directed towards ensuring that risk-management functions are conducted appropriately. Larger, more complex institutions should have separate and independent risk-management units.

Board of Directors and Senior Management Oversight

The board of directors and senior management have unique yet complementary responsibilities related to the oversight and management of the institution's IRR risk profile.

2. For some instruments, the economic value of an instrument may be the same or differ from its fair value depending on the facts and circumstances. The fair value is an accounting term and is generally considered to be the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. For more information on fair value and the fair value measurement of derivatives, see ASC Topic 820, "Fair Value Measurement" as well as the Call Report instructions.

Board of Directors

The board of directors is ultimately responsible for establishing the institution's level of IRR. The board of directors or a board committee should oversee the establishment, approval, and periodic review of IRR management strategies, policies, procedures, and limits (or risk tolerances). In addition, the board or a board committee should understand the implications of the IRR strategies that the institution pursues, including their potential impact on market, liquidity, credit, and operational risks. To be appropriately informed about the institution's IRR exposure, the nature of risks in current and proposed new activities, and the adequacy of the institution's risk-management process, the board or its committee should receive reports from senior management that contain sufficient detail to assist in making informed policy decisions. The frequency of board reports depends on the complexity of the institution's holdings and the materiality of changes in its holdings.

Unlike senior management, the members of an institution's board of directors do not necessarily need to have detailed technical knowledge of complex financial instruments, legal issues, or sophisticated risk-management techniques. However, the institution's board of directors should oversee and hold senior management accountable for appropriately measuring, monitoring, and controlling IRR.

Senior Management

Senior management should be responsible for implementing

- adequate systems and standards for measuring risk,
- standards for valuing positions and measuring performance,
- a comprehensive IRR reporting and monitoring process, and
- effective internal controls and review processes.

Senior management should be responsible for implementing board-approved strategies, policies, and procedures as well as managing IRR within the designated lines of authority and responsibility. Senior management should develop and implement policies and procedures that align with the board's goals, objectives, and risk limits. Senior management should be responsible for overseeing institution personnel to confirm that operating standards are being followed. Further, senior management should assure that institution personnel who perform analysis and risk-management activities related to IRR have the technical knowledge, depth, and experience commensurate with the nature and scope of the institution's activities.

Reports to senior management should provide aggregate information as well as sufficient supporting detail, so that management can assess the sensitivity of the institution to changes in market conditions and other important risk factors. Effective IRR reports generally include measurement of IRR exposures relative to limits and disclosure of key assumptions. Senior management should also periodically review the institution's IRR management policies and procedures to assess the appropriateness of its risk management. Senior management should also discuss risk-measurement, reporting, and management procedures with risk-management staff. These discussions will assist senior management in developing and providing IRR reports to the board of directors that contain sufficient detail to assist in making informed policy decisions for the institution.

Policies, Procedures, and Limits

Institutions should have clear policies and procedures for limiting and controlling IRR. In general, these policies and procedures should

- delineate lines of responsibility and accountability over IRR management decisions,
- clearly define authorized instruments and permissible hedging and position-taking strategies,
- identify the frequency and method for measuring and monitoring IRR, and
- specify quantitative limits that define the acceptable level of risk for the institution.

In addition, management should define the specific procedures and approvals necessary for exceptions to policies, limits, and authorizations. All IRR risk policies should be reviewed by management and approved by the board of directors at least annually and revised as needed.

Clear Lines of Authority

Whether through formal written policies or operating procedures, management should define the structure of managerial responsibilities, oversight, and lines of authority in the following areas:

- developing and implementing strategies and tactics used in managing IRR
- establishing and maintaining an IRR measurement and monitoring system that is commensurate with the institution's size and complexity
- identifying potential IRR and related issues arising from the use of new products
- developing IRR management policies, procedures and limits, and authorizing exceptions to policies and limits

Individuals and management committees responsible for making decisions about IRR management should be clearly identified. Most institutions delegate IRR management responsibilities to a committee of senior managers, sometimes called an asset/liability committee (ALCO). At these institutions, policies identify the ALCO membership, the committee's duties and responsibilities, the extent of its decisionmaking authority, and the form and frequency of its reports to senior management and the board of directors. An ALCO should have sufficiently broad participation across major banking functions (for example, lending, investment, deposits, and funding) so that its decisions can be executed effectively throughout the institution. In many large institutions, the ALCO delegates day-to-day responsibilities for IRR management to an independent risk-management department or function.

Individuals involved in the IRR management process (including separate risk-management units, if present) should be sufficiently independent from the business lines, including through the reporting structure, to provide for adequate separation of duties and avoid potential conflicts of interest. Also, personnel charged with measuring and monitoring IRR should have a well-founded understanding of the institution's IRR profile. Compensation policies for these individuals should be adequate enough to attract and retain personnel who are well qualified to assess the risks of the institution's activities, and are compatible with effective controls and risk management.

Authorized Activities

Institutions should clearly identify the types of financial instruments that are permissible for managing IRR, either specifically or by their characteristics. As appropriate to its size and complexity, the institution should delineate procedures for acquiring specific instruments, managing individual portfolios, and controlling the institution's aggregate IRR exposure. Major hedging or risk-management initiatives should be approved by the board or board committee before being implemented.

Before introducing new products, hedging, or position-taking initiatives, management should also determine whether there are adequate operational procedures and risk-control systems in place and whether procedures need to be revised.

Risk Limits

The goal of IRR management is to maintain an institution's IRR exposure within self-imposed parameters over a range of possible changes in interest rates. A system of IRR limits and risk-taking guidelines assists an institution in achieving that goal. Such a system should set limits for the institution's level of IRR and, where appropriate, provide the capability to allocate these limits to individual portfolios or activities. Systems should also identify for management when a limit is violated to allow for prompt management attention. Further, in the event of a limit violation, an institution's processes should address specific escalation procedures outlining designated responsible personnel and risk mitigation procedures.

Risk limits should be appropriate to the size, complexity, and financial condition of the institution. Depending on the nature of an institution's holdings and general sophistication, limits can be identified for individual business units, portfolios, instrument types, or specific instruments.[3] The level of detail of risk limits should reflect the characteristics of the institution's holdings, including the various sources of IRR to which the institution is exposed. Limits applied to portfolio categories and individual instruments should be consistent with and

3. This manual's section on "Investment Securities and End-User Activities" discusses issues in setting price volatility limits in the acquisition of securities and derivatives.

complementary to consolidated limits. For example, an institution should consider whether

- IRR limits are consistent with the institution's overall approach to measuring and managing IRR and address the potential impact of changes in market interest rates on both reported earnings and the institution's economic value of equity (EVE);
- limits are consistent with the risk tolerance of the board of directors;
- IRR tolerances address the potential impact of changing interest rates on capital and earnings from a short-term and a long-term perspective;
- limits on the IRR exposure of earnings, which primarily address short term exposure, are broadly consistent with those used to control the exposure of an institution's economic value, which reflects long term exposure;
- IRR limits and risk tolerances consider specific scenarios of market interest rate movements, such as an increase or decrease of a particular magnitude; and
- the rate movements used in developing these limits represent meaningful stress situations, taking into account historic rate volatility and the time required for management to address exposures.

Interest Rate Risk Monitoring and Reporting

An effective process of measuring, monitoring, and reporting exposures is essential for adequately managing IRR. The sophistication and complexity of this process should be appropriate to the size, complexity, nature, and mix of an institution's business lines and its IRR characteristics.

Effective IRR measurement systems monitor the effect of rate changes on both earnings and economic value. The latter is particularly important for institutions with significant holdings of intermediate and long-term instruments or instruments with embedded options because their market values can be particularly sensitive to changes in market interest rates.

IRR measurement systems should

- assess material IRR associated with an institution's assets, liabilities, and OBS positions;
- use generally accepted financial concepts and risk-measurement techniques; and
- have well-supported assumptions and parameters.

In many cases, the interest rate characteristics of an institution's largest holdings will dominate its aggregate risk profile. While all of an institution's holdings should receive appropriate treatment, measurement systems should provide more detailed information on the major holdings and instruments whose values are especially sensitive to rate changes. The IRR measurement system should have sufficient functionality and sophistication to properly identify and value instruments with significant embedded or explicit option characteristics.

An accurate, informative, and timely management information system is essential for managing IRR exposure, and ensuring risks and activities align with the institution's policies and risk tolerance. Reporting of risk measures should be regular and clearly compare current exposure with the institution's internal risk limits. In general, senior management should receive quarterly reports on the institution's IRR profile. The reports should utilize current and accurate data. More frequent reporting may be appropriate depending on the institution's exposure to IRR and the potential for significant changes to the institution's capital and earnings. In addition, past forecasts or risk estimates should be compared with actual results as one tool to identify any potential shortcomings in modeling techniques.[4]

The types of reports prepared for the board and for various levels of management will vary based on the institution's IRR profile. Effective IRR reports enable senior management to

- evaluate the level of and trends in the institution's aggregate IRR exposure;
- demonstrate and verify compliance with the institution's policies and limits;
- evaluate the sensitivity and reasonableness of key assumptions;
- assess the results and future implications of major hedging or position-taking initiatives that have been taken or are being actively considered;

4. For more information, see SR-11-7, "Guidance on Model Risk Management."

- understand the implications of various stress scenarios, including those involving breakdowns of key assumptions and parameters;
- review IRR policies, procedures, and the adequacy of the IRR measurement systems; and
- determine whether the institution holds sufficient capital for the level of risk being taken.

IRR Measurement Methods

There are a number of techniques to measure the IRR exposure of both earnings and economic value. Their complexity ranges from simple calculations and static simulations using current holdings to highly sophisticated dynamic modeling techniques that reflect potential future business and business decisions. Regardless of the methods used, an institution's IRR measurement system should be sufficiently robust to capture material on and off-balance-sheet positions and incorporate a stress-testing process to identify and quantify the institution's IRR exposure and potential problem areas.

The most common types of IRR measurement systems are

- Gap Analysis
- Earnings Simulation Analysis
- Economic Value of Equity (EVE)

Each risk-measurement system has limitations and vary in the degree of its ability to capture various components of IRR. The following exhibit demonstrates the types of interest rate exposures that each measurement system generally addresses. While different methodologies capture different risk exposures, outputs from all models should generally provide a consistent view of IRR trends. If divergent outcomes occur, they are typically due to the structure of the balance sheet, the interest rate environment, the timing of asset/liability mismatches, the sensitivity of funding sources to interest rate changes, or the volume of fixed or floating rate assets. Institution management should understand the nature and underlying reasons for material differences in outputs.

Gap analysis is a basic IRR measurement technique utilizing a maturity/repricing schedule, which distributes assets, liabilities, and OBS holdings into time bands according to their final maturity (if fixed rate) or time remaining to their next repricing (if floating). The choice of time bands may vary from institution to institution. Those assets and liabilities lacking contractual repricing intervals or maturities are assigned to repricing time bands according to the judgment and analysis of the institution.

Table 1—Interest Rate Exposures by Measurement Systems

	Gap Analysis	Earnings Simulation Analysis	Economic Value of Equity
Short-term earnings exposure	Yes	Yes	Limited*
Long-term exposure	Yes	Limited*	Yes
Repricing risk	Yes	Yes	Yes
Yield curve risk	Limited*	Yes	Yes
Basis risk	Limited*	Yes	Limited*
Option risk	Limited*	Limited*	Yes
Price risk	Limited*	Limited*	Yes

*Depending on the sophistication of the model and the manner in which it is used

Gap analysis can be used to generate rough indicators of the IRR sensitivity of both earnings and economic values to changing interest rates. To evaluate earnings exposures, liabilities arrayed in each time band can be subtracted from the assets arrayed in the same time band to yield a dollar amount of maturity/repricing mismatch or gap in each time band. The direction and magnitude of the gaps in various time bands can demonstrate potential earnings volatility arising from changes in market interest rates. A maturity/repricing schedule also can evaluate the effects of changing rates on an institution's economic value.

Typically, gap analysis includes ratios of rate-sensitive assets to rate-sensitive liabilities in given time periods. Within a given time band, an institution may have a positive, negative, or neutral gap. An institution with a positive gap is "asset sensitive" for the given time band because more assets than liabilities are subject to repricing. An institution with a negative gap is "liability sensitive" for the given time band because more liabilities than assets are subject to repricing. An institution with a neutral gap (a ratio of rate-sensitive assets to rate-sensitive liabilities equal to one) is neither asset nor liability sensitive for the given time band.

At the most basic level, mismatches or gaps in long-dated time bands can provide insights into the potential vulnerability of the economic value of relatively noncomplex institutions. However, gap analysis alone is generally not suitable for adequately assessing the institution's risk profile for the large majority of institutions. Long-term gap calculations, along with simple maturity distributions of holdings, may be sufficient for relatively noncomplex institutions with basic balance sheets, minimal optionality, and mainly repricing risk.

Earnings simulation analysis estimates cash flows and resulting earnings streams over a specific time period under various interest rate scenarios to estimate the effect of interest rate changes on net interest income or net income. For assessing the exposure of earnings, simulations estimating cash flows and resulting earnings streams over a specific period are conducted based on existing holdings and assumed interest rate scenarios. A simulation model's accuracy depends on the use of accurate assumptions and data.

A key aspect of IRR simulation involves the selection of an appropriate time horizon(s) over which to assess IRR exposures. Simulations can be performed over any time horizon and often are used to analyze multiple horizons identifying short-term, intermediate-term, and long-term risk. Utilizing a two-year time period generally is effective when using earnings simulation models. A two-year time frame effectively captures an institution's important transactions, tactics, and strategies to increase revenues, which can be hidden by viewing projected results within shorter time horizons. However, to assess the effects of certain products with embedded options, IRR simulations over longer time horizons (five-to-seven years) are typically needed.

Income simulations are static or dynamic. Static simulations are based on current holdings and assume a constant balance sheet with no new growth. Dynamic simulations include assumptions of asset growth, changes in existing business lines, new business, or changes in management or customer behaviors. Dynamic earnings simulation models can be useful for business planning and budgeting purposes. However, dynamic simulations are highly dependent on key variables and assumptions and can be inaccurate over an extended period. Furthermore, model assumptions, such as growth, can potentially hide underlying risk exposures. Therefore, static and dynamic simulations, in tandem, should be used to provide a more complete description of the institution's IRR exposure.

Economic value of equity (EVE) models consider the present value of expected cash flow over the entire expected life of the institution's holdings. EVE models simulate various interest rate scenarios to estimate the changes in an institution's economic value of capital as a result of changes in interest rates. This approach focuses on a longer-term time horizon, captures future cash flows expected from existing assets and liabilities, and is effective in considering embedded options in a typical institution's portfolio.

Most EVE models use a static approach by providing a snapshot in time of the risk inherent in the portfolio or balance sheet. However, some institutions incorporate dynamic modeling techniques that provide forward-looking estimates of economic value.

When utilizing EVE methods, institution management should establish appropriate EVE risk limits. Appropriate limits generally are based on the change of economic capital rather than absolute levels of economic capital. The accuracy of the assumptions in the model are critically important in the EVE model's ability to calculate the future cash flows of the institution's instruments. Unreasonable assumptions can lead to pronounced output errors in EVE models. As such, institution management should understand the significance and accuracy of assumptions by conducting sensitivity testing.

IRR Scenarios

IRR exposure estimates, whether linked to earnings or economic value, use some form of forecasts or scenarios of possible changes in market interest rates. Institution management should measure IRR exposure estimates over a probable range of potential interest rate scenarios, including meaningful stress situations. The scenarios should adequately cover the institution's meaningful sources of IRR associated with its holdings. In developing appropriate scenarios, institution management should consider the current level and term structure of rates and possible changes to that environment, given the historical and expected future volatility of market rates.

There are various common rate scenarios, including rate shock, rate ramp, stair step, and non-parallel yield curve shifts. A rate-shock scenario is the most commonly used. In this scenario, rate changes are instantaneous and sustained. For instance, a plus 300 basis-point, rate-shock scenario would consist of the full 300 basis-point interest rate increase occurring in the first period measured and remain in effect for all measured periods. A rate ramp scenario consists of rate changes applied gradually over a measured period, such as a 300 basis-point rate increase during a 12-month period with rates rising 25 basis points each month. A stair-step scenario also consists of rate changes applied gradually; however, the changes are administered at less frequent intervals. For example, a 300 basis-point increase might be measured over a two-year period with rates increasing 50 basis points per quarter the first year and 25 basis points per quarter the second year. Nonparallel yield curve shifts are scenarios in which the yields do not change by the same number of basis points for every maturity, such as flattening, steepening, or inversion of the yield curve.

Effective scenarios conducted by institution management typically include an instantaneous plus or minus 200 basis-point parallel shift in market rates (rate shock). However, those scenarios alone may not adequately assess an institution's IRR exposure. As such, institutions should also consider utilizing changes in rates of greater magnitude, such as plus or minus 300 and 400 basis-point shocks. More sophisticated analyses involve the use of multiple scenarios, including the potential effects of changes in the relationships among interest rates (option risk and basis risk) and changes in the general level of interest rates and changes in the shape of the yield curve.

Data Integrity

In addition to validity of the underlying assumptions, and IRR scenarios used to model IRR exposures, the usefulness of IRR measurements depends on the integrity of the data on current holdings. Simulation techniques that rely heavily on specific assumptions should be used carefully because they rely on specific assumptions and parameters, which can lead to inaccurate reports if the underlying data is inaccurate.

The integrity of data on current positions is an important component of the risk-measurement process. Management should ensure that all material positions are represented in IRR measures, and that the data used are accurate and meaningful. IRR measurement techniques should reflect relevant repricing and maturity characteristics on key holdings. When applicable, data should include information on the contractual coupon rates and cash flows of associated instruments and contracts. Manual adjustments to underlying data should be supported and controlled.

Account Aggregation

Account aggregation is the process of grouping and measuring accounts of similar types and cash flow characteristics. The account aggregation process should be supported and periodically reviewed. The level of account aggregation from transaction systems into the IRR model will vary from one institution to another based the complexity of the accounts and the sophistication of the IRR model. Institutions should appropriately aggregate current account positions by meaningful characteristics (for example, by instrument type, coupon rate, or repricing characteristic). This allows the institution to appropriately measure material types and sources of IRR, including those arising from explicit or embedded options. Both contractual and behavioral characteristics should be considered when determining the cash flow patterns of accounts to aggregate.

Assumptions

Assumptions should be documented and their effects should be well understood by management. Management should review the assumptions used in assessing the interest rate sensitivity of complex instruments, such as those with embedded options, and instruments with uncertain maturities. Management should assess the consistent replacement growth rate assumptions if the ban uses dynamic simulations of future growth and business assumptions. Assumptions about customer behavior and new business should consider historical patterns and be consistent with the interest rate scenarios used. Institutions should review the reasonableness of assumptions covering asset prepayments, non-maturity deposit price sensitivity and decay rates, and key rate drivers for each interest rate shock scenario.[5]

The following discussion provides background information on the types of assumptions used in IRR models.

Driver rates and betas. Driver rates are utilized in most earnings simulations and economic value models and represent the rate or rates which drive the re-pricing characteristics of assets and liabilities. Examples of driver rates include the fed funds rate, U.S. Treasury yields, and the Wall Street Journal Prime rate. Depending on the sophistication of the model, a variety of driver rates may be tailored to the different products the institution offers. While institution rates generally move in relation to a driver rate, the movement may be less or more than the movement in the driver rate depending on management's pricing strategies. Most models utilize a beta factor to serve as a proxy for management's reaction to market changes. A beta factor represents the magnitude of the changes in the rates of bank products compared to the changes in the driver rates. For example, management may be expected to only increase deposit rates by 40 basis points for every 100 basis points move in the fed funds rate, resulting in a beta factor of 40 percent. Beta factors should be based on an analysis of the relationship between the product and the driver rate. To help determine the beta, management can perform correlation or regression analysis to quantify the historical relationship between the product and the drivers.

Non-maturity deposits. Assumptions about non-maturity deposits are critical as non-maturity deposits represent a large portion of the industry's funding base. An institution's IRR measurement system should consider the sensitivity of non-maturity deposits, including demand deposits, negotiable order of withdrawal accounts, savings deposits, and money market deposit accounts. There are a variety of techniques used to analyze IRR characteristics, and each institution should use a technique that is commensurate to the size, sophistication, and complexity of the institution. In general, treatment of non-maturity deposits should consider the historical behavior of the institution's deposits; general conditions in the institution's markets, including the degree of competition it faces or likely to face; and anticipated pricing behavior under the scenario investigated.

As non-maturity deposits have no contractual maturity date, institutions should utilize assumptions that determine the maturity of the accounts. The most common assumption utilized is a decay rate. Also, institutions experiencing or projecting capital levels that trigger brokered and high interest rate deposit restrictions should adjust deposit assumptions accordingly.[6]

Assumptions, including deposit betas and decay rates, should be supported to the fullest extent practicable. Treatment of non-maturity deposits within the measurement system may, of course, change from time-to-time based on market and economic conditions. Such changes should be well founded and documented. Treatments used in constructing earnings simulation assessments should be conceptually and empirically consistent with those used in developing EVE assessments of IRR.

Asset prepayment. Prepayment assumptions reflect the optionality and prepayment risk associated with loans and mortgage-related securities and are critical as cash flows may be received more quickly or more slowly than anticipated. Prepayments are highly influenced by the direction of interest rates as loan prepayments generally slow during periods of rising rates. Prepayment assumptions should take into consideration various factors, such as aging, geographic location, loan size, and fixed versus variable rates.

Stress Testing

Stress testing, which includes both scenario and sensitivity analysis, is an important part of IRR management. An institution's risk-measurement system for IRR should contain a meaningful evaluation of the effect of stressful market conditions on the institution. Stress scenarios should be designed to provide informa-

5. A decay rate estimates the amount of existing non-maturity deposit that will run off over a given time period. Generally, rate-sensitive and higher-cost deposits, such as brokered and Internet deposits, should reflect higher decay rates than other types of deposits.

6. Section 38 of the FDI Act (12 U.S.C. 1831o) requires insured depository institutions that are undercapitalized to receive approval before engaging in certain activities, and further restricts interest rates paid on deposits by institutions that are not well capitalized. Section 38 restricts or prohibits certain activities and requires an insured depository institution to submit a capital restoration plan when it becomes undercapitalized.

tion on the kinds of conditions under which the institution's strategies or positions would be most vulnerable; thus, testing may be tailored to the risk characteristics of the institution. Possible stress scenarios might include more severe changes in the term structure of interest rates, substantial rate changes over time, relationships among key market rates (basis risk), or volatility of market rates. The stress testing of assumptions used for illiquid instruments and instruments with uncertain contractual maturities, such as core deposits, is particularly critical to achieving an understanding of the institution's risk profile. Therefore, stress scenarios may include extremes of observed market conditions and plausible worst-case scenarios.

Management should conduct sensitivity analysis of the assumptions having the largest influence on an institution's model output under stressful situations. This sensitivity analysis may consist of testing key assumptions or variables by changing the variable in question while keeping all other variables constant and comparing the results to the base-case scenario. Based on the results of sensitivity analysis, management should be able to identify the assumptions which have the most impact on model output. This enables management to focus their efforts in verifying the most salient assumptions. Additionally, sensitivity analysis can be used to determine the conditions under which key business assumptions and model parameters or when IRR may be exacerbated by other risks or earnings pressures.

Internal Controls

An important element of an institution's internal controls for IRR is senior management's comprehensive evaluation and review of the various components of the IRR management process. Although procedures for establishing limits and adhering to them may vary among institutions, periodic control reviews should be conducted to determine whether the organization enforces its IRR policies and procedures. Senior management should promptly address situations where interest rate positions exceed established internal risk limits. Issues should be resolved based on processes described in approved policies. The institution should conduct periodic reviews of IRR management process. Reviews should also be conducted in light of significant changes since the last review, such as the nature of instruments acquired, as well as modifications to risk-measurement methodologies, limits, and internal controls.

Validating IRR models is a fundamental part of any institution's system of internal controls. An important element of model validation is independent review of the model's logical and conceptual soundness. The scope of the independent review should assess the institution's measurement of IRR, including the reasonableness of assumptions, the process used in determining assumptions, and the back testing of assumptions and results. Management also should implement adequate follow-up procedures to monitor the institution's corrective actions. The results of these reviews should be available for the relevant supervisory authorities.

Smaller institutions that do not have the resources to staff an independent review function should have processes in place to ensure the integrity of the various elements of their IRR management processes. Often, smaller institutions will use an internal party that is sufficiently removed from the primary IRR functions or an external auditor to independently verify the integrity of the IRR models used. More robust model validations processes for measurement systems are appropriate for institutions with complex risk exposures. These processes should include review by external auditors or other knowledgeable outside parties to ensure the IRR models' adequacy and integrity. Since measurement systems may incorporate one or more subsidiary systems or processes, institutions should ensure that multiple component systems are well integrated and consistent in all critical respects.

The frequency and extent to which an institution should reevaluate its risk-measurement methodologies and models depends, in part, on the specific IRR exposures created by their holdings and activities, the pace and nature of changes in market interest rates, and the extent to which there are new developments in measuring and managing IRR. In general, an institution should review its underlying IRR measurement methodologies and IRR management process annually, and more frequently as institution behaviors and market conditions dictate.

SUPERVISORY CONSIDERATIONS IN ASSESSING IRR SENSITIVITY TO MARKET RISK

Quantitative Level of IRR Exposure and Effect on Earnings and Capital

Examiners evaluating the quantitative level of IRR should review and assess the effects of past and potential changes in interest rates on an institution's financial condition, particularly its earnings, capital, liquidity, and, in some cases, asset quality. This assessment involves a broad analysis of an institution's business mix, balance-sheet composition, OBS holdings, and holdings of interest rate-sensitive instruments. Examiners should understand the institution's material holdings, and assess how changes in interest rates might affect the institution's financial performance. While the scope of the assessment should reflect the size, sophistication, and nature of the institution's holdings, primary areas of review include

- major on- and off-balance-sheet positions,
- concentrations in interest-sensitive instruments,
- the existence of highly volatile instruments, and
- significant sources of noninterest income that may be sensitive to changes in interest rates.

IRR Exposure to Earnings and Capital

An institution's IRR exposure should be assessed in terms of the potential effects on the institution's earnings and capital. When evaluating the potential effects of changing rates on an institution's earnings, examiners will assess the key determinants of the net interest margin, the effect that fluctuations in net interest margins can have on overall net income, and the rate sensitivity of non-interest income and expense. Analyzing the historical behavior of the net interest margin, including the yields on major assets, liabilities, and off-balance-sheet positions that make up that margin, can provide useful insights into the relative stability of an institution's earnings. Examiners should evaluate the exposure of earnings to changes in interest rates relative to the institution's overall level of earnings and the potential length of time such exposure might persist.

Exposures that would result in a significant decline in net interest margins or net income should prompt further investigation of the adequacy and stability of earnings and the adequacy of the institution's risk-management process. Specifically, in institutions exhibiting significant earnings exposures, examiners should emphasize the results of the institution's stress tests to determine the extent to which more significant and stressful rate moves might magnify the erosion in earnings identified in the more modest rate scenario.

When determining the amount of IRR exposure in context of capital, examiners will consider the effect of changes in market interest rates on the economic value of equity, level of embedded losses in the bank's financial structure, and impact of potential rate changes on the institution's earnings.

Examiners should take into account the absolute level of an institution's earnings or capital both before and after the estimated IRR shock. Institutions with strong earnings and capital can withstand greater shocks, whereas institutions with already less than satisfactory earnings or capital may warrant greater supervisory concern at relatively small IRR shocks.

Qualitative Assessment of Interest Rate Risk Management

When evaluating interest rate risk management at an institution, examiners should place primary consideration on the following elements of a sound risk-management system:

- board of directors and senior management oversight;
- policies, procedures, and limits;
- risk monitoring and management information systems; and
- internal controls.[7]

Through discussions with appropriate institution personnel, examiners should determine whether the institution has established appropriate corporate governance processes (internal

7. These elements are consistent with the guidance provided in SR-16-11, "Supervisory Guidance for Assessing Risk Management at Supervised Institutions with Total Consolidated Assets Less than $50 Billion."

policies, procedures, risk limits, and strategies), and whether the board of directors, or a committee thereof, is regularly informed about the level and trend of IRR, and reviews conformance with internal IRR policy limits and risk tolerances. If inadequacies are noted, examiners should communicate these findings to the institution and discuss strategies to improve the institution's corporate governance processes.

Examiners should determine whether internal measurement processes and systems are adequate. In particular, examiners should review the institution's input process by focusing on the procedures for entering and reconciling system data, categorizing and aggregating account data, ensuring the completeness of account data, and assessing the effectiveness of internal controls. In addition, examiners should review the results of the audit or independent reviews, and determine whether the results were appropriately reported to the board of directors, or a committee thereof, and whether the results revealed significant deficiencies.

EXAMINATION PROCESS

Examiners should assess and assign a rating to the sensitivity to market risk component, or "S" component, of the CAMELS rating system, at each full-scope examination.[8] To meet examination objectives efficiently and effectively while remaining sensitive to potential burdens imposed on institutions, the examination of sensitivity to market risk should follow a structured, risk-focused approach. A fundamental tenet of this approach is that supervisory resources are targeted at functions, activities, and holdings that pose the most risk to the safety and soundness of an institution. Accordingly, institutions with low levels of IRR would be expected to receive relatively less supervisory attention than those with more severe IRR exposures.

Many institutions have become especially skilled in managing and limiting the exposure of their earnings to changes in interest rates. Accordingly, for most banks and especially for smaller institutions with less complex holdings, the IRR element of the examination may be relatively simple and straightforward. On the other hand, some banks consider IRR an intended consequence of their business strategies and choose to take and manage that risk explicitly—often with complex financial instruments. These banks, along with banks that have a wide array of activities or complex holdings, generally should receive greater supervisory attention.

Examination Scope and Off-Site Analysis

During the examination scoping process prior to the on-site examination, examiners should use surveillance metrics and supervisory judgment, to determine bank's risk tier (low, moderate, or high). The scope of the examination work program should align with the bank's risk classification. More information on the use of surveillance metrics during the examination scoping process is discussed in this manual's section entitled, "Community Bank Supervision Process."

Additionally, examiners should assess the level of IRR exposure and the quality of IRR management to the fullest extent possible during the scoping process by reviewing the following:

- organizational charts and policies identifying authorities and responsibilities for managing IRR;
- IRR policies, procedures, and limits;
- ALCO committee minutes and reports (from 6 to 12 months before the scope visit);
- board of director reports on IRR exposures;
- audit reports (both internal and external);
- most recent IRR report, including assumptions used in the model; and
- Federal Reserve surveillance reports and supervisory screens.

If the examiners' assessment of the risk tier differs from the initial quantitative risk tier, examiners should adjust the risk tier. Adjustments to the risk tier during the scoping process based on examiner judgement should be rationalized and documented in the appropriate work papers.

During the Examination

Examiners should complete the appropriate examination procedures based on the bank's assigned risk tier. During the examination, the

8. There may be instances where the assessment of sensitivity to market risk is a topic of a targeted examination.

examiner-in-charger and the examiner working the IRR portion of the examination should confirm the risk classifications on which planned work programs were based and, if needed, adjust or expand the work programs. If initial discussions with management or additional information obtained during the examination indicates significant weakness in the bank's risk management or higher-than-anticipated risk, examiners should modify the examination's scope and work programs accordingly. All examination work programs are to include the review and verification of corrective action taken to address any outstanding Matters Requiring Immediate Attention (MRIAs) or Matters Requiring Attention (MRAs).

Material weakness in risk management or high levels of IRR exposure relative to earnings and capital may require corrective action. If an examiner determines that an IRR weakness warrants corrective action based on safety and soundness, the examiner, in consultation with the examiner-in-charge, should outline any MRIAs or MRAs.

When issuing a supervisory finding (including through the issuance of an MRIA or MRA), examiners will not criticize an institution for a "violation" of supervisory guidance (as supervisory guidance is not legally binding). When appropriate, examiners may reference (including in writing) supervisory guidance (such as interagency statements, advisories, bulletins, and policy statements) to provide examples of safe-and-sound conduct, appropriate risk-management practices, and other approaches to addressing compliance with laws or regulations.[9]

Assessing CAMELS Ratings

For most banks, IRR is the primary market risk exposure. Accordingly, the CAMELS market-risk sensitivity or "S" rating for most banks should be based on assessments of the adequacy of IRR management practices and the quantitative level of IRR exposure.[10] In particular, the "S" rating for most banks where IRR is the primary market risk exposure should be based on an assessment of the following evaluation factors:

- the sensitivity of the bank's earnings or the economic value of its capital to adverse changes in interest rates;
- the ability of management to identify, measure, monitor, and control exposure to interest rate risk given the bank's size, complexity, and risk profile;
- the nature and complexity of interest rate risk exposure arising from non-trading positions; and
- where appropriate, the nature and complexity of market-risk exposure arising from trading and foreign operations.

In addition to these listed factors, there may be additional factors that may be appropriate for the examiner to evaluate as part of determining the "S" rating for a bank.

The "S" component rating definitions of the CAMELS rating system are as follows:

1. A rating of "1" indicates that interest rate risk sensitivity is well controlled and that there is minimal potential that the earnings performance or capital position will be adversely affected. Risk-management practices are strong for the size, sophistication, and market risk accepted by the institution. The level of earnings and capital provide substantial support for the degree of interest rate risk taken by the institution.
2. A rating of "2" indicates that interest rate risk sensitivity is adequately controlled and that there is only moderate potential that the earnings performance or capital position will be adversely affected. Risk-management practices are satisfactory for the size, sophistication, and interest rate risk accepted by the institution. The level of earnings and capital provide adequate support for the degree of interest rate risk taken by the institution.
3. A rating of "3" indicates that control of interest rate risk sensitivity needs improvement or that there is significant potential that the earnings performance or capital position will be adversely affected. Risk-management practices need to be improved given the size, sophistication, and level of risk accepted by the institution. The level of earnings and capital may not adequately support the degree of interest rate risk taken by the institution.

9. SR-18-5/CA-18-7, "Interagency Statement Clarifying the Role of Supervisory Guidance."

10. "Overall Conclusions Regarding Condition of the Bank: Uniform Financial Institutions Rating System," provides guidance on the market-risk sensitivity component of the CAMELS rating system.

4. A rating of "4" indicates that control of interest rate risk sensitivity is unacceptable or that there is high potential that the earnings performance or capital position will be adversely affected. Risk-management practices are deficient for the size, sophistication, and level of risk accepted by the institution. The level of earnings and capital provide inadequate support for the degree of interest rate risk taken by the institution.

5. A rating of "5" indicates that control of interest rate risk sensitivity is unacceptable or that the level of risk taken by the institution is an imminent threat to its viability. Risk-management practices are wholly inadequate for the size, sophistication, and level of interest rate risk accepted by the institution.

The adequacy of a bank's IRR management is a leading indicator of its potential IRR exposure. Therefore, assessment of IRR management practices should be the basis for the overall assessment of a bank's IRR. Unsafe exposures and management weaknesses should be fully reflected in "S" ratings. Unsafe exposures and unsound management practices that are not resolved during the on-site examination should be addressed through subsequent follow-up actions by the examiner and other supervisory personnel.

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Rate Sensitivity

4000—MANAGEMENT ACTIVITIES AND INTERNAL CONTROLS

The 4000 series of sections explain key concepts related to bank management and internal controls. These sections address the supervisory approach for the assessment of a bank's risk management practices over certain banking activities. There are also sections on key aspects of an effective internal controls framework.

Directors are placed in a position of trust by the bank's shareholders, and both statutes and common law place responsibility for the affairs of a bank firmly and squarely on the board of directors. The board of directors of a bank should delegate the day-to-day routine of conducting the bank's business to its officers and employees, but the board cannot delegate its responsibility for the consequences of unsound or imprudent policies and practices, whether they involve lending, investing, protecting against internal fraud, or any other banking activity. The board of directors is responsible to the bank's depositors, other creditors, and shareholders for safeguarding their interests through the lawful, informed, efficient, and able administration of the institution. In the exercise of their duties, directors are governed by federal and state banking, securities, and antitrust statutes, as well as by common law, which imposes a liability on directors of all corporations. Directors who fail to discharge their duties completely or who are negligent in protecting the interests of depositors or shareholders may be subject to removal from office, criminal prosecution, civil money penalties imposed by bank regulators, and civil liability. See section 5040 of this manual, "Formal Corrective Actions," which describes those enforcement powers in greater detail.

DIRECTOR SELECTION

The affairs of each state member bank are overseen by its board of directors. The initial directors are elected by the shareholders at a meeting held before the bank is authorized to commence business. Thereafter, they are elected at meetings held at least annually on a day specified in the bank's bylaws. The directors hold office for a stated tenure, generally ranging from one to three years, or until their successors are elected and have qualified. No state member bank is to have less than five or more than 25 directors as specified in section 31 of the Banking Act of 1933. Various laws govern the election, number, qualifications, oath, liability, and removal of directors and officers, as well as the disclosure requirements for their outside business interests. Other laws pertain to certain restrictions, prohibitions, and penalties for securities dealers serving as directors, officers, or employees; director interlocks; purchases of assets from, or sales to, directors; commissions and gifts for procuring loans; embezzlement; abstraction; willful misapplication; false entries; political contributions; and other matters. The examiner must be familiar with these laws and the related regulations and interpretations.

DIRECTOR INDEPENDENCE

Directors must exercise their independent judgment when managing the bank's affairs. A responsible board will not merely rubber-stamp management's recommendations, but will review them carefully before deciding whether they are in the bank's best interests. A board that is excessively influenced by management, a single director, or a shareholder, or any combination thereof, may not be fulfilling its responsibilities to depositors, other creditors, and shareholders. Diversification of the board of directors is important and can be accomplished by including directors with no ownership or family-ownership interest in the bank and who are not employed by the bank.

A bank's board of directors may include one or more advisory directors. Advisory directors generally do not vote but may provide additional information or advice to the voting directors. An advisory director who functions in that capacity is generally not subject to the same regulatory requirements as voting members and has less liability for the board's actions. However, if an advisory director exercises a degree of influence or control over the board or the bank that is not commensurate with that status, it is appropriate for examiners to subject that individual to the same standards as voting directors. Such a person might also be subject to the same liability standards as a voting director.

DIRECTORS' RESPONSIBILITIES

Directors play a critical role in overseeing the affairs of the bank. Directors should understand that if they neglect to carry out their fiduciary duties and responsibilities, they may be financially liable if the bank fails or experiences loss. An examiner sometimes has to remind bank directors of the extent of their duties and responsibilities. Unless bank directors realize the importance of their positions and act accordingly, they are failing to discharge their obligations to the shareholders, depositors, other creditors, and the community.

Selection of Competent Executive Officers

One of the board's most important duties is to select and appoint executive officers who are qualified to administer the bank's affairs effectively and soundly. The board is also responsible for removing officers who do not meet reasonable standards of honesty, competency, executive ability, and efficiency. The responsibility for selecting executive officers also entails retaining them and ensuring that competent successors can be promoted or hired to fill unanticipated voids. The board is responsible for evaluating the performance of the chief executive officer and approving the CEO's compensation. In many banks, the board also approves compensation for other executive officers.

A state member bank that has been chartered or undergone a change of control within the last two years, that is not in compliance with the minimum capital adequacy guidelines or regulations of the Board, or that is in an otherwise troubled condition must provide 30 days' written notice to its regulating Reserve Bank before it can add a director, promote an internal staff member to senior executive officer, or employ a new senior executive officer.

Effective Supervision of Bank Affairs

The type and degree of supervision required of a bank's board of directors to ensure a bank is soundly managed involve reasonable business judgment and competence and sufficient time to become informed about the bank's affairs. Directors ultimately are responsible for the soundness of the bank. If negligence is involved, a director may be personally liable. The responsibility of directors to supervise the bank's affairs may not be delegated to the active executive officers or anyone else. Directors may delegate to executive officers certain authority, but not the primary responsibility of ensuring that the bank is operated in a sound and legal manner.

Adoption and Adherence to Sound Policies and Objectives

The directors' role is to provide a clear framework of objectives and policies within which the chief executive officer can operate and administer the bank's affairs. This framework is often accomplished through the use of strategic plans and budgets. The strategic plan would discuss long-term, and in some cases, short-term goals and objectives as well as how progress toward their achievement will be measured. The objectives and policies should cover all areas of the bank's operations. The board of directors is responsible for establishing the policies that govern and guide the day-to-day operations of the bank, so they should review and approve them from time to time. These policies are primarily intended to ensure that the risks undertaken by the banks are prudent and are being properly managed. This means that the board of directors must, as a group, have a fundamental understanding of the various types of risks associated with different aspects of the banking business, for example, credit risk, foreign-exchange risk, or interest-rate risk, and define the types of risks the bank will undertake. Some of the more important areas in which policies and objectives must be established include investments, loans, asset and liability management, profit planning and budgeting, capital planning, and personnel. Directors are also responsible for adopting policies and procedures required by law or regulation, such as real estate lending policies, a security program, an interbank liabilities policy, and a Bank Secrecy Act program. The examination of these policies is covered in other sections of this manual.

Avoidance of Self-Serving Practices

A bank's directors bear a greater than normal responsibility for upholding safe and sound practices in dealing with transactions involving other members of the directorate and their related interests. Directors' decisions must preclude the possibility of partiality or favored treatment. Unwarranted loans to a bank's directors or their interests can be a serious safety-and-soundness concern for the bank. Directors who become financially dependent on their bank normally lose their usefulness as directors. Other self-serving practices the examiner should watch for are—

- gratuities paid to directors to obtain their approval of financing arrangements or the use of particular services,
- the use of bank funds by directors, officers, or shareholders to obtain loans or transact other business (Directors should be especially critical of correspondent bank balances when officers, directors, or shareholders are borrowing from the depository bank. The Department of Justice's position is that certain interbank deposits connected with a loan to officers, directors, or shareholders of the depositing bank might constitute a misapplication of funds in violation of 18 USC 656), and
- transactions involving conflicts of interest (When board decisions involve a potential conflict of interest, the director with the potential conflict should fully disclose the nature of the conflict and abstain from voting on the matter. The abstention should be recorded in the minutes. The examiner should also be aware that ethical conflicts of interest can arise when a director or director-related firm performs professional services for the bank. For example, a director who is also the bank's legal counsel may not, in some situations, be able to advise or represent the bank objectively.).

Awareness of the Bank's Financial Condition and Management Policies

Management Information Systems

A management information system (MIS) provides the information, often originated from an institution's mainframe and microcomputers, necessary to manage an organization effectively. MIS should have clearly defined guidelines, policies, practices, standards, and procedures for the organization. These should be incorporated in the development, maintenance, and use of MIS throughout the institution.

MIS is used by all levels of bank staff to monitor various aspects of bank operations, up to and including its overall risk-management process. Therefore, MIS should be supportive of the institution's longer term strategic goals and objectives. At the other extreme, these everyday financial accounting systems also are used to ensure that basic control is maintained over financial recordkeeping activities. Since numerous decisions are based on MIS reports, appropriate control procedures must be set up to ensure that information is correct and relevant.

Audits

In May 1993, pursuant to requirements of the Federal Deposit Insurance Corporation Improvement Act of 1991 (FDICIA), the FDIC issued rules and guidelines that require all banks with total assets in excess of $500 million to have annual audits by an independent public accountant. Copies of these audit reports are to be sent to the FDIC and the appropriate Federal Reserve Bank. Furthermore, the Federal Reserve encourages banks with assets of $500 million or less to provide for annual audits by independent public accountants.

The board or a committee designated by the board should review the audit reports with the bank's management and the independent public accountants. The review should include—

- the scope of services required by the audit, significant accounting policies, and audit conclusions regarding significant accounting estimates;
- the adequacy of internal controls, and actions necessary to ensure the resolution of any problems or deficiencies; and
- the institution's compliance with applicable laws and regulations.

Many states have laws requiring directors' examinations of the bank. When the directors lack adequate knowledge of examination techniques and procedures, they are encouraged to employ a qualified accountant or other specialist to conduct all or part of this examination. The examining committee or the entire board should play an active role. Directors should obtain a clear understanding of the scope of the procedures to be employed, and the final report of the directors' examination should be reviewed by the board of directors.

Further guidance on the use of audit reports and the reliance placed upon the work of external and internal auditors in the examination process can be found in the "Internal and External Audit Section" of this manual.

Maintenance of Reasonable Capitalization

A board of directors has the responsibility for maintaining its bank on a sufficiently capitalized basis. Capital planning and capital adequacy are discussed in the manual section "Assessment of Capital Adequacy," and the examiner should be familiar with this information.

Compliance with Banking Laws and Regulations

Directors must carefully observe that banking laws are not violated; they may be personally liable for losses arising out of illegal actions. In addition, civil money penalties can be assessed for unsafe and unsound actions that do not necessarily involve a violation of a banking law.

Guarantee of a Beneficial Influence on the Community's Economy

One reason for approving a newly chartered bank for Federal Reserve membership is to meet a specific community need. Directors, therefore, have a continuing responsibility to provide those banking services which meet the legitimate credit and other needs of the community being served. Directors should be certain that the bank attempts to satisfy all legitimate credit needs of the community.

BOARD MEETINGS

The board should conduct its business in meetings held as required by the bank's bylaws or state law. Regular meetings of the board should review statements showing the bank's financial condition and earnings; the investment portfolio; and loan activity, including past-due and nonaccrual loans, charged-off or recovered loans, large new loans, and loans to insiders. Directors should also review and approve all policies annually, and review and approve all insurance policies as they are obtained or renewed. They should also review audit and examination reports and initiate action to correct any deficiencies noted, review correspondence with regulatory agencies, review pending litigation, and keep informed of any major prospective undertakings, such as mergers, acquisitions, or new branches or construction.

Minutes of Board Meetings

The board should ensure that an accurate, adequate record of its actions is maintained. Such a record is usually kept in the form of minutes of the board meetings. The minutes should document the board's review of all regular items mentioned above as well as the review and discussion of all significant items that are not part of the regular meeting. Additionally, at a minimum, the minutes should record the attendance or absence of each director at each meeting, detail the establishment and composition of any committees, and note the abstention of any director from any vote. Examiners should review the minutes of board meetings, as well as a sample package prepared for a board meeting, to determine that directors are receiving adequate information to make informed, sound decisions. Meetings conducted by telephone, if allowable under state law, should be documented as thoroughly as regular meetings.

BOARD COMMITTEES

Many boards elect to delegate some of their workload to committees. The extent and nature of the bank's activities and the relative expertise of each board member play key roles in the board's determination of which committees to establish, who sits on them, and how much authority they have. Thus, there is no ideal committee structure. However, committees frequently found in state member banks include the following:

- *Executive Committee*—may be empowered to act when the full board is unable to meet, for example, between regular meetings. An executive committee is usually found in large institutions, where it relieves the full board of the burden of reviewing the details of financial statements and operational activities.

- *Audit Committee*—typically monitors compliance with bank policies and procedures, and reviews internal and external audit reports and bank examination reports. Because it is responsible for ensuring compliance, accuracy, and integrity throughout the organization, the audit committee should consist only of outside directors. The audit committee may supervise the bank's internal auditor and his or her staff directly by hiring personnel, evaluating their performance, and setting their compensation.
- *Loan Committee*—may be established to monitor underwriting standards and loan quality, and to ensure that lending policies and procedures are adequate. In most banks with loan committees, all new loans are reviewed by the loan committee either before or after funding, with the threshold for prior approval being the amount of either the loan or the aggregate debt to the borrower. The loan committee may also be responsible for the loan review function and for maintaining an adequate reserve for loan losses.
- *Investment or Asset-Liability Management Committee*—monitors the bank's investment policies, procedures, and holdings portfolio to ensure that goals for diversification, credit quality, profitability, liquidity, community investment, pledging requirements, and regulatory compliance are met. In some banks whose complexity warrants it, asset-liability management committees have been established to replace or supplement investment committees. An asset-liability management committee monitors the bank's balance sheet and external forces, notably interest rates, to help coordinate asset acquisition and funding sources.
- *Other Committees*—depending on the nature and complexity of the bank's business, the board may establish other committees to monitor such areas as trust, branching, new facilities construction, personnel/human resources, electronic data processing, and consumer compliance.

Minutes of all major actions taken by committees that play a significant role in managing the bank should be kept and meet the same minimum standards used for minutes of meetings of the full board.

COMPLIANCE WITH FORMAL AND INFORMAL SUPERVISORY ACTIONS

Bank directors must ensure that management corrects deficiencies found in the bank. Instructions to do so may come from the Federal Reserve as a formal or informal supervisory action, depending on the severity of the problem.

Formal actions, which include cease-and-desist orders and written agreements, are normally exercised when banks have serious problems. For less serious problems, the Federal Reserve issues informal actions such as a "memorandum of understanding." Informal actions are an agreement between the Reserve Bank and the bank that sets forth the required corrective actions. The Reserve Banks are generally responsible for monitoring compliance with both types of supervisory actions. To assist in that process, the Reserve Bank normally receives and evaluates periodic progress reports from the bank. In addition, information is provided by the examiner, who checks the bank's compliance with the action. The Reserve Banks may initiate additional supervisory action against the bank or individuals associated with it when compliance is insufficient.

Examiners should briefly discuss compliance with any enforcement actions on the Examination Conclusions and Comments page and direct the board of directors' attention to the Compliance with Enforcement Actions page of the examination report. The type and date of the action or resolutions and parties to the action should be listed. In addition, the examiner should generally list each provision requiring action by the bank and provide a comment addressing compliance with that provision. The examiner should comment on how the bank accomplished compliance or the problems that have prevented compliance. While certain information might be better discussed in the confidential section of the report, it is appropriate to make all salient negative comments on the Compliance with Enforcement Actions page to ensure that bank directors are notified of the remaining deficiencies that need to be corrected.

The Reserve Bank may recommend termination or modification of a formal supervisory action whenever it determines that the action has satisfactorily served its purpose and should be removed or modified. In these cases, the Reserve

Bank will send a memorandum with the appropriate explanation to the Board's Division of Supervision and Regulation (S&R) for review and evaluation. S&R and the Board's Legal Division, when appropriate, will prepare the documents necessary to terminate or modify the existing formal supervisory action.

Duties and Responsibilities of Directors
Examination Objectives
Effective date November 1995

Section 4000.2

1. To determine whether the board of directors fully understands its duties and responsibilities.
2. To determine if the board of directors is discharging its responsibilities in an appropriate manner.
3. To determine whether the board of directors has developed adequate objectives and policies.
4. To determine the existence of any conflicts of interest or self-dealing.
5. To determine compliance with laws and regulations.

1. Update the following and review for possible violations of law—
   a. A list of directors to include—
      - home address (If the director was appointed or elected since the previous examination, state the number of years residing at present address.),
      - date of birth,
      - years as a director of the bank,
      - approximate net worth,
      - occupation,
      - citizenship,
      - common stock ownership (beneficial, direct, and indirect), and
      - bonuses, fees, etc.
   b. A list of embezzlements, defalcations, misappropriations, mysterious disappearances, or thefts that have occurred since the last examination. That list should be signed by the chief executive officer or the auditor.
   c. A list of management officials (as defined in the Depository Institution Management Interlocks Act) of the bank, its holding company, and holding company affiliates who are management officials of other depository institutions.
   d. A list of the indebtedness of directors, executives officers, and principal shareholders to the bank examined and any other bank, along with a statement of the terms and conditions of each extension of credit.
2. Obtain or update a listing of all areas of the bank's operations that are administered under the provisions of written objectives and policies that have been developed by or with the approval of the board. Inform the examiners assigned to review those departments that a policy has been developed or an update has occurred.
3. Analyze the listing obtained in step 2, and note any area of banking activity for which policies should be developed.
4. Determine that the board has accepted its responsibility to effectively supervise the affairs of the bank and to be informed of the bank's condition by performing the following:
   a. Obtain a complete set of the latest reports furnished to directors at the last meeting, and list the areas of operation covered by the reports.
   b. Distribute copies of the reports to the examiners in other areas, and request that they determine if reports furnished to the board are prepared accurately, contain sufficient detail to allow the directors to make an intelligent decision, and are submitted on a timely basis.
   c. Prepare a list of areas not reporting or of reports the board does not receive that are considered necessary to maintain adequate supervision. As guidelines, consider the following reports:
      - A monthly statement of condition or balance sheet and a monthly statement of income. Those statements should be in reasonable detail and should be compared with the prior month, with the same month of a prior year, and with the budget. The directors should receive explanations for all large variances.
      - Monthly statements of changes in all capital and reserve accounts. Such statements should explain any changes.
      - Investment reports that group the securities by classifications; that reflect the book value, fair market value, and yield; and that include a summary of purchases and sales.
      - Loan reports that list significant past-due loans, trends in delinquencies, rate reductions, non-income-producing loans, and large new loans granted since the last report.
      - Audit and examination reports. Deficiencies in these reports should produce a prompt and efficient response from the board. The reports reviewed and actions taken should be reflected in minutes of the board of directors meetings.
      - A full report of all new executive-officer borrowing at any bank.
      - A monthly listing of type and amount of borrowing by the bank.
      - An annual presentation of bank insurance coverage.

- All correspondence addressed to the board of directors from the Federal Reserve and any other source.
- A monthly analysis of the bank's liquidity position.
- An annual projection of the bank's capital needs.
- A listing of any new litigation and a status report on existing litigation and potential exposure.
- A thorough report on any major bank endeavor that each bank director is expected to make a decision on, including branch applications and major building plans.

d. Determine the mechanism used to assign responsibility for correcting deficiencies noted in regulatory reports, internal audit reports, external audit reports, or any other reports to the board, and determine the board's system of determining compliance with such recommendations.

e. Determine how directors perform a director's examination, the frequency of such examinations, and what part the directors take in the process.

f. Review the bank's method of ensuring continued or resumed operations in the event of a disaster. Complete the emergency preparedness measures questionnaire for inclusion in the workpapers.

g. Review correspondence between the Federal Reserve and the bank to determine that it has been properly reported.

5. Determine evidence of conflicts of interest and self-dealing by—
   a. obtaining and summarizing information on the business interests of directors, executive officers, and principal shareholders;
   b. comparing that information to develop a list of directors who have business interests in common;
   c. analyzing the interests of directors to determine if the board consists of a variety of individuals;
   d. obtaining from the examiner assigned to assessment of capital adequacy a list of shareholders who own or control, either directly or indirectly, 5 percent or more of any class of voting security;
   e. distributing a list of the insiders (directors, officers, and shareholders whose ownership of voting securities in the institution is more than 10 percent) and their related interests to the appropriate examining personnel to ascertain the extent of loans to or transactions with insiders and their interests (Those examiners should be alert for any relationships with insiders' interests that are not included on the list.);
   f. requesting that the appropriate examiners determine if any transactions with insiders are on terms more favorable than those offered to other customers (If so, determine whether the board has approved such transactions.);
   g. determining that directors have reviewed their correspondent bank accounts in relation to possible conflicts of interest arising from directors', officers', or shareholders' borrowing from depository banks; and
   h. correlating all information on insider transactions, and preparing appropriate report comments.
6. Obtain the minutes of the meetings of the board of directors, the charter, the bylaws, and the minutes of shareholders meetings.
   a. Review and summarize the bylaws and charter of the organization, including any specific provisions on the requirements of directors. The resulting material should become a permanent part of the workpapers and should be updated at subsequent examinations.
   b. Read and summarize the minutes of all meetings of the board since the last examination, making certain to—
      - list any actions taken in contravention of the bylaws;
      - record major actions taken by the board that are not a part of a normal monthly meeting;
      - record any resolution or discussion covering the development of or entrance into a new area, such as a geographic area, customer service, asset category, or liability category;
      - record the creation of any special committee and the area with which it is designed to deal;
      - determine that actions taken by standing committees are reviewed and ratified by the full board;
      - if the minutes specify any transactions with directors or their interests, deter-

mine that the abstention of any interested director from voting on the matters is noted;
- if the minutes do not mention any director-related transactions that have been uncovered during the examination, inquire if the interested director did refrain from voting.

c. Read and summarize the minutes of the board's annual organization meeting and—
- list standing committees and their members,
- have examiners who are examining areas that have standing-committee supervision read and summarize the minutes of those committees, and
- prepare a list of major areas of operation that are not monitored by specific committees.

d. Read and summarize the minutes of any stockholders meetings. The summary should include a list of directors elected at the annual meeting, the number of shares present and voted, individuals acting as proxies, and specific action approved by shareholders.

e. Ascertain during the review of shareholders meeting minutes that (1) shareholders' approval has been received; (2) the bank's charter has been amended, if necessary; and (3) compliance with appropriate state or federal statutes has been met for the following:
- any establishment of or change of a branch location
- any issuance of preferred stock
- any increase in capital stock, either through sale or a stock dividend
- any reduction in capital stock (and ascertain whether the resultant capital is not below what is required by the capital adequacy guidelines)
- any stock split
- any bank pension plan established since the preceding examination
- any bank involvement in a conversion, merger, or consolidation
- all other matters subject to vote

f. Determine the date of the annual shareholders meeting and if it was in compliance with the bylaws.

g. Review the charter and/or bylaws for quorum requirements of shareholder meetings. Ascertain that, at any meeting, the quorum requirements were satisfied according to recorded requirements or by having more than one-half of the eligible shareholders represented.

h. Review any stock option or stock purchase plan adopted since the preceding examination, and review such action for compliance with the various conditions involving charter and shareholder approval.

i. Determine if any candidate was nominated for director, other than the slate nominated by bank management, and review for compliance with the appropriate state statute.

7. Determine that the directors have accepted their responsibility for selecting competent officers by—
   a. determining that the board or a committee thereof reviews, at least annually, the chief executive officer's performance in attaining or progressing toward attaining specific objectives or goals set by the board,
   b. determining if a policy statement on personnel exists, and ascertaining what provisions the board has made for successor management,
   c. determining if any management contracts exist and, if one does, obtaining a copy, summarizing the pertinent points, and determining the reasonableness of terms,
   d. determining by inquiry how the remuneration of executive officers is set and who makes decisions concerning executive salaries, and
   e. listing any titled individual who, by action of the board, is specifically excluded from being an executive officer.
8. Determine compliance with laws and regulations by—
   a. reviewing workpapers of other examination areas or discussing compliance with other examiners to determine any violations of laws or regulations concerning directors that were disclosed in these examination areas,
   b. reviewing the nature and extent of violations discovered at prior examinations to determine if similar violations have occurred at this examination, and
   c. correlating information obtained from the minutes of board meetings to the reports of officer borrowings that have

been prepared at and forwarded from other banks to determine that all such borrowings have been reported to the board.

9. Determine compliance with the Foreign Corrupt Practices Act (15 USC 78dd-1 and -2) by—
   a. reviewing the bank's policy prohibiting improper or illegal payments, bribes, kickbacks, etc., to any foreign government official or other person or organization covered by the law;
   b. determining how that policy has been communicated to officers, employees, or agents of the bank;
   c. reviewing any investigation or study done by, or on behalf of, the board of directors on the bank's policies and operations concerning the advance of funds in possible violation of the act;
   d. reviewing the work done by the examiner assigned to internal control to determine whether internal or external auditors have established routines to discover improper or illegal payments;
   e. analyzing the general level of internal control to determine whether there is sufficient protection against the inaccurate recording of improper or illegal payments on the bank's books;
   f. requesting that examiners working in other areas of the bank be alert for any transactions that might violate the provisions of the act;
   g. compiling any information discovered throughout the examination on possible violations; and
   h. performing procedures on suspected criminal violations as outlined in section 5020.3, "Overall Conclusions Regarding Condition of the Bank: Examination Procedures."
10. Answer the following questions. (This questionnaire is intended to be a quick review for determining that all laws and regulations pertaining to directors have been complied with. Questions should be answered "no" and sub-questions should be answered "yes." Any deviation from this pattern indicates a violation or potential violation. Situations that are not judged to be violations require comments stating the basis for that judgment.)
    a. Is the number of directors less than 5 or greater than 25 (section 31, Banking Act of June 16, 1933)?
    b. Have any directors failed to qualify by reason of insufficient stock ownership (12 USC 72)?
    c. Are any directors noncitizens of the United States (12 USC 72)? If so, has the citizenship requirement been waived?
    d. Do more than one-third of the directors fail to reside in the state, territory, or district in which the bank is located, or within 100 miles of the bank's head office (12 USC 72)?
    e. Did more than one-third of the directors fail to reside in the state, territory or district in which the bank is located, or within 100 miles of the bank's head office, for one year before election (12 USC 72)?
    f. Are any transactions with directors or their related interests on more favorable terms than those offered to other customers (Regulation O (12 CFR 215))?
    g. Do the deposit accounts of directors receive greater interest than those of other customers (section 22(e), Federal Reserve Act (12 USC 376))?
    h. Have any provisions of a cease-and-desist agreement or order been violated (Rules of Practice for Hearings (12 CFR 263))?
    i. Has any director, officer, or employee been convicted of a crime involving a breach of trust or act of dishonesty (section 8(g) of the Federal Deposit Insurance Act (12 USC 1829))? If so, has the FDIC approved his or her membership on the board or employment?
    j. Have any tie-ins of services been authorized by the board (Regulation Y (12 CFR 225.7))?
    k. Were any loans to bank examiners disclosed (Criminal Code—18 USC 212 and 213)?
    l. Has the bank made any political contributions (Federal Election Campaign Act (12 USC 441b))?
    m. Have any employees been found to have misappropriated funds, made false entries, or otherwise defrauded the bank (18 USC 656)?
    n. Has an officer of the bank failed to make appropriate written reports when an

embezzlement, misapplication, or similar transaction occurred (SR-579)?

o. Have any extortionate extensions of credit been discovered (18 USC 892–894)?
p. Have any checks been certified against uncollected funds (18 USC 1004)?
q. Have unauthorized obligations of the bank been issued (18 USC 1005 and 1006)?
r. Has there been a change in control (Regulation Y (12 CFR 225.41–225.43))? If so, was the Federal Reserve notified and was the application approved?
s. Have any purchase-money loans been made that are secured by 25 percent or more of the stock of another secured bank (Regulation Y (12 CFR 225.41))? If so, have the appropriate authorities been notified?
t. Has the bank failed to maintain records of directors, executive officers, and principal shareholders and their related interests (Regulation O (12 CFR 215.8))?
u. Are management officials of the bank, or its holding company or holding company affiliates, also management officials of an unaffiliated depository institution or depository holding company (Regulation L (12 CFR 212))? If so—
   - was such relationship established prior to November 10, 1978, and previously permitted by section 8, Clayton Anti-Trust Act (15 USC 19)?
   - was prior approval of the Federal Reserve obtained for a relationship that was developed since November 10, 1978?
   - does the interlocking relationship meet the criteria of one of the exceptions permitted by Regulation L (12 CFR 212)?
   - is the management relationship with an institution whose—
     — principal offices or branches, excluding electronic terminals, are located in a different RMSA from the bank's or its holding company's offices or branches (does not apply if either institution has assets of less than $20 million) (12 CFR 212.3(b))?
     — principal offices or branches, excluding electronic terminals, are located in another city, town, or village not contiguous or adjacent and 10 miles or more apart?
   - if the bank or its holding company has assets exceeding $2.5 billion, does the interlocking management relationship exist with a nonaffiliated depository institution holding company with assets of $1.5 billion or less?

v. Have any loans to executive officers been uncovered that were not reported to the board (Regulation O (12 CFR 215) and 12 USC 503)?
w. Has a majority of the board failed to preapprove extensions of credit to any of the bank's executive officers, directors, or principal shareholders and their related interests when the total loans to the individual exceed the amount prescribed in Regulation O?
x. Has the bank notified executive officers and principal shareholders of their reporting requirements (Regulation O (12 CFR 215))?

11. Determine compliance with administrative actions by—
    a. reviewing provisions of the document and
    b. reviewing bank records and performing necessary procedures to isolate noncompliance.
12. Evaluate the bank's compliance with formal or informal administrative actions and prepare comments for page one of the examination report (SR-02-17 and SR-92-21). (See also section 5040.1.)
13. Determine compliance with conditions imposed in the approvals of corporate filings for—
    a. branches and relocation applications, including—
       - capital plans or capital injections,
       - fixed-asset limitations, and
       - CRA plans;
    b. subordinated debt, operating subsidiaries, and interim bank applications, including—
       - capital plans and
       - prior review and appropriate clearance of disclosures.
14. On the basis of the information obtained by performing the foregoing procedures, or any other procedures deemed appropriate, evaluate the adequacy and effectiveness of the board of directors. The evaluation should include, but is not limited to—

a. the frequency and effectiveness of meetings;
b. the effectiveness of board committees;
c. the directors' role in establishing policy;
d. the adequacy of the policies and major inconsistencies therein;
e. the quality of reports for directors, noting any deficiencies in information flows from operating management;
f. violations of laws and regulations;
g. whether any one person or group appears to control or dominate the board (if so, comment on any adverse effects on operating policies, procedures, or the overall financial condition of the bank); and
h. the board's responsiveness to recommendations from the auditors and supervisory authorities.

15. Update the workpapers with any information that will facilitate future examinations.

As part of their executive compensation and retention programs, banks and other financial institutions (collectively referred to in this section as ''institutions'') often enter into deferred compensation agreements with selected employees. These agreements are generally structured as nonqualified retirement plans for federal income tax purposes and are based on individual agreements with selected employees.

Institutions often purchase bank-owned life insurance (BOLI) in connection with many of their deferred compensation agreements. (See sections 4042.1 and 2210.1 for an explanation of the accounting for BOLI transactions). BOLI may produce attractive tax-equivalent yields that offset some or all of the costs of the agreements.

Deferred compensation agreements are commonly referred to as *indexed retirement plans* (IRPs) or as *revenue-neutral plans.* The institution's designated management and accounting staff that is responsible for the institution's financial reporting must regularly review the accounting for deferred compensation agreements to ensure that the obligations under the agreements are appropriately measured and reported in accordance with generally accepted accounting principles (GAAP). In so doing, the management and accounting staff should apply and follow Accounting Principles Board Opinion No. 12, ''Omnibus Opinion—1967,'' as amended by Statement of Financial Accounting Standards No. 106 (FAS 106), ''Employers' Accounting for Postretirement Benefits Other Than Pensions'' (hereafter referred to as APB 12).

IRPs are one type of deferred compensation agreement that institutions enter into with selected employees. IRPs are typically designed so that the spread each year, if any, between the tax-equivalent earnings on the BOLI covering an individual employee and a hypothetical earnings calculation is deferred and paid to the employee as a post-retirement benefit. This spread is commonly referred to as *excess earnings.* The hypothetical earnings are computed on the basis of a predefined variable index rate (for example, the cost of funds or the federal funds rate) times a notional amount. The notional amount is typically the amount the institution initially invested to purchase the BOLI plus subsequent after-tax benefit payments actually made to the employee. By including the after-tax benefit payments and the amount initially invested to purchase the BOLI in the notional amount, the hypothetical earnings reflect an estimate of what the institution could have earned if it had not invested in the BOLI or entered into the IRP with the employee. Each employee's IRP may have a different notional amount on which the index is based. The individual IRP agreements also specify the retirement age and vesting provisions, which can vary from employee to employee.

An IRP agreement typically requires the excess earnings that accrue before an employee's retirement to be recorded in a separate liability account. Once the employee retires, the balance in the liability account is generally paid to the employee in equal, annual installments over a set number of years (for example, 10 or 15 years). These payments are commonly referred to as the *primary benefit* or *pre-retirement benefit.*

An employee may also receive the excess earnings that are earned after his or her retirement. This benefit may continue until the employee's death and is commonly referred to as the *secondary benefit* or *post-retirement benefit.* The secondary benefit is paid annually, once the employee has retired, and is in addition to the primary benefit.

Examiners should be aware that some institutions may not be correctly accounting for the obligations under an IRP. Because many institutions were incorrectly accounting for IRPs, the federal banking and thrift agencies issued on February 11, 2004, an Interagency Advisory on Accounting for Deferred Compensation Agreements and Bank-Owned Life Insurance. (See SR-04-4.) The guidance is stated here, except for the information on the reporting of deferred compensation agreement obligations in the bank Call Reports and on changes in accounting for those agreements. Examiners should determine whether an institution's deferred compensation agreements are correctly accounted for. If the accounting is incorrect, assurance should be obtained from the institution's management that corrections will be made in accordance with GAAP and the advisory's instructions for changes in accounting. The examiner's findings should be reported in the examination report. Also report the nature of the accounting errors and the estimated financial impact that correcting the errors will have on the institution's financial statements, including its earnings and capital position.

ACCOUNTING FOR DEFERRED COMPENSATION AGREEMENTS, INCLUDING IRPs

Deferred compensation agreements with select employees under individual contracts generally do not constitute post-retirement income plans (that is, pension plans) or post-retirement health and welfare benefit plans. The accounting for individual contracts that, when taken together, do not represent a post-retirement plan should follow APB 12. If the individual contracts, taken together, are equivalent to a plan, the plan should be accounted for under Statement of Financial Accounting Standards No. 87, ''Employers' Accounting for Pensions,'' or under FAS 106.

APB 12 requires that an employer's obligation under a deferred compensation agreement be accrued according to the terms of the individual contract over the required service period to the date the employee is fully eligible to receive the benefits, or the *full eligibility date.* Depending on the individual contract, the full eligibility date may be the employee's expected retirement date, the date the employee entered into the contract, or a date between these two dates. APB 12 does not prescribe a specific accrual method for the benefits under deferred compensation contracts, stating only that the ''cost of those benefits shall be accrued over that period of the employee's service in a systematic and rational manner.'' The amounts to be accrued each period should result in a deferred compensation liability at the full eligibility date that equals the then-present value of the estimated benefit payments to be made under the individual contract.

APB 12 does not specify how to select the discount rate to measure the present value of the estimated benefit payments. Therefore, other relevant accounting literature must be considered in determining an appropriate discount rate. An institution's incremental borrowing rate[1] and the current rate of return on high-quality fixed-income debt securities[2] should be the acceptable discount rates to measure deferred compensation agreement obligations. An institution must select and consistently apply a discount-rate policy that conforms with GAAP.

For each IRP, an institution should calculate the present value of the expected future benefit payments under the IRP at the employee's full eligibility date. The expected future benefit payments can be reasonably estimated. They should be based on reasonable and supportable assumptions and should include both the primary benefit and, if the employee is entitled to excess earnings that are earned after retirement, the secondary benefit. The estimated amount of these benefit payments should be discounted because the benefits will be paid in periodic installments after the employee retires. The number of periods the primary and any secondary benefit payments should be discounted may differ because the discount period for each type of benefit payment should be based on the length of time during which each type of benefit will be paid, as specified in the IRP.

After the present value of the expected future benefit payments has been determined, the institution should accrue an amount of compensation expense and a liability each year from the date the employee enters into the IRP until the full eligibility date. The amount of these annual accruals should be sufficient to ensure that a deferred compensation liability equal to the present value of the expected benefit payments is recorded by the full eligibility date. *Any method of deferred compensation accounting that does not recognize some expense for the primary benefit and any secondary benefit in each year from the date the employee enters into the IRP until the full eligibility date is not considered to be systematic and rational.*

Vesting provisions should be reviewed to ensure that the full eligibility date is properly determined because this date is critical to the measurement of the liability estimate. Because APB 12 requires that the present value of the expected benefit payments be recorded by the full eligibility date, institutions also need to consider changes in market interest rates to appropriately measure deferred compensation

1. Accounting Principles Board Opinion No. 21, ''Interest on Receivables and Payables,'' paragraph 13, states in part that ''the rate used for valuation purposes will normally be at least equal to the rate at which the debtor can obtain financing of a similar nature from other sources at the date of the transaction.''

2. FAS 106, paragraph 186, states that ''[t]he objective of selecting assumed discount rates is to measure the single amount that, if invested at the measurement date in a portfolio of high-quality debt instruments, would provide the necessary future cash flows to pay the accumulated benefits when due.''

liabilities. Therefore, to comply with APB 12, institutions should periodically review both their estimates of the expected future benefits under IRPs and the discount rates used to compute the present value of the expected benefit payments, and revise those estimates and rates, when appropriate.

Deferred compensation agreements, including IRPs, may include noncompete provisions or provisions requiring employees to perform consulting services during post-retirement years. If the value of the noncompete provisions cannot be reasonably and reliably estimated, no value should be assigned to the noncompete provisions in recognizing the deferred compensation liability. Institutions should allocate a portion of the future benefit payments to consulting services to be performed in post-retirement years only if the consulting services are determined to be substantive. Factors to consider in determining whether post-retirement consulting services are substantive include but are not limited to (1) whether the services are required to be performed, (2) whether there is an economic benefit to the institution, and (3) whether the employee forfeits the benefits under the agreement for failure to perform such services.

APPENDIX—EXAMPLES OF ACCOUNTING FOR DEFERRED COMPENSATION AGREEMENTS

The following are examples of the full-eligibility-date accounting requirements for a basic deferred compensation agreement. The assumptions used in these examples are for illustrative purposes only. An institution must consider the terms of its specific agreements, the current interest-rate environment, and current mortality tables in determining appropriate assumptions to use in measuring and recognizing the present value of the benefits payable under its deferred compensation agreements.

Institutions that enter into deferred compensation agreements with employees, particularly more-complex agreements (such as IRPs), should consult with their external auditors and their respective Federal Reserve Bank to determine the appropriate accounting for their specific agreements.

Example 1: Fully Eligible at Agreement Inception

A company enters into a deferred compensation agreement with a 55-year-old employee who has worked five years for the company. The agreement states that, in exchange for the employee's past and future services and for his or her service as a consultant for two years after retirement, the company will pay an annual benefit of $20,000 to the employee, commencing on the first anniversary of the employee's retirement. The employee is fully eligible for the deferred compensation benefit payments at the inception of the agreement, and the consulting services are not substantive.

Other key facts and assumptions used in determining the benefits payable under the agreement and in determining the liability and expense the company should record in each period are summarized in the following table:

Expected retirement age	60
Number of years to expected retirement age	5
Discount rate (%)	6.75
Expected mortality age based on present age	70

At the employee's expected retirement date, the present value of a lifetime annuity of $20,000 that begins on that date is $142,109 (computed as $20,000 times 7.10545, the factor for the present value of 10 annual payments at 6.75 percent). At the inception date of the agreement, the present value of that annuity of $102,514 (computed as $142,109 times 0.721375, the factor for the present value of a single payment in five years at 6.75 percent) is recognized as compensation expense because the employee is fully eligible for the deferred compensation benefit at that date.

The following table summarizes *one* systematic and rational method of recognizing the expense and liability under the deferred compensation agreement:

	A	B	C	D (B + C)	E	F (E + D – A)
Year	*Benefit payment ($)*	*Service component ($)*	*Interest component ($)*	*Compensation expense ($)*	*Beginning-of-year liability ($)*	*End-of-year liability ($)*
0	–	102,514	–	102,514	–	102,514
1	–	–	6,920	6,920	102,514	109,434
2	–	–	7,387	7,387	109,434	116,821
3	–	–	7,885	7,885	116,821	124,706
4	–	–	8,418	8,418	124,706	133,124
5	–	–	8,985	8,985	133,124	142,109
6	20,000	–	9,593	9,593	142,109	131,702
7	20,000	–	8,890	8,890	131,702	120,592
8	20,000	–	8,140	8,140	120,592	108,732
9	20,000	–	7,339	7,339	108,732	96,071
10	20,000	–	6,485	6,485	96,071	82,556
11	20,000	–	5,572	5,572	82,556	68,128
12	20,000	–	4,599	4,599	68,128	52,727
13	20,000	–	3,559	3,559	52,727	36,286
14	20,000	–	2,449	2,449	36,286	18,735
15	20,000	–	1,265	1,265	18,735	0
Totals	200,000	102,514	97,486	200,000		

The following entry would be made at the inception date of the agreement (the final day of year 0) to record the service component of the compensation expense and related deferred compensation agreement liability:

	Debit	*Credit*
Compensation expense	$102,514	
Deferred compensation liability		$102,514

[To record the column B service component]

In each period after the inception date of the agreement, the company would adjust the deferred compensation liability for the interest component and any benefit payment. In addition, the company would reassess the assumptions used in determining the expected future benefits under the agreement and the discount rate used to compute the present value of the expected benefits in each period after the inception of the agreement, and revise the assumptions and rate, as appropriate.

Assuming that no changes were necessary to the assumptions used to determine the expected future benefits under the agreement or to the discount rate used to compute the present value of the expected benefits, the following entry would be made in year 1 to record the interest component of the compensation expense:

	Debit	Credit
Compensation expense	$6,920	
Deferred compensation liability		$6,920

[To record the column C interest component (computed by multiplying the prior-year column F balance by the discount rate)]

Similar entries (but for different amounts) would be made in year 2 through year 15 to record the interest component of the compensation expense.

The following entry would be made in year 6 to record the payment of the annual benefit:

	Debit	Credit
Deferred compensation liability	$20,000	
Cash		$20,000

[To record the column A benefit payment]

Similar entries would be made in year 7 through year 15 to record the payment of the annual benefit.

Example 2: Fully Eligible at Retirement Date

If the terms of the contract described in example 1 had stated that the employee is only entitled to receive the deferred compensation benefit if the sum of the employee's age and years of service equals 70 or more at the date of retirement, the employee would be fully eligible for the deferred compensation benefit at age 60, after rendering five more years of service. At the employee's expected retirement date, the present value of a lifetime annuity of $20,000 that begins on the first anniversary of that date is $142,109 (computed as $20,000 times 7.10545, the factor for the present value of 10 annual payments at 6.75 percent). The company would accrue this amount in a systematic and rational manner over the five-year period from the date it entered into the agreement to the date the employee is fully eligible for the deferred compensation benefit. Under *one* systematic and rational method, the annual service component accrual would be $24,835 (computed as $142,109 divided by 5.72213, the factor for the future value of five annual payments at 6.75 percent).

Other key facts and assumptions used in determining the benefits payable under the agreement and in determining the liability and expense the company should record in each period are summarized in the following table:

Expected retirement age	60
Number of years to expected retirement age	5
Discount rate (%)	6.75
Expected mortality age based on present age	70

The following table summarizes *one* systematic and rational method of recognizing the expense and liability under the deferred compensation agreement:

	A	B	C	D (B + C)	E	F (E + D – A)
Year	*Benefit payment ($)*	*Service component ($)*	*Interest component ($)*	*Compensation expense ($)*	*Beginning-of-year liability ($)*	*End-of-year liability ($)*
1	–	24,835	–	24,835	–	24,835
2	–	24,835	1,676	26,511	24,835	51,346
3	–	24,835	3,466	28,301	51,346	79,647
4	–	24,835	5,376	30,211	79,647	109,858
5	–	24,835	7,416	32,251	109,858	142,109
6	20,000	–	9,593	9,593	142,109	131,702
7	20,000	–	8,890	8,890	131,702	120,592
8	20,000	–	8,140	8,140	120,592	108,732
9	20,000	–	7,339	7,339	108,732	96,071
10	20,000	–	6,485	6,485	96,071	82,556
11	20,000	–	5,572	5,572	82,556	68,128
12	20,000	–	4,599	4,599	68,128	52,727
13	20,000	–	3,559	3,559	52,727	36,286
14	20,000	–	2,449	2,449	36,286	18,735
15	20,000	–	1,265	1,265	18,735	0
Totals	200,000	124,175	75,825	200,000		

No entry would be made at the inception date of the agreement. The following entry would be made in year 1 to record the service component of the compensation expense and related deferred compensation agreement liability:

	Debit	*Credit*
Compensation expense	$24,835	
Deferred compensation liability		$24,835

[To record the column B service component]

Similar entries would be made in year 2 through year 5 to record the service component of the compensation expense.

In each subsequent period, until the date the employee is fully eligible for the deferred compensation benefit, the company would adjust the deferred compensation liability for the total expense (the service and interest components). In each period after the full eligibility date, the company would adjust the deferred compensation liability for the interest component and any benefit payment. In addition, the company would reassess the assumptions used in determining the expected future benefits under the agreement and the discount rate used to compute the present value of the expected benefits in each period after the inception of the agreement, and revise the assumptions and rate, as appropriate.

Assuming no changes were necessary to the assumptions used to determine the expected future benefits under the agreement or to the discount rate used to compute the present value of the expected benefits, the following entry would be made in year 2 to record the interest component of the compensation expense:

	Debit	*Credit*
Compensation expense	$1,676	
Deferred compensation liability		$1,676

[To record the column C interest component (computed by multiplying the prior-year column F balance by the discount rate)]

Similar entries (but for different amounts) would be made in year 3 through year 15 to record the interest component of the compensation expense.

The following entry would be made in year 6 to record the payment of the annual benefit:

	Debit	*Credit*
Deferred compensation liability	$20,000	
Cash		$20,000

[To record the column A benefit payment]

Similar entries would be made in year 7 through year 15 to record the payment of the annual benefit.

Incentive compensation practices in the financial industry were one of many factors that contributed to the financial crisis that began in mid-2007. Banking organizations too often rewarded employees for increasing the organization's revenue or short-term profit without adequate recognition of the risks the employees' activities posed to the organization.[1] These practices exacerbated the risks and losses at a number of banking organizations and resulted in the misalignment of the interests of employees with the long-term well-being and safety and soundness of their organizations. This section provides guidance on sound incentive compensation practices to banking organizations supervised by the Federal Reserve (also the Office of the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the Office of Thrift Supervision (collectively, the ''Agencies'')).[2] This guidance is intended to assist banking organizations in designing and implementing incentive compensation arrangements and related policies and procedures that effectively consider potential risks and risk outcomes.[3]

Alignment of incentives provided to employees with the interests of shareholders of the organization often also benefits safety and soundness. However, aligning employee incentives with the interests of shareholders is not always sufficient to address safety-and-soundness concerns. Because of the presence of the federal safety net (including the ability of insured depository institutions to raise insured deposits and access the discount window and payment services of the Federal Reserve), shareholders of a banking organization in some cases may be willing to tolerate a degree of risk that is inconsistent with the organization's safety and soundness. Accordingly, the Federal Reserve expects banking organizations to maintain incentive compensation practices that are consistent with safety and soundness, even when these practices go beyond those needed to align shareholder and employee interests.

To be consistent with safety and soundness, incentive compensation arrangements[4] at a banking organization should:

1. Provide employees incentives that appropriately balance risk and reward;
2. Be compatible with effective controls and risk-management; and
3. Be supported by strong corporate governance, including active and effective oversight by the organization's board of directors.

These principles, and the types of policies, procedures, and systems that banking organizations should have to help ensure compliance with them, are discussed later in this guidance.

The Federal Reserve expects banking organizations to regularly review their incentive compensation arrangements for all executive and non-executive employees who, either individually or as part of a group, have the ability to expose the organization to material amounts of risk, as well as to regularly review the risk-management, control, and corporate governance processes related to these arrangements. Banking organizations should immediately address any identified deficiencies in these arrangements or processes that are inconsistent with safety and soundness. Banking organizations are responsible for ensuring that their incentive compensation arrangements are consistent with the prin-

1. Examples of risks that may present a threat to the organization's safety and soundness include credit, market, liquidity, operational, legal, compliance, and reputational risks.

2. As used in this guidance, the term ''banking organization'' includes national banks, state member banks, state nonmember banks, savings associations, U.S. bank holding companies, savings and loan holding companies, Edge and agreement corporations, and the U.S. operations of foreign banking organizations (FBOs) with a branch, agency, or commercial lending company in the United States. If the Federal Reserve is referenced, the reference is intended to also include the other supervisory Agencies.

3. This guidance (see 75 *Fed. Reg.* 36395, June 25, 2010, for the entire text) and the principles reflected herein are consistent with the *Principles for Sound Compensation Practices* issued by the Financial Stability Board (FSB) in April 2009, and with the FSB's *Implementation Standards* for those principles, issued in September 2009.

4. In this guidance, the term ''incentive compensation'' refers to that portion of an employee's current or potential compensation that is tied to achievement of one or more specific metrics (e.g., a level of sales, revenue, or income). Incentive compensation does not include compensation that is awarded solely for, and the payment of which is solely tied to, continued employment (e.g., salary). In addition, the term does not include compensation arrangements that are determined based solely on the employee's level of compensation and does not vary based on one or more performance metrics (e.g., a 401(k) plan under which the organization contributes a set percentage of an employee's salary).

ciples described in this guidance and that they do not encourage employees to expose the organization to imprudent risks that may pose a threat to the safety and soundness of the organization.

The Federal Reserve recognizes that incentive compensation arrangements often seek to serve several important and worthy objectives. For example, incentive compensation arrangements may be used to help attract skilled staff, induce better organization-wide and employee performance, promote employee retention, provide retirement security to employees, or allow compensation expenses to vary with revenue on an organization-wide basis. Moreover, the analysis and methods for ensuring that incentive compensation arrangements take appropriate account of risk should be tailored to the size, complexity, business strategy, and risk tolerance of each organization. The resources required will depend upon the complexity of the firm and its use of incentive compensation arrangements. For some, the task of designing and implementing compensation arrangements that properly offer incentives for executive and non-executive employees to pursue the organization's long-term well-being and that do not encourage imprudent risk-taking is a complex task that will require the commitment of adequate resources.

While issues related to designing and implementing incentive compensation arrangements are complex, the Federal Reserve is committed to ensuring that banking organizations move forward in incorporating the principles described in this guidance into their incentive compensation practices.[5]

As discussed further below, because of the size and complexity of their operations, large complex banking organizations (LCBOs)[6] should have and adhere to systematic and formalized policies, procedures, and processes. These are considered important in ensuring that incentive compensation arrangements for all covered employees are identified and reviewed by appropriate levels of management (including the board of directors where appropriate and control units), and that they appropriately balance risks and rewards. In several places, this guidance specifically highlights the types of policies, procedures, and systems that LCBOs should have and maintain but that generally are not expected of smaller, less complex organizations. LCBOs warrant the most intensive supervisory attention because they are significant users of incentive compensation arrangements and because flawed approaches at these organizations are more likely to have adverse effects on the broader financial system. The Federal Reserve will work with LCBOs as necessary through the supervisory process to ensure that they promptly correct any deficiencies that may be inconsistent with the safety and soundness of the organization.

The policies, procedures, and systems of smaller banking organizations that use incentive compensation arrangements[7] are expected to be less extensive, formalized, and detailed than those of LCBOs. Supervisory reviews of incentive compensation arrangements at smaller, less-complex banking organizations will be conducted by the Federal Reserve as part of the evaluation of those organizations' risk-management, internal controls, and corporate governance during the regular, risk-focused examination process. These reviews will be tailored to reflect the scope and complexity of an organization's activities, as well as the prevalence and scope of its incentive compensation arrangements. Little, if any, additional examination work is expected for smaller banking organizations that do not use, to a significant extent, incentive compensation arrangements.[8]

5. In December 2009, the Federal Reserve, working with the other Agencies, initiated a special horizontal review of incentive compensation arrangements and related risk-management, control, and corporate governance practices of large banking organizations (LBOs). This initiative was designed to spur and monitor the industry's progress towards the implementation of safe and sound incentive compensation arrangements, identify emerging best practices, and advance the state of practice more generally in the industry.

6. For supervisory purposes, the Federal Reserve (as well as the other federal bank regulatory agencies) segments the organizations it supervises into different supervisory portfolios based on, among other things, size, complexity, and risk profile. For purposes of this guidance, the LBOs referred to in the guidance are identified in this section as large complex banking organizations to be consistent with the Federal Reserve's other supervisory policies. LBOs are designated by (1) the OCC as the largest and most complex national banks as defined in the Large Bank Supervision booklet of the Comptroller's Handbook; (2) the FDIC, large, complex insured depository institutions (IDIs); and (3) the OTS, the largest and most complex savings associations and savings and loan holding companies.

7. This guidance does not apply to banking organizations that do not use incentive compensation.

8. To facilitate these reviews, where appropriate, a smaller banking organization should review its compensation arrangements to determine whether it uses incentive compensation arrangements to a significant extent in its business operations. A smaller banking organization will not be considered a significant user of incentive compensation arrangements simply because the organization has a firm-wide profit-sharing or

For all banking organizations, supervisory findings related to incentive compensation will be communicated to the organization and included in the relevant report of examination or inspection. In addition, these findings will be incorporated, as appropriate, into the organization's rating component(s) and subcomponent(s) relating to risk-management, internal controls, and corporate governance under the relevant supervisory rating system, as well as the organization's overall supervisory rating.

The Federal Reserve (or the organization's appropriate federal supervisor) may take enforcement action against a banking organization if its incentive compensation arrangements or related risk-management, control, or governance processes pose a risk to the safety and soundness of the organization, particularly when the organization is not taking prompt and effective measures to correct the deficiencies. For example, the appropriate federal supervisor may take an enforcement action if material deficiencies are found to exist in the organization's incentive compensation arrangements or related risk-management, control, or governance processes, or the organization fails to promptly develop, submit, or adhere to an effective plan designed to ensure that its incentive compensation arrangements do not encourage imprudent risk-taking and are consistent with principles of safety and soundness. As provided under section 8 of the Federal Deposit Insurance Act (12 U.S.C. 1818), an enforcement action may, among other things, require an organization to take affirmative action, such as developing a corrective action plan that is acceptable to the appropriate federal supervisor to rectify safety-and-soundness deficiencies in its incentive compensation arrangements or related processes. Where warranted, the appropriate federal supervisor may require the organization to take additional affirmative action to correct or remedy deficiencies related to the organization's incentive compensation practices.

Effective and balanced incentive compensation practices are likely to evolve significantly in the coming years, spurred by the efforts of banking organizations, supervisors, and other stakeholders. The Federal Reserve will review and update this guidance as appropriate to incorporate best practices that emerge from these efforts.

bonus plan that is based on the bank's profitability, even if the plan covers all or most of the organization's employees.

SCOPE OF APPLICATION

The incentive compensation arrangements and related policies and procedures of banking organizations should be consistent with principles of safety and soundness.[9] Incentive compensation arrangements for executive officers as well as for non-executive personnel who have the ability to expose a banking organization to material amounts of risk may, if not properly structured, pose a threat to the organization's safety and soundness. Accordingly, this guidance applies to incentive compensation arrangements for:

1. Senior executives and others who are responsible for oversight of the organization's firm-wide activities or material business lines;[10]
2. Individual employees, including non-executive employees, whose activities may expose the organization to material amounts of risk (e.g., traders with large position limits relative to the organization's overall risk tolerance); and
3. Groups of employees who are subject to the same or similar incentive compensation arrangements and who, in the aggregate, may expose the organization to material amounts of risk, even if no individual employee is likely to expose the organization to material risk (e.g., loan officers who, as a group, originate loans that account for a material amount of the organization's credit risk).

For ease of reference, these executive and non-executive employees are collectively referred to hereafter as "covered employees" or "employees." Depending on the facts and circumstances of the individual organization, the

9. In the case of the U.S. operations of FBOs, the organization's policies, including management, review, and approval requirements for its U.S. operations, should be coordinated with the FBO's group-wide policies developed in accordance with the rules of the FBO's home country supervisor. The policies of the FBO's U.S. operations should also be consistent with the FBO's overall corporate and management structure, as well as its framework for risk-management and internal controls. In addition, the policies for the U.S. operations of FBOs should be consistent with this guidance.

10. Senior executives include, at a minimum, "executive officers" within the meaning of the Federal Reserve's Regulation O (see 12 CFR 215.2(e)(1)) and, for publicly traded companies, "named officers" within the meaning of the Securities and Exchange Commission's rules on disclosure of executive compensation (see 17 CFR 229.402(a)(3)). Savings associations should also refer to the OTS's rule on loans by savings associations to their executive officers, directors, and principal shareholders. (12 CFR 563.43).

types of employees or categories of employees that are outside the scope of this guidance because they do not have the ability to expose the organization to material risks would likely include, for example, tellers, bookkeepers, couriers, or data processing personnel.

In determining whether an employee, or group of employees, may expose a banking organization to material risk, the organization should consider the full range of inherent risks arising from, or generated by, the employee's activities, even if the organization uses risk-management processes or controls to limit the risks such activities ultimately may pose to the organization. Moreover, risks should be considered to be material for purposes of this guidance if they are material to the organization, or are material to a business line or operating unit that is itself material to the organization.[11]

For purposes of illustration, assume that a banking organization has a structured-finance unit that is material to the organization. A group of employees within that unit who originate structured-finance transactions that may expose the unit to material risks should be considered "covered employees" for purposes of this guidance even if those transactions must be approved by an independent risk function prior to consummation, or the organization uses other processes or methods to limit the risk that such transactions may present to the organization.

Strong and effective risk-management and internal control functions are critical to the safety and soundness of banking organizations. However, irrespective of the quality of these functions, poorly designed or managed incentive compensation arrangements can themselves be a source of risk to a banking organization. For example, incentive compensation arrangements that provide employees strong incentives to increase the organization's short-term revenues or profits, without regard to the short- or long-term risk associated with such business, can place substantial strain on the risk-management and internal control functions of even well-managed organizations.

Moreover, poorly balanced incentive compensation arrangements can encourage employees to take affirmative actions to weaken or circumvent the organization's risk-management or internal control functions, such as by providing inaccurate or incomplete information to these functions, to boost the employee's personal compensation. Accordingly, sound compensation practices are an integral part of strong risk-management and internal control functions. A key goal of this guidance is to encourage banking organizations to incorporate the risks related to incentive compensation into their broader risk-management framework. Risk-management procedures and risk controls that ordinarily limit risk-taking do not obviate the need for incentive compensation arrangements to properly balance risk-taking incentives.

11. Thus, risks may be material to an organization even if they are not large enough themselves to threaten the solvency of the organization.

PRINCIPLES OF A SOUND INCENTIVE COMPENSATION SYSTEM

Principle 1: Balanced Risk-Taking Incentives

Incentive compensation arrangements should balance risk and financial results in a manner that does not encourage employees to expose their organizations to imprudent risks.

Incentive compensation arrangements typically attempt to encourage actions that result in greater revenue or profit for the organization. However, short-run revenue or profit can often diverge sharply from actual long-run profit because risk outcomes may become clear only over time. Activities that carry higher risk typically yield higher short-term revenue, and an employee who is given incentives to increase short-term revenue or profit, without regard to risk, will naturally be attracted to opportunities to expose the organization to more risk.

An incentive compensation arrangement is balanced when the amounts paid to an employee appropriately take into account the risks (including compliance risks), as well as the financial benefits, from the employee's activities and the impact of those activities on the organization's safety and soundness. As an example, under a balanced incentive compensation arrangement, two employees who generate the same amount of short-term revenue or profit for an organization should not receive the same amount of incentive compensation if the risks taken by the employees in generating that revenue or profit differ materially. The employee whose activities create materially larger risks for the organization should receive less than the other employee, all else being equal.

The performance measures used in an incentive compensation arrangement have an important effect on the incentives provided employees and, thus, the potential for the arrangement to encourage imprudent risk-taking. For example, if an employee's incentive compensation payments are closely tied to short-term revenue or profit of business generated by the employee, without any adjustments for the risks associated with the business generated, the potential for the arrangement to encourage imprudent risk-taking may be quite strong. Similarly, traders who work with positions that close at year-end could have an incentive to take large risks toward the end of a year if there is no mechanism for factoring how such positions perform over a longer period of time. The same result could ensue if the performance measures themselves lack integrity or can be manipulated inappropriately by the employees receiving incentive compensation.

On the other hand, if an employee's incentive compensation payments are determined based on performance measures that are only distantly linked to the employee's activities (e.g., for most employees, organization-wide profit), the potential for the arrangement to encourage the employee to take imprudent risks on behalf of the organization may be weak. For this reason, plans that provide for awards based solely on overall organization-wide performance are unlikely to provide employees, other than senior executives and individuals who have the ability to materially affect the organization's overall risk profile, with unbalanced risk-taking incentives.

Incentive compensation arrangements should not only be balanced in design, they also should be implemented so that actual payments vary based on risks or risk outcomes. If, for example, employees are paid substantially all of their potential incentive compensation even when risk or risk outcomes are materially worse than expected, employees have less incentive to avoid activities with substantial risk.

- *Banking organizations should consider the full range of risks associated with an employee's activities, as well as the time horizon over which those risks may be realized, in assessing whether incentive compensation arrangements are balanced.*

The activities of employees may create a wide range of risks for a banking organization, such as credit, market, liquidity, operational, legal, compliance, and reputational risks, as well as other risks to the viability or operation of the organization. Some of these risks may be realized in the short term, while others may become apparent only over the long term. For example, future revenues that are booked as current income may not materialize, and short-term profit-and-loss measures may not appropriately reflect differences in the risks associated with the revenue derived from different activities (e.g., the higher credit or compliance risk associated with subprime loans versus prime loans).[12] In addition, some risks (or combinations of risky strategies and positions) may have a low probability of being realized, but would have highly adverse effects on the organization if they were to be realized ("bad tail risks"). While shareholders may have less incentive to guard against bad tail risks because of the infrequency of their realization and the existence of the federal safety net, these risks warrant special attention for safety-and-soundness reasons given the threat they pose to the organization's solvency and the federal safety net.

Banking organizations should consider the full range of current and potential risks associated with the activities of covered employees, including the cost and amount of capital and liquidity needed to support those risks, in developing balanced incentive compensation arrangements. Reliable quantitative measures of risk and risk outcomes ("quantitative measures"), where available, may be particularly useful in developing balanced compensation arrangements and in assessing the extent to which arrangements are properly balanced. However, reliable quantitative measures may not be available for all types of risk or for all activities, and their utility for use in compensation arrangements varies across business lines and employees. The absence of reliable quantitative measures for certain types of risks or outcomes does not mean that banking organizations should ignore such risks or outcomes for purposes of assessing whether an incentive compensation

12. Importantly, the time horizon over which a risk outcome may be realized is not necessarily the same as the stated maturity of an exposure. For example, the ongoing reinvestment of funds by a cash management unit in commercial paper with a one-day maturity not only exposes the organization to one-day credit risk, but also exposes the organization to liquidity risk that may be realized only infrequently.

arrangement achieves balance. For example, while reliable quantitative measures may not exist for many bad-tail risks, it is important that such risks be considered given their potential effect on safety and soundness. As in other risk-management areas, banking organizations should rely on informed judgments, supported by available data, to estimate risks and risk outcomes in the absence of reliable quantitative risk measures.

Large complex banking organizations. In designing and modifying incentive compensation arrangements, LCBOs should assess in advance of implementation whether such arrangements are likely to provide balanced risk-taking incentives. Simulation analysis of incentive compensation arrangements is one way of doing so. Such analysis uses forward-looking projections of incentive compensation awards and payments based on a range of performance levels, risk outcomes, and levels of risks taken. This type of analysis, or other analysis that results in assessments of likely effectiveness, can help an LCBO assess whether incentive compensation awards and payments to an employee are likely to be reduced appropriately as the risks to the organization from the employee's activities increase.

- *An unbalanced arrangement can be moved toward balance by adding or modifying features that cause the amounts ultimately received by employees to appropriately reflect risk and risk outcomes.*

If an incentive compensation arrangement may encourage employees to expose their banking organization to imprudent risks, the organization should modify the arrangement as needed to ensure that it is consistent with safety and soundness. Four methods are often used to make compensation more sensitive to risk. These methods are:

1. *Risk Adjustment of Awards:* The amount of an incentive compensation award for an employee is adjusted based on measures that take into account the risk the employee's activities may pose to the organization. Such measures may be quantitative, or the size of a risk adjustment may be set judgmentally, subject to appropriate oversight.
2. *Deferral of Payment:* The actual payout of an award to an employee is delayed significantly beyond the end of the performance period, and the amounts paid are adjusted for actual losses or other aspects of performance that are realized or become better known only during the deferral period.[13] Deferred payouts may be altered according to risk outcomes either formulaically or judgmentally, subject to appropriate oversight. To be most effective, the deferral period should be sufficiently long to allow for the realization of a substantial portion of the risks from employee activities, and the measures of loss should be clearly explained to employees and closely tied to their activities during the relevant performance period.
3. *Longer Performance Periods:* The time period covered by the performance measures used in determining an employee's award is extended (for example, from one year to two or more years). Longer performance periods and deferral of payment are related in that both methods allow awards or payments to be made after some or all risk outcomes are realized or better known.
4. *Reduced Sensitivity to Short-Term Performance:* The banking organization reduces the rate at which awards increase as an employee achieves higher levels of the relevant performance measure(s). Rather than offsetting risk-taking incentives associated with the use of short-term performance measures, this method reduces the magnitude of such incentives. This method also can include improving the quality and reliability of performance measures in taking into account both short-term and long-term risks, for example improving the reliability and accuracy of estimates of revenues and long-term profits upon which performance measures depend.[14]

13. The deferral-of-payment method is sometimes referred to in the industry as a "clawback." The term "clawback" also may refer specifically to an arrangement under which an employee must return incentive compensation payments previously received by the employee (and not just deferred) if certain risk outcomes occur. Section 304 of the Sarbanes-Oxley Act of 2002 (15 U.S.C. 7243), which applies to chief executive officers and chief financial officers of public banking organizations, is an example of this more specific type of "clawback" requirement.

14. Performance targets may have a material effect on risk-taking incentives. Such targets may offer employees greater rewards for increments of performance that are above

These methods for achieving balance are not exclusive, and additional methods or variations may exist or be developed. Moreover, each method has its own advantages and disadvantages. For example, where reliable risk measures exist, risk adjustment of awards may be more effective than deferral of payment in reducing incentives for imprudent risk-taking. This is because risk adjustment potentially can take account of the full range and time horizon of risks, rather than just those risk outcomes that occur or become more evident during the deferral period. On the other hand, deferral of payment may be more effective than risk adjustment in mitigating incentives to take hard-to-measure risks (such as the risks of new activities or products, or certain risks such as reputational or operational risk that may be difficult to measure with respect to particular activities), especially if such risks are likely to be realized during the deferral period. Accordingly, in some cases two or more methods may be needed in combination for an incentive compensation arrangement to be balanced.

The greater the potential incentives an arrangement creates for an employee to increase the risks associated with the employee's activities, the stronger the effect should be of the methods applied to achieve balance. Thus, for example, risk adjustments used to counteract a materially unbalanced compensation arrangement should have a similarly material impact on the incentive compensation paid under the arrangement. Further, improvements in the quality and reliability of performance measures themselves, for example, improving the reliability and accuracy of estimates of revenues and profits upon which performance measures depend, can significantly improve the degree of balance in risk-taking incentives.

Where judgment plays a significant role in the design or operation of an incentive compensation arrangement, strong policies and procedures, internal controls, and ex post monitoring of incentive compensation payments relative to actual risk outcomes are particularly important to help ensure that the arrangements as implemented are balanced and do not encourage imprudent risk-taking. For example, if a banking organization relies to a significant degree on the judgment of one or more managers to ensure that the incentive compensation awards to employees are appropriately risk-adjusted, the organization should have policies and procedures that describe how managers are expected to exercise that judgment to achieve balance and that provide for the manager(s) to receive appropriate available information about the employee's risk-taking activities to make informed judgments.

the target or may provide that awards will be granted only if a target is met or exceeded. Employees may be particularly motivated to take imprudent risk in order to reach performance targets that are aggressive but potentially achievable.

Large complex banking organizations. Methods and practices for making compensation sensitive to risk are likely to evolve rapidly during the next few years, driven in part by the efforts of supervisors and other stakeholders. LCBOs should actively monitor developments in the field and should incorporate into their incentive compensation systems new or emerging methods or practices that are likely to improve the organization's long-term financial well-being and safety and soundness.

- *The manner in which a banking organization seeks to achieve balanced incentive compensation arrangements should be tailored to account for the differences between employees—including the substantial differences between senior executives and other employees—as well as between banking organizations.*

Activities and risks may vary significantly both across banking organizations and across employees within a particular banking organization. For example, activities, risks, and incentive compensation practices may differ materially among banking organizations based on, among other things, the scope or complexity of activities conducted and the business strategies pursued by the organizations. These differences mean that methods for achieving balanced compensation arrangements at one organization may not be effective in restraining incentives to engage in imprudent risk-taking at another organization. Each organization is responsible for ensuring that its incentive compensation arrangements are consistent with the safety and soundness of the organization.

Moreover, the risks associated with the activities of one group of non-executive employees (e.g., loan originators) within a banking organization may differ significantly from those of another group of non-executive employees (e.g., spot foreign exchange traders) within the organization. In addition, reliable quantitative measures of risk and risk outcomes are unlikely to be available for a banking organization as a whole, particularly a large, complex organization. This factor can make it difficult for banking organizations to achieve balanced compensation arrangements for senior executives who have responsibility for managing risks on an organization-wide basis solely through use of the risk-adjustment-of-award method.

Furthermore, the payment of deferred incentive compensation in equity (such as restricted stock of the organization) or equity-based instruments (such as options to acquire the organization's stock) may be helpful in restraining the risk-taking incentives of senior executives and other covered employees whose activities may have a material effect on the overall financial performance of the organization. However, equity-related deferred compensation may not be as effective in restraining the incentives of lower-level covered employees (particularly at large organizations) to take risks because such employees are unlikely to believe that their actions will materially affect the organization's stock price.

Banking organizations should take account of these differences when constructing balanced compensation arrangements. For most banking organizations, the use of a single, formulaic approach to making employee incentive compensation arrangements appropriately risk-sensitive is likely to result in arrangements that are unbalanced at least with respect to some employees.[15]

Large complex banking organizations. Incentive compensation arrangements for senior executives at LCBOs are likely to be better balanced if they involve deferral of a substantial portion of the executives' incentive compensation over a multi-year period in a way that reduces the amount received in the event of poor performance, substantial use of multi-year performance periods, or both. Similarly, the compensation arrangements for senior executives at LCBOs are likely to be better balanced if a significant portion of the incentive compensation of these executives is paid in the form of equity-based instruments that vest over multiple years, with the number of instruments ultimately received dependent on the performance of the organization during the deferral period.

The portion of the incentive compensation of other covered employees that is deferred or paid in the form of equity-based instruments should appropriately take into account the level, nature, and duration of the risks that the employees' activities create for the organization and the extent to which those activities may materially affect the overall performance of the organization and its stock price. Deferral of a substantial portion of an employee's incentive compensation may not be workable for employees at lower pay scales because of their more limited financial resources. This may require increased reliance on other measures in the incentive compensation arrangements for these employees to achieve balance.

- *Banking organizations should carefully consider the potential for "golden parachutes" and the vesting arrangements for deferred compensation to affect the risk-taking behavior of employees while at the organizations.*

Arrangements that provide for an employee (typically a senior executive), upon departure from the organization or a change in control of the organization, to receive large additional payments or the accelerated payment of deferred amounts without regard to risk or risk outcomes can provide the employee significant incentives to expose the organization to undue risk. For example, an arrangement that provides an employee with a guaranteed payout upon departure from an organization, regardless of performance, may neutralize the effect of any balancing features included in the arrangement to help prevent imprudent risk-taking.

Banking organizations should carefully review any such existing or proposed arrangements (sometimes called "golden parachutes") and the potential impact of such arrangements on the organization's safety and soundness. In appropriate circumstances an organization should consider including balancing features—such as risk adjustment or deferral requirements that extend past the employee's departure—in the arrangements to mitigate the potential for the arrangements to encourage imprudent risk-taking. In all cases, a banking organization should ensure that the structure and terms of any golden parachute

15. For example, spreading payouts of incentive compensation awards over a standard three-year period may not appropriately reflect the differences in the type and time horizon of risk associated with the activities of different groups of employees, and may not be sufficient by itself to balance the compensation arrangements of employees who may expose the organization to substantial longer-term risks.

arrangement entered into by the organization do not encourage imprudent risk-taking in light of the other features of the employee's incentive compensation arrangements.

Large complex banking organizations. Provisions that require a departing employee to forfeit deferred incentive compensation payments may weaken the effectiveness of the deferral arrangement if the departing employee is able to negotiate a "golden handshake" arrangement with the new employer.[16] This weakening effect can be particularly significant for senior executives or other skilled employees at LCBOs whose services are in high demand within the market.

Golden handshake arrangements present special issues for LCBOs and supervisors. For example, while a banking organization could adjust its deferral arrangements so that departing employees will continue to receive any accrued deferred compensation after departure (subject to any clawback or malus[17]), these changes could (1) reduce the employee's incentive to remain at the organization and, thus, weaken an organization's ability to retain qualified talent, which is an important goal of compensation, and (2) create conflicts of interest. Moreover, actions of the hiring organization (which may or may not be a supervised banking organization) ultimately may defeat these or other risk-balancing aspects of a banking organization's deferral arrangements. LCBOs should monitor whether golden handshake arrangements are materially weakening the organization's efforts to constrain the risk-taking incentives of employees. The Federal Reserve will continue to work with banking organizations and others to develop appropriate methods for addressing any effect that such arrangements may have on the safety and soundness of banking organizations.

- *Banking organizations should effectively communicate to employees the ways in which incentive compensation awards and payments will be reduced as risks increase.*

In order for the risk-sensitive provisions of incentive compensation arrangements to affect employee risk-taking behavior, the organization's employees need to understand that the amount of incentive compensation that they may receive will vary based on the risk associated with their activities. Accordingly, banking organizations should ensure that employees covered by an incentive compensation arrangement are informed about the key ways in which risks are taken into account in determining the amount of incentive compensation paid. Where feasible, an organization's communications with employees should include examples of how incentive compensation payments may be adjusted to reflect projected or actual risk outcomes. An organization's communications should be tailored appropriately to reflect the sophistication of the relevant audience(s).

Principle 2: Compatibility with Effective Controls and Risk-Management

A banking organization's risk-management processes and internal controls should reinforce and support the development and maintenance of balanced incentive compensation arrangements.

In order to increase their own compensation, employees may seek to evade the processes established by a banking organization to achieve balanced compensation arrangements. Similarly, an employee covered by an incentive compensation arrangement may seek to influence, in ways designed to increase the employee's pay, the risk measures or other information or judgments that are used to make the employee's pay sensitive to risk.

Such actions may significantly weaken the effectiveness of an organization's incentive compensation arrangements in restricting imprudent risk-taking. These actions can have a particularly damaging effect on the safety and soundness of the organization if they result in the weakening of risk measures, information, or judgments that the organization uses for other risk-management, internal control, or financial purposes. In such cases, the employee's actions

16. Golden handshakes are arrangements that compensate an employee for some or all of the estimated, non-adjusted value of deferred incentive compensation that would have been forfeited upon departure from the employee's previous employment.

17. A malus arrangement permits the employer to prevent vesting of all or part of the amount of a deferred remuneration award. Malus provisions are invoked when risk outcomes are worse than expected or when the information upon which the award was based turns out to have been incorrect. Loss of unvested compensation due to the employee voluntarily leaving the firm is not an example of malus as the term is used in this guidance.

may weaken not only the balance of the organization's incentive compensation arrangements, but also the risk-management, internal controls, and other functions that are supposed to act as a separate check on risk-taking. For this reason, traditional risk-management controls alone do not eliminate the need to identify employees who may expose the organization to material risk, nor do they obviate the need for the incentive compensation arrangements for these employees to be balanced. Rather, a banking organization's risk-management processes and internal controls should reinforce and support the development and maintenance of balanced incentive compensation arrangements.

- *Banking organizations should have appropriate controls to ensure that their processes for achieving balanced compensation arrangements are followed and to maintain the integrity of their risk-management and other functions.*

To help prevent damage from occurring, a banking organization should have strong controls governing its process for designing, implementing, and monitoring incentive compensation arrangements. Banking organizations should create and maintain sufficient documentation to permit an audit of the effectiveness of the organization's processes for establishing, modifying, and monitoring incentive compensation arrangements. Smaller banking organizations should incorporate reviews of these processes into their overall framework for compliance monitoring (including internal audit).

Large complex banking organizations. LCBOs should have and maintain policies and procedures that (1) identify and describe the role(s) of the personnel, business units, and control units authorized to be involved in the design, implementation, and monitoring of incentive compensation arrangements; (2) identify the source of significant risk-related inputs into these processes and establish appropriate controls governing the development and approval of these inputs to help ensure their integrity; and (3) identify the individual(s) and control unit(s) whose approval is necessary for the establishment of new incentive compensation arrangements or modification of existing arrangements.

An LCBO also should conduct regular internal reviews to ensure that its processes for achieving and maintaining balanced incentive compensation arrangements are consistently followed. Such reviews should be conducted by audit, compliance, or other personnel in a manner consistent with the organization's overall framework for compliance monitoring. An LCBO's internal audit department also should separately conduct regular audits of the organization's compliance with its established policies and controls relating to incentive compensation arrangements. The results should be reported to appropriate levels of management and, where appropriate, the organization's board of directors.

- *Appropriate personnel, including risk-management personnel, should have input into the organization's processes for designing incentive compensation arrangements and assessing their effectiveness in restraining imprudent risk-taking.*

Developing incentive compensation arrangements that provide balanced risk-taking incentives and monitoring arrangements to ensure they achieve balance over time requires an understanding of the risks (including compliance risks) and potential risk outcomes associated with the activities of the relevant employees. Accordingly, banking organizations should have policies and procedures that ensure that risk-management personnel have an appropriate role in the organization's processes for designing incentive compensation arrangements and for assessing their effectiveness in restraining imprudent risk-taking.[18] Ways that risk managers might assist in achieving balanced compensation arrangements include, but are not limited to

1. reviewing the types of risks associated with the activities of covered employees;
2. approving the risk measures used in risk adjustments and performance measures, as well as measures of risk outcomes used in deferred-payout arrangements; and
3. analyzing risk-taking and risk outcomes relative to incentive compensation payments.

Other functions within an organization, such as its control, human resources, or finance func-

18. Involvement of risk-management personnel in the design and monitoring of these arrangements also should help ensure that the organization's risk-management functions can properly understand and address the full range of risks facing the organization.

tions, also play an important role in helping ensure that incentive compensation arrangements are balanced. For example, these functions may contribute to the design and review of performance measures used in compensation arrangements or may supply data used as part of these measures.

- *Compensation for employees in risk-management and control functions should be sufficient to attract and retain qualified personnel and should avoid conflicts of interest.*

The risk-management and control personnel involved in the design, oversight, and operation of incentive compensation arrangements should have appropriate skills and experience needed to effectively fulfill their roles. These skills and experiences should be sufficient to equip the personnel to remain effective in the face of challenges by covered employees seeking to increase their incentive compensation in ways that are inconsistent with sound risk-management or internal controls. The compensation arrangements for employees in risk-management and control functions thus should be sufficient to attract and retain qualified personnel with experience and expertise in these fields that is appropriate in light of the size, activities, and complexity of the organization.

In addition, to help preserve the independence of their perspectives, the incentive compensation received by risk-management and control personnel staff should not be based substantially on the financial performance of the business units that they review. Rather, the performance measures used in the incentive compensation arrangements for these personnel should be based primarily on the achievement of the objectives of their functions (e.g., adherence to internal controls).

- *Banking organizations should monitor the performance of their incentive compensation arrangements and should revise the arrangements as needed if payments do not appropriately reflect risk.*

Banking organizations should monitor incentive compensation awards and payments, risks taken, and actual risk outcomes to determine whether incentive compensation payments to employees are reduced to reflect adverse risk outcomes or high levels of risk taken. Results should be reported to appropriate levels of management, including the board of directors where warranted and consistent with Principle 3 below. The monitoring methods and processes used by a banking organization should be commensurate with the size and complexity of the organization, as well as its use of incentive compensation. Thus, for example, a small, noncomplex organization that uses incentive compensation only to a limited extent may find that it can appropriately monitor its arrangements through normal management processes.

A banking organization should take the results of such monitoring into account in establishing or modifying incentive compensation arrangements and in overseeing associated controls. If, over time, incentive compensation paid by a banking organization does not appropriately reflect risk outcomes, the organization should review and revise its incentive compensation arrangements and related controls to ensure that the arrangements, as designed and implemented, are balanced and do not provide employees incentives to take imprudent risks.

Principle 3: Strong Corporate Governance

Banking organizations should have strong and effective corporate governance to help ensure sound compensation practices, including active and effective oversight by the board of directors.

Given the key role of senior executives in managing the overall risk-taking activities of an organization, the board of directors of a banking organization should directly approve the incentive compensation arrangements for senior executives.[19] The board also should approve and document any material exceptions or adjustments to the incentive compensation arrangements established for senior executives and

19. As used in this guidance, the term "board of directors" is used to refer to the members of the board of directors who have primary responsibility for overseeing the incentive compensation system. Depending on the manner in which the board is organized, the term may refer to the entire board of directors, a compensation committee of the board, or another committee of the board that has primary responsibility for overseeing the incentive compensation system. In the case of FBOs, the term refers to the relevant oversight body for the firm's U.S. operations, consistent with the FBO's overall corporate and management structure.

should carefully consider and monitor the effects of any approved exceptions or adjustments on the balance of the arrangement, the risk-taking incentives of the senior executive, and the safety and soundness of the organization.

The board of directors of an organization also is ultimately responsible for ensuring that the organization's incentive compensation arrangements for all covered employees are appropriately balanced and do not jeopardize the safety and soundness of the organization. The involvement of the board of directors in oversight of the organization's overall incentive compensation program should be scaled appropriately to the scope and prevalence of the organization's incentive compensation arrangements.

Large complex banking organizations and organizations that are significant users of incentive compensation. The board of directors of an LCBO or other banking organization that uses incentive compensation to a significant extent should actively oversee the development and operation of the organization's incentive compensation policies, systems, and related control processes. The board of directors of such an organization should review and approve the overall goals and purposes of the organization's incentive compensation system. In addition, the board should provide clear direction to management to ensure that the goals and policies it establishes are carried out in a manner that achieves balance and is consistent with safety and soundness.

The board of directors of such an organization also should ensure that steps are taken so that the incentive compensation system—including performance measures and targets—is designed and operated in a manner that will achieve balance.

- *The board of directors should monitor the performance, and regularly review the design and function, of incentive compensation arrangements.*

To allow for informed reviews, the board should receive data and analysis from management or other sources that are sufficient to allow the board to assess whether the overall design and performance of the organization's incentive compensation arrangements are consistent with the organization's safety and soundness. These reviews and reports should be appropriately scoped to reflect the size and complexity of the banking organization's activities and the prevalence and scope of its incentive compensation arrangements.

The board of directors of a banking organization should closely monitor incentive compensation payments to senior executives and the sensitivity of those payments to risk outcomes. In addition, if the compensation arrangement for a senior executive includes a clawback provision, then the review should include sufficient information to determine if the provision has been triggered and executed as planned.

The board of directors of a banking organization should seek to stay abreast of significant emerging changes in compensation plan mechanisms and incentives in the marketplace as well as developments in academic research and regulatory advice regarding incentive compensation policies. However, the board should recognize that organizations, activities, and practices within the industry are not identical. Incentive compensation arrangements at one organization may not be suitable for use at another organization because of differences in the risks, controls, structure, and management among organizations. The board of directors of each organization is responsible for ensuring that the incentive compensation arrangements for its organization do not encourage employees to take risks that are beyond the organization's ability to manage effectively, regardless of the practices employed by other organizations.

Large complex banking organizations and organizations that are significant users of incentive compensation. The board of an LCBO or other organization that uses incentive compensation to a significant extent should receive and review, on an annual or more frequent basis, an assessment by management, with appropriate input from risk-management personnel, of the effectiveness of the design and operation of the organization's incentive compensation system in providing risk-taking incentives that are consistent with the organization's safety and soundness. These reports should include an evaluation of whether or how incentive compensation practices may increase the potential for imprudent risk-taking.

The board of such an organization also should receive periodic reports that review incentive compensation awards and payments relative to risk outcomes on a backward-looking basis to determine whether the organization's incentive compensation arrangements may be promoting imprudent risk-taking. Boards of directors of these organizations also should consider periodically obtaining and reviewing simulation analysis of compensation on a forward-looking basis based on a range of performance levels, risk outcomes, and the amount of risks taken.

- *The organization, composition, and resources of the board of directors should permit effective oversight of incentive compensation.*

The board of directors of a banking organization should have, or have access to, a level of expertise and experience in risk-management and compensation practices in the financial services industry that is appropriate for the nature, scope, and complexity of the organization's activities. This level of expertise may be present collectively among the members of the board, may come from formal training or from experience in addressing these issues, including as a director, or may be obtained through advice received from outside counsel, consultants, or other experts with expertise in incentive compensation and risk-management. The board of directors of an organization with less complex and extensive incentive compensation arrangements may not find it necessary or appropriate to require special board expertise or to retain and use outside experts in this area.

In selecting and using outside parties, the board of directors should give due attention to potential conflicts of interest arising from other dealings of the parties with the organization or for other reasons. The board also should exercise caution to avoid allowing outside parties to obtain undue levels of influence. While the retention and use of outside parties may be helpful, the board retains ultimate responsibility for ensuring that the organization's incentive compensation arrangements are consistent with safety and soundness.

Large complex banking organizations and organizations that are significant users of incentive compensation. If a separate compensation committee is not already in place or required by other authorities,[20] the board of directors of an LCBO or other banking organization that uses incentive compensation to a significant extent should consider establishing such a committee—reporting to the full board—that has primary responsibility for overseeing the organization's incentive compensation systems. A compensation committee should be composed solely or predominantly of non-executive directors. If the board does not have such a compensation committee, the board should take other steps to ensure that non-executive directors of the board are actively involved in the oversight of incentive compensation systems. The compensation committee should work closely with any board-level risk and audit committees where the substance of their actions overlap.

- *A banking organization's disclosure practices should support safe and sound incentive compensation arrangements.*

If a banking organization's incentive compensation arrangements provide employees incentives to take risks that are beyond the tolerance of the organization's shareholders, these risks are likely to also present a risk to the safety and soundness of the organization.[21] To help promote safety and soundness, a banking organization should provide an appropriate amount of information concerning its incentive compensation arrangements for executive and non-executive employees and related risk-management, control, and governance processes to shareholders to allow them to monitor and, where appropriate, take actions to restrain the potential for such arrangements and processes that encourage employees to take imprudent risks. Such disclosures should include information relevant to employees other than senior executives. The scope and level of the information disclosed by the organization should be tailored to the nature and complexity of the organization and its incentive compensation arrangements.[22]

- *Large complex banking organizations should follow a systematic approach to developing a compensation system that has balanced incentive compensation arrangements.*

20. See New York Stock Exchange Listed Company Manual Section 303A.05(a); Nasdaq Listing Rule 5605(d); Internal Revenue Code section 162(m) (26 U.S.C. 162(m)).

21. On the other hand, as noted previously, compensation arrangements that are in the interests of the shareholders of a banking organization are not necessarily consistent with safety and soundness.

22. A banking organization also should comply with the incentive compensation disclosure requirements of the federal securities law and other laws as applicable. See, for example, Proxy Disclosure Enhancements, SEC Release Nos. 33-9089, 34-61175, 74 F.R. 68334 (Dec. 23, 2009) (to be codified at 17 CFR 229 and 249).

At banking organizations with large numbers of risk-taking employees engaged in diverse activities, an ad hoc approach to developing balanced arrangements is unlikely to be reliable. Thus, an LCBO should use a systematic approach—supported by robust and formalized policies, procedures, and systems—to ensure that those arrangements are appropriately balanced and consistent with safety and soundness. Such an approach should provide for the organization effectively to:

1. Identify employees who are eligible to receive incentive compensation and whose activities may expose the organization to material risks. These employees should include
   a. senior executives and others who are responsible for oversight of the organization's firm-wide activities or material business lines;
   b. individual employees, including non-executive employees, whose activities may expose the organization to material amounts of risk; and
   c. groups of employees who are subject to the same or similar incentive compensation arrangements and who, in the aggregate, may expose the organization to material amounts of risk;
2. Identify the types and time horizons of risks to the organization from the activities of these employees;
3. Assess the potential for the performance measures included in the incentive compensation arrangements for these employees, those that encourage employees to take imprudent risks;
4. Include balancing elements (such as risk adjustments or deferral periods) within the incentive compensation arrangements for these employees, that are reasonably designed to ensure that the arrangement will be balanced in light of the size, type, and time horizon of the inherent risks of the employees' activities;
5. Communicate to the employees the ways in which their incentive compensation awards or payments will be adjusted to reflect the risks of their activities to the organization; and
6. Monitor incentive compensation awards, payments, risks taken, and risk outcomes for these employees and modify the relevant arrangements if payments made are not appropriately sensitive to risk and risk outcomes.

CONCLUSION ON SOUND INCENTIVE COMPENSATION

Banking organizations are responsible for ensuring that their incentive compensation arrangements do not encourage imprudent risk-taking behavior and are consistent with the safety and soundness of the organization. The Federal Reserve expects banking organizations to take prompt action to address deficiencies in their incentive compensation arrangements or related risk-management, control, and governance processes.

The Federal Reserve intends to actively monitor the actions taken by banking organizations in this area and will promote further advances in designing and implementing balanced incentive compensation arrangements. Where appropriate, the Federal Reserve will take supervisory or enforcement action to ensure that material deficiencies that pose a threat to the safety and soundness of the organization are promptly addressed. The Federal Reserve also will update this guidance as appropriate to incorporate best practices as they develop over time.

The purpose of this section is to guide the examiner in evaluating bank management. Although the directorate is an integral part of the overall management of a bank, the management appraisal examination program is concerned primarily with the active officers. A review of the quality of director guidance and supervision is covered in "Duties and Responsibilities of Directors."

It is the responsibility of directors to employ a competent chief executive officer. Thereafter, senior management normally assumes the responsibility to employ, maintain and educate a qualified staff. Since a direct relationship exists between the overall condition of a bank and the quality of management, the first priority in evaluating the condition of the bank is to make an accurate appraisal of the competency of the management team.

Management is responsible, not only for the operations of the bank and the quality of its assets on a day-to-day basis, but also for planning for the future. Senior management should be evaluated on its plans for maintaining or improving the condition of the bank in the future as well as on the bank's present condition. The depth of planning and a general forward looking attitude of executive officers should be considered when projecting future management impact. This should include an evaluation of management's efforts to provide for succession of senior bank officials.

The projection of future management impact involves an appraisal of the quality and quantity of senior and middle management. This assessment of course must be relative to the size and community circumstances of the bank. Examiners must not restrict their appraisals to the past and present. The past and present certainly are significant, requiring an in-depth analysis of financial condition, earnings and capital adequacy, both on an absolute basis and as a trend, but, the determination of what the management will do for the bank in the future is most significant. The System's goal is to prevent problems from developing rather than waiting for future examinations to identify deteriorating conditions.

Bank management receives strong pressure from customers, stockholders and competitors. Customers demand more for their money, in the form of both interest and services, and stockholders demand higher returns on their investments, both in dividends and increased market value of their stock. No bank is completely free from the pressure of competition and, for most institutions, this is one of the strongest forces felt. In the midst of those pressures, the clear mandate to bank management is to "perform." Performance is measured in terms of long-run profitability, liquidity and solvency. It is almost impossible for a bank to achieve those long-range goals unless careful planning and coordination bring efficiency to its activities. Management must recognize the bank's position in the market and make plans which will achieve the objectives set for the institution by the directors. It must be constantly alert to the need for continually upgrading and expanding services and facilities to support and encourage the bank's growth.

Both the directors and senior management have important roles in a bank's program of internal control and internal audit. Although directors have overall audit responsibility and should require that the auditor report directly to them, senior management normally is charged with the duty of maintaining a strong system of internal control.

The entire examination procedure, as outlined throughout this manual, is designed to provide a clear picture of both the present and anticipated future condition of the bank under examination. As a result, the reports and workpapers generated by the examination process will serve as a major tool for examiners in their evaluation of management. Examination procedures for various balance sheet accounts and departmental areas are designed to effect a comprehensive evaluation of internal control and internal and/or external audit, and will provide the examiner with insight into the degree of compliance with the bank's own written policies in such areas. Similarly, the examination procedures in "Loan Portfolio Management," "Investment Securities," "Funds Management," "Assessment of Capital Adequacy," and "Analytical Review and Income and Expense" are designed to lead to a detailed analysis of written objectives, policies and procedures in those management areas.

The examiner must take a practical approach to evaluating these features depending on the bank's characteristics. The examiner can have greater confidence in the continuity of top and middle management when it is known that the bank has an inflow of new personnel at various levels and that training procedures and advancement policies will keep the organization viable and dynamic.

The examiner must be concerned with salary levels within the bank and must review information collected during the examination about the bank's employee benefits program. Salaries paid and benefits provided should be compared with those offered by an appropriate peer group, and inquiry should be made to determine the relationship between the bank's payroll structure and that offered by competitors for the same caliber personnel.

The examiner must judge the appropriateness of asset distribution in view of the bank's sources of funds. The examiner must evaluate the adequacy of the bank's capital position and expectations in view of asset quality and plans for growth and expansion. The overall management evaluation should be made by the examiner-in-charge, because he or she is in the best position to identify weaknesses and inconsistencies in policies. Although examiners-in-charge will rely heavily upon the information received from assisting examining personnel in various areas under review, it is their task to assemble all of such information into a composite picture of the quality of management.

Senior management is responsible for the quality of all bank personnel and for planning its own replacement. A bank's recruiting, training, and personnel development activities are vital to the development and continuity of a quality staff. The examiner must evaluate those areas to determine the quality of overall management. Some features of good personnel management are:

- An organizational structure.
- Detailed position descriptions.
- Carefully planned recruiting.
- Appropriate training.
- Performance review.
- Salary administration.
- Provision for communication.

The examiner should identify and interpret trends that can reveal flaws in policy either as written or as practiced. The examiner should question the quality of management in any area in which he or she finds serious shortcomings or makes significant criticisms.

The examiner should be alert for situations in which top management dominates the board or where top management acts solely at the direction of either the board or a dominant influence on the board. Although it is extremely important for the directors to assume their appropriate role in setting objectives and formulating policy consistent with their responsibilities to the depositors, shareholders and regulators, dialogue with top management must occur. In banks where both directors and senior management recognize and assume their appropriate duties and responsibilities, areas for conflict are greatly reduced.

1. To determine the consistency of written objectives, policies, and procedures in the various asset, liability, and operational areas.
2. To determine that policies are being adhered to throughout the system.
3. To determine that management plans adequately for future conditions and developments.
4. To evaluate the adequacy of the bank's personnel practices as they relate to management continuity.
5. To evaluate management experience and depth.
6. To determine that management has established systems which facilitate efficient operation and communication.
7. To evaluate the propriety and soundness of management decisions.
8. To project the impact of management on the future condition of the bank.

In the following procedural steps examiners should attempt to utilize already developed material from internal or external audit sources. Also, the examining resources and circumstances of the bank must be weighed in perspective to set the depth of scope for this area.

1. Obtain the following, if available:
   a. Organization chart.
   b. Management plan.
   c. Administrative and personal manuals.
   d. Marketing plan.
   e. Resumes for all executive officers and department or division heads which have not been obtained in previous examinations.
   f. A list of the salary of and other compensation paid to each executive officer.
   g. A list of the salary ranges for other officers of the bank broken down by position.
   h. A description of other employee benefits.
2. Become familiar with the quality of key personnel by:
   a. Updating management briefs for all executive officers and department or division heads.
   b. Distributing the updated management briefs to appropriate examining personnel and requesting that they be returned upon completion.
3. Review administrative manuals and:
   a. Extract any policy statements contained therein.
   b. Extract any general information considered relevant in appraising management.
   c. Analyze the manual(s), in general, as useful management tools.
4. Review management plan and extract information concerning:
   a. Areas of bank where increased or decreased officer staffing is planned.
   b. Number of officers to be added or removed.
   c. Qualification requirements for planned additional officers.
5. Establish the hierarchy of the organization by determining the functional responsibility levels of various officers and whether lines of authority are drawn in accordance with the organization chart.
6. Review the bank's marketing plan for specific programs being planned and general applicability to the institution.
7. Review the bank's schedule of salaries and make comparisons with similar information from an appropriate peer group. If deemed appropriate, compare salaries paid and benefits received in the bank to those of other institutions with which it competes directly. Determine whether the bank is paying salaries or bonuses to inactive officers or directors and, if so, determine that such payments have been disclosed to shareholders.
8. Determine whether any executive incentive compensation plans (performance bonuses) have been established and, if so;
   a. Review specific provisions of the plans and determine the beneficiaries.
   b. Review controls established to prevent the beneficiary(s) of the plan from understating noncash expenses (accrual expense accounts, provision for possible loan losses, etc.) or overstating noncash income (accrual income accounts).
9. Review the bank's activities with regard to developing personnel for senior management succession. At a minimum, this review should include:
   a. An assessment of the quality of lower levels of management and the potential for advancement.
   b. An assessment of the bank's officer hiring policies to determine that it is appropriate to meet the bank's current and future needs.
10. Obtain and analyze daily or other periodic reports submitted to executive management with the view of determining the usefulness of the reports in monitoring the condition and operation of the bank.
11. As the evaluation of the various areas of examination interest are being completed, discuss with assisting personnel:
    a. Any of their observations indicative of the general morale level.
    b. The technical proficiency of officers in their area.
    c. The level of direct impact that officers have on the condition of their areas.

12. Review the section on "Analytical Review and Income and Expense" and extract any information related to financial planning that is considered relevant to evaluating management. Also consider the quality, depth and applicability of financial planning.
13. In conjunction with reviewing the work papers and comments generated during the examination:
    a. Familiarize yourself with the bank's written objectives and policies.
    b. Analyze those policies and determine any inconsistencies in management areas.
    c. Review any internal control and policy exceptions and any other criticisms made in connection with the examination of all areas of the bank.
    d. Determine the extent to which improper implementation is negating the effect of written policies and procedures.
    e. Review the appropriateness of asset distribution in view of the bank's sources of funds.
    f. Review the evaluation of the bank's capital position and expectations in view of asset quality and plans for growth and expansion.
14. In cases where previously obtained information is incomplete or where no records could be reviewed, interview appropriate management in order to judge quality and depth. The interview should be conducted in such a manner as to generate necessary information for determining:
    a. Sources of information used to keep current.
    b. Stengths and weaknesses of lower level personnel.
    c. Succession of management and replacement of key personnel.
    d. General management plan.
    e. Methods of control utilized.
    f. Workload factors and efficiency of personnel.
    g. Frequency of staff meetings and how the communications system works.
    h. Management projections for the institution over the next year.
    i. Any major new proposal being considered or changes in asset mix or services.
    j. The nature and degree of working relationship with directors.
    k. The existence of any time-consuming outside activities of executive management.
15. By reviewing the results of the preceding steps and performing any other procedures deemed appropriate, answer the following questions (normally these questions will serve as a summary of information obtained, thus compiling factual data to support your objective comments on management):
    a. Have overall management objectives been set?
    b. Does the bank forecast manpower requirements?
    c. Are qualified people advanced from within?
    d. Are supervisory personnel involved in the selection of new employees and given the right of acceptance or rejection?
    e. Is management training given to those persons likely to assume higher level positions?
    f. Are salaries competitive?
    g. Are employee benefit programs competitive?
16. Prepare comments on the quality of management supervision. The comments should, at a minimum, discuss the following:
    a. General and technical ability.
    b. Effectiveness.
    c. Experience.
    d. Any inconsistencies in written objectives, policies and procedures.
    e. Any serious or widespread lack of proper implementation of written procedures.
    f. An evaluation of the bank's salary structure.
    g. The promptness with which management addresses problems.
    h. The extent to which executive management delegates and demands accountability.
    i. Any evidence that executive management is more concerned with the operation of a functional area than with overall supervision of the bank.
    j. The potential for upward movement of existing management personnel.
    k. Management's commitment to effecting corrective action in problem areas.
    l. Unsafe or unsound management.
    m. Any situation which might require close monitoring or removal of management.

17. For banks that are subsidiaries of bank holding companies (BHCs), review the relative degree of centralized control by parent or the lead bank, and evaluate:
    a. The general level of management's dependence on central BHC staff.
    b. Independence on final credit decisions.
    c. Independence on investment decisions.
    d. Independence on operational practices or service fee arrangements.

    While examiners may expect that economies of scale or optimization of tax, investment, or credit considerations on a consolidated basis may be beneficial to the entire organization, examiners must be alert to the danger of such considerations becoming overly burdensome or unfair to the subsidiary bank being examined. (Reference Federal Reserve Policy Statement on Intercorporate Income Tax Accounting Transactions of Bank Holding Companies and State Member Banks.)

18. Update the workpapers with any information that will facilitate future examinations.

1. Does the bank have an organizational chart?
2. If not, have lines of authority and reporting responsibility been formally established?
3. Does the bank have a full-time personnel manager?
4. Does the bank utilize written personnel manuals?
5. Does the bank utilize a system of written job descriptions, including descriptions for supervisory personnel?
6. Does the bank actively recruit personnel?
7. Does the bank perform background investigations of new employees?
8. Does the bank have a formal training program?
9. Does the bank utilize other than on-the-job training?
10. Does the bank utilize a graded salary scale?
11. Does the bank consider competition in preparing a salary range? If so, in what manner?
12. Does the top management at least annually review lower management?
13. Does the bank prepare or utilize a long-range forecast of economic conditions germane to its trade area?
14. Does top management consult with directors for their opinion of future condition?
15. Does the bank either employ an economist or utilize the services of an outside economic advisor?
16. Does senior management propose to the directors areas for policy decision?
17. Does the bank have a management succession plan?
18. Does the bank employ a marketing manager and/or outside marketing consultant?
19. Does senior management receive:
    a. A brief statement of condition daily?
    b. A daily liquidity report?
    c. A listing of assets subject to quality limitations at least monthly?
    d. An earnings statement on a comparative basis at least monthly?
20. Does the bank's auditing function audit the officer's adherence to general policy?
21. Are staff meetings held on a regular basis?
22. Are minutes kept for staff meetings?
23. Does the bank use a system of progress reports on specific projects?
24. Does the bank have a tax department or a tax consultant?

Supervisory Guidance for Assessing Risk Management at Supervised Institutions with Total Consolidated Assets Less than $100 Billion

Effective date October 2023

Section 4011.1

INTRODUCTION AND APPLICABILITY

This section conveys the supervisory guidance that is attached to SR-16-11, "Supervisory Guidance for Assessing Risk Management at Supervised Institutions with Total Consolidated Assets Less than $100 Billion." The guidance in SR-16-11 applies to the supervision of Federal Reserve regulated institutions with total consolidated assets less than $100 billion, which includes state member banks, bank holding companies, savings and loan holding companies (including insurance and commercial savings and loan holding companies), as well as foreign banking organizations (FBOs) with consolidated U.S. assets of less than $100 billion. This guidance is not applicable to intermediate holding companies of foreign banking organizations established pursuant to the Federal Reserve's Regulation YY with total consolidated assets of $50 billion or more.

OVERVIEW

Managing risks is fundamental to the business of banking. Accordingly, the Federal Reserve places significant supervisory emphasis on an institution's management of risk, including its system of internal controls, when evaluating the overall effectiveness of an institution's risk management. An institution's failure to establish a management structure that adequately identifies, measures, monitors, and controls the risks of its activities has long been considered unsafe and unsound conduct. Principles of sound management should apply to the entire spectrum of risks facing an institution including, but not limited to, credit, market, liquidity, operational, compliance, and legal risk:

- *Credit risk* arises from the potential that a borrower or counterparty will fail to perform on an obligation.
- *Market risk* is the risk to a financial institution's condition resulting from adverse movements in market rates or prices, including, but not limited to, interest rates, foreign exchange rates, commodity prices, or equity prices.
- *Liquidity risk* is the potential that a financial institution will be unable to meet its obligations as they come due because of an inability to liquidate assets or obtain adequate funding (referred to as "funding liquidity risk") or that it cannot easily unwind or offset specific exposures without significantly lowering market prices because of inadequate market depth or market disruptions (referred to as "market liquidity risk").
- *Operational risk* is the risk resulting from inadequate or failed internal processes, people, and systems or from external events (this definition conforms to the Basel committee's definition of operational risk).
- *Compliance risk* is the risk of regulatory sanctions, fines, penalties or losses resulting from failure to comply with laws, rules, regulations, or other supervisory requirements applicable to a financial institution.
- *Legal risk* is the potential that actions against the institution that result in unenforceable contracts, lawsuits, legal sanctions, or adverse judgments can disrupt or otherwise negatively affect the operations or condition of a financial institution.

These risks and the activities associated with them are addressed in greater detail in the Federal Reserve's supervision manuals and other guidance documents.[1] In practice, an institution's business activities present various combinations, concentrations, and interrelationships of these risks depending on the nature and scope of the particular activity. This section provides guidelines for supervisory assessment of the overall effectiveness of an institution's risk management and its formal or informal systems for identifying, measuring, monitoring, and controlling these risks.

1. Refer to the Federal Reserve's *Commercial Bank Examination Manual*, *Bank Holding Company Supervision Manual*, *Examination Manual for U.S. Branches and Agencies of Foreign Banking Organizations,* and relevant Federal Financial Institutions Examination Council Examination Manuals.

ELEMENTS OF RISK MANAGEMENT

As part of the risk management evaluation of overall management effectiveness at an institution, examiners should place primary consideration on findings relating to the following elements of a sound risk management system:

- board and senior management oversight[2]
- policies, procedures, and limits
- risk monitoring and management information systems
- internal controls

Each of these elements is described further, along with a list of considerations relevant to assessing each element. Examiners should recognize that the considerations specified in these guidelines are intended only to assist in the evaluation of risk management practices and are not a checklist of requirements for each institution.

An institution's risk management processes are expected to evolve in sophistication, commensurate with the institution's asset growth, complexity, and risk. At a larger or more complex organization, the institution should have more sophisticated risk management processes that address the full range of risks regardless of where the activity is conducted in the organization. Moreover, while a holding company should be able to assess the major risks of the consolidated organization, examiners should expect a parent company that centrally manages the operations and functions of its subsidiary banks to have more comprehensive, detailed, and developed risk management systems than a parent company that delegates the management of risks to relatively autonomous subsidiaries.[3]

For a small community banking organization (CBO) engaged solely in traditional banking activities and whose senior management is actively involved in the details of day-to-day operations, relatively basic risk management systems may be adequate. In accordance with the *Interagency Guidelines Establishing Standards for Safety and Soundness*, a CBO is expected, at a minimum, to have internal controls, information systems, and internal audit that are appropriate for the size of the institution and the nature, scope, and risk of its activities.[4]

The risk management processes of a regional banking organization (RBO) would typically contain detailed guidelines that set specific prudent limits on the principal types of risks relevant to a RBO's consolidated activities. Furthermore, because of the diversity and the geographic dispersion of their activities, these institutions will require relatively more sophisticated information systems that provide management with timely information that supports the management of risks. The information systems, in turn, should provide management with information that present a consolidated and integrated view of risks that are relevant to the duties and responsibilities of individual managers, senior management, and the board of directors.[5]

Consistent with the principle of national treatment, the Federal Reserve has the same supervisory goals and standards for the U.S. operations of FBOs as for domestic organizations of similar size, scope, and complexity.[6] Given the added element of foreign ownership, an FBO's risk management processes and control functions for the U.S. operations may be implemented domestically or outside of the United States. In cases where these functions are performed outside of the United States, the FBO's oversight function, policies and procedures, and information systems need to be sufficiently transparent to allow U.S. supervisors to assess their adequacy. Additionally, the FBO's U.S. senior management need to demonstrate and maintain a thorough understanding of all relevant risks affecting the U.S. operations and the associated

2. For the purpose of this guidance, for foreign banking organizations, "board of directors" refers to the equivalent governing body of the U.S. operations of the FBO.

3. If these subsidiaries are regulated by another federal banking agency, Federal Reserve examiners should rely on the conclusions drawn by relevant regulators regarding risk management to the fullest extent possible. See also, SR-16-4, "Relying on the Work of the Regulators of the Subsidiary Insured Depository Institution(s) of Bank Holding Companies and Savings and Loan Holding Companies with Total Consolidated Assets of Less than $100 Billion."

4. Refer to 12 CFR 208, Appendix D-1, the Interagency Guidelines Establishing Standards for Safety and Soundness.

5. Subpart C of the Federal Reserve's Regulation YY includes risk committee requirements for bank holding companies with total consolidated assets of $50 billion or more and less than $100 billion.

6. National treatment requires nondiscrimination between domestic and foreign firms, or treatment of foreign entities that is no less favorable than that accorded to domestic enterprises in like circumstances. The International Banking Act of 1978 generally gives foreign banks operating in the United States the same powers as domestic banking organizations and subjects them to the same restrictions and obligations.

management information systems, used to manage and monitor these risks within the U.S. operations.

The information systems at a larger institution will naturally require frequent monitoring and testing by independent control areas, and by both internal and external auditors, to ensure the integrity of the information used by the board of directors and senior management in overseeing compliance with policies and limits. Therefore, an institution's risk oversight function needs to be sufficiently independent of the business lines to achieve an adequate separation of duties and the avoidance of conflicts of interest.

Board and Senior Management Oversight

The board of directors has the responsibility for establishing the level of risk that the institution should take. Accordingly, the board of directors should approve the institution's overall business strategies and significant policies, including those related to managing risks. Further, the board of directors should also ensure that senior management is fully capable of implementing the institution's business strategies and risk limits. In evaluating senior management, the board of directors should consider whether management is taking the steps necessary to identify, measure, monitor, and control these risks.

The board of directors should collectively have a balance of skills, knowledge, and experience to clearly understand the activities and risks to which the institution is exposed. The board of directors should take steps to develop an appropriate understanding of the risks the institution faces, through briefings from experts internal to their organization and potentially from external experts. The institution's management information systems should provide the board of directors with sufficient information to identify the size and significance of the risks. Using this knowledge and information, the board of directors should provide clear guidance regarding the level of exposures acceptable to the institution and oversee senior management's implementation of the procedures and controls necessary to comply with approved policies.

Senior management is responsible for implementing strategies set by the board of directors in a manner that controls risks and that complies with laws, rules, regulations, or other supervisory requirements on both a long-term and day-to-day basis. Accordingly, senior management should be fully involved in and possess sufficient knowledge of all activities to ensure that appropriate policies, controls, and risk monitoring systems are in place and that accountability and lines of authority are clearly delineated. Senior management is also responsible for establishing and communicating a strong awareness of the need for effective risk management, internal controls, and high ethical business practices. To fulfill these responsibilities, senior management needs to have a thorough understanding of banking and financial market activities and detailed knowledge of the institution's activities, including the internal controls that are necessary to limit the related risks.

In assessing the quality of the oversight provided by the board of directors and senior management, examiners should consider the following:

- The board of directors has approved significant policies to establish risk tolerances for the institution's activities and periodically reviews risk exposure limits to align with changes in the institution's strategies, address new activities and products, and react to changes in the industry and market conditions.
- Senior management has identified and has a clear understanding and working knowledge of the risks inherent in the institution's activities. Senior management also remains informed about these risks as the institution's business activities evolve or expand and as changes and innovations occur in financial markets and risk management practices.
- Senior management has identified and reviewed risks associated with engaging in new activities or introducing new products to ensure that the necessary infrastructure and internal controls are in place to manage the related risks.
- Senior management has ensured that the institution's activities are managed and staffed by personnel with the knowledge, experience, and expertise consistent with the nature and scope of the institution's activities and risks.
- All levels of senior management provide appropriate management of the day-to-day activities of officers and employees, including oversight of senior officers or heads of business lines.
- Senior management has established and maintains effective information systems to identify, measure, monitor, and control the sources of risks to the institution.

Policies, Procedures, and Limits

Although an institution's board of directors approves an institution's overall business strategy and policy framework, senior management develops and implements the institution's risk management policies and procedures that address the types of risks arising from its activities. Once the risks are properly identified, the institution's policies and procedures should provide guidance for the day-to-day implementation of business strategies, including limits designed to prevent excessive and imprudent risks. An institution should have policies and procedures that address its significant activities and risks with the appropriate level of detail to address the type and complexity of the institution's operations. A smaller, less complex institution that has effective senior management directly involved in day-to-day operations would generally not be expected to have policies as sophisticated as larger institutions. In a larger institution, where senior managers rely on widely dispersed staffs to implement strategies for more varied and complex businesses, far more detailed policies and procedures would generally be expected. In either case, senior management is expected to ensure that policies and procedures address the institution's material areas of risk and that policies and procedures are modified when necessary to respond to significant changes in the institution's activities or business conditions.

The following guidelines should assist examiners in evaluating an institution's policies, procedures, and limits:

- The institution's policies, procedures, and limits provide for adequate identification, measurement, monitoring, and control of the risks posed by its significant risk-taking activities.
- The policies, procedures, and limits are consistent with the institution's stated strategy and risk profile.
- The policies and procedures establish accountability and lines of authority across the institution's activities.
- The policies and procedures provide for the review and approval of new business lines, products, and activities, as well as material modifications to existing activities, services, and products, to ensure that the institution has the infrastructure necessary to identify, measure, monitor, and control associated risks before engaging in a new or modified business line, product, or activity.

Risk Monitoring and Management Information Systems

Institutions of all sizes are expected to have risk monitoring and management information systems in place that provide the board of directors and senior management with timely information and a clear understanding of the institution's business activities and risk exposures. The sophistication of risk monitoring and management information systems should be commensurate with the complexity and diversity of the institution's operations. Accordingly, a smaller and less complex institution may require less frequent management and board reports to support risk monitoring activities. For example, these reports may include, daily or weekly balance sheets and income statements, a watch list for potentially troubled loans, a report on past due loans, an interest rate risk report, and similar items. In contrast, a larger, more complex institution would be expected to have much more comprehensive reporting and monitoring systems, which includes more frequent reporting to board and senior management, tighter monitoring of high-risk activities, and the ability to aggregate risks on a fully consolidated basis across all business lines, legal entities, and activities.

In assessing an institution's measurement and monitoring of risk and its management reports and information systems, examiners should consider whether these conditions exist:

- The institution's risk monitoring practices and reports address all of its material risks.
- Key assumptions, data sources, models, and procedures used in measuring and monitoring risks are appropriate and adequately documented and tested for reliability on an on-going basis.[7]
- Reports and other forms of communication address the complexity and range of an institution's activities, monitor key exposures and compliance with established limits and strategy, and as appropriate, compare actual versus expected performance.
- Reports to the board of directors and senior management are accurate, and provide timely and sufficient information to identify any adverse trends and to evaluate the level of risks faced by the institution.

7. See this manual's section "Model Risk Management," and SR-11-7, "Guidance on Model Risk Management."

Internal Controls

An effective internal control structure is critical to the safe and sound operation of an institution. Effective internal controls promote reliable financial and regulatory reporting, safeguard assets, and help to ensure compliance with relevant laws, rules, regulations, supervisory requirements, and institutional policies. Therefore, an institution's senior management is responsible for establishing and maintaining an effective system of controls, including the enforcement of official lines of authority and the appropriate segregation of duties.

Adequate segregation of duties is a fundamental and essential element of a sound risk management and internal control system. Failure to implement and maintain an adequate segregation of duties can constitute an unsafe and unsound practice and possibly lead to serious losses or otherwise compromise the integrity of the institution's internal controls. Serious lapses or deficiencies in internal controls, including inadequate segregation of duties, may warrant supervisory action, including formal enforcement action.

Internal controls should be tested by an independent party who reports either directly to the institution's board of directors or its designated committee, which is typically the audit committee.[8] However, small CBOs whose size and complexity do not warrant a full scale internal audit function may rely on regular reviews of essential internal controls conducted by other institution personnel. Given the importance of appropriate internal controls to institutions of all sizes and risk profiles, the results of audits or reviews, whether conducted by an internal auditor or by other personnel, should be adequately documented, as should management's responses to the findings. In addition, communication channels should allow for adverse or sensitive findings to be reported directly to the board of directors or to the relevant board committee.

In evaluating internal controls, examiners should consider whether these conditions are met:

- The system of internal controls is appropriate to the type and level of risks posed by the nature and scope of the institution's activities.
- The institution's organizational structure establishes clear lines of authority and responsibility for risk management and for monitoring adherence to policies, procedures, and limits.
- Internal audit or other control functions, such as loan review and compliance, provide for independence and objectivity.
- The official organizational structures reflect actual operating practices and management responsibilities and authority over a particular business line or activity.
- Financial, operational, risk management, and regulatory reports are reliable, accurate, and timely; and wherever applicable, material exceptions are noted and promptly investigated or remediated.
- Policies and procedures for control functions support compliance with applicable laws, rules, regulations, or other supervisory requirements.
- Internal controls and information systems are adequately tested and reviewed; the coverage, procedures, findings, and responses to audits, regulatory examinations, and other review tests are adequately documented; identified material weaknesses are given appropriate and timely, high-level attention; and management's actions to address material weaknesses are objectively verified and reviewed.
- The institution's board of directors, or audit committee, and senior management are responsible for developing and implementing an effective system of internal controls and that the internal controls are operating effectively.

Conclusions

Examiners are expected to assess risk management for an institution and assign formal ratings of "risk management" as described in this manual for state member banks, the *Bank Holding Company Manual* for holding companies, and the *Examination Manual for U.S. Branches and Agencies of Foreign Banking Organizations*.[9] In

8. Given the importance of the internal audit function, several additional policy statements have been issued. For comprehensive guidance on internal audit, see SR-03-5, "Amended Interagency Guidance on the Internal Audit Function and its Outsourcing" and for institutions with more than $10 billion in assets, see SR-13-1/ CA-13-1, "Supplemental Policy Statement on the Internal Audit Function and Its Outsourcing."

9. Refer to the section entitled, "Overall Conclusions Regarding Condition of the Bank: Uniform Financial Institutions Rating System and the Federal Reserve's Risk Management Rating," of this manual; the RFI Ratings section of the *Bank Holding Company Supervision Manual*; and the "Rating System for U.S. Branches and Agencies of Foreign Banking

reports of examination or inspection, and in transmittal letters to the boards of directors of state member banks, holding companies, and to the FBO officer of the U.S. operations, examination staff should specifically reference the types and nature of corrective actions that need to be taken by an institution to address noted risk management and internal control deficiencies. Where appropriate, the Federal Reserve will advise an institution that supervisory action will be initiated, if the institution fails to timely remediate risk management weaknesses when such failures create the potential for serious losses or if material deficiencies or situations threaten its safety and soundness. Such supervisory actions may include formal enforcement actions against the institution, or its responsible officers and directors, or both, and would require the immediate implementation of all necessary corrective measures.

If bank or holding company subsidiaries are regulated by another federal banking agency, Federal Reserve examiners should rely to the fullest extent possible on the conclusions drawn by relevant regulators regarding risk management. See also, SR-16-4, “Relying on the Work of the Regulators of the Subsidiary Insured Depository Institution(s) of Bank Holding Companies and Savings and Loan Holding Companies with Total Consolidated Assets of Less than $100 Billion.”

Organizations” section of the *Examination Manual for U.S. Branches and Agencies of Foreign Banking Organizations*. For relevant savings and loan holding companies, see the RFI Ratings section of the *Bank Holding Company Supervision Manual* and SR-14-9, “Incorporation of Federal Reserve Policies into the Savings and Loan Holding Company Supervision Program.”

APPLICABILITY

The guidance in this section largely is based on SR-95-51, “Rating the Adequacy of Risk Management Processes and Internal Controls at State Member Banks and Bank Holding Companies.” This risk management guidance applies to the supervision of state member banks and bank holding companies with greater than $100 billion in total consolidated assets.

SR-95-51 instituted an explicit risk-management rating requirement to be assigned for examinations commencing on or after January 2, 1996. The risk-management rating applies to all state member banks, regardless of their size. For more information on this risk-management rating, see this manual’s section entitled, “Uniform Financial Institutions Rating System and the Federal Reserve’s Risk Management Rating.”

INTRODUCTION

The Federal Reserve places significant supervisory emphasis on the adequacy of an institution’s management of risk, including its system of internal controls, when assessing the condition of an organization. An institution’s failure to establish a management structure that adequately identifies, measures, monitors, and controls the risks involved in its various products and lines of business has long been considered unsafe-and-unsound conduct. Principles of sound management should apply to the entire spectrum of risks facing a banking institution, including, but not limited to, credit, market, liquidity, operational, legal, and reputational risk.

- *Credit risk* arises from the potential that a borrower or counterparty will fail to perform on an obligation.
- *Market risk* is the risk to a financial institution’s condition resulting from adverse movements in market rates or prices, such as interest rates, foreign exchange rates, or equity prices.
- *Liquidity risk* is the potential that an institution will be unable to meet its obligations as they come due because of an inability to liquidate assets or obtain adequate funding (referred to as “funding liquidity risk”), or that it cannot easily unwind or offset specific exposures without significantly lowering market prices because of inadequate market depth or market disruptions (referred to as “market liquidity risk”).
- *Operational risk* arises from the potential that inadequate information systems, operational problems, breaches in internal controls, fraud, or unforeseen catastrophes will result in unexpected losses.
- *Legal risk* arises from the potential that unenforceable contracts, lawsuits, or adverse judgments can disrupt or otherwise negatively affect the operations or condition of an institution.
- *Reputational risk* is the potential that negative publicity regarding an institution’s business practices, whether true or not, will cause a decline in the customer base, costly litigation, or revenue reductions.

In practice, an institution’s business activities present various combinations and concentrations of these risks, depending on the nature and scope of the particular activity. The following discussion provides guidelines for determining the quality of bank management’s formal or informal systems for identifying, measuring, and containing these risks.

ELEMENTS OF RISK MANAGEMENT

When evaluating the quality of risk management as part of the evaluation of the overall quality of management, examiners should place primary consideration on findings relating to the following elements of a sound risk-management system:
- active board and senior management oversight
- adequate policies, procedures, and limits
- adequate risk measurement, risk monitoring, and management information systems
- comprehensive internal controls

Examiners should recognize that the considerations specified in these guidelines are intended only to assist in the evaluation of risk-management practices, and not as a checklist of requirements for each institution. Moreover, while all bank holding companies should be able to assess the major risks of the consolidated organization, examiners should expect parent companies that centrally manage the operations and functions of their subsidiary banks to have more comprehensive, detailed, and developed risk-management systems than companies that delegate the management of risks to relatively autonomous banking subsidiaries.

Adequate risk-management programs can vary considerably in sophistication, depending on the size and complexity of the institution and the level of risk that it accepts. For smaller institutions engaged solely in traditional banking activities and whose senior managers and directors are actively involved in the details of day-to-day operations, relatively basic risk-management systems may be adequate. In such institutions, these systems may consist only of written policies addressing material areas of operations, such as lending or investing, basic internal control systems, and a limited set of management and board reports. However, large, multinational organizations will require far more elaborate and formal risk-management systems to address their broader and typically more-complex range of financial activities, and to provide senior managers and directors with the information they need to monitor and direct day-to-day activities. In addition to the banking organization's market and credit risks, risk-management systems should encompass the organization's trust and fiduciary activities, including investment advisory services, mutual funds, and securities lending.

The risk-management processes of large banking organizations would typically contain detailed guidelines that set specific prudential limits on the principal types of risks relevant to their activities worldwide. Furthermore, because of the diversity of their activities and the geographic dispersion of their operations, these institutions will require timely and relatively more sophisticated reporting systems in order to manage their risks properly. These reporting systems, in turn, should comprise an adequate array of reports that provide the levels of detail about risk exposures that are relevant to the duties and responsibilities of individual managers and directors.

Such extensive systems of large institutions will naturally require frequent monitoring and testing by independent control areas and internal, as well as external, auditors to ensure the integrity of the information used by senior officials in overseeing compliance with policies and limits. The risk-management systems or units of such institutions must also be sufficiently independent of the business lines in order to ensure an adequate separation of duties and the avoidance of conflicts of interest.

Board Oversight and the Role of Senior Management

Boards of directors have ultimate responsibility for the level of risk taken by their institutions. Accordingly, they should approve the overall business strategies and significant policies of their organizations, including those related to managing and taking risks, and should also ensure that senior management is fully capable of managing the activities that their institutions conduct. While all boards of directors are responsible for understanding the nature of the risks significant to their organizations and overseeing and holding senior management accountable for maintaining an effective risk-management framework, the level of technical knowledge required of directors may vary depending on the particular circumstances at the institution.

Directors of large banking organizations that conduct a broad range of technically complex activities, for example, cannot be expected to understand the full details of their institutions' activities or the precise ways risks are measured and controlled. They should, however, have a clear understanding of the types of risks to which their institutions are exposed and senior management should provide reports to the board of directors that identify and summarize the size, complexity, and significance of the risks in terms that are meaningful to them. In fulfilling this responsibility, directors should take steps to develop an appropriate understanding of the risks their institutions face, possibly through briefings from auditors and experts external to the organization. Using this knowledge and information, directors should provide clear guidance regarding the level of exposures acceptable to their institutions and have the responsibility to ensure that senior management implements the procedures and controls necessary to comply with adopted policies.

Directors of institutions that conduct more traditional and less complicated business activities may require significantly less knowledge of complex financial transactions or capital markets.

Senior management is responsible for implementing strategies in a manner that manages, monitors, and mitigates risks associated with each strategy and that ensures compliance with laws and regulations on both a long-term and day-to-day basis. Accordingly, senior management should be fully involved in the activities of their institutions and possess sufficient knowledge of all major business lines to ensure that appropriate policies, controls, and risk monitoring systems are in place and that accountability and lines of authority are clearly delineated. Senior management is also responsible for establishing and communicating a strong awareness of and need for effective internal controls and high ethical standards. Meeting these responsibilities requires senior managers of a bank or bank holding company to have a thorough understanding of banking and financial market activities and detailed knowledge of the activities their institution conducts, including the nature of internal controls necessary to limit the related risks.

When assessing the quality of the oversight by boards of directors and the managing, monitoring, and mitigating of risk by senior management, examiners should consider whether the institution follows policies and practices such as those described below:

- The board makes appropriate efforts to remain informed about risks inherent to the institution's activities and holds senior management accountable as financial markets, risk-management practices, and the bank holding company's activities evolve.
- The board reviews and approves significant policies to limit risks inherent in the institution's lending, investing, trading, trust, fiduciary, and other significant activities or products.
- The board reviews and approves significant risk-exposure limits to conform to any changes in the institution's strategies, reviews new products, and reacts to changes in market conditions.
- Senior management have identified and have a clear understanding and working knowledge of the types of risks inherent in the institution's activities, and they make appropriate efforts to remain informed about these risks as financial markets, risk-management practices, and the institution's activities evolve.
- Senior management is sufficiently familiar with and is using adequate recordkeeping and reporting systems to measure and monitor the major sources of risk to the organization.
- Senior management ensures that its lines of business are managed and staffed by personnel whose knowledge, experience, and expertise is consistent with the nature and scope of the banking organization's activities.
- Senior management ensures that the depth of staff resources is sufficient to operate and soundly manage the institution's activities, and ensures that employees have the integrity, ethical values, and competence that are consistent with a prudent management philosophy and operating style.
- Senior management at all levels provides adequate supervision of the day-to-day activities of officers and employees, including management supervision of senior officers or heads of business lines.
- Senior management is able to respond to risks that may arise from changes in the competitive environment or from innovations in markets in which the organization is active.
- Before embarking on new activities or introducing new products, senior management identifies and reviews all risks associated with the activities or products and ensures that the infrastructure and internal controls necessary to manage the related risks are in place.

Adequate Policies, Procedures, and Limits

An institution's directors should set clear, aligned, and consistent direction regarding the firm's strategy and risk appetite. Once risks are properly identified, the institution's policies and its fully articulated procedures provide detailed guidance for the day-to-day implementation of broad business strategies, and generally include limits designed to shield the organization from excessive and imprudent risks. While all banking organizations should have policies and procedures that address their significant activities and risks, the coverage and level of detail embodied in these statements will vary among institutions. A smaller, less complex institution that has effective management that is heavily involved in day-to-day operations generally would be expected to have only basic policies addressing the significant areas of operations and setting forth a limited set of requirements and procedures. In a larger institution, where senior managers must rely on widely dispersed staffs to implement strategies in an extended range of potentially complex businesses, more detailed policies and related procedures would generally be expected. In either case, however, senior management is expected to ensure that policies and procedures address the material areas of risk to an institution and that they are modified when necessary to respond to significant changes in the banking organization's activities or business conditions.

Examiners should consider the following when evaluating the adequacy of a banking organization's policies, procedures, and limits:

- The institution's policies, procedures, and limits provide for adequate identification, measurement, monitoring, and control of the risks posed by its lending, investing, trading, trust, fiduciary, and other significant activities.
- The policies, procedures, and limits are consistent with senior management's experience level, the institution's stated goals and objectives, and the overall financial strength of the organization.
- Policies clearly delineate accountability and lines of authority across the institution's activities.
- Policies provide for the review of new activities to ensure that the financial institution has the necessary infrastructures to identify, monitor, and control risks associated with an activity before it is initiated.

Adequate Risk Monitoring and Management Information Systems

Effective risk monitoring requires institutions to identify and measure all material risk exposures. Consequently, risk monitoring activities must be supported by information systems that provide senior managers and directors with timely reports on the financial condition, operating performance, and risk exposure of the consolidated organization as well as with regular and sufficiently detailed reports for line managers engaged in the day-to-day management of the organization's activities.

The sophistication of risk monitoring and management information systems should be consistent with the complexity and diversity of the institution's operations. Accordingly, smaller and less complicated banking organizations may require only a limited set of management and board reports to support risk monitoring activities. These reports include, for example, daily or weekly balance sheets and income statements, a watch list for potentially troubled loans, a report for past due loans, a simple interest rate risk report, and similar items. Larger, more complicated institutions, however, would be expected to have much more comprehensive reporting and monitoring systems that allow, for example, for more frequent reporting, tighter monitoring of complex trading activities, and the aggregation of risks on a fully consolidated basis across all business lines and activities. Financial institutions of all sizes are expected to have risk monitoring and management information systems in place that provide directors and senior management with a clear understanding of the banking organization's positions and risk exposures.

When assessing the adequacy of an institution's risk measurement and monitoring, as well as its management reports and information systems, examiners should consider whether these conditions exist:

- The institution's risk monitoring practices and reports address all of its material risks.
- Key assumptions, data sources, and procedures used in measuring and monitoring risk are appropriate and adequately documented, and are tested for reliability on an ongoing basis.
- Reports and other forms of communication are consistent with the banking organization's activities; are structured to monitor exposures and compliance with established limits, goals, or objectives; and, as appropriate, compare actual versus expected performance.
- Reports to senior management or to the institution's directors are accurate and timely, and contain sufficient information for decision makers to identify any adverse trends and to evaluate adequately the level of risk faced by the institution.

Adequate Internal Controls

An institution's internal control structure is critical to the safe-and-sound functioning of the organization generally and to its risk-management system, in particular. Establishing and maintaining an effective system of controls, including the enforcement of official lines of authority and the appropriate separation of duties—such as trading, custodial, and back-office—is one of management's more important responsibilities.

Appropriately segregating duties is a fundamental and essential element of a sound risk management and internal control system. Failure to implement and maintain an adequate separation of duties can constitute an unsafe-and-unsound practice and possibly lead to serious losses or otherwise compromise the financial integrity of the institution. Serious lapses or deficiencies in internal controls, including inadequate segregation of duties, may warrant supervisory action, including formal enforcement action.

When properly structured, a system of internal controls promotes effective operations and reliable financial and regulatory reporting, safeguards assets, and helps to ensure compliance with relevant laws, regulations, and institutional policies. Ideally, internal controls are tested by an independent internal auditor who reports directly either to the institution's board of directors or its designated committee, which is typically the audit committee. However, smaller institutions whose size and complexity do not warrant a full-scale internal audit function may rely on regular reviews of essential internal controls conducted by other institution personnel. Personnel performing these reviews generally should be independent of the function they are assigned to review. Given the importance of appropriate internal controls to banking organizations of all sizes and risk profiles, the results of audits or reviews, whether conducted by an internal auditor or by other personnel, should be adequately documented, as should senior management's responses to them. In addition, communication channels should exist that allow negative or sensitive findings to be reported directly to the board of directors or to the relevant board committee.

When evaluating the adequacy of a financial institution's internal controls and audit procedures, examiners should consider whether these conditions are met:

- The system of internal controls is appropriate to the type and level of risks posed by the nature and scope of the organization's activities.
- The institution's organizational structure establishes clear lines of authority and responsibility for monitoring adherence to policies, procedures, and limits.
- Reporting lines for the control areas are independent from the business lines, and there is adequate separation of duties throughout the organization—such as duties relating to trading, custodial, and back-office activities.
- Official organizational structures reflect actual operating practices.
- Financial, operational, and regulatory reports are reliable, accurate, and timely, and, when applicable, exceptions are noted and promptly investigated.
- Adequate procedures exist for ensuring compliance with applicable laws and regulations.
- Internal audit or other control-review practices provide for independence and objectivity.
- Internal controls and information systems are adequately tested and reviewed. The coverage of, procedures for, and findings and responses to audits and review tests are adequately documented. Identified material weaknesses are given appropriate and timely high-level attention, and management's actions to address material weaknesses are objectively verified and reviewed.
- The institution's audit committee or board of directors engages in robust inquiry into the effectiveness of internal audits and other control-review activities regularly.

The risk-management rating is to be reflected in the institution's overall "Management" rating. The risk-management rating should be consistent with the stated rating criteria of "1" through "5." For more information see the section entitled, "Uniform Financial Institutions Rating System and the Federal Reserve's Risk Management Rating."

Banking organizations should be attentive to the possible adverse consequences (including financial loss) of decisions based on models that are incorrect or misused and should address those consequences through active model risk management. The key aspects of an effective model risk-management framework are described in more detail below, including robust model development, implementation, and use; effective validation; and sound governance, policies, and controls. (See SR-11-7.)

INTRODUCTION—PART I

Banks rely heavily on quantitative analysis and models in most aspects of financial decision making.[1] They routinely use models for a broad range of activities, including underwriting credits; valuing exposures, instruments, and positions; measuring risk; managing and safeguarding client assets; determining capital and reserve adequacy; and many other activities. In recent years, banks have applied models to more complex products and with more ambitious scope, such as enterprise-wide risk measurement, while the markets in which they are used have also broadened and changed. Changes in regulation have spurred some of the recent developments, particularly the U.S. regulatory capital rules for market, credit, and operational risk based on the framework developed by the Basel Committee on Banking Supervision. Even apart from these regulatory considerations, however, banks have been increasing the use of data-driven, quantitative decision making tools for a number of years.

The expanding use of models in all aspects of banking reflects the extent to which models can improve business decisions, but models also come with costs. There is the direct cost of devoting resources to develop and implement models properly. There are also the potential indirect costs of relying on models, such as the possible adverse consequences (including financial loss) of decisions based on models that are incorrect or misused. Those consequences should be addressed by active management of model risk.

This guidance describes the key aspects of effective model risk management. Part II explains the purpose and scope of the guidance, and part III gives an overview of model risk management. Part IV discusses robust model development, implementation, and use. Part V describes the components of an effective validation framework. Part VI explains the salient features of sound governance, policies, and controls over model development, implementation, use, and validation. Part VII concludes.

PURPOSE AND SCOPE—PART II

The purpose of this section is to provide comprehensive guidance for banks on effective model risk management. Rigorous model validation plays a critical role in model risk management; however, sound development, implementation, and use of models are also vital elements. Furthermore, model risk management encompasses governance and control mechanisms such as board and senior management oversight, policies and procedures, controls and compliance, and an appropriate incentive and organizational structure.

Previous guidance and other publications issued by the Office of the Comptroller of the Currency (OCC) and the Federal Reserve on the use of models pay particular attention to model validation.[2] Based on supervisory and industry experience over the past several years, this document expands on existing guidance—most importantly by broadening the scope to include

1. Unless otherwise indicated, *banks* refers to national banks and all other institutions for which the Office of the Comptroller of the Currency is the primary supervisor, and to bank holding companies, state member banks, and all other institutions for which the Federal Reserve Board is the primary supervisor.

2. For instance, the OCC provided guidance on model risk, focusing on model validation, in OCC 2000-16 (May 30, 2000), other bulletins, and certain subject matter booklets of the *Comptroller's Handbook.* The Federal Reserve issued SR-09-01, "Application of the Market Risk Rule in Bank Holding Companies and State Member Banks," which highlights various concepts pertinent to model risk management, including standards for validation and review, model validation documentation, and back-testing. The Federal Reserve's *Trading and Capital-Markets Activities Manual* also discusses validation and model risk management. In addition, the advanced-approaches risk-based capital rules (12 CFR 3, Appendix C; 12 CFR 208, Appendix F; and 12 CFR 225, Appendix G) contain explicit validation requirements for subject banking organizations.

all aspects of model risk management. Many banks may already have in place a large portion of these practices, but all banks should ensure that internal policies and procedures are consistent with the risk-management principles and supervisory expectations contained in this guidance. Details may vary from bank to bank, as practical application of this guidance should be customized to be commensurate with a bank's risk exposures, its business activities, and the complexity and extent of its model use. For example, steps taken to apply this guidance at a community bank using relatively few models of only moderate complexity might be significantly less involved than those at a larger bank where use of models is more extensive or complex.

OVERVIEW OF MODEL RISK MANAGEMENT—PART III

For the purposes of this section, the term *model* refers to a quantitative method, system, or approach that applies statistical, economic, financial, or mathematical theories, techniques, and assumptions to process input data into quantitative estimates. A *model* consists of three components: an information input component, which delivers assumptions and data to the model; a processing component, which transforms inputs into estimates; and a reporting component, which translates the estimates into useful business information. Models meeting this definition might be used for analyzing business strategies; informing business decisions; identifying and measuring risks; valuing exposures, instruments, or positions; conducting stress testing; assessing adequacy of capital; managing client assets; measuring compliance with internal limits; maintaining the formal control apparatus of the bank; meeting financial or regulatory reporting requirements; and issuing public disclosures. The definition of *model* also covers quantitative approaches whose inputs are partially or wholly qualitative or based on expert judgment, provided that the output is quantitative in nature.[3]

Models are simplified representations of real-world relationships among observed characteristics, values, and events. Simplification is inevitable, due to the inherent complexity of those relationships, but also intentional, to focus attention on particular aspects considered to be most important for a given model application. Model quality can be measured in many ways: precision, accuracy, discriminatory power, robustness, stability, and reliability, to name a few. Models are never perfect, and the appropriate metrics of quality, and the effort that should be put into improving quality, depend on the situation. For example, precision and accuracy are relevant for models that forecast future values, while discriminatory power applies to models that rank order risks. In all situations, it is important to understand a model's capabilities and limitations given its simplifications and assumptions.

The use of models invariably presents model risk, which is the potential for adverse consequences from decisions based on incorrect or misused model outputs and reports. Model risk can lead to financial loss, poor business and strategic decision making, or damage to a bank's reputation. Model risk occurs primarily for two reasons:

- The model may have fundamental errors and may produce inaccurate outputs when viewed against the design objective and intended business uses. The mathematical calculation and quantification exercise underlying any model generally involves application of theory, choice of sample design and numerical routines, selection of inputs and estimation, and implementation in information systems. Errors can occur at any point from design through implementation. In addition, shortcuts, simplifications, or approximations used to manage complicated problems could compromise the integrity and reliability of outputs from those calculations. Finally, the quality of model outputs depends on the quality of input data and assumptions, and errors in inputs or incorrect assumptions will lead to inaccurate outputs.
- The model may be used incorrectly or inappropriately. Even a fundamentally sound model producing accurate outputs consistent with the design objective of the model may exhibit high model risk if it is misapplied or misused. Models by their nature are simplifications of reality, and real-world events may prove those simplifications inappropriate. This is even more of a concern if a model is used outside the environment for which it was designed. Banks may do this intentionally as they apply

3. While outside the scope of this guidance, more qualitative approaches used by banking organizations—i.e., those *not* defined as models according to this guidance—should also be subject to a rigorous control process.

existing models to new products or markets, or inadvertently as market conditions or customer behavior changes. Decision makers need to understand the limitations of a model to avoid using it in ways that are not consistent with the original intent. Limitations come in part from weaknesses in the model due to its various shortcomings, approximations, and uncertainties. Limitations are also a consequence of assumptions underlying a model that may restrict the scope to a limited set of specific circumstances and situations.

Model risk should be managed like other types of risk. Banks should identify the sources of risk and assess the magnitude. Model risk increases with greater model complexity, higher uncertainty about inputs and assumptions, broader use, and larger potential impact. Banks should consider risk from individual models and in the aggregate. Aggregate model risk is affected by interaction and dependencies among models; reliance on common assumptions, data, or methodologies; and any other factors that could adversely affect several models and their outputs at the same time. With an understanding of the source and magnitude of model risk in place, the next step is to manage it properly.

A guiding principle for managing model risk is "effective challenge" of models, that is, critical analysis by objective, informed parties who can identify model limitations and assumptions and produce appropriate changes. Effective challenge depends on a combination of incentives, competence, and influence. Incentives to provide effective challenge to models are stronger when there is greater separation of that challenge from the model development process and when challenge is supported by well-designed compensation practices and corporate culture. Competence is a key to effectiveness since technical knowledge and modeling skills are necessary to conduct appropriate analysis and critique. Finally, challenge may fail to be effective without the influence to ensure that actions are taken to address model issues. Such influence comes from a combination of explicit authority, stature within the organization, and commitment and support from higher levels of management.

Even with skilled modeling and robust validation, model risk cannot be eliminated, so other tools should be used to manage model risk effectively. Among these are establishing limits on model use, monitoring model performance, adjusting or revising models over time, and supplementing model results with other analysis and information. Informed conservatism, in either the inputs or the design of a model or through explicit adjustments to outputs, can be an effective tool, though not an excuse to avoid improving models.

As is generally the case with other risks, materiality is an important consideration in model risk management. If at some banks the use of models is less pervasive and has less impact on their financial condition, then those banks may not need as complex an approach to model risk management in order to meet supervisory expectations. However, where models and model output have a material impact on business decisions, including decisions related to risk management and capital and liquidity planning, and where model failure would have a particularly harmful impact on a bank's financial condition, a bank's model risk-management framework should be more extensive and rigorous.

Model risk management begins with robust model development, implementation, and use. Another essential element is a sound model validation process. A third element is governance, which sets an effective framework with defined roles and responsibilities for clear communication of model limitations and assumptions, as well as the authority to restrict model usage. Each of these elements is discussed in the following sections.

MODEL DEVELOPMENT, IMPLEMENTATION, AND USE—PART IV

Model risk management should include disciplined and knowledgeable development and implementation processes that are consistent with the situation and goals of the model user and with bank policy. Model development is not a straightforward or routine technical process. The experience and judgment of developers, as much as their technical knowledge, greatly influence the appropriate selection of inputs and processing components. The training and experience of developers exercising such judgment affects the extent of model risk. Moreover, the modeling exercise is often a multidisciplinary activity drawing on economics, finance, statistics, mathematics, and other fields. Models are employed in real-world markets and events and, therefore, should be tailored for specific applications and informed by business uses. In addition, a considerable amount of subjective judgment is exercised at various stages of model development, implementation, use, and validation. It is important for decision makers to recognize that this subjectivity elevates the importance of sound and comprehensive model risk-management processes.[4]

Model Development and Implementation

An effective development process begins with a clear statement of purpose to ensure that model development is aligned with the intended use. The design, theory, and logic underlying the model should be well documented and generally supported by published research and sound industry practice. The model methodologies and processing components that implement the theory, including the mathematical specification and the numerical techniques and approximations, should be explained in detail with particular attention to merits and limitations. Developers should ensure that the components work as intended, are appropriate for the intended business purpose, and are conceptually sound and mathematically and statistically correct. Comparison with alternative theories and approaches is a fundamental component of a sound modeling process.

The data and other information used to develop a model are of critical importance; there should be rigorous assessment of data quality and relevance, and appropriate documentation. Developers should be able to demonstrate that such data and information are suitable for the model and that they are consistent with the theory behind the approach and with the chosen methodology. If data proxies are used, they should be carefully identified, justified, and documented. If data and information are not representative of the bank's portfolio or other characteristics, or if assumptions are made to adjust the data and information, these factors should be properly tracked and analyzed so that users are aware of potential limitations. This is particularly important for external data and information (from a vendor or outside party), especially as they relate to new products, instruments, or activities.

An integral part of model development is testing, in which the various components of a model and its overall functioning are evaluated to determine whether the model is performing as intended. Model testing includes checking the model's accuracy, demonstrating that the model is robust and stable, assessing potential limitations, and evaluating the model's behavior over a range of input values. It should also assess the impact of assumptions and identify situations where the model performs poorly or becomes unreliable. Testing should be applied to actual circumstances under a variety of market conditions, including scenarios that are outside the range of ordinary expectations, and should encompass the variety of products or applications for which the model is intended. Extreme values for inputs should be evaluated to identify any boundaries of model effectiveness. The impact of model results on other models that rely on those results as inputs should also be evaluated. Included in testing activities should be the purpose, design, and execution of test plans, summary results with commentary and evaluation, and detailed analysis of informative samples. Testing activities should be appropriately documented.

The nature of testing and analysis will depend on the type of model and will be judged by different criteria depending on the context. For example, the appropriate statistical tests depend on specific distributional assumptions and the purpose of the model. Furthermore, in many cases statistical tests cannot unambiguously reject false hypotheses or accept true ones based on sample information. Different tests have different strengths and weaknesses under different conditions. Any single test is rarely sufficient, so banks should apply a variety of tests to develop a sound model.

Banks should ensure that the development of the more judgmental and qualitative aspects of their models is also sound. In some cases, banks may take statistical output from a model and modify it with judgmental or qualitative adjustments as part of model development. While such practices may be appropriate, banks should ensure that any such adjustments made as part of the development process are conducted in an

4. Smaller banks that rely on vendor models may be able to satisfy the standards in this guidance without an in-house staff of technical, quantitative model developers. However, even if a bank relies on vendors for basic model development, the bank should still choose the particular models and variables that are appropriate to its size, scale, and lines of business and ensure the models are appropriate for the intended use.

appropriate and systematic manner and are well documented.

Models typically are embedded in larger information systems that manage the flow of data from various sources into the model and handle the aggregation and reporting of model outcomes. Model calculations should be properly coordinated with the capabilities and requirements of information systems. Sound model risk management depends on substantial investment in supporting systems to ensure data and reporting integrity, together with controls and testing to ensure proper implementation of models, effective systems integration, and appropriate use.

Model Use

Model use provides additional opportunity to test whether a model is functioning effectively and to assess its performance over time as conditions and model applications change. It can serve as a source of productive feedback and insights from a knowledgeable internal constituency with strong interest in having models that function well and reflect economic and business realities. Model users can provide valuable business insight during the development process. In addition, business managers affected by model outcomes may question the methods or assumptions underlying the models, particularly if the managers are significantly affected by, and do not agree with, the outcome. Such questioning can be healthy if it is constructive and causes model developers to explain and justify the assumptions and design of the models.

However, challenge from model users may be weak if the model does not materially affect their results, if the resulting changes in models are perceived to have adverse effects on the business line, or if change in general is regarded as expensive or difficult. User challenges also tend not to be comprehensive because they focus on aspects of models that have the most direct impact on the user's measured business performance or compensation, and thus may ignore other elements and applications of the models. Finally, such challenges tend to be asymmetric because users are less likely to challenge an outcome that results in an advantage for them. Indeed, users may incorrectly believe that model risk is low simply because outcomes from model-based decisions appear favorable to the institution. Thus, the nature and motivation behind model users' input should be evaluated carefully, and banks should also solicit constructive suggestions and criticism from sources independent of the line of business using the model.

Reports used for business decision making play a critical role in model risk management. Such reports should be clear and comprehensible and take into account the fact that decision makers and modelers often come from quite different backgrounds and may interpret the contents in different ways. Reports that provide a range of estimates for different input-value scenarios and assumption values can give decision makers important indications of the model's accuracy, robustness, and stability as well as information on model limitations.

An understanding of model uncertainty and inaccuracy and a demonstration that the bank is accounting for them appropriately are important outcomes of effective model development, implementation, and use. Because they are by definition imperfect representations of reality, all models have some degree of uncertainty and inaccuracy. These can sometimes be quantified, for example, by an assessment of the potential impact of factors that are unobservable or not fully incorporated in the model, or by the confidence interval around a statistical model's point estimate. Indeed, using a range of outputs, rather than a simple point estimate, can be a useful way to signal model uncertainty and avoid spurious precision. At other times, only a qualitative assessment of model uncertainty and inaccuracy is possible. In either case, it can be prudent for banks to account for model uncertainty by explicitly adjusting model inputs or calculations to produce more severe or adverse model output in the interest of conservatism. Accounting for model uncertainty can also include judgmental conservative adjustments to model output, placing less emphasis on that model's output, or ensuring that the model is only used when supplemented by other models or approaches.[5]

While conservative use of models is prudent in general, banks should be careful in applying conservatism broadly or claiming to make conservative adjustments or add-ons to address

5. To the extent that models are used to generate amounts included in public financial statements, any adjustments for model uncertainty must comply with generally accepted accounting principles.

model risk, because the impact of such conservatism in complex models may not be obvious or intuitive. Model aspects that appear conservative in one model may not be truly conservative compared with alternative methods. For example, simply picking an extreme point on a given modeled distribution may not be conservative if the distribution was misestimated or misspecified in the first place. Furthermore, initially conservative assumptions may not remain conservative over time. Therefore, banks should justify and substantiate claims that model outputs are conservative with a definition and measurement of that conservatism that is communicated to model users. In some cases, sensitivity analysis or other types of stress testing can be used to demonstrate that a model is indeed conservative. Another way in which banks may choose to be conservative is to hold an additional cushion of capital to protect against potential losses associated with model risk. However, conservatism can become an impediment to proper model development and application if it is seen as a solution that dissuades the bank from making the effort to improve the model; in addition, excessive conservatism can lead model users to discount the model outputs.

As previously explained, robust model development, implementation, and use is important to model risk management. But it is not enough for model developers and users to understand and accept the model. Because model risk is ultimately borne by the bank as a whole, the bank should objectively assess model risk and the associated costs and benefits using a sound model-validation process.

MODEL VALIDATION—PART V

Model validation is the set of processes and activities intended to verify that models are performing as expected, in line with their design objectives and business uses. Effective validation helps ensure that models are sound. It also identifies potential limitations and assumptions and assesses their possible impact. As with other aspects of effective challenge, model validation should be performed by staff with appropriate incentives, competence, and influence.

All model components, including input, processing, and reporting, should be subject to validation; this applies equally to models developed in-house and to those purchased from, or developed by, vendors or consultants. The rigor and sophistication of validation should be commensurate with the bank's overall use of models, the complexity and materiality of its models, and the size and complexity of the bank's operations.

Validation involves a degree of independence from model development and use. Generally, validation should be done by people who are not responsible for development or use and do not have a stake in whether a model is determined to be valid. Independence is not an end in itself but rather helps ensure that incentives are aligned with the goals of model validation. While independence may be supported by separation of reporting lines, it should be judged by actions and outcomes, since there may be additional ways to ensure objectivity and prevent bias. As a practical matter, some validation work may be most effectively done by model developers and users; it is essential, however, that such validation work be subject to critical review by an independent party, who should conduct additional activities to ensure proper validation. Overall, the quality of the process is judged by the manner in which models are subject to critical review. This could be determined by evaluating the extent and clarity of documentation, the issues identified by objective parties, and the actions taken by management to address model issues.

In addition to independence, banks can support appropriate incentives in validation through compensation practices and performance evaluation standards that are tied directly to the quality of model validations and the degree of critical, unbiased review. In addition, corporate culture plays a role if it establishes support for objective thinking and encourages questioning and challenging of decisions.

Staff doing validation should have the requisite knowledge, skills, and expertise. A high level of technical expertise may be needed because of the complexity of many models, both in structure and in application. These staff also should have a significant degree of familiarity with the line of business using the model and the model's intended use. A model's developer is an important source of information but cannot be relied on as an objective or sole source on which to base an assessment of model quality.

Staff conducting validation work should have explicit authority to challenge developers and users and to elevate their findings, including issues and deficiencies. The individual or unit to whom those staff report should have sufficient influence or stature within the bank to ensure that any issues and deficiencies are appropriately addressed in a timely and substantive manner. Such influence can be reflected in reporting lines, title, rank, or designated responsibilities. Influence may be demonstrated by a pattern of actual instances in which models, or the use of models, have been appropriately changed as a result of validation.

The range and rigor of validation activities conducted prior to first use of a model should be in line with the potential risk presented by use of the model. If significant deficiencies are noted as a result of the validation process, use of the model should not be allowed or should be permitted only under very tight constraints until those issues are resolved. If the deficiencies are too severe to be addressed within the model's framework, the model should be rejected. If it is not feasible to conduct necessary validation activities prior to model use because of data paucity or other limitations, that fact should be documented and communicated in reports to users, senior management, and other relevant parties. In such cases, the uncertainty about the results that the model produces should be mitigated by other compensating controls. This is particularly applicable to new models and to the use of existing models in new applications.

Validation activities should continue on an ongoing basis after a model goes into use, to track known model limitations and to identify any new ones. Validation is an important check on model use during periods of benign economic and financial conditions, when estimates of risk and potential loss can become overly optimistic, and when the data at hand may not fully reflect more stressed conditions. Ongoing validation activities help to ensure that changes in markets, products, exposures, activities, clients, or business practices do not create new model limitations. For example, if credit risk models do not incorporate underwriting changes in a timely manner, flawed and costly business decisions could be made before deterioration in model performance becomes apparent.

Banks should conduct a periodic review—at least annually but more frequently if warranted—of each model to determine whether it is working as intended and if the existing validation activities are sufficient. Such a determination could simply affirm previous validation work, suggest updates to previous validation activities, or call for additional validation activities. Material changes to models should also be subject to validation. It is generally good practice for banks to ensure that all models undergo the full validation process, as described in the following section, at some fixed interval, including updated documentation of all activities.

Effective model validation helps reduce model risk by identifying model errors, corrective actions, and appropriate use. It also provides an assessment of the reliability of a given model, based on its underlying assumptions, theory, and methods. In this way, it provides information about the source and extent of model risk. Validation also can reveal deterioration in model performance over time and can set thresholds for acceptable levels of error, through analysis of the distribution of outcomes around expected or predicted values. If outcomes fall consistently outside this acceptable range, then the models should be redeveloped.

Key Elements of Comprehensive Validation

An effective validation framework should include three core elements:

- Evaluation of conceptual soundness, including developmental evidence
- Ongoing monitoring, including process verification and benchmarking
- Outcomes analysis, including back-testing

Evaluation of Conceptual Soundness

This first element involves assessing the quality of the model design and construction. It entails review of documentation and empirical evidence supporting the methods used and variables selected for the model. Documentation and testing should convey an understanding of model limitations and assumptions. Validation should ensure that judgment exercised in model design and construction is well informed, carefully considered, and consistent with published research and with sound industry practice. Developmental evidence should be reviewed before a model goes into use and also as part of the ongoing validation process, in particular whenever there is a material change in the model.

A sound development process will produce documented evidence in support of all model choices, including the overall theoretical construction, key assumptions, data, and specific mathematical calculations. As part of model validation, those model aspects should be subjected to critical analysis by both evaluating the quality and extent of developmental evidence and conducting additional analysis and testing as necessary. Comparison to alternative theories and approaches should be included. Key assumptions and the choice of variables should be assessed, with analysis of their impact on model outputs and particular focus on any potential limitations. The relevance of the data used to build the model should be evaluated to ensure that it is reasonably representative of the bank's portfolio or market conditions, depending on the type of model. This is an especially important exercise when a bank uses external data or the model is used for new products or activities.

Where appropriate to the particular model, banks should employ sensitivity analysis in model development and validation to check the impact of small changes in inputs and parameter values on model outputs to make sure they fall within an expected range. Unexpectedly large changes in outputs in response to small changes in inputs can indicate an unstable model. Varying several inputs simultaneously as part of sensitivity analysis can provide evidence of unexpected interactions, particularly if the interactions are complex and not intuitively clear. Banks benefit from conducting model stress testing to check performance over a wide range of inputs and parameter values, including extreme values, to verify that the model is robust. Such testing helps establish the boundaries of model performance by identifying the acceptable range of inputs as well as conditions under which the model may become unstable or inaccurate.

Management should have a clear plan for using the results of sensitivity analysis and other quantitative testing. If testing indicates that the model may be inaccurate or unstable in some circumstances, management should consider modifying certain model properties, putting less reliance on its outputs, placing limits on model use, or developing a new approach.

Qualitative information and judgment used in model development should be evaluated, including the logic, judgment, and types of information used, to establish the conceptual soundness of the model and set appropriate conditions for its use. The validation process should ensure that qualitative, judgmental assessments are conducted in an appropriate and systematic manner, are well supported, and are documented.

Ongoing Monitoring

The second core element of the validation process is ongoing monitoring. Such monitoring confirms that the model is appropriately implemented and is being used and is performing as intended.

Ongoing monitoring is essential to evaluate whether changes in products, exposures, activities, clients, or market conditions necessitate adjustment, redevelopment, or replacement of the model and to verify that any extension of the model beyond its original scope is valid. Any model limitations identified in the development stage should be regularly assessed over time, as part of ongoing monitoring. Monitoring begins when a model is first implemented in production systems for actual business use. This monitoring should continue periodically over time, with a frequency appropriate to the nature of the model, the availability of new data or modeling approaches, and the magnitude of the risk involved. Banks should design a program of ongoing testing and evaluation of model performance along with procedures for responding to any problems that appear. This program should include process verification and benchmarking.

Process verification checks that all model components are functioning as designed. It includes verifying that internal and external data inputs continue to be accurate, complete, consistent with model purpose and design, and of the highest quality available. Computer code implementing the model should be subject to rigorous quality and change control procedures to ensure that the code is correct, that it cannot be altered except by approved parties, and that all changes are logged and can be audited. System integration can be a challenge and deserves special attention because the model processing component often draws from various sources of data, processes large amounts of data, and then feeds into multiple data repositories and reporting systems. User-developed applications, such as spreadsheets or ad hoc database applications used to generate quantitative estimates, are particularly prone to model risk. As the content or composition of information changes over time, systems may need to be updated to reflect any changes in the data or its use. Reports derived from model outputs should be reviewed as part of validation to verify that they are accurate, complete, and informative, and that they contain appropriate indicators of model performance and limitations.

Many of the tests employed as part of model development should be included in ongoing monitoring and be conducted on a regular basis to incorporate additional information as it becomes available. New empirical evidence or theoretical research may suggest the need to modify or even replace original methods. Analysis of the integrity and applicability of internal and external information sources, including information provided by third-party vendors, should be performed regularly.

Sensitivity analysis and other checks for robustness and stability should likewise be repeated periodically. They can be as useful during ongoing monitoring as they are during model development. If models only work well for certain ranges of input values, market conditions, or other factors, they should be monitored to identify situations where these constraints are approached or exceeded.

Ongoing monitoring should include the analysis of overrides with appropriate documentation. In the use of virtually any model, there will be cases where model output is ignored, altered, or reversed based on the expert judgment of model users. Such overrides are an indication that, in some respect, the model is not performing as intended or has limitations. Banks should evaluate the reasons for overrides and track and analyze override performance. If the rate of overrides is high, or if the override process consistently improves model performance, it is often a sign that the underlying model needs revision or redevelopment.

Benchmarking is the comparison of a given model's inputs and outputs to estimates from alternative internal or external data or models. It can be incorporated in model development as well as in ongoing monitoring. For credit-risk models, examples of benchmarks include models from vendor firms or industry consortia and data from retail credit bureaus. Pricing models for securities and derivatives often can be compared with alternative models that are more accurate or comprehensive but also too time-consuming to run on a daily basis. Whatever the source, benchmark models should be rigorous, and benchmark data should be accurate and complete to ensure a reasonable comparison.

Discrepancies between the model output and benchmarks should trigger investigation into the sources and degree of the differences, and examination of whether they are within an expected or appropriate range given the nature of the comparison. The results of that analysis may suggest revisions to the model. However, differences do not necessarily indicate that the model is in error. The benchmark itself is an alternative prediction, and the differences may be due to the different data or methods used. If the model and the benchmark match well, that is evidence in favor of the model, but it should be interpreted with caution so the bank does not get a false degree of comfort.

Outcomes Analysis

The third core element of the validation process is outcomes analysis, a comparison of model outputs to corresponding actual outcomes. The precise nature of the comparison depends on the objectives of a model and might include an assessment of the accuracy of estimates or forecasts, an evaluation of rank-ordering ability, or other appropriate tests. In all cases, such comparisons help to evaluate model performance by establishing expected ranges for those actual outcomes in relation to the intended objectives and assessing the reasons for observed variation between the two. If outcomes analysis produces evidence of poor performance, the bank should take action to address those issues. Outcomes analysis typically relies on statistical tests or other quantitative measures. It can also include expert judgment to check the intuition behind the outcomes and confirm that the results make sense. When a model itself relies on expert judgment, quantitative outcomes analysis helps to evaluate the quality of that judgment. Outcomes analysis should be conducted on an ongoing basis to test whether the model continues to perform in line with design objectives and business uses.

A variety of quantitative and qualitative testing and analytical techniques can be used in outcomes analysis. The choice of technique should be based on the model's methodology, and its complexity, data availability, and the magnitude of potential model risk to the bank. Outcomes analysis should involve a range of tests because any individual test will have weaknesses. For example, some tests are better at checking a model's ability to rank-order or segment observations on a relative basis, whereas others are better at checking absolute forecast accuracy. Tests should be designed for each situation, as not all will be effective or feasible in every circumstance, and attention should be paid to choosing the appropriate type of outcomes analysis for a particular model.

Models are regularly adjusted to take into account new data or techniques, or because of deterioration in performance. Parallel outcomes analysis, under which both the original and adjusted models' forecasts are tested against realized outcomes, provides an important test of such model adjustments. If the adjusted model does not outperform the original model, developers, users, and reviewers should realize that additional changes—or even a wholesale redesign—are likely necessary before the adjusted model replaces the original one.

Back-testing is one form of outcomes analysis; specifically, it involves the comparison of actual outcomes with model forecasts during a sample time period not used in model development and at an observation frequency that matches the forecast horizon or performance window of the model. The comparison is generally done using expected ranges or statistical confidence intervals around the model forecasts. When outcomes fall outside those intervals, the bank should analyze the discrepancies and investigate the causes that are significant in terms of magnitude or frequency. The objective of the analysis is to determine whether differences stem from the omission of material factors from the model, whether they arise from errors with regard to other aspects of model specification such as interaction terms or assumptions of linearity, or whether they are purely random and thus consistent with acceptable model performance. Analysis of in-sample fit and of model performance in holdout samples (data set aside and not used to estimate the original model) are important parts of model development but are not substitutes for back-testing.

A well-known example of back-testing is the evaluation of value-at-risk (VaR), in which actual profit and loss is compared with a model forecast loss distribution. Significant deviation in expected versus actual performance and unexplained volatility in the profits and losses of trading activities may indicate that hedging and pricing relationships are not adequately measured by a given approach. Along with measuring the frequency of losses in excess of a single VaR percentile estimator, banks should use other tests, such as assessing any clustering of exceptions and checking the distribution of losses against other estimated percentiles.

Analysis of the results of even high-quality and well-designed back-testing can pose challenges, since it is not a straightforward, mechanical process that always produces unambiguous results. The purpose is to test the model, not individual forecast values. Back-testing may entail analysis of a large number of forecasts over different conditions at a point in time or over multiple time periods. Statistical testing is essential in such cases, yet such testing can pose challenges in both the choice of appropriate tests and the interpretation of results; banks should support and document both the choice of tests and the interpretation of results.

Models with long forecast horizons should be back-tested, but given the amount of time it would take to accumulate the necessary data, that testing should be supplemented by evaluation over shorter periods. Banks should employ outcomes analysis consisting of "early warning" metrics designed to measure performance beginning very shortly after model introduction and trend analysis of performance over time. These outcomes analysis tools are not substitutes for back-testing, which should still be performed over the longer time period, but rather are very important complements.

Outcomes analysis and the other elements of the validation process may reveal significant errors or inaccuracies in model development or outcomes that consistently fall outside the bank's predetermined thresholds of acceptability. In such cases, model adjustment, recalibration, or redevelopment is warranted. Adjustments and recalibration should be governed by the principle of conservatism and should undergo independent review.

Material changes in model structure or technique, and all model redevelopment, should be subject to validation activities of appropriate range and rigor before implementation. At times, banks may have a limited ability to use key model validation tools like back-testing or sensitivity analysis for various reasons, such as lack of data or of price observability. In those cases, even more attention should be paid to the model's limitations when considering the appropriateness of model usage, and senior management should be fully informed of those limitations when using the models for decision making. Such scrutiny should be applied to individual models and models in the aggregate.

Validation of Vendor and Other Third-Party Products

The widespread use of vendor and other third-party products—including data, parameter values, and complete models—poses unique challenges for validation and other model risk-management activities because the modeling expertise is external to the user and because some components are considered proprietary. Vendor products should nevertheless be incorporated into a bank's broader model risk-management framework, following the same principles as applied to in-house models, although the process may be somewhat modified.

As a first step, banks should ensure that there are appropriate processes in place for selecting vendor models. Banks should require the vendor to provide developmental evidence explaining the product components, design, and intended use, to determine whether the model is appropriate for the bank's products, exposures, and risks. Vendors should provide appropriate testing results that show their product works as expected. They should also clearly indicate the model's limitations and assumptions and where the product's use may be problematic. Banks should expect vendors to conduct ongoing performance monitoring and outcomes analysis, with disclosure to their clients, and to make appropriate modifications and updates over time.

Banks are expected to validate their own use of vendor products. External models may not allow full access to computer coding and implementation details, so the bank may have to rely more on sensitivity analysis and benchmarking. Vendor models are often designed to provide a range of capabilities and so may need to be customized by a bank for its particular circumstances. A bank's customization choices should be documented and justified as part of validation. If vendors provide input data or assumptions, or use them to build models, their relevance for the bank's situation should be investigated. Banks should obtain information regarding the data used to develop the model and assess the extent to which that data are representative of the bank's situation. The bank also should conduct ongoing monitoring and outcomes analysis of vendor model performance using the bank's own outcomes.

Systematic procedures for validation help the bank to understand the vendor product and its capabilities, applicability, and limitations. Such detailed knowledge is necessary for basic controls of bank operations. It is also very important for the bank to have as much knowledge in-house as possible, in case the vendor or the bank terminates the contract for any reason, or if the vendor is no longer in business. Banks should have contingency plans for instances when the vendor model is no longer available or cannot be supported by the vendor.

GOVERNANCE, POLICIES, AND CONTROLS—PART VI

Developing and maintaining strong governance, policies, and controls over the model risk-management framework is fundamentally important to its effectiveness. Even if model development, implementation, use, and validation are satisfactory, a weak governance function will reduce the effectiveness of overall model risk management. A strong governance framework provides explicit support and structure to risk-management functions through policies defining relevant risk-management activities, procedures that implement those policies, allocation of resources, and mechanisms for evaluating whether policies and procedures are being carried out as specified. Notably, the extent and sophistication of a bank's governance function is expected to align with the extent and sophistication of model usage.

Board of Directors and Senior Management

Model risk governance is provided at the highest level by the board of directors and senior management when they establish a bank-wide approach to model risk management. As part of their overall responsibilities, a bank's board and senior management should establish a strong model risk-management framework that fits into the broader risk management of the organization. That framework should be grounded in an understanding of model risk—not just for individual models but also in the aggregate. The framework should include standards for model development, implementation, use, and validation.

While the board is ultimately responsible, it generally delegates to senior management the responsibility for executing and maintaining an effective model risk-management framework. Duties of senior management include establishing adequate policies and procedures and ensuring compliance, assigning competent staff, overseeing model development and implementation, evaluating model results, ensuring effective challenge, reviewing validation and internal audit findings, and taking prompt remedial action when necessary. In the same manner as for other major areas of risk, senior management, directly and through relevant committees, is responsible for regularly reporting to the board on significant model risk, from individual models and in the aggregate, and on compliance with policy. Board members should ensure that the level of model risk is within their tolerance and should direct changes where appropriate. These actions will set the tone for the whole organization about the importance of model risk and the need for active model risk management.

Policies and Procedures

Consistent with good business practices and existing supervisory expectations, banks should formalize model risk-management activities with policies and the procedures to implement them. Model risk-management policies should be consistent with this guidance and also be commensurate with the bank's relative complexity, business activities, corporate culture, and overall organizational structure. The board or its delegates should approve model risk-management policies and review them annually to ensure consistent and rigorous practices across the organization. Those policies should be updated as necessary to ensure that model risk-management practices remain appropriate and keep current with changes in market conditions, bank products and strategies, bank exposures and activities, and practices in the industry. All aspects of model risk management should be covered by suitable policies, including model and model risk definitions; assessment of model risk; acceptable practices for model development, implementation, and use; appropriate model validation activities; and governance and controls over the model risk-management process.

Policies should emphasize testing and analysis and promote the development of targets for model accuracy, standards for acceptable levels of discrepancies, and procedures for review of, and response to, unacceptable discrepancies. They should include a description of the processes used to select and retain vendor models, including the people who should be involved in such decisions.

The prioritization, scope, and frequency of validation activities should be addressed in these policies. They should establish standards for the extent of validation that should be performed before models are put into production and the scope of ongoing validation. The policies should also detail the requirements for validation of vendor models and third-party products. Finally, they should require maintenance of detailed documentation of all aspects of the model risk-management framework, including an inventory of models in use, results of the modeling and validation processes, and model issues and their resolution.

Policies should identify the roles and assign responsibilities within the model risk-management framework with clear detail on staff expertise, authority, reporting lines, and continuity. They should also outline controls on the use of external resources for validation and compliance and specify how that work will be integrated into the model risk-management framework.

Roles and Responsibilities

Conceptually, the roles in model risk management can be divided among ownership, controls, and compliance. While there are several ways in which banks can assign the responsibilities associated with these roles, it is important that reporting lines and incentives be clear, with potential conflicts of interest identified and addressed.

Business units are generally responsible for the model risk associated with their business strategies. The role of model owner involves ultimate accountability for model use and performance within the framework set by bank policies and procedures. Model owners should be responsible for ensuring that models are properly developed, implemented, and used. The model owner should also ensure that models in use have undergone appropriate validation and approval processes, promptly identify new or changed models, and provide all necessary information for validation activities.

Model risk taken by business units should be controlled. The responsibilities for risk controls may be assigned to individuals, committees, or a combination of the two, and include risk measurement, limits, and monitoring. Other responsibilities include managing the independent validation and review process to ensure that effective challenge takes place. Appropriate resources should be assigned for model validation and for guiding the scope and prioritization of work. Issues and problems identified through validation and other forms of oversight should be communicated by risk-control staff to relevant individuals and business users throughout the organization, including senior management, with a plan for corrective action. Control staff should have the authority to restrict the use of models and monitor any limits on model usage. While they may grant exceptions to typical procedures of model validation on a temporary basis, that authority should be subject to other control mechanisms, such as timelines for completing validation work and limits on model use.

Compliance with policies is an obligation of model owners and risk-control staff, and there should be specific processes in place to ensure that these roles are being carried out effectively and in line with policy. Documentation and tracking of activities surrounding model development, implementation, use, and validation are needed to provide a record that makes compliance with policy transparent.

Internal Audit

A bank's internal audit function should assess the overall effectiveness of the model risk-management framework, including the framework's ability to address both types of model risk for individual models and in the aggregate. Findings from internal audit related to models should be documented and reported to the board or its appropriately delegated agent. Banks should ensure that internal audit operates with the proper incentives, has appropriate skills, and has adequate stature in the organization to assist in model risk management. Internal audit's role is not to duplicate model risk-management activities. Instead, its role is to evaluate whether model risk management is comprehensive, rigorous, and effective. To accomplish this evaluation, internal audit staff should possess sufficient expertise in relevant modeling concepts as well as their use in particular business lines. If some internal audit staff perform certain validation activities, then they should not be involved in the assessment of the overall model risk-management framework.

Internal audit should verify that acceptable policies are in place and that model owners and control groups comply with those policies. Internal audit should also verify records of model use and validation to test whether validations are performed in a timely manner and whether models are subject to controls that appropriately account for any weaknesses in validation activities. Accuracy and completeness of the model inventory should be assessed. In addition, processes for establishing and monitoring limits on model usage should be evaluated. Internal audit should determine whether procedures for updating models are clearly documented and test whether those procedures are being carried out as specified. Internal audit should check that model owners and control groups are meeting documentation standards, including risk reporting. Additionally, internal audit should perform assessments of supporting operational systems and evaluate the reliability of data used by models.

Internal audit also has an important role in ensuring that validation work is conducted properly and that appropriate effective challenge is being carried out. It should evaluate the objectivity, competence, and organizational standing of the key validation participants, with the ultimate goal of ascertaining whether those participants have the right incentives to discover and report deficiencies. Internal audit should review validation activities conducted by internal and external parties with the same rigor to see if those activities are being conducted in accordance with this guidance.

External Resources

Although model risk management is an internal process, a bank may decide to engage external resources to help execute certain activities related to the model risk-management framework. These activities could include model validation and review, compliance functions, or other activities in support of internal audit. These resources may provide added knowledge and another level of critical and effective challenge, which may improve the internal model development and risk-management processes. However, this potential benefit should be weighed against the added costs for such resources and the added time that external parties require to understand internal data, systems, and other relevant bank-specific circumstances.

Whenever external resources are used, the bank should specify the activities to be conducted in a clearly written and agreed-upon scope of work. A designated internal party from the bank should be able to understand and evaluate the results of validation and risk-control activities conducted by external resources. The internal party is responsible for verifying that the agreed upon scope of work has been completed; evaluating and tracking identified issues and ensuring they are addressed; and making sure that completed work is incorporated into the bank's overall model risk-management framework. If the external resources are only utilized to do a portion of validation or compliance work, the bank should coordinate internal resources to complete the full range of work needed. The bank should have a contingency plan in case an external resource is no longer available or is unsatisfactory.

Model Inventory

Banks should maintain a comprehensive set of information for models implemented for use, under development for implementation, or recently retired. While each line of business may maintain its own inventory, a specific party should also be charged with maintaining a firm-wide inventory of all models, which should assist a bank in evaluating its model risk in the aggregate. Any variation of a model that warrants a separate validation should be included as a separate model and cross-referenced with other variations.

While the inventory may contain varying levels of information, given different model complexity and the bank's overall level of model usage, the following are some general guidelines. The inventory should describe the purpose and products for which the model is designed, actual or expected usage, and any restrictions on use. It is useful for the inventory to list the type and source of inputs used by a given model and underlying components (which may include other models), as well as model outputs and their intended use. It should also indicate whether models are functioning properly, provide a description of when they were last updated, and list any exceptions to policy. Other items include the names of individuals responsible for various aspects of the model development and validation; the dates of completed and planned validation activities; and the time frame during which the model is expected to remain valid.

Documentation

Without adequate documentation, model risk assessment and management will be ineffective. Documentation of model development and validation should be sufficiently detailed so that parties unfamiliar with a model can understand how the model operates, its limitations, and its key assumptions. Documentation provides for continuity of operations, makes compliance with policy transparent, and helps track recommendations, responses, and exceptions. Developers, users, control and compliance units, and supervisors are all served by effective documentation. Banks can benefit from advances in information and knowledge management systems and electronic documentation to improve the organization, timeliness, and accessibility of the various records and reports produced in the model risk-management process.

Documentation takes time and effort, and model developers and users who know the models well may not appreciate its value. Banks should therefore provide incentives to produce effective and complete model documentation. Model developers should have responsibility during model development for thorough documentation, which should be kept up-to-date as the model and application environment changes. In addition, the bank should ensure that other participants in model risk-management activities document their work, including ongoing monitoring, process verification, benchmarking, and outcomes analysis. Also, line of business or other decision makers should document information leading to selection of a given model and its subsequent validation. For cases in which a bank uses models from a vendor or other third party, it should ensure that appropriate documentation of the third-party approach is available so that the model can be appropriately validated.

Validation reports should articulate model aspects that were reviewed, highlighting potential deficiencies over a range of financial and economic conditions, and determining whether adjustments or other compensating controls are warranted. Effective validation reports include clear executive summaries, with a statement of model purpose and an accessible synopsis of model and validation results, including major limitations and key assumptions.

CONCLUSION—PART VII

Section 4027.1 provides comprehensive guidance on effective model risk management. Many of the activities described are common industry practice. But all banks should confirm that their practices conform to the principles in this guidance for model development, implementation, and use, as well as model validation. Banks should also ensure that they maintain strong governance and controls to help manage model risk, including internal policies and procedures that appropriately reflect the risk-management principles described in this guidance. Details of model risk-management practices may vary from bank to bank, as practical application of this guidance should be commensurate with a bank's risk exposures, its business activities, and the extent and complexity of its model use.

INTRODUCTION

Asset securitization typically involves the transfer of potentially illiquid on-balance-sheet assets (for example, mortgages, loans, leases) to a third party or trust. In turn, the third party or trust issues certificates or notes to investors. The cash flow from the transferred assets supports repayment of the certificates or notes. Firms use asset securitization to access alternative funding sources, manage loan concentrations, improve financial-performance ratios, and more efficiently meet customers' financing needs. Assets that are typically securitized include credit card receivables, automobile receivable paper, commercial or residential first-priority mortgages, commercial loans, home-equity loans, and student loans.

WHY FIRMS ENGAGE IN SECURITIZATION ACTIVITIES

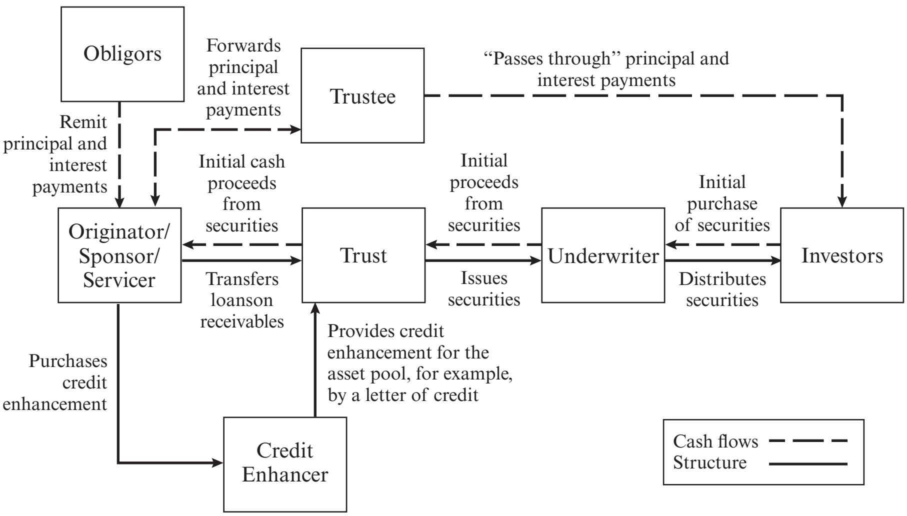
While the objectives of securitization may vary, securitized transactions may provide several benefits, such as

- transferring some of a firm's risks of ownership to parties willing and able to manage the risk;
- improving a firm's ability to manage potential asset-liability mismatches and credit concentrations;
- reducing a firm's interest-rate risk by improving the firm's asset-liability mix, especially if the firm has a large investment in fixed-rate, low-yield assets;
- transferring some on-balance-sheet assets to off-balance-sheet assets to provide some cost savings of on-balance sheet financing and enhances the firm's returns on equity and assets; or
- allowing a firm to convert its illiquid assets into a security with greater marketability that can be sold and used to diversify a firm's funding base at a potentially more favorable rate of return.

THE SECURITIZATION PROCESS

As depicted in figure 1, the asset-securitization process begins with the segregation of assets into pools that are relatively homogeneous with

Figure 1. Pass-through, asset-backed securities: structure and cash flows



respect to credit, maturity, and interest-rate risks. These pools of assets are then transferred to a trust or other entity known as "an issuer" because the entity issues the securities or ownership interests that will be acquired by investors. These asset-backed securities (ABS) may take the form of debt, certificates of beneficial ownership, or other financial instruments. The issuer is typically protected from bankruptcy through various structural and legal arrangements. A sponsor of the securitization provides the assets to be securitized (which may or may not have been originated by the sponsor) and owns or otherwise establishes the issuer.

Each issue of ABS has a servicer that is responsible for collecting interest and principal payments on assets in the underlying pool backing the securitization and for transmitting these funds to investors (or to a trustee representing the investors). A trustee is responsible for monitoring the activities of the servicer to ensure that the servicer properly fulfills its role and legal obligations.

The structure of the ABS also may include a guarantor that ensures that investors receive principal and interest payments on the securities on a timely basis. The guarantor agrees to make these payments to investors even if the servicer cannot collect these payments from the obligors of the underlying assets. Many issuances of mortgage-backed securities are guaranteed directly by the Government National Mortgage Association (GNMA or Ginnie Mae), which is backed by the full faith and credit of the U.S. government. Privately issued mortgage-backed securities and other types of ABS may depend on some form of credit enhancement provided by the originator of the assets or a third party to insulate the investor from some portion of, or all, credit losses. The amount of the credit enhancement may be based on several multiples of the historical losses experienced on the particular assets backing the security.

The structure of an ABS and the terms of the investors' interest(s) in the underlying assets backing the security can vary widely depending on the type of assets, the risk tolerance(s) and investment objective(s) of the investors, and the use of credit enhancements. Securitizations typically divide the credit risk of the underlying assets into different levels (sometimes called "tranches") of risk–return properties and distribute it based on the risk tolerance(s) of investors. The *first-dollar* loss, or most subordinate, position is the first to absorb credit losses, and the most senior investor position is the last to absorb losses. There also may be one or more loss positions between those tranches. Each loss position functions as a credit enhancement for the more senior positions in the structure. In other words, when ABS reallocate the risks in the underlying assets (particularly credit risk), the risks are moved into security tranches that match the desires of investors. For example, senior-subordinated security structures give holders of senior tranches greater credit-risk protection—albeit at lower yields—than holders of subordinated tranches. Under this structure, at least two classes of asset-backed securities—a senior and a junior (or subordinated) class—are issued in connection with the same pool of assets. The senior class is structured so that it has a priority claim on the cash flows from the underlying pool of assets. The subordinated class must absorb credit losses on the collateral before the senior portion experiences any losses.

TYPES OF ASSET-BACKED SECURITIES

Asset securitization involves different types of capital-market instruments. These instruments may be structured as "pass-throughs" or "pay-throughs."

Under a pass-through structure, the cash flows from the underlying pool of assets are passed through to investors on a pro rata or proportional basis. This type of security may be a single-class instrument, such as a GNMA pass-through, or a multiclass instrument, such as a real estate mortgage investment conduit.

The pay-through structure, which contains multiple classes, aggregates the cash flows from the underlying pool of assets and reallocates them to two or more issues of securities that have different cash-flow characteristics and maturities. While not particularly common, one example of a pay-through structure is the collateralized mortgage obligation (CMO), which has a series of bond classes, each with its own specified coupon and stated maturity. In most cases, the assets that make up the CMO collateral pools are pass-through securities. Scheduled principal payments and any prepayments from the underlying assets go first to the earliest maturing class of bonds. This first class of bonds must be retired before the principal cash flows from the assets would be used to retire the later bond classes. The development of the pay-through structure resulted from the desire to broaden the marketability of these securities to investors who were interested in maturities other than those generally associated with pass-through securities.

ABS backed by multiple classes of securities also may be issued as derivative instruments, such as "stripped" securities. Investors in each class of a stripped security would receive a different portion of the principal and interest cash flows from the underlying pool of assets. In their purest form, stripped securities may be issued as interest-only strips, for which the investor receives 100 percent of the interest paid on the underlying pool of assets, and as principal-only strips, for which the investor receives all of the principal paid on the underlying pool of assets. Other types of financial instruments may arise as a result of asset securitization, such as

- *Servicing assets.* These assets become a distinct asset recorded on the balance sheet of a firm when contractually separated from the assets that have been sold or securitized so that a firm retains servicing rights. In addition, servicing assets are created when a firm purchases the right to act as the servicer for the loan pool. The value of the servicing rights is based on the contractually specified servicing fees, net of servicing costs.
- *Interest-only strips receivables.* These cash flows are accounted for separately from servicing rights and reflect the right to future interest income from the serviced assets in excess of the contractually specified servicing fees.
- *ABS residuals.* These residuals (sometimes referred to as "residuals," "residual interests," or "retained interests") represent claims on any cash flows that remain after all obligations to investors of other tranches in the securitization and any related expenses have been met. The excess cash flows may arise as a result of overcollateralization or from income from reinvestment of cash. Residuals can be retained by sponsors or purchased by investors in the form of securities.

Asset-Backed Commercial Paper Programs

An asset-backed commercial paper (ABCP) program typically is a program through which a firm provides funding to its corporate customers by sponsoring and administering a bankruptcy-remote, special-purpose entity that purchases asset pools from, or extends loans to, those customers.[1] The underlying asset pools for an ABCP program might include, for example, trade receivables, consumer loans, or ABS. The ABCP program raises cash to provide funding to the firm's customers through the issuance of externally rated commercial paper into the market. The sponsoring firm often provides liquidity and credit enhancements to the ABCP program.

ABCP programs differ from some other methods of securitization in that ABCP programs typically include more than one type of asset in the underlying asset pool. Moreover, in certain cases, the cash flow from the asset pool may not necessarily match the payments to investors—the maturity of the underlying assets need not always parallel the maturity of the commercial paper liabilities of the ABCP program—since the ABCP program can engage in maturity transformation. In those instances, when the commercial paper issued by the ABCP program matures, that commercial paper usually is rolled over into, or otherwise funded by, another commercial paper issuance by the ABCP program.

For more information, see this manual's section entitled, "Overview of Asset-Backed Commercial Paper Programs."

RISKS ASSOCIATED WITH SECURITIZATION ACTIVITIES

The types of risks that firms encounter when engaging in securitization activities include credit risk, concentration risk, interest-rate risk (including prepayment risk), operational risk, and liquidity risk. Securitization activities have the potential to increase the overall risk profile of the firm if they are not carried out prudently. A firm's risk exposure will depend on the firm's role in the ABS, such as originator, servicer, credit

1. ABCP programs can include structured investment vehicles (entities that earn a spread by issuing commercial paper and medium-term notes and using the proceeds to purchase highly rated debt securities) and securities arbitrage programs.

enhancer, trustee, or investor. Potential risks can include the following:

- *Credit risk.* Firms should be aware that the credit risk involved in many securitization activities may not always be obvious. For certain types of loan securitizations, a firm may be exposed to essentially the same credit risk as in traditional lending activities, even though a particular transaction may appear to separate the firm from any risk exposure. In such cases, the firm's transfer of an asset from its balance sheet may not result in a commensurate reduction in its credit risk. Transactions that can give rise to such instances include loan sales with recourse; providing protection through credit derivatives; direct-credit substitutes, such as letters of credit; and liquidity facilities extended to securitization programs (for example, asset-securitization structures used to securitize credit card receivables).
- *Concentration risk.* A firm involved in originating, packaging, servicing, underwriting, or enhancing the creditworthiness of ABS should follow its internal diversification requirements for aggregate outstanding credits to any particular institution, industry, or geographic area.
- *Reputational risk.* The securitization activities of firms also may expose them to different levels reputational risks depending on the role that the firm in the securitization process. These firms should consider the reputational risk exposure and associated potential losses that can arise from these securitization activities. Deterioration of assets in a pool underlying a prior securitization may result in negative investor sentiment that could result in increased spreads for subsequent ABS issuances. To avoid potential increases in their funding costs, firms sometimes support their securitization transactions by improving the performance of the underlying asset pool (for example, by selling discounted receivables or adding higher-quality assets to the pool). Thus, a firm's voluntary support of its securitizations in order to protect its reputation may cause adverse effects on the sponsoring or issuing firm's earnings and capital.
- *Liquidity and market risk.* The existence of recourse provisions in asset sales, the extension of liquidity facilities to securitization programs, and early-amortization triggers of certain ABS transactions can result in significant liquidity risk to a firm serving as sponsor or issuer for the securitization. Firms engaging in these activities should ensure that their liquidity contingency plans fully incorporate the potential risk posed by their securitization activities. Upon new issuance of ABS, a firm acting as issuer should determine the potential effect on the firm's liquidity at the inception of each transaction and throughout the life of the ABS to evaluate the firm's future funding needs.
- *Transfer risk.* Transfer risk is analogous to liquidity risk. It is the risk that a firm with obligations under securitization arrangements (for example, as liquidity provider or servicer) may wish to relinquish those obligations to another party but may not be able to do so.
- *Operational risk.* This risk arises from uncertainty about a firm's ability to meet its obligations under securitization arrangements. For instance, operational risk arises when a firm has insufficient resources to meet its contractual obligations or when its fee income is insufficient to cover the costs associated with its obligations. A firm filling a role that potentially requires long-term resource commitments, such as servicer or credit enhancer, is susceptible to an operational risk.
- *Legal risk.* When a firm plays multiple roles in securitization, conflicts of interest may arise. Policies and procedures should address any potential conflict, especially any legal risk or negative market risk that may result if the firm appears to compromise any fiduciary and contractual responsibilities to obligors or investors.

ADDITIONAL RISKS ASSOCIATED WITH SECURITIZATION ACTIVITIES

Investor-Specific Risks

Investors in ABS may be exposed to varying degrees of credit risk based on the potential for obligors of the underlying assets to default on principal and interest payments. As with direct investment in the underlying assets, an investment in ABS is subject to the risk that the various parties in the securitization structure, for example, the servicer or trustee, may not be able to fulfill their contractual obligations. Moreover, ABS investors may be susceptible to concentrations of risks across various ABS investments, such as (1) overexposure to a particular firm that performs various roles in ABS securitizations, or (2) concentrations to particular geographic exposures of the underlying asset pool(s). Also, ABS investors may face heightened liquidity risk when seeking to sell ABS compared to direct holders of the underlying assets, since the secondary markets for certain ABS may be more limited than those of the underlying asset. Furthermore, certain derivative instruments, such as stripped asset-backed securities and residuals, may be extremely sensitive to interest rates and exhibit a relatively high degree of price volatility. Therefore, a firm investing in these instruments may face considerable volatility in its risk exposure unless it uses a properly structured hedging strategy.

Issuer-Specific Risks

Firms that issue ABS may feel conflicting pressures related to the assets to be transferred into pools for securitization: some may feel pressure to sell only their best assets into securitization pools, thus reducing the asset quality of their own loan portfolios, while others may feel they can relax their credit standards based on the belief that any higher-risk assets can be sold for securitization quickly, without risk to the firm's own portfolio. In addition, some issuers may face pressures to repurchase from a securitization any securities backed by loans or leases they previously originated that have deteriorated and become nonperforming in order to preserve their reputations, even if under no legal obligation to repurchase those assets (sometimes termed "moral recourse"). Issuers also may face funding risk if market conditions are not conducive to the issuance of ABS in the securitization pipeline and the firm therefore must hold the underlying assets.

Servicer-Specific Risks

Firms that service securitizations need to have policies, operations, and systems that would allow them to continue to serve as servicer without interruption and to avoid defaults. A firm can realize substantial fee income by acting as a servicer, particularly if it can leverage its fixed investment in servicing systems to achieve economies of scale. However, in seeking such scale, a firm can risk overloading its system's capacity, thereby creating enormous out-of-balance positions and cost overruns. Servicing problems may precipitate a technical default, which in turn could lead to premature redemption or accelerated repayment of the security. A firm in the role of servicer also may incur collection costs on nonperforming assets that exceed servicing fee income.

RISK MANAGEMENT OF ASSET SECURITIZATIONS

A firm should address the risks arising from its securitization activities as part of its overall risk-management system, including

- establishing clear roles for its board of directors and senior management;
- adopting appropriate policies, procedures, and processes to manage the firm's risks;
- establishing a process for measuring and monitoring risks; and
- maintaining appropriate internal controls to verify the integrity of processes associated with these activities.

For more information, see SR-99-37, "Risk Management and Valuation of Retained Interests Arising from Securitization Activities." Firms with significant securitization activities are expected to have established more elaborate and formal approaches to manage the risks associated with these activities and should ensure that risk exposures resulting from these activities are fully incorporated into relevant management information system reports and risk-management reviews.

The Roles of Senior Management and the Board of Directors

A firm's board of directors is responsible for overseeing the development of, reviewing, approving, and periodically monitoring the firm's strategy and risk appetite.[2] As such, the board of directors should have an understanding of the

2. For more information, see SR-21-3, "Supervisory Guidance on Board of Directors' Effectiveness," which generally applies to domestic bank holding companies and savings and loan holding companies with total consolidated assets of $100 billion or more.

firm's securitization activities and the associated risks. The board should approve significant policies relating to the firm's strategy and risk exposure arising from its securitization activities. The board also should hold senior management accountable for effectively implementing the firm's securitization strategy in a manner consistent with its risk appetite while maintaining an effective risk-management framework and system of internal controls.

Senior management is responsible for ensuring that the formality and sophistication of the techniques used to manage these risks are commensurate with the nature and volume of the firm's securitization activities. Senior management is responsible for ensuring that the risks arising from securitization activities are adequately managed on both a short-term and long-run basis. Management should ensure that adequate policies and procedures are in place for incorporating the risk of these activities into the firm's overall risk-management process.

Policies and Procedures

A firm's policies and procedures for asset securitization activities should ensure that the economic substance of the risk exposures generated by these activities is fully recognized and appropriately managed. In addition, firms involved in securitization activities should have appropriate policies, procedures, and controls for underwriting ABS; funding the possible return of revolving receivables (for example, credit card receivables and home-equity lines); and establishing limits on exposures to individual institutions, types of collateral, and geographic and industry concentrations.

To manage the risks associated with asset securitization activities appropriately, firms typically should—

- establish independent risk-management processes, including appropriate information systems, to monitor securitization-pool performance on an individual and aggregate transaction level;
- use conservative valuation assumptions and modeling methodologies to establish, evaluate, and adjust the carrying value of retained interests on a regular and timely basis;
- ensure staff in the audit or internal review functions periodically review data integrity, model algorithms, key underlying assumptions, and the appropriateness of the valuation and modeling process for any securitized assets retained by the institution, and report such findings to the board or an appropriate board committee;
- maintain accurate and timely risk-based capital calculations, including recognition and reporting of any recourse obligation resulting from a securitization activity;
- establish internal limits to govern the maximum amount of retained interests in any security as a percentage of total equity capital; and
- have a realistic liquidity plan in place in case of market disruptions.

Independent Risk-Management Function

Firms engaged in securitization activities should have an independent risk-management function commensurate with the complexity and volume of their securitization activity and their overall risk exposures. Considering a firm's securitization activities, the risk-management function should maintain appropriate policies and operating procedures, including clearly articulated risk limits. An effective asset-securitization policy generally—

- describes the maintenance of a consistently applied accounting methodology;
- explains the regulatory reporting requirements;
- covers valuation methodologies, including residual value assumptions, and formal procedures to approve changes to those assumptions;
- addresses management reporting process(es); and
- contains exposure limits and requirements for both individual- and aggregate-transaction monitoring.

The firm's risk-management function is responsible for monitoring origination, collection, and default-management practices. This includes regular evaluations of the quality of underwriting, soundness of the collateral valuation process, effectiveness of collection activities, ability of the default-management staff to resolve severely delinquent loans in a timely and efficient manner, and appropriateness of loss-recognition practices. Because the securitization of assets can result in current recognition of anticipated income, the risk-management function should monitor the types, volumes, and risks of assets being originated, transferred, and serviced. Senior management and the risk-management staff should be cognizant of any misaligned incentives among line managers to originate abnormally large volumes or higher-risk assets to meet income projections. Such misaligned incentives can lead to potential compromise of credit-underwriting standards, which may accelerate credit losses in future periods, impair the value of retained interests, or potentially lead to funding problems.

Risk Measurement and Monitoring

A firm's risk-management function should include systems to measure and monitor risks in a way that fully incorporates all risks involved in its securitization activities. The risk-management function should appropriately identify credit exposures from all securitization activities, and also should measure, quantify, and control those exposures on a fully consolidated basis. The economic substance of the credit exposures of securitization activities should be fully incorporated into the firm's efforts to quantify its credit risk, including efforts to establish more formal grading of credits to allow for statistical estimation of loss-probability distributions. Securitization activities should also be included in any aggregations of credit risk by borrower, industry, or economic sector.

A firm's information systems should identify and segregate those credit exposures arising from the firm's loan-sale and securitization activities. Such exposures include the sold portions of loan participations and syndications, exposures arising from the extension of credit-enhancement and liquidity facilities, the effects of any early-amortization event, and any investment(s) in ABS. Effective reports provide senior management with timely and sufficient information to monitor the firm's exposure limits and overall risk profile with respect to its securitization activities.

Stress Testing

The use of stress testing, including combinations of market events that could affect a firm's credit exposures and securitization activities, is another important element of risk management. Stress testing involves identifying possible events or changes in market behavior that could have unfavorable effects on the institution and assessing the firm's ability to withstand them. Stress testing should consider the probability of adverse events, including likely worst-case scenarios. An effective stress testing program is conducted by a firm on a consolidated basis and considers, for instance, the effect of higher-than-expected levels of delinquencies and defaults in the underlying asset pool. The firm should also consider the consequences of early-amortization events with respect to credit card securities, as these could raise concerns regarding the firm's capital adequacy and its liquidity and funding capabilities. Stress-test analyses should also include contingency plans for possible management actions in over a range of situations.

Internal Controls

One of management's most important responsibilities is establishing and maintaining an effective system of internal controls. A firm's internal controls should enforce the official lines of authority and the appropriate separation of duties established for managing the firm's risks. These internal controls should consider the type and level of risks, given the nature and scope of the firm's securitization activities. Moreover, these internal controls should ensure that financial reporting (in public financial statements and regulatory financial reports) is reliable.

Effective internal controls are essential to a firm's management of the risks associated with securitization. When properly designed and consistently enforced, a sound system of internal controls will help management safeguard the firm's resources; ensure that financial information and reports are reliable; and confirm that the firm is complying with contractual obligations, including any securitization covenants. Internal controls will also detect and reduce the possibility of significant errors and irregularities. Internal controls typically (1) limit authorities; (2) safeguard access to and use of records; (3) separate and rotate duties; and (4) ensure both regular and unscheduled reviews, including transaction testing.

Operational and managerial standards have been established for internal control and information systems.[3] A firm should maintain an appropriate system of internal controls based on the size, nature, scope, and the risk of the firm's activities.[4]

Audit Function or Internal Review

Through its risk and audit committees, an effective board of directors assesses and supports the stature and independence of the firm's independent risk management and internal audit functions. The firm's audit staff or independent-review function should be competent and fully capable of reviewing the firm's securitization activities. The audit function should perform periodic reviews of securitization activities, including transaction testing and verification, and report all findings to the board or appropriate board committee. The audit function also may assist senior management in identifying and measuring risk related to securitization activities. Principal audit targets should include compliance with securitization policies, operating and accounting procedures, securitization covenants, and the accuracy of management information systems and regulatory reports. The audit function also should confirm that the firm's regulatory reporting process is designed and managed to facilitate timely and accurate reporting. Furthermore, when a third-party services the loans underlying the securitization, the auditors should perform an independent verification of the existence of the loans to ensure that balances reconcile to internal records.

Management Information Systems

Adequate reports on the performance of assets in the ABS from management information system (MIS) can help a firm appropriately manage the amount of economic capital to cover the various risks inherent in a securitization transaction. A firm's reporting and documentation methods should support the initial valuation of any retained interests in securitized assets and provide ongoing impairment analyses of these assets. In general, effective MIS reports address the following:

- *Securitization summaries for each ABS transaction.* The summary should include relevant transaction terms, such as collateral type, liquidity facilities, maturity, credit-enhancement and subordination features, financial covenants (termination events and spread-account capture triggers), any repurchase rights or obligations, and counterparty exposures. Management should distribute transaction summaries to appropriate personnel associated with securitization activities.
- *Performance reports by portfolio and specific product type.* Performance factors include gross portfolio yield, default rates and loss severity, delinquencies, prepayments, payments, and excess spread amounts. The reports should reflect the performance of assets, both on an individual-pool basis and across total managed assets. These reports should segregate specific products issued by the firm.
- *Historical (or vintage) analysis for each pool using monthly data.* Historical analysis helps management understand past performance trends and their implications for future default rates, prepayments, and delinquencies, and therefore valuation of any retained interests. Management can use these reports to compare historical performance trends with underwriting standards, including the use of a validated credit-scoring model, to ensure loan pricing is consistent with risk levels. Historical or trend analysis also helps in the comparison of deal performance at periodic intervals and helps validate retained-interest valuation assumptions.
- *Static-pool cash-collection analysis.* A static-pool cash-collection analysis involves (1) reviewing monthly cash receipts relative to the principal balance of the pool to determine the cash yield on the portfolio, (2) comparing the cash yield to the accrual yield, and (3) tracking monthly changes. Management should compare on a monthly basis the timing and amount of cash flows received from the securitization trust with those projected as part of the retained-interest valuation analysis.

3. *See* 12 CFR 208, appendix D-1 (describing safety-and-soundness standards for state member banks).

4. Regulated financial institutions that are subject to the requirements of 12 CFR pt. 363 issued by the FDIC should include an assessment of the effectiveness of internal controls over their asset-securitization activities as part of management's report on the overall effectiveness of the system of internal controls over financial reporting. This assessment implicitly includes internal controls over financial information that the firm includes in its regulatory reporting.

Some master-trust structures allow excess cash flow to be shared between series or pools. For revolving-asset trusts with this master-trust structure, management should perform a cash-collection analysis for each master-trust structure. These analyses are critical in assessing the actual performance of the portfolio in terms of default and prepayment rates. If cash receipts are less than those assumed in the original valuation of the retained interest, this analysis will provide a firm with an early warning of possible problems with collections or extension practices and impairment of the retained interest.

- *Sensitivity analysis.* A sensitivity analysis measures a range of activities, such as the effect of changes in default rates, prepayment rates, payment rates, or discount rates, and assists management in establishing and validating the carrying value of the retained interest. Effective sensitivity analysis is performed at least quarterly. Analyses should consider potential adverse trends and determine "best," "probable," and "worst-case" scenarios for each event. Other relevant factors may include the effect of increased defaults on collection staff resources, the timing of cash flows, spread-account capture triggers, overcollateralization triggers, and early-amortization triggers. An increase in defaults can result in higher-than-expected costs and a delay in cash flows, thus decreasing the value of the retained interests. Management should periodically assess how changes in retained interests affect both the firm's earnings and its capital. Management should incorporate this analysis into their overall interest-rate-risk measurement system and include this analysis in information provided to the firm's board of directors or an appropriate board committee.
- *Statement of covenant compliance.* Ongoing compliance with deal-performance triggers as defined by the pooling and servicing agreements should be affirmed at least monthly. Performance triggers include early amortization, spread capture, changes to overcollateralization requirements, and events that could result in the firm being removed as servicer.

A firm must not include confidential supervisory information related to supervisory actions or thresholds in any covenants included in documents related to a securitization transaction.[5] Examples of such supervisory actions include a downgrade in a bank's CAMELS rating, an enforcement action, or a downgrade in a bank's prompt-corrective-action capital category. Further, covenants that provide for the early termination of the transaction or compel the transfer of servicing due, directly or indirectly, to the occurrence of a supervisory action or event will be criticized, under appropriate circumstances, as an unsafe and unsound banking practice.[6] Any early amortization or transfer of servicing triggered by such events can create or exacerbate liquidity and earnings problems for a firm, which in turn may lead to further deterioration in its financial condition.

CAPITAL ADEQUACY

The Federal Reserve's Regulation Q (12 CFR pt. 217) establishes a capital framework that considers the credit risk of exposures that involve the tranching of credit risk of one or more underlying securitization exposures. Regulation Q establishes risk weights for securitization exposures that are retained on- or off-balance sheet. Regulation Q defines a securitization exposure as an on- or off-balance-sheet credit exposure (including credit-enhancing representations and warranties) that arises from a traditional or synthetic securitization (including a resecuritization), or an exposure that directly or indirectly references such a securitization exposure.

Common examples of securitization exposures include private-label CMOs, trust-preferred collateralized debt obligations, and ABS, provided there is tranching of credit risk. In general, supervised institutions subject to Regulation Q's requirements calculate the risk weight of securitization exposures using methodologies prescribed in the rule, such as the gross-up approach or the Simplified Supervisory Formula Approach. The methodology must be applied consistently across all securitization exposures, except in certain cases.

For more information, see this manual's section entitled "Assessment of Capital Adequacy."

5. For more information on the treatment of confidential supervisory information, see 12 U.S.C. 1817(a) and 1831m, as well as 12 CFR 261 subpart C.

6. *See* SR-02-14, "Covenants in Securitization Documents Linked to Supervisory Actions or Thresholds."

ACCOUNTING AND REPORTING

Sale or Borrowing Treatment

Asset-securitization transactions are frequently structured to obtain certain accounting treatments, which in turn affect the firm's reported measures of profitability and capital adequacy. In transferring assets into a pool to serve as collateral for ABS, a key question is whether the transfer should be treated as a sale of the assets or as a collateralized borrowing (meaning a financing transaction secured by assets).

When a loan is acquired (through origination or purchase) with the intent or expectation that it may or will be sold at some indefinite date in the future, the loan should be reported as held for sale or held for investment, based on consideration of all the facts and circumstances, in accordance with generally accepted accounting principles (GAAP) and related supervisory guidance. In addition, a loan acquired and held for securitization purposes should be reported as a loan held for sale, provided the securitization transaction will be accounted for as a sale under Accounting Standards Codification (ASC) Topic 860, Transfers and Servicing. Notwithstanding the above, banks may classify loans as trading assets if the bank applies fair value accounting, with changes in fair value reported in current earnings, and manages these assets and liabilities as trading assets, subject to the controls and applicable regulatory guidance related to trading activities. For example, a bank generally would not classify a loan that meets these criteria as a trading asset unless the bank holds the loan for one of the following purposes: (a) to facilitate market making activities, including such activities as accumulating loans for sale or securitization; (b) to benefit from actual or expected price movements; or (c) to lock in arbitrage profits.

Institutions that file the Report of Condition and Income (Call Report) and are involved in securitization activities should pay particular attention to the following schedules on the Call Report: Schedule RC-F: Other Assets; Schedule RC-L: Off Balance Sheet Items; and Schedule RC-R: Regulatory Capital.

Valuation and Modeling Processes for Retained Interests

The methodologies and models firms use to value retained interests and the difficulties in managing exposure to these volatile assets can raise supervisory concerns. Under GAAP, a firm recognizes an immediate gain (or loss) on the sale of assets by recording its retained interest at fair value. The valuation of the retained interest is based on the present value of future cash flows in excess of the amounts needed to service the securities and to cover credit losses and other fees of the securitization vehicle.

Determinations of fair value should be based on reasonable, conservative assumptions about factors, such as discount rates, projected credit losses, and prepayment rates. Bank supervisors expect retained interests to be supported by verifiable documentation of fair value in accordance with GAAP. In the absence of such support, the retained interests should not be carried as assets on an institution's books but should be charged off. Other supervisory concerns include failure to recognize and to hold sufficient capital against recourse obligations generated by securitizations and absence of an adequate and independent audit function.

The methodology and key assumptions used to value the retained interests and servicing assets or liabilities must be reasonable and fully documented. The key assumptions in all valuation analyses include prepayment rates, payment rates, default rates, loss-severity factors, and discount rates. Institutions are expected to take a logical and conservative approach when developing securitization assumptions and capitalizing future income flows. It is important that management quantifies the assumptions at least quarterly on a pool-by-pool basis and maintains supporting documentation for all changes to the assumptions as part of the valuation. Policies should define the acceptable reasons for changing assumptions and require appropriate management approval.

An exception to this pool-by-pool valuation analysis may be applied to revolving-asset trusts if the master-trust structure allows excess cash flows to be shared between series. In a master trust, each certificate of each series represents an undivided interest in all of the receivables in the trust. Therefore, valuations are appropriate at the master-trust level.

To determine the value of the retained interest at inception, and to make appropriate adjustments going forward, the institution should implement a reasonable modeling process to comply with ASC Topic 860. Management is expected to employ reasonable and conservative valuation assumptions and projections and to maintain verifiable objective documentation of the fair value of the retained interest. Senior management is responsible for ensuring that the valuation model accurately reflects the cash flows according to the terms of the securitization's structure. For example, the model should account for any cash collateral or overcollateralization triggers, trust fees, and insurance payments, as appropriate. Management is accountable for ensuring that the model builder(s) possess the necessary expertise and technical proficiency to perform the modeling process. Senior management should ensure that internal controls are in place to provide for the ongoing integrity of MIS associated with securitization activities.

As part of the modeling process, the risk-management function should ensure that periodic validations are performed to reduce vulnerability to model risk. Validation of the model includes testing the internal logic, ensuring empirical support for the model assumptions, and back-testing the models using actual cash flows on a pool-by-pool basis. The validation process should be documented to support conclusions. Senior management should ensure that the validation process is independent from line management and from the modeling process. The audit scope should include procedures to ensure that the modeling process and validation mechanisms are both appropriate for the institution's circumstances and executed consistently with its asset-securitization policy.

Use of Outside Parties

Third parties are often engaged to provide professional guidance and support regarding a firm's securitization activities and transactions as well as valuation of retained interests. The use of outside resources does not relieve a board of directors of its oversight responsibility, nor does it relieve senior management of its responsibilities to provide supervision, monitoring, and oversight of securitization activities, particularly management of the risks associated with retained interests. Management is expected to have the experience, knowledge, and abilities to discharge its duties; to understand the nature and extent of the risks presented by retained interests; and to have the policies and procedures necessary to implement an effective risk-management system to control such risks. Management should have an understanding of the valuation techniques used to determine the value of the firm's interest in a securitization, including the basis and reasonableness of underlying assumptions and projections.

Market Discipline and Disclosures

Transparency through public disclosure is crucial to effective market discipline and can reinforce supervisory expectations for a firm's risk management. Timely and adequate information on a firm's asset-securitization activities should be disclosed. The information in the firm's public disclosures should be comprehensive; however, the amount of disclosure that is appropriate will depend on the volume of securitizations and the complexity of the firm's securitization activities. Well informed investors, depositors, creditors, and other counterparties can provide a firm with strong incentives for maintaining sound risk-management systems and internal controls.

Adequate disclosure allows market participants to understand a firm's financial condition and apply market discipline, thus creating incentives to reduce inappropriate risk-taking or to address inadequate risk-management practices. Examples of sound disclosures include—

- accounting policies for measuring retained interests, including a discussion of the implications of key assumptions on the recorded value of the firm's interest in the securitization(s);
- the process and methodology used to adjust the value of retained interests for changes in key assumptions;
- quantitative and qualitative risk characteristics of the underlying securitized assets;
- the role of retained interests as credit enhancements to special-purpose entities and other securitization vehicles, including a discussion of techniques used for measuring credit risk; and
- sensitivity analyses conducted by the firm to understand the effect of changes in key

assumptions on the fair value of retained interests.

SUPERVISORY CONSIDERATIONS

Examiners are expected to exercise judgment in determining which examination procedures are appropriate for assessing the securitization activities of an individual bank. The scope of each review will largely depend on the size and complexity of a bank's securitization activities as well as the ability of the bank to manage the risks associated with these activities appropriately. The Securitization Examination Documentation (ED) module provides more detailed examination procedures for examination staff. The Securitization ED module primarily applies to examinations of banks that use securitizations to transfer financial assets off their balance sheets. The ED Module also applies to the review of banks that originate or purchase financial assets for securitization; retain beneficial interests in securitized assets; or provide liquidity or credit enhancements.

As previously noted, securitization activities have the potential to increase the overall risk profile of the bank if the activities are not carried out prudently. Banks that engage in securitization activities encounter various risks, such as credit, concentration, interest-rate, operational, and liquidity risks. The nature of a bank's securitization activities and the bank's ability to manage those activities will influence how examiners assign supervisory ratings, particularly a bank's CAMELS component or composite ratings.

For example, examiners should determine whether the bank has sufficient capital in relation to risks arising from securitization activities. If, in the examiner's judgment, a bank's capital level is not sufficient to provide protection against potential losses from securitization activities, this deficiency should be reflected in the bank's CAMELS rating and discussed with bank management. In such situations, examiners would expect that the bank would develop and implement a plan for strengthening its overall capital adequacy to levels deemed appropriate given its risk exposure.

Asset securitization activities can adversely influence how examiners rate a bank's asset quality in several ways. A bank that originates abnormally large volumes or higher-risk assets to sustain ongoing income needs potentially may compromise its credit-underwriting standards. The result could be an acceleration of credit losses in future periods. Further, a bank could be exposed to concentration risk if its securitized assets contain excessive exposures to an industry or region.

In terms of the assessment of liquidity, one factor examiners should consider is a bank's ability to securitize and sell certain pools of assets.[7] While securitization can be an effective funding method for some banks, there are several risks.[8] For instance, banks that originate or purchase loans for asset securitization programs may face heightened liquidity risk due to unexpected funding needs associated with an early amortization event or disruption of warehouse funding. Furthermore, the bank's overall cash flow might be dependent on the residual cash flows from the performance of the underlying assets. If the performance of the underlying assets is worse than projected, the bank's overall cash flow will be less than anticipated, which would adversely affect the bank's liquidity. Examiners should determine whether a bank has reviewed the projected cash flow from the underlying assets to ensure that principal and interest payments will be timely and will be sufficient to cover costs even under adverse scenarios.

Securitization activities could affect the way examiners assess the sensitivity to market risk component rating of the CAMELS rating system. Examiners should assess whether banks engaged in underwriting or market-making activities have implemented adequate hedging or other risk-management policies to limit exposure to adverse price movements. For instance, banks should appropriately manage changes in default rates, prepayment rates, payment rates, and discount rates when establishing and validating the carrying value of any retained interest(s). Examiners should review a bank's analysis as well as the volatility associated with retained interests when assessing a bank's sensitivity to market risk component rating.[9]

Further, the ability of banks to appropriately manage and monitor the risks associated with

7. SR-96-38, "Uniform Financial Institutions Rating System."

8. SR-10-6, "Interagency Policy Statement on Funding and Liquidity Risk Management."

9. SR-96-13, "Joint Agency Policy Statement on Interest-Rate Risk," advises that examiners may direct institutions with a high level of exposure to interest-rate risk relative to capital to take corrective action.

securitization activities will influence examiners' assessment of a bank's management rating. For example, if bank management conducts securitization activities in a manner that is inconsistent with the bank's strategic and financial objectives, such conduct may adversely affect the bank's management rating. The management rating could also be adversely affected if a bank exhibits internal control failures or is not appropriately responsive to findings arising from internal audits, independent reviews, or previous supervisory assessments of the bank's securitization function.

Asset Securitization
Examination Procedures
Effective date May 2022

Section 4030.3

Examination procedures are available on the Examination Documentation (ED) modules page on the Board's website. See the following ED module for examination procedures on this topic:

- Securitization

This section sets forth the Interagency Statement on Sound Practices Concerning Elevated-Risk Complex Structured Finance Activities, issued January 11, 2007.[1] The supervisory guidance addresses risk-management principles that should assist institutions to identify, evaluate, and manage the heightened legal and reputational risks that may arise from their involvement in complex structured finance transactions (CSFTs). The guidance is focused on sound practices related to CSFTs that may create heightened legal or reputational risks to the institution and are defined as "elevated-risk CSFTs." Such transactions are typically conducted by a limited number of large financial institutions.[2] (See SR-07-05.)

INTERAGENCY STATEMENT ON SOUND PRACTICES CONCERNING ELEVATED-RISK COMPLEX STRUCTURED FINANCE ACTIVITIES

Financial markets have grown rapidly over the past decade, and innovations in financial instruments have facilitated the structuring of cash flows and allocation of risk among creditors, borrowers, and investors in more efficient ways. Financial derivatives for market and credit risk, asset-backed securities with customized cash-flow features, specialized financial conduits that manage pools of assets, and other types of structured finance transactions serve important business purposes, such as diversifying risks, allocating cash flows, and reducing cost of capital. As a result, structured finance transactions have become an essential part of U.S. and international capital markets. Financial institutions have played and continue to play an active and important role in the development of structured finance products and markets, including the market for the more complex variations of structured finance products.

When a financial institution[3] participates in a CSFT, it bears the usual market, credit, and operational risks associated with the transaction. In some circumstances, a financial institution also may face heightened legal or reputational risks due to its involvement in a CSFT. For example, in some circumstances, a financial institution may face heightened legal or reputational risk if a customer's regulatory, tax, or accounting treatment for a CSFT, or disclosures to investors concerning the CSFT in the customer's public filings or financial statements, do not comply with applicable laws, regulations, or accounting principles. Indeed, in some instances, CSFTs have been used to misrepresent a customer's financial condition to investors, regulatory authorities, and others. In these situations, investors have been harmed and financial institutions have incurred significant legal and reputational exposure. In addition to legal risk, reputational risk poses a significant threat to financial institutions because the nature of their business requires them to maintain the confidence of customers, creditors, and the general marketplace.

The agencies[4] have long expected financial institutions to develop and maintain robust control infrastructures that enable them to identify, evaluate, and address the risks associated with their business activities. Financial institutions also must conduct their activities in accordance with applicable statutes and regulations.

Scope and Purpose of Statement

The agencies issued this statement to describe the types of risk-management principles they believe may help a financial institution to identify CSFTs that may pose heightened legal or reputational risks to the institution and to evalu-

1. See 72 *Fed. Reg.* 1372, January 11, 2007.
2. The statement will not affect or apply to the vast majority of financial institutions, including most small institutions.
3. As used in this statement, the term *financial institution* or *institution* refers to state member banks and bank holding companies (other than foreign banking organizations) in the case of the Board of Governors of the Federal Reserve System (FRB); to national banks in the case of the Office of the Comptroller of the Currency (OCC); to federal and state savings associations and savings and loan holding companies in the case of the Office of Thrift Supervision (OTS); to state nonmember banks in the case of the Federal Deposit Insurance Corporation (FDIC); and to registered broker-dealers and investment advisers in the case of the Securities and Exchange Commission (SEC). The U.S. branches and agencies of foreign banks supervised by the FRB, the OCC, and the FDIC also are considered to be financial institutions for purposes of this statement.
4. The federal banking agencies (the FRB, the OCC, the FDIC, and the OTS) and the SEC.

ate, manage, and address these risks within the institution's internal control framework.

Structured finance transactions encompass a broad array of products with varying levels of complexity. Most structured finance transactions, such as standard public mortgage-backed securities transactions, public securitizations of retail credit cards, asset-backed commercial paper conduit transactions, and hedging-type transactions involving "plain vanilla" derivatives and collateralized loan obligations, are familiar to participants in the financial markets, and these vehicles have a well-established track record. These transactions typically would not be considered CSFTs for the purpose of this statement.

Because this statement focuses on sound practices related to CSFTs that may create heightened legal or reputational risks—transactions that typically are conducted by a limited number of large financial institutions—it will not affect or apply to the vast majority of financial institutions, including most small institutions. As in all cases, a financial institution should tailor its internal controls so that they are appropriate in light of the nature, scope, complexity, and risks of its activities. Thus, for example, an institution that is actively involved in structuring and offering CSFTs that may create heightened legal or reputational risk for the institution should have a more formalized and detailed control framework than an institution that participates in these types of transactions less frequently. The internal controls and procedures discussed in this statement are not all-inclusive, and, in appropriate circumstances, an institution may find that other controls, policies, or procedures are appropriate in light of its particular CSFT activities.

Because many of the core elements of an effective control infrastructure are the same regardless of the business line involved, this statement draws heavily on controls and procedures that the agencies previously have found to be effective in assisting a financial institution to manage and control risks and identifies ways in which these controls and procedures can be effectively applied to elevated-risk CSFTs. Although this statement highlights some of the most significant risks associated with elevated-risk CSFTs, it is not intended to present a full exposition of all risks associated with these transactions. Financial institutions are encouraged to refer to other supervisory guidance prepared by the agencies for further information concerning market, credit, operational, legal, and reputational risks as well as internal audit and other appropriate internal controls.

This statement does not create any private rights of action and does not alter or expand the legal duties and obligations that a financial institution may have to a customer, its shareholders, or other third parties under applicable law. At the same time, adherence to the principles discussed in this statement would not necessarily insulate a financial institution from regulatory action or any liability the institution may have to third parties under applicable law.

Identification and Review of Elevated-Risk CSFTs

A financial institution that engages in CSFTs should maintain a set of formal, written, firm-wide policies and procedures that are designed to allow the institution to identify, evaluate, assess, document, and control the full range of credit, market, operational, legal, and reputational risks associated with these transactions. These policies may be developed specifically for CSFTs, or included in the set of broader policies governing the institution generally. A financial institution operating in foreign jurisdictions may tailor its policies and procedures as appropriate to account for, and comply with, the applicable laws, regulations, and standards of those jurisdictions.[5]

A financial institution's policies and procedures should establish a clear framework for the review and approval of individual CSFTs. These policies and procedures should set forth the responsibilities of the personnel involved in the origination, structuring, trading, review, approval, documentation, verification, and execution of CSFTs. Financial institutions may find it helpful to incorporate the review of new CSFTs into their existing new-product policies. In this regard, a financial institution should define what constitutes a "new" complex structured finance product and establish a control process for the approval of such new products. In determining

5. In the case of U.S. branches and agencies of foreign banks, these policies, including management, review, and approval requirements, should be coordinated with the foreign bank's group-wide policies developed in accordance with the rules of the foreign bank's home-country supervisor and should be consistent with the foreign bank's overall corporate and management structure as well as its framework for risk management and internal controls.

whether a CSFT is new, a financial institution may consider a variety of factors, including whether it contains structural or pricing variations from existing products; whether the product is targeted at a new class of customers; whether it is designed to address a new need of customers; whether it raises significant new legal, compliance, or regulatory issues; and whether it or the manner in which it would be offered would materially deviate from standard market practices. An institution's policies should require new complex structured finance products to receive the approval of all relevant control areas that are independent of the profit center before the product is offered to customers.

Identifying Elevated-Risk CSFTs

As part of its transaction and new-product approval controls, a financial institution should establish and maintain policies, procedures, and systems to identify elevated-risk CSFTs. Because of the potential risks they present to the institution, transactions or new products identified as elevated-risk CSFTs should be subject to heightened reviews during the institution's transaction or new-product approval processes. Examples of transactions that an institution may determine warrant this additional scrutiny are those that (either individually or collectively) appear to the institution during the ordinary course of its transaction approval or new-product approval process to—

- lack economic substance or business purpose;
- be designed or used primarily for questionable accounting, regulatory, or tax objectives, particularly when the transactions are executed at year-end or at the end of a reporting period for the customer;
- raise concerns that the client will report or disclose the transaction in its public filings or financial statements in a manner that is materially misleading or inconsistent with the substance of the transaction or applicable regulatory or accounting requirements;
- involve circular transfers of risk (either between the financial institution and the customer or between the customer and other related parties) that lack economic substance or business purpose;
- involve oral or undocumented agreements that, when taken into account, would have a material impact on the regulatory, tax, or accounting treatment of the related transaction, or the client's disclosure obligations;[6]
- have material economic terms that are inconsistent with market norms (for example, deep "in the money" options or historic rate rollovers); or
- provide the financial institution with compensation that appears substantially disproportionate to the services provided or investment made by the financial institution or to the credit, market, or operational risk assumed by the institution.

The examples listed previously are provided for illustrative purposes only, and the policies and procedures established by financial institutions may differ in how they seek to identify elevated-risk CSFTs. The goal of each institution's policies and procedures, however, should remain the same: to identify those CSFTs that warrant additional scrutiny in the transaction or new-product approval process due to concerns regarding legal or reputational risks.

Financial institutions that structure or market, act as an advisor to a customer regarding, or otherwise play a substantial role in a transaction may have more information concerning the customer's business purpose for the transaction and any special accounting, tax, or financial disclosure issues raised by the transaction than institutions that play a more limited role. Thus, the ability of a financial institution to identify the risks associated with an elevated-risk CSFT may differ depending on its role.

Due Diligence, Approval, and Documentation Process for Elevated-Risk CSFTs

Having developed a process to identify elevated-risk CSFTs, a financial institution should implement policies and procedures to conduct a heightened level of due diligence for these transactions. The financial institution should design these policies and procedures to allow personnel at an appropriate level to understand and evaluate the potential legal or reputational risks presented by

6. This item is not intended to include traditional, nonbinding "comfort" letters or assurances provided to financial institutions in the loan process where, for example, the parent of a loan customer states that the customer (i.e., the parent's subsidiary) is an integral and important part of the parent's operations.

the transaction to the institution and to manage and address any heightened legal or reputational risks ultimately found to exist with the transaction.

Due diligence. If a CSFT is identified as an elevated-risk CSFT, the institution should carefully evaluate and take appropriate steps to address the risks presented by the transaction, with a particular focus on those issues identified as potentially creating heightened levels of legal or reputational risk for the institution. In general, a financial institution should conduct the level and amount of due diligence for an elevated-risk CSFT that is commensurate with the level of risks identified. A financial institution that structures or markets an elevated-risk CSFT to a customer, or that acts as an advisor to a customer or investors concerning an elevated-risk CSFT, may have additional responsibilities under the federal securities laws, the Internal Revenue Code, state fiduciary laws, or other laws or regulations and, thus, may have greater legal- and reputational-risk exposure with respect to an elevated-risk CSFT than a financial institution that acts only as a counterparty for the transaction. Accordingly, a financial institution may need to exercise a higher degree of care in conducting its due diligence when the institution structures or markets an elevated-risk CSFT or acts as an advisor concerning such a transaction than when the institution plays a more limited role in the transaction.

To appropriately understand and evaluate the potential legal and reputational risks associated with an elevated-risk CSFT that a financial institution has identified, the institution may find it useful or necessary to obtain additional information from the customer or to obtain specialized advice from qualified in-house or outside accounting, tax, legal, or other professionals. As with any transaction, an institution should obtain satisfactory responses to its material questions and concerns prior to consummation of a transaction.[7]

In conducting its due diligence for an elevated-risk CSFT, a financial institution should independently analyze the potential risks to the institution from both the transaction and the institution's overall relationship with the customer. Institutions should not conclude that a transaction identified as being an elevated-risk CSFT involves minimal or manageable risks solely because another financial institution will participate in the transaction or because of the size or sophistication of the customer or counterparty. Moreover, a financial institution should carefully consider whether it would be appropriate to rely on opinions or analyses prepared by or for the customer concerning any significant accounting, tax, or legal issues associated with an elevated-risk CSFT.

Approval process. A financial institution's policies and procedures should provide that CSFTs identified as having elevated legal or reputational risk are reviewed and approved by appropriate levels of control and management personnel. The designated approval process for such CSFTs should include representatives from the relevant business line(s) and/or client management, as well as from appropriate control areas that are independent of the business line(s) involved in the transaction. The personnel responsible for approving an elevated-risk CSFT on behalf of a financial institution should have sufficient experience, training, and stature within the organization to evaluate the legal and reputational risks, as well as the credit, market, and operational risks to the institution.

The institution's control framework should have procedures to deliver the necessary or appropriate information to the personnel responsible for reviewing or approving an elevated-risk CSFT to allow them to properly perform their duties. Such information may include, for example, the material terms of the transaction, a summary of the institution's relationship with the customer, and a discussion of the significant legal, reputational, credit, market, and operational risks presented by the transaction.

Some institutions have established a senior management committee that is designed to involve experienced business executives and senior representatives from all of the relevant control functions within the financial institution (including such groups as independent risk management, tax, accounting, policy, legal, compliance, and financial control) in the oversight and approval of those elevated-risk CSFTs that are identified by the institution's personnel as requiring senior management review and approval due to the potential risks associated with the transactions. While this type of management committee may not be appropriate for all financial institutions, a financial institution should establish processes that assist the institution in con-

7. Of course, financial institutions also should ensure that their own accounting for transactions complies with applicable accounting standards, consistently applied.

sistently managing the review and approval of elevated-risk CSFTs on a firm-wide basis.[8]

If, after evaluating an elevated-risk CSFT, the financial institution determines that its participation in the CSFT would create significant legal or reputational risks for the institution, the institution should take appropriate steps to address those risks. Such actions may include declining to participate in the transaction, or conditioning its participation upon the receipt of representations or assurances from the customer that reasonably address the heightened legal or reputational risks presented by the transaction. Any representations or assurances provided by a customer should be obtained before a transaction is executed and be received from, or approved by, an appropriate level of the customer's management. A financial institution should decline to participate in an elevated-risk CSFT if, after conducting appropriate due diligence and taking appropriate steps to address the risks from the transaction, the institution determines that the transaction presents unacceptable risk to the institution or would result in a violation of applicable laws, regulations, or accounting principles.

Documentation. The documentation that financial institutions use to support CSFTs is often highly customized for individual transactions and negotiated with the customer. Careful generation, collection, and retention of documents associated with elevated-risk CSFTs are important control mechanisms that may help an institution monitor and manage the legal, reputational, operational, market, and credit risks associated with the transactions. In addition, sound documentation practices may help reduce unwarranted exposure to the financial institution's reputation.

A financial institution should create and collect sufficient documentation to allow the institution to—

- document the material terms of the transaction;
- enforce the material obligations of the counterparties;
- confirm that the institution has provided the customer any disclosures concerning the transaction that the institution is otherwise required to provide; and
- verify that the institution's policies and procedures are being followed and allow the internal audit function to monitor compliance with those policies and procedures.

When an institution's policies and procedures require an elevated-risk CSFT to be submitted for approval to senior management, the institution should maintain the transaction-related documentation provided to senior management as well as other documentation, such as minutes of the relevant senior management committee, that reflect senior management's approval (or disapproval) of the transaction, any conditions imposed by senior management, and the factors considered in taking such action. The institution should retain documents created for elevated-risk CSFTs in accordance with its record retention policies and procedures as well as applicable statutes and regulations.

Other Risk-Management Principles for Elevated-Risk CSFTs

General business ethics. The board and senior management of a financial institution also should establish a "tone at the top" through both actions and formalized policies that sends a strong message throughout the financial institution about the importance of compliance with the law and overall good business ethics. The board and senior management should strive to create a firm-wide corporate culture that is sensitive to ethical or legal issues as well as the potential risks to the financial institution that may arise from unethical or illegal behavior. This kind of culture coupled with appropriate procedures should reinforce business-line ownership of risk identification and encourage personnel to move ethical or legal concerns regarding elevated-risk CSFTs to appropriate levels of management. In appropriate circumstances, financial institutions may also need to consider implementing mechanisms to protect personnel by permitting the confidential disclosure of concerns.[9] As in other areas of financial institution management, compensation and incentive plans

8. The control processes that a financial institution establishes for CSFTs should take account of, and be consistent with, any informational barriers established by the institution to manage potential conflicts of interest, insider trading, or other concerns.

9. The agencies note that the Sarbanes-Oxley Act of 2002 requires companies listed on a national securities exchange or inter-dealer quotation system of a national securities association to establish procedures that enable employees to submit concerns regarding questionable accounting or auditing mat-

should be structured, in the context of elevated-risk CSFTs, so that they provide personnel with appropriate incentives to have due regard for the legal-, ethical-, and reputational-risk interests of the institution.

Reporting. A financial institution's policies and procedures should provide for the appropriate levels of management and the board of directors to receive sufficient information and reports concerning the institution's elevated-risk CSFTs to perform their oversight functions.

Monitoring compliance with internal policies and procedures. The events of recent years evidence the need for an effective oversight and review program for elevated-risk CSFTs. A financial institution's program should provide for periodic independent reviews of its CSFT activities to verify and monitor that its policies and controls relating to elevated-risk CSFTs are being implemented effectively and that elevated-risk CSFTs are accurately identified and have received proper approvals. These independent reviews should be performed by appropriately qualified audit, compliance, or other personnel in a manner consistent with the institution's overall framework for compliance monitoring, which should include consideration of issues such as the independence of reviewing personnel from the business line. Such monitoring may include more-frequent assessments of the risk arising from elevated-risk CSFTs, both individually and within the context of the overall customer relationship, and the results of this monitoring should be provided to an appropriate level of management in the financial institution.

Audit. The internal audit department of any financial institution is integral to its defense against fraud, unauthorized risk taking, and damage to the financial institution's reputation. The internal audit department of a financial institution should regularly audit the financial institution's adherence to its own control procedures relating to elevated-risk CSFTs, and further assess the adequacy of its policies and procedures related to elevated-risk CSFTs. Internal audit should periodically validate that business lines and individual employees are complying with the financial institution's standards for elevated-risk CSFTs and appropriately identifying any exceptions. This validation should include transaction testing for elevated-risk CSFTs.

Training. An institution should identify relevant personnel who may need specialized training regarding CSFTs to be able to effectively perform their oversight and review responsibilities. Appropriate training on the financial institution's policies and procedures for handling elevated-risk CSFTs is critical. Financial institution personnel involved in CSFTs should be familiar with the institution's policies and procedures concerning elevated-risk CSFTs, including the processes established by the institution for identification and approval of elevated-risk CSFTs and new complex structured finance products and for the elevation of concerns regarding transactions or products to appropriate levels of management. Financial institution personnel involved in CSFTs should be trained to identify and properly handle elevated-risk CSFTs that may result in a violation of law.

CONCLUSION

Structured finance products have become an essential and important part of the U.S. and international capital markets, and financial institutions have played an important role in the development of structured finance markets. In some instances, however, CSFTs have been used to misrepresent a customer's financial condition to investors and others, and financial institutions involved in these transactions have sustained significant legal and reputational harm. In light of the potential legal and reputational risks associated with CSFTs, a financial institution should have effective risk-management and internal control systems that are designed to allow the institution to identify elevated-risk CSFTs; to evaluate, manage, and address the risks arising from such transactions; and to conduct those activities in compliance with applicable law.

ters on a confidential, anonymous basis. (See 15 USC 78j-1(m).)

Bank management is responsible for controlling risk at a level deemed acceptable for the organization. An effective risk-management program begins with the identification of exposures that could disrupt the timely and accurate delivery of business services or result in unexpected financial claims on bank resources. Risk management also involves the implementation of cost-effective controls and the shifting, transfer, or assignment of risk to third parties through insurance coverage or other risk-transfer techniques. Although the design and sophistication of risk-management procedures varies from bank to bank, each institution's decision-making process should effectively identify; control; and, when or where appropriate, result in some transfer of risk. The risk-assessment program should be conducted annually to establish whether potential service disruptions and estimated risk-related financial costs and losses can be contained at levels deemed acceptable to bank management and the board of directors. Note that insurance can provide a bank with the resources to restore business operations and financial stability only *after* an unanticipated event has occurred, but a bank's own risk-management controls can prevent and minimize losses before they occur.

RISK-MANAGEMENT PROGRAM

A sound operational risk-management program requires the annual review of all existing business operations and a risk assessment of all proposed services. Identified risks should be analyzed to estimate their potential and probable levels of loss exposure. While the historical loss experience of the bank and other service providers may be helpful in quantifying loss exposure, technological and societal changes may result in exposure levels that differ from historical experience. Nevertheless, current exposure estimates should be derived from the bank's historical loss experience and augmented with industry experience. In addition, the bank's insurance broker or agent should be a source of advice.

Management must decide the most appropriate method for addressing a particular risk. Although many factors influence this decision, the purpose of risk management is to minimize the probability of losses and the net costs associated with them. In that context, cost is broadly defined to include—

- the direct and consequential cost of loss-prevention measures (controls), plus
- insurance premiums, plus
- losses sustained, including the consequential effects and expenses to reduce such losses, minus
- recoveries from third parties and indemnities from insurers on account of such losses, plus
- pertinent administrative costs.

Bank risks with potentially high or even catastrophic financial consequences should be eliminated or substantially mitigated whenever possible, even when the risk's frequency of occurrence is low. These risks can be eliminated by discontinuing operations where appropriate or by assigning the risk exposure to other parties using third-party service providers. When the exposure cannot be shifted to other parties or otherwise mitigated, the bank must protect itself with appropriate levels of insurance. Certain loss exposures may be deemed reasonable because their probability of frequency and severity of loss are low, the level of expected financial loss or service disruption is minimal, or the costs associated with the recovery of assets and restoration of services are low.

Bank management may decide to reduce insurance premiums and claims-processing costs by self-insuring for various types of losses, setting higher deductible levels, lowering the coverage limits for insurance purchased, and narrowing coverage terms and conditions. A financial organization's primary defenses against loss are adequate internal controls and procedures, which insurance is intended to complement, not replace. Thus, an overall appraisal of the organization's control environment is a significant consideration in determining the adequacy of the insurance program. To the extent that controls are lacking, the need for additional insurance coverage increases. These determinations should be based on the results of the risk assessment and be consistent with the limits established by the board of directors. Insurance decisions may also be influenced by the insurance broker's advice regarding current insurance market and premium trends.

Following September 2001, insurance companies reevaluated their position on providing coverage for acts of terrorism. As a result, terrorism coverage has become expensive or unavailable. The bank's "schedule of insurance" should note which policies contain exclusions, sublimits, or large deductibles for losses incurred as a result of terrorism.

When selecting insurance carriers, banks should consider the financial strength and claims-paying capacity of the insurance underwriter, as well as the robustness or strength of the supervisory regime to which the insurer is subject. This procedure is important for all significant policy-coverage lines. Rating agencies typically consider a number of insurers vulnerable, and some underwriters may have large environmental exposures but capped equity resources. Many large commercial enterprises acquire insurance coverage from foreign companies or from subsidiaries of U.S. insurers domiciled in the Caribbean or other countries. The quality of insurance supervision in many foreign countries may not meet the standards expected in the United States.

TYPES OF RISKS

Business risks generally fall into three categories: (1) physical property damage, (2) liability resulting from product failure or unintended employee performance, and (3) loss of key personnel. Common property risks are fires or natural disasters such as storms and earthquakes, but acts of violence or terrorism can also be included in this category. Risk-management programs for property damage should consider not only the protection and replacement of the physical plant, but also the effects of business interruptions, loss of business assets, and reconstruction of records.

Insurance programs increasingly cover the consequences of the second category, product failure or unintended employee performance. These risks include the injury or death of employees, customers, and others; official misconduct; and individual and class-action lawsuits alleging mistreatment or the violation of laws or regulations. All aspects of a bank's operation are susceptible to liability risks. While property-loss levels can be estimated with relative confidence, jury awards for personal injury or product liability, and the related litigation costs, often exceed expectations. In addition, it can be difficult to identify potential sources of liability exposure.

The third category, personnel risk, concerns those exposures associated with the loss of key personnel through death, disability, retirement, or resignation, as well as threats to all employees and third parties arising out of crimes such as armed robbery and extortion. The consequences of personnel loss are often more pronounced in small and medium-sized banks that do not have the financial resources to support a broad level of management.

INSURANCE PROGRAM

Program Objectives

A bank's insurance program should match the objectives of its management, the director-approved risk guidelines, and its individual risk profile. Insurance is primarily the transfer of the financial effect of losses and should be considered as only a part of the broader risk-management process. In that sense, it is imperative that management understands the costs and benefits of the bank's insurance program.

Due to the fluid nature of the insurance market and insurance products, there is no standard program or contract structure. Rather, many different insurance policies, coverages, endorsements, limits, deductibles, and payment plans fit together to form an insurance program. Based on the size and scope of a bank's operations, broader or narrower coverage, higher or lower limits, and separate policies may be purchased. Insurance programs should be customized to the risks that each bank faces. If a bank is particularly susceptible to a specific risk, purchasing additional insurance for that risk may be prudent.

A policy's deductible size and coverages, and the limits purchased, determine how much risk the bank has retained. Likewise, the payment plan of an insurance policy greatly influences the amount of risk transferred. An insurance policy alone does not represent significant risk transfer if the payment plan includes reimbursement to the insurance company for all losses, usually subject to a maximum. These reimbursement, loss-sensitive, or retrospectively rated plans can be viewed more as a risk-financing tool than as risk transfer. Management should understand and quantify the total "all-in" cost of these plans, as well as how these costs correspond with the risk guidelines approved by the directors.

Common Insurance-Policy Components and Concepts

There is a difference between "policy" and "coverage," but the two terms are often used interchangeably. The term "policy" usually refers to the actual insurance contract, while the term "coverage" refers to the types of risks to which the policy is designed to respond. For example, a directors' and officers' policy may include employment-practices liability (EPL) coverage. However, the bank may also purchase a separate EPL policy

An "endorsement" is a modification to a policy. Endorsements can be either a simple change in wording from the original contract or a more complex addition or deletion of a coverage section. To expand on the example above, EPL coverage is often endorsed onto a directors' and officers' policy. When an endorsement adds a coverage to a policy, it is often called a "rider."

The "limit of insurance" is the dollar amount of insurance protection purchased. Each policy has a different limit, and some may have separate limits for separate coverages provided under the same policy. Policies usually include a "per-occurrence" and an "aggregate" limit. The per-occurrence limit is the most the insurer will pay under the policy for any one insured event, while the policy aggregate is the most the insurer will pay in total, regardless of the number and size of insurable events.

"Deductibles" and "self-insured retentions (SIRs)" are the dollar amounts the bank must contribute to the loss before insurance applies.[1] They are effectively the same concept, with the difference being a deductible reduces the limits of insurance while a SIR does not. A deductible is included within or as part of the limits. A SIR is outside or in addition to the provided limits. For example, a $5 million policy limit with a $1 million deductible consists of $4 million of protection and the $1 million deductible. A $5 million policy limit with a $1 million SIR provides $5 million in protection after the $1 million dollar SIR is paid by the bank. As in any clause of an insurance contract, the terms can be negotiated so a deductible does not reduce the limits.

"Occurrence" and "claims made" are two separate types of coverage bases of policies that differ as to the period protected, when claims are recognized, and when the policies are "triggered" or respond. Under an occurrence, or "loss-sustained," form the amount and type of coverage (if any) for the loss event is based on the policy that was in force when the event took place or occurred, regardless of when a claim is submitted. Under a claims-made, or "discovery," policy, the insurance policy in force when the loss event was discovered and reported to the insurance company would apply, regardless of when the event causing the claim occurred. Both types of policies have provisions regarding prompt claims-reporting to insurers. However, claims-made policies are usually stricter and their coverage may be compromised by failing to report claims in a timely manner.

Self-Insurance or Alternative Risk Transfer

There are numerous nontraditional insurance programs that larger, more complex banking organizations employ. These programs include, but are not limited to, captive insurance companies, individual or group self-insurance, risk-retention groups, and purchasing groups. These alternative risk-transfer (ART) programs are complex, and they should include common bank policies and procedures. For example, the bank should have access to individuals with insurance expertise. Outside consultants, qualified insurance brokers, and bank directors or management with insurance expertise are an integral part of a successful ART program. The ART program should also incorporate stop-loss provisions and reinsurance coverage to cap the organization's exposure to severe claims or unexpected loss experience.

COMMON POLICIES AND COVERAGES

The following is not intended to be a comprehensive list of policies and coverages available, but rather a listing and description of those that

1. An organization can maintain an unfunded reserve for loss-retention purposes.

banks most frequently purchase. The list is divided into three general types of insurance: liability, property, and life insurance. A fourth category is included for aircraft and aviation insurance, which consists of various types of property and liability coverage. While this last coverage category may be unnecessary for most banking organizations, for those institutions that do have exposure to risks associated with aircraft ownership, the risks may be exceptionally large.

Fidelity Insurance Bond

Liability insurance is sometimes called "third-party insurance" because three parties are involved in a liability loss: the insured, the insurance company, and the party (the claimant) who is injured or whose property is damaged by the insured. The insurance company pays the claimant on behalf of the insured if the insured is legally liable for the injury or damage. An insured's legal liability for injury is often the result of a negligent act, but there are other sources of liability. Several examples of liability insurance are discussed below.

Fidelity bond coverage provides reimbursement for loss from employee dishonesty; robbery; burglary; theft; forgery; mysterious disappearance; and, in specified instances, damage to offices or fixtures of the insured. Coverage applies to all banking locations except automated teller machines, for which coverage must be specifically added. All banks should obtain fidelity bond coverage that is appropriate for their business needs.

The most widely used form of fidelity bond is the Financial Institution Bond (FIB), Standard Form No. 24 (formerly named the bankers' blanket bond). Standard Form No. 24 is a claims-made, or discovery, form. The "basic" FIB has four insuring agreements or parts. Employee Dishonesty/Fidelity (Clause A) covers dishonest or fraudulent acts committed by employees. On-Premises (Clause B) covers losses from burglary, misplacement, or an unexplained disappearance that occurs on premises. In-Transit (Clause C) covers losses from burglary, misplacement, or an unexplained disappearance that occurs while the property is in transit. Counterfeit Currency (Clause F) covers losses from accepting counterfeit currency.

In addition to the basic four FIB insuring agreements, Forgery or Alteration (Clause D) and Securities (Clause E) may also appear on the standard form. (These coverages may not be a component of the most basic insurance program for a small bank.) Significant enhancements and additional coverages are often endorsed onto the FIB. Any misrepresentation, omission, concealment, or incorrect statement of material fact in the insurance application is grounds for recission of the fidelity bond by the underwriting insurance company.

When the bank under examination is a subsidiary of a bank holding company, and the holding company has purchased one fidelity bond to cover all affiliated banks, the examiner should determine that the policy is sufficient to cover the exposures of the subsidiary bank being examined. Examiners also should determine that any policy premiums the subsidiary bank pays to the parent holding company are not disproportionate to the bank's benefits from the group policy and that such premiums are consistent with the fair-market requirements of section 23B of the Federal Reserve Act. Split-limit coverage may reduce protection if a loss involves the collusion of subsidiary bank employees or other affiliates of a bank holding company.

Clause A: Fidelity (Employee Dishonesty)

Clause A covers losses resulting directly from dishonest or fraudulent acts an officer or employee commits, either acting alone or in collusion with others. The employee must have had a manifest intent to cause a loss to the financial institution, and the employee or another person or entity must obtain financial benefit from the dishonest or fraudulent act. Officers, attorneys retained by the bank, persons provided by an employment contractor, and nonemployee data processors who are performing services for the insured are typically all considered "employees." If any of the loss results from loans, that part of the loss is covered only if the employee was in collusion with other parties to the transaction and the employee received a minimum financial-benefit amount, as specified in the policy. ("Financial benefit" does not include any employee benefits earned in the normal course of employment, including salaries, commissions, fees, bonuses, promotions, awards, profit-sharing plans, or pensions.) Clause A should not prevent the recovery of losses from employee dishonesty that are concealed by fictitious loans.

Clause B: On-Premises

Clause B covers losses of property (as defined in the bond) that occur on premises as a result of robbery, burglary, larceny, misplacement, theft, or a mysterious and unexplained disappearance. Under specified conditions, damage to offices and equipment may be covered under this clause, However, premises coverage should not be confused with standard fire or other types of property insurance.

Clause C: In-Transit

Clause C covers loss of property that is in transit. The property typically must be in the custody of (1) a natural person acting as a messenger for the insured, (2) a transportation company transporting the property in an armored motor vehicle, or (3) a transportation company transporting the property by means other than an armored motor vehicle. When an armored vehicle is not used by a transportation company, "property" is generally limited to records, certified securities, and negotiable instruments that are not payable to the bearer, are not endorsed, and have no restrictive endorsements. Some insuring agreements insure certain financial institution employees that carry cash.

Clause D: Forgery or Alteration

Clause D covers forgery, which is the signing of the name of another person or organization with the intent to deceive. Clause D also covers losses resulting from the alteration of any negotiable instrument. Evidences of debt, which the bank receives either over-the-counter or through clearings, are not usually covered. Fraudulent items received through an electronic funds transfer system are generally excluded.

Clause E: Securities

Clause E covers losses that result from a bank's extending credit or assuming liability on the faith of original securities, documents, or written instruments that are forged, altered, lost, or stolen. These include but are not limited to a certificated security, a title, a deed or mortgage, a certificate of origin or title, an evidence of debt, a security agreement, an instruction to a Federal Reserve Bank, and a statement of uncertificated security of a Federal Reserve Bank. Coverage is included for certain counterfeit securities and instruments. The bank must have acted in good faith and had actual physical possession of the original instrument.

Clause F: Counterfeit Currency

Clause F provides coverage for losses resulting from the receipt of counterfeit money. The coverage is counterfeit money of the United States, Canada, or any other country where the insured maintains a branch office.

Common FIB Extensions, Riders, or Endorsements

Fidelity bond protection can be extended by purchasing additional coverage through extensions, riders, and endorsements. If a bank has significant risk exposures in certain areas, these additional protections should be considered. The most common of these protections are listed below.

Extortion/Threats to Persons or Property

The extortion/threats to persons or property rider insures against loss of property that is surrendered away from a banking office as the result of a threat to do bodily harm to a director, trustee, employee, or relative, or of threats to damage banking premises or property. While a bank may add this coverage with a rider to its FIB, many banks purchase a separate, more comprehensive policy or endorse this coverage onto the directors' and officers' policy.

Trading Losses

The trading-loss rider amends the FIB exclusion by providing coverage for trading losses resulting directly from employee dishonesty.

Automated Teller Machines

The automated teller machine (ATM) rider covers losses of money from, or damage to, an unattended ATM that results from robbery, burglary, or theft.

Electronic or Computer Systems

The electronic or computer-systems rider covers direct losses caused by fraudulent funds transfers originated through the bank's computer systems. The fraud may be caused by a dishonest employee, customer, or third party.

Unauthorized Signatures

The unauthorized-signature rider covers losses resulting from a bank's acceptance, cashing, or payment of any negotiable instrument or withdrawal order that bears an unauthorized signature. An "unauthorized signature" is not forged, but is the signature of an individual who is not an authorized signatory on the account.

Fraudulent Mortgages

The fraudulent-mortgages rider insures against loan losses that result from a bank's accepting or acting on mortgages or deeds of trust that have defective signatures. "Defective signatures" are those obtained through fraud or trickery or under false pretenses.

Counterfeit Checks

The counterfeit-check rider insures against loss from counterfeit checks and other negotiable instruments. The coverage applies whether or not the counterfeit instruments are forged.

Service Contractors

The service-contractor rider covers loss resulting from fraudulent or dishonest acts committed by a servicing contractor. A "servicing contractor" services real estate and home-improvement mortgages, as well as tax and insurance escrow accounts; manages real property; or provides other related services. The coverage extends to losses resulting from the contractor's failure to forward collected funds to the bank when the servicing contractor has committed to do so.

Money-Order Issuer's

With a money-order-issuer's rider, coverage is expanded to authorized third parties that issue registered checks or personal money orders on behalf of the insured.

Liability Insurance

Electronic and Computer Crimes

To broaden the electronic and computer-systems rider that is normally attached to the FIB, an additional electronic and computer-crime rider may be purchased. This rider is a "companion policy" that covers losses the bank may incur from having (1) transferred, paid, or delivered any funds or property; (2) established any credit; or (3) debited any account or given value as a direct result of fraudulent input of electronic data or computer instructions into the insured's computer. These losses may result from someone's unauthorized access to a terminal or the bank's communications lines, or from the fraudulent preparation of tapes or computer programs. Under this rider, coverage may include electronic funds transfer systems, the bank's proprietary systems, and voice instructions given over the telephone. Losses caused by software programmers and consultants, ATM systems, computer viruses, software piracy, computer extortion, and facsimiles may also be covered.

Excess Bank Employee Dishonesty Bond

The excess bank employee dishonesty bond adds limits over and above the FIB. Often an FIB cannot be purchased with limits that are large enough to satisfy the risk-transfer needs of larger banks. When this occurs, the bank may purchase an excess bond that would respond if a claim is larger than the per-occurrence limits on the FIB or if the aggregate limit of the FIB has been exhausted. The most common form of this coverage is the excess bank employee dishonesty blanket bond, Standard Form No. 28.

Combination Safe Depository

Combination safe depository insurance consists of two coverage sections that can be purchased together or separately. Coverage (A) applies to losses when the bank is legally obligated to pay for loss of a customer's property held in safe deposit boxes (including loss from damage or destruction). Coverage (B) generally covers loss, damage, or destruction of property in customers' safe deposit boxes, whether or not the bank is legally liable, when the loss results from an activity other than employee dishonesty, such as robbery or burglary.

Directors' and Officers' Liability

Directors' and officers' (D&O) liability insurance usually has three coverage parts: Side A, Side B, and Entity Securities Coverage (C). Side A covers the directors and officers individually for alleged wrongful acts. Side B reimburses the bank for money it has paid to or on behalf of its directors and officers to indemnify them for damages they may be liable for as a result of alleged wrongful acts. Entity Securities Coverage protects the corporation against securities claims. Subject to many exclusions and definitions, a "wrongful act" means any actual or alleged act, error, omission, misstatement, misleading statement, neglect, or breach of duty. D&O policies are primarily written on a claims-made basis. Larger banks will purchase excess D&O coverage. Like the FIB, there are numerous coverages or enhancements that can be endorsed onto a D&O policy.

Entity errors and omissions. The entity errors and omissions (E&O) insurance rider extends coverage to the financial institution as an entity for wrongful acts. A separate, more robust E&O policy may also be purchased. The separate policy is commonly referred to as bankers' professional liability.

Fiduciary liability and ERISA errors and omissions. Fiduciary liability (or fiduciary errors and omissions) extends insurance coverage for management of the bank's own employee pension or profit-sharing plans. A separate, more robust fiduciary policy may be purchased to expand further the coverage of the bank's management of its own plans. Without this additional special endorsement, neither the fiduciary errors and omissions nor the bank's directors' and officers' liability insurance will cover liability arising under the Employee Retirement Income Security Act of 1974 (ERISA). For protection against exposure arising from a breach of fiduciary duty under ERISA, a special ERISA errors and omissions endorsement is required (also called fiduciary or employee benefit plan liability). In addition to bank trust departments, banks whose only fiduciary responsibilities relate to their employee benefit plan should consider this coverage. A related specialized coverage called IRA/Keogh errors and omissions is also available.

For properties held or managed by a bank's trust department, a master or comprehensive policy is often obtained instead of individual policies. A master policy protects the trust-account properties from fire or other loss and insures the accounts and the bank against third-party liability in connection with the properties. The master policy does not usually cover claims by trust customers against the bank for negligence, errors, or violations resulting in loss to fiduciary accounts. However, separate fiduciary (or trust department) errors and omissions policies incorporate these areas.

Trust Errors and Omissions

Trust errors and omissions insurance provides coverage for wrongful acts while the bank is acting as trustee, guardian, conservator, or administrator. This is a claims-made policy that can be endorsed onto the D&O policy.

Employment-Practices Liability

Employment-practices liability (EPL) insurance provides coverage for an entity against employee claims of wrongful termination, discrimination, sexual harassment or "wrongful employment acts." This is usually a claims-made policy that can be endorsed onto the D&O policy.

Bankers' Professional Liability

Bankers' professional liability (BPL-E&O) provides coverage for claims resulting from any actual or alleged wrongful acts, errors, or omissions bank employees commit in the performance of professional duties. Coverage can be broadened to include securities E&O, insurance agent E&O, brokerage service E&O, and notary E&O.

Mortgage Impairment

Mortgage-impairment insurance coverage protects the bank's interest, as mortgagee, from loss when contractually required insurance on real property held as collateral has inadvertently not been obtained. Upon discovery of the lack of required coverage, the bank has a limited time to either induce the borrower to obtain the required insurance or to place the insurance on its own.

Mortgage Errors and Omissions

Mortgage errors and omissions insurance, a broader version of mortgage-impairment coverage, provides coverage for direct damage and E&O losses to either the bank or the borrower. Mortgage E&O coverage also applies to the bank's mishandling of real estate taxes, life and disability insurance, and escrowed insurance premiums. Claims must result in a loss to the mortgaged property.

Commercial General Liability

Commercial general liability (CGL) insurance protects against claims of bodily injury or property damage for which the business may be liable and which may arise from the bank's premises, operations, and products. In addition to bodily injury and property damage, CGL can include liability coverage for various other offenses that might give rise to claims, such as libel, slander, false arrest, and advertising injury. A CGL policy can be underwritten on either an occurrence or a claims-made basis.

Workers' Compensation and Employers' Liability

Workers' compensation insurance covers injuries or deaths of employees caused by accidents in the course of employment. Workers' compensation insurance consists of two basic coverage parts: statutory benefits and employers' liability (EL). The two are mutually exclusive remedies to an employee injured on the job. EL protects a company from a lawsuit filed by an employee, while statutory benefits coverage provides medical care and long-term disability, death, or other benefits. State laws govern these provisions, so the provisions differ from state to state. The statutory coverage of workers' compensation is a no-fault system intended to benefit both the injured employee and the employer.

Automobile Liability and Physical Damage

Automobile liability insurance provides third-party liability protection for bodily injury or property damage resulting from accidents that involve the bank's vehicles. First-party coverage for damage to the vehicles is also provided. This coverage should be extended to include—

- nonowned and hired coverage, if employees use personal autos or rent autos while on bank business;
- coverage for autos that have been repossessed; and
- garage-keeper's liability, if the bank rents its parking facilities to customers or the public.

Umbrella and Excess Liability

Umbrella and excess liability insurance offers additional liability limits in excess of the coverage limits of any policy over which it "attaches" or becomes effective. Basic umbrella coverage attaches to CGL and automobile insurance and to the employers' liability section of workers' compensation policies. An excess liability policy attaches over an umbrella policy. More complex insurance programs may include both umbrella and excess liability policies that attach over the D&O, E&O, EPL, or other insurance.

Property Insurance

Several types of insurance coverage are available to help banks recover from property damage. Some of the more common types of property coverages are briefly described below.

Broad Form Property Insurance

Property insurance insures against the loss of or damage to real and personal property. The loss or damage may be caused by perils such as fire, theft, windstorm, hail, explosion, riot, aircraft, motor vehicles, vandalism, malicious mischief, riot and civil commotion, and smoke.

Fire

Fire insurance covers all losses directly attributed to fire, including damage from smoke or water and chemicals used to extinguish the fire. Additional fire damage for the building contents may be included, but often is written in combination with the policy on the building and permanent fixtures. Most fire insurance policies contain "co-insurance" clauses, meaning that insurance coverage must be maintained at a fixed proportion of the replacement value of the building. If a bank fails to maintain the required relationship of protection, all losses will be reimbursed at the ratio of the amount of the insurance carried to the amount required, applied to the value of the building at the time of the loss. When determining insurable value for fire insurance purposes, the basis typically is the cost of replacing the property with a similar kind or quality at the time of loss. Different types of values, however, may be included in policies, and care should be taken to ensure that the bank is calculating the correct value for its needs.

Business Personal Property

Traditionally known as "contents" insurance, business personal property insurance affords insurance protection coverage for the furniture, fixtures, equipment, machinery, merchandise, materials, and all other personal property owned by the bank and used in its business.

Blanket Coverage

Blanket insurance covers, in a single contract, either multiple types of property at a single location or one or more types of property at multiple locations.

Builder's Risk

Builder's-risk insurance is commercial property coverage specifically for buildings that are in the course of construction.

Business Interruption

Business-interruption insurance indemnifies the insured against losses arising from its inability to continue normal operations and functions of the business. Coverage is triggered by the total or partial suspension of business operations due to the loss of, loss of use of, or damage to all or part of the bank's buildings, plant machinery, equipment, or other personal property, when the loss is the result of a covered cause.

Contingent business-interruption insurance is also available to cover the bank's loss of earnings caused by a loss to another business that is one of its major suppliers or customers. This insurance is also known as "business income from dependent properties."

Crimes

Crime insurance covers money, securities, merchandise, and other property from various criminal causes of loss, such as burglary, robbery, theft, and employee dishonesty.

Data Processing

Data processing insurance coverage provides loss protection if data processing systems break down. This insurance also covers the additional expense incurred in making the system operational again.

Difference in Conditions

A difference-in-conditions (DIC) insurance contract is a separate coverage that expands or supplements property insurance that was written on a named-perils basis. A DIC policy will cover the property on an all-risk basis, subject to certain exclusions.

Ocean and Inland Marine

Ocean marine insurance covers ships and their cargo against such causes as fire, lightning, and "perils of the seas." These include high winds, rough waters, running aground, and collision with other ships or objects.

Inland marine insurance was originally developed to provide coverage for losses to cargo transported over land. It now covers limited types of property in addition to goods in transit.

Valuable Papers and Destruction of Records

Valuable-papers and destruction-of-records insurance coverage is for the physical loss or damage to valuable papers and records of the insured. The coverage includes practically all types of printed documents or records except money.

Accounts Receivable

Accounts-receivable insurance covers losses that occur when an insured is unable to collect outstanding accounts because of damage to or destruction of the accounts-receivable records that was caused from a peril covered in the policy.

Cash Letters

Cash-letter insurance covers the costs for reproducing cash-letter items and items that remain uncollectible after a specified period of time. Generally, these policies do not cover losses due to dishonest acts of employees.

First-Class, Certified, and Registered Mail

The insurance coverage for first-class, certified, and registered mail provides protection on the shipment of property sent through the mail, as well as during transit by messenger or carrier to and from the post office. The insurance is principally used to cover registered mail in excess of the maximum $25,000 insurance provided by the U.S. Postal Service.

Commercial Multiple Peril

Commercial multiple peril insurance encompasses a range of insurance coverages, including property and liability. Small institutions may purchase this package policy when stand-alone polices are excessive or inefficient.

Life Insurance

Common types of life insurance policies purchased by banks are described below.

Key Person

When the death of a bank officer, or key person, would be of such consequence to the bank as to give it an insurable interest, key-person life insurance would insure the bank on the life of this individual.

Split-Dollar

In split-dollar life insurance, the purchaser of the policy pays at least part of the insurance premiums and is entitled to only a portion of the cash surrender value, death benefit, or both. See SR-93-37 ("Split-Dollar Life Insurance," June 18, 1993) and its attachments for further discussion of the Federal Reserve's position on these arrangements between bank holding companies and their subsidiary banks.

Bank-Owned

Bank-owned life insurance consists of tax-advantaged insurance policies that are purchased to cover the lives of bank officers and other highly compensated employees. The policies may be used as a funding mechanism for employee pension and benefit plans. The bank is the owner and beneficiary of the policy, and the cash value of the policy is considered an asset of the bank.

Aircraft or Aviation Insurance

Although aviation-liability exposures are frequently overlooked in the myriad of other financial institution exposures, they have tremendous potential for large catastrophic losses and must be addressed by senior risk-management executives at all financial institutions. Often hidden or obscure, aviation liability ranges from the more typical owned and nonowned liability and physical-damage exposures to the more exotic exposures from hangar-keepers, aviation products, and airport or heliport premises. In view of the specialized nature of aviation exposures, it is important that the bank deal with knowledgeable and experienced agents or brokers and underwriters in developing its aviation insurance program. While exposure categories overlap significantly, the following summary highlights the key areas of concern to most financial institutions.

Aviation Liability

Aviation liability insurance can be written to include aviation-products liability, all owned or nonowned exposures, and passenger liability. A bank's umbrella liability insurance program should also apply over the aviation policy's limit.

Nonowned Exposures

While many banks do not feel the need for aviation insurance because they do not own an aircraft, they may overlook liability exposures from nonowned aircraft and may, in fact, need this coverage. For example, an employee may use a personal aircraft on bank business, or lease or rent an aircraft to ferry customers or employees to a distant meeting. Financing or leasing an aircraft could create a nonowned exposure, even though the aircraft is not under bank control.

Most aviation-underwriting markets have programs available to meet the above exposures. However, additional exposures may require special coverage. Banks should consider the following situations:

- If the bank repairs and maintains the aircraft, it may incur a products-liability exposure after control is relinquished to others, such as when the aircraft is sold.
- If the bank finances aircraft, maintaining only a security interest, it becomes an owner when it repossesses the aircraft. In this case, there could be a definite need for both liability and physical-damage coverage. The coverage may be written at the time of repossession or negotiated in advance of the need for it. The bank should not attempt to continue coverage for its exposure under the borrower's policy.

All-Risk Physical Damage

To protect the bank's security interest in an aircraft hull, borrowers should be required to maintain full-value, all-risk physical-damage insurance (both ground-risk and in-flight coverage) in favor of the bank. However, a number of warranties in aircraft insurance policies could void the contract, so bankers are further advised to require that a borrower's hull insurance policy contain a breach-of-warranty endorsement to protect the bank if the borrower or owner violates provisions of the policy. The underwriter should agree to give the bank at least 30 days' advance notice of any change in the policy. Depending on the use of the aircraft, special consideration should be given to the territorial limits of coverage, as well as to confiscation protection. Since breach-of-warranty endorsements, like aircraft insurance policies, are far from standard, it is important that the bank understand and agree with the underwriter's language. It is particularly appropriate to review the consequences of potential recovery to the lien holder if the aircraft is damaged while a delinquency exists on the note.

Bank as Lessor

If the bank's security interest is that of the lessor, aviation liability insurance should be carried by the bank as lessor and also by the customer as lessee. In certain cases, it may be appropriate to require the lessee, through his or her underwriter, to provide the equivalent of the breach-of-warranty endorsement to the liability program and physical-damage coverage. The bank may also consider obtaining contingent lessor's liability.

Airport Premises and Hangar-Keepers

Airport-premises and hangar-keeper's insurance apply if the bank repossesses real estate on which an airport facility exists and continues to operate, or if the bank permits use of the facility pending further sale. In either case, the bank may assume liability exposures associated with the control tower, as well as airport-premises liability. Both the bank's comprehensive general liability and aviation liability programs should be reviewed for proper coverage.

If the bank owns or operates a hangar for its aircraft and attempts to share the burden of costs with others by renting aircraft space, it can pick up exposure to hangar-keeper's liability, unless the contract is properly worded. Appropriate consideration should be given to hold-harmless indemnification clauses, any regular or special insurance requirements, and waivers of subrogation.

Accidental Death and Dismemberment and Travel

Accidental death and dismemberment and travel insurance is another aspect of aviation insurance that banking institutions should consider. Many insurance programs for accidental death and dismemberment and corporate business travel accidents exclude coverage in corporate-owned, -leased, or -hired aircraft. Banks need to review the language of these policies carefully to be certain that they provide necessary and adequate coverages for the use of such aircraft.

RECORDKEEPING

The diversity of available insurance policies and their coverages emphasize the need for banks to maintain a concise, easily referenced schedule of their insurance coverage, referred to as the "schedule of insurance." These records should include the following information:

- insurance coverages provided, with major exclusions detailed
- the underwriter
- deductible amounts
- upper limits on policies
- terms of the policies
- dates that premiums are due
- premium amounts
- claim-reporting procedures

In preparation for policy renewal, the bank's risk manager and insurance broker organize much of the bank's relevant insurance data into a "submission." The submission may include—

- historical, current, and forecasted exposure information, such as sales, number and type of employees, property characteristics and values, and number and type of autos;
- loss and claim history by line of insurance, including detailed information on large claims, loss development, and litigation;
- information on company risk-management policies and financials; and
- specifications on desired coverages, terms and conditions, limits, deductibles, and payment plans.

The submission is delivered to the insurance company underwriter and forms the basis for determining premiums, rates, limits, and the program structure. The information may give the examiner a sense of why premiums and coverages change from year to year and whether purchased limits are sufficient.

Banks should retain the original policies and supporting documents for appropriate time periods. Records of losses should also be maintained, regardless of whether the bank was reimbursed. This information indicates areas where internal controls may need to be improved and is useful in measuring the level of risk exposure in a particular area.

1. To determine whether insurance is effectively integrated into the operational-risk-management program, and whether the insurance is appropriate, in light of the institution's internal-control environment.
2. To determine if insurance coverage adequately protects against significant or catastrophic loss.
3. To determine if recordkeeping practices are sufficient to enable effective risk and insurance management.
4. To ascertain if, and ensure that, the risk manager has initiated corrective action when policies, practices, procedures, or internal controls are deficient or when violations of banking laws and regulations have been noted.

1. If selected for implementation, complete or update the ‘‘Bank Risk and Insurance Management’’ section of the internal control questionnaire.
2. Test for compliance with policies, practices, procedures, and internal controls in conjunction with performing the remaining examination procedures. From the examiner who is assigned to ‘‘internal control,’’ obtain a listing of any deficiencies noted in the latest review conducted by internal or external auditors and risk managers. Determine if appropriate corrections have been made.
3. Determine if the bank has designated a qualified risk manager, with expertise in insurance programs, to be responsible for loss control. If not, determine which officer handles the risk- and insurance-management function and whether external consultants are employed in designing the insurance program.
4. Obtain the bank’s schedule of insurance policies in force and the renewal submissions. If the bank does not maintain a schedule, request that the bank complete a schedule of existing insurance coverage.
   a. Determine whether there have been any material changes in insurance coverage, limits, or deductibles since the last examination and the reasons for such changes. Do the changes reflect—
      - revised business strategies, the bank structure, operating processes, or technology systems that affect insurable risks, and
      - shifts to self-insurance or co-insurance or a change in insurance carriers?
   b. If there have been material changes, determine how they are being managed.
5. Using the bank-prepared summary of insurance coverage, determine that coverage conforms to the guidelines for maximum loss exposure, as established by the board of directors.
   a. Determine whether the use of insurance is in accordance with board-approved risk-management policies and guidelines.
   b. If the bank self-insures, determine what methods are used for this purpose; how the value of self-insurance is quantified; and how ‘‘premiums’’ are accounted for, funded, allocated, and tracked.
6. Determine whether insurance coverage provides adequate protection for the bank. The quality of internal controls and the audit function must be considered when making this assessment.
   a. Determine whether the bank manages its insurance coverage as an element of the operational-risk-management program.
   b. Determine whether the insurance program is managed on a corporate-wide basis or within each business unit.
   c. Identify any products, processes, or systems that the bank is not able to obtain insurance coverage for and determine how the associated risk is being managed.
   d. Determine whether the bank maintains a database of operational-loss events, the comprehensiveness of the database, and the claims history of operational losses.
   e. Review the due-diligence process used to assess the qualifications of providers of insurance coverage, including primary reinsurers.
7. If the bank’s fidelity insurance has lapsed, determine that the appropriate Federal Reserve Bank has been notified.
8. Determine that the bank has adequate procedures to ensure that—
   a. reports of losses are filed with the bonding company pursuant to policy provisions,
   b. premiums are paid before policy expiration dates,
   c. policies are renewed without a lapse of coverage at expiration dates, and
   d. material changes in exposures are reported to the bank’s insurance agent or broker and result in appropriate insurance-policy endorsements.

If the procedures are deficient, verify that reports have been filed as required and premiums have been paid.

9. Review any significant financial institution bond claims that were filed since the last examination to determine—

   a. any adverse effect on the bank's condition,
   b. whether the incident (or incidents) reflects any deficiencies with respect to internal controls and procedures, and
   c. whether management has taken appropriate steps to correct any deficiencies and made appropriate reports to the board of directors.
10. Prepare, in appropriate report form, and discuss with appropriate officers—
   a. recommended corrective action when policies, practices, procedures, or internal controls are deficient;
   b. recommended improvements in the risk-management program that relate to insurance;
   c. important areas in which insurance coverage is either nonexistent or inadequate in view of current circumstances; and
   d. any other deficiencies noted.
11. Update the workpapers with any information that will facilitate future examinations.

Review the bank's internal controls, policies, practices, and procedures for its own insurance coverage. The bank's risk-management system should be documented completely and concisely and should include, where appropriate, the risk-assessment matrix, a narrative description, flowcharts, the schedule of insurance coverage, policy forms, renewal submissions, and other pertinent information.

BANK RISK AND INSURANCE MANAGEMENT

1. Does the bank have established insurance guidelines that provide for—
   a. a reasonably frequent, and at least annual, determination of risks the bank assumes or transfers, including high-dollar and low-probability events?
   b. limits as to the amount of risk that may be retained or self-insured?
   c. periodic appraisals of major fixed assets to be insured?
   d. a credit or financial analysis of the insurance companies who have issued policies to the bank?
2. Does the bank have a risk manager who is responsible for assessing and developing controls to deal with the consolidated risks of the institution?
3. Is the bank's insurance program managed as an element of its overall operational-risk-management program; that is, are insurance coverages reviewed and coordinated by the person handling the operational-risk-management function?
4. Does the bank use the services of a professionally knowledgeable insurance agent, broker, direct writer, or consultant to assist in selecting and providing advice on alternative means of providing insurance coverage?
5. Does the bank's security officer coordinate his or her activities with the person responsible for handling the operational-risk-management function?
6. Does the bank maintain a concise, easily referenced schedule of existing insurance coverage?
7. Does the bank maintain records, by type of risk, to facilitate an analysis of the bank's experience in costs, claims, losses, and settlements under the various insurance policies in force?
8. Is a complete schedule of insurance coverage presented to the board of directors at least annually for review and approval? Does the schedule include the respective insurance premiums (net costs), claims, and loss experience, and is this information reviewed as part of this process?

CONCLUSION

1. Is the foregoing information an adequate basis for evaluating internal control; that is, there are no significant deficiencies in areas not covered in this questionnaire that impair any controls? Explain negative answers briefly, and indicate any additional examination procedures deemed necessary.
2. Based on a composite evaluation, as evidenced by answers to the foregoing questions, internal control is considered (adequate/inadequate).

State member banks may purchase bank-owned life insurance (BOLI) as principal if such purchases are permitted for national banks and permitted under state law. The legal authority and guidance for acquiring permissible BOLI and for engaging in insurance activities is discussed within the following interagency statement. When such insurance purchases or insurance activities are not permissible for national banks, a determination of permissibility depends on a decision of the FDIC (1) that the investment or activity would not pose any significant risk to the insurance fund and (2) that the bank continues to comply with the required capital standards.

The bank supervisory agencies have concerns that some banks have committed a significant amount of capital to BOLI without having an adequate understanding or a proper assessment of the full array of risks it poses—especially risks that are difficult to measure, such as liquidity, transaction/operational, reputation, and compliance/legal risks. Banks are therefore expected to implement appropriate risk-management processes, including meaningful risk limits, before implementing or adding to a BOLI program. The following interagency guidance was developed for banks and savings associations (institutions) and examination staff to help ensure that risk-management practices for BOLI are consistent with safe and sound business practices. The interagency statement was issued on December 7, 2004.

INTERAGENCY STATEMENT ON THE PURCHASE AND RISK MANAGEMENT OF LIFE INSURANCE

This interagency statement[1] provides general guidance for banks and savings associations (institutions) regarding supervisory expectations for the purchase of and risk management for BOLI. Guidance is also provided for split-dollar arrangements and the use of life insurance as security for loans. The agencies are providing this guidance to help ensure that institutions' risk-management processes for BOLI are consistent with safe and sound banking practices. Among the safe and sound banking practices discussed in this statement are (1) the need for senior management and board oversight of BOLI, including both a thorough pre-purchase analysis of risks and rewards and post-purchase risk assessment and (2) the permissibility of BOLI purchases and holdings, as well as their risks and associated safety-and-soundness considerations. The statement's appendix [titled appendix A for this section of the manual] contains a discussion of insurance types and the purposes for which institutions commonly purchase life insurance, as well as a glossary of BOLI-related terminology [titled appendix B for this section].

The statement's guidance for the pre-purchase analysis of life insurance applies to all BOLI contracts entered into after December 7, 2004. The guidance concerning the ongoing risk management of BOLI subsequent to its purchase applies to all holdings of life insurance regardless of when purchased. Institutions that purchase life insurance after December 7, 2004, that are not in compliance with this guidance may be subject to supervisory action. Institutions that entered into BOLI contracts before this date will be evaluated according to each agency's pre-purchase guidance in effect at that time.

Compliance with the supervisory guidance in this statement regarding permissible uses for insurance (e.g., recovery of the costs of providing benefits) does not determine whether the policy satisfies state insurable interest requirements.

Legal Authority

National banks may purchase and hold certain types of life insurance under 12 USC 24 (Seventh), which provides that national banks may exercise "all such incidental powers as shall be necessary to carry on the business of banking." Federal savings associations also may purchase and hold certain types of life insurance incidental to the express powers granted under the Home Owners' Loan Act. The OCC and OTS have delineated the scope of these authorities through various interpretations addressing the

1. Adopted by the Board of Governors of the Federal Reserve System (FRB), the Office of the Comptroller of the Currency (OCC), the Federal Deposit Insurance Corporation (FDIC), and the Office of Thrift Supervision (OTS) (the agencies).

permissible use of life insurance by national banks and federal savings associations.

Under these authorities, national banks and federal savings associations may purchase life insurance in connection with employee compensation and benefit plans, key-person insurance, insurance to recover the cost of providing pre- and post-retirement employee benefits, insurance on borrowers, and insurance taken as security for loans. The OCC and OTS may approve other uses on a case-by-case basis.

National banks and federal savings associations may *not* purchase life insurance—

- for speculation;
- to provide funds to acquire shares of stock from the estate of a major shareholder upon the shareholder's death, for the further purpose of controlling the distribution of ownership in the institution;
- as a means of providing estate-planning benefits for insiders, unless the benefit is a part of a reasonable compensation package; or
- to generate funds for normal operating expenses other than employee compensation and benefits.

National banks and federal savings associations may not hold life insurance in excess of their risk of loss or cost to be recovered. For example, once an individual no longer qualifies as a key person because of retirement, resignation, discharge, change of responsibilities, or for any other reason, the risk of loss has been eliminated. Therefore, national banks and federal savings associations may be required to surrender or otherwise dispose of key-person life insurance held on an individual who is no longer a key person. Typically, term or declining term insurance is the most appropriate form of life insurance for key-person protection.

National banks and federal savings associations may hold equity-linked variable life insurance policies (that is, insurance policies with a return tied to the performance of a portfolio of equity securities held in a separate account[2] of the insurance company) only for the purpose of economically hedging their equity-linked obligations under employee benefit plans. As discussed more fully in the section on "Price Risk," for equity-linked variable life insurance holdings to be permissible, the national bank or federal savings association must demonstrate that—

- it has a specific, equity-linked obligation; and
- both at the inception of the hedge and on an ongoing basis, changes in the value of the equity-linked variable life insurance policy are highly correlated with changes in the value of the equity-linked obligation.

If a national bank or federal savings association does not meet these requirements, the equity-linked variable life insurance holdings are not permissible. The use of equity-linked variable life insurance holdings as a long-term hedge against general benefit costs is not permissible because the life insurance is not hedging a specific equity-linked liability and does not meet the "highly correlated" requirement.

As a general matter, the ability of state-chartered banks to purchase insurance (including equity-linked variable life insurance) is governed by state law. In some instances, state laws permit state-chartered banks to engage in activities (including making investments) thatgo beyond the authority of a national bank. The Federal Deposit Insurance Act (section 24) generally requires insured state-chartered banks to obtain the FDIC's consent before engaging as principal in activities (including making investments) that are not permissible for a national bank. Similarly, the Federal Deposit Insurance Act (section 28) generally requires a state-chartered savings association to obtain the FDIC's consent prior to engaging as principal in activities (including making investments) that are not permissible for a federal savings association. While insured state-chartered banks and state savings associations may seek the FDIC's consent to make purchases of life insurance that would not be within the authority of a national bank or federal savings association, such banks and savings associations should be aware that the FDIC will not grant permission to make life insurance purchases if the FDIC determines that doing so would present a significant risk to the deposit insurance fund or that engaging in such

2. A separate account is a design feature that is generally available to purchasers of whole life or universal life whereby the policyholder's cash surrender value is supported by assets segregated from the general assets of the carrier. Under such an arrangement, the policyholder neither owns the underlying separate account nor controls investment decisions (e.g., timing of investments or credit selection) in the underlying separate account that is created by the insurance carrier on its behalf. Nevertheless, the policyholder assumes all investment and price risk.

purchases is inconsistent with the purposes of federal deposit insurance.

Accounting Considerations

Institutions should follow generally accepted accounting principles (GAAP) applicable to life insurance for financial and regulatory reporting purposes. Financial Accounting Standards Board (FASB) Technical Bulletin No. 85-4, "Accounting for Purchases of Life Insurance" (TB 85-4), discusses how to account for holdings of life insurance. Under TB 85-4, only the amount that could be realized under an insurance contract as of the balance-sheet date (that is, the CSV reported to the institution by the carrier, less any applicable surrender charges not reflected by the insurance carrier in the reported CSV) is reported as an asset. The guidance set forth in TB 85-4 concerning the carrying value of insurance on the balance sheet is generally appropriate for all forms of BOLI.

An institution may purchase multiple permanent insurance policies from the same insurance carrier with each policy having its own surrender charges. In some cases, the insurance carrier will issue a rider or other contractual provision stating that it will waive the surrender charges if all of the policies are surrendered at the same time. Because it is not known at any balance-sheet date whether one or more of the policies will be surrendered before the deaths of those insured, the possibility that the institution will surrender all of these policies simultaneously and avoid the surrender charges is a gain contingency. Under FASB Statement No. 5, "Accounting for Contingencies," "[c]ontingencies that might result in gains usually are not reflected in the accounts since to do so might be to recognize revenue prior to its realization." Accordingly, an institution should report each of the insurance policies on its balance sheet at the policy's CSV reported by the insurance carrier, less any applicable surrender charges not reflected in the reported CSV, without regard to the existence of the rider.

In accordance with the instructions for Consolidated Reports of Condition and Income and Thrift Financial Reports, an institution should report the carrying value of its BOLI holdings as an "other asset" and the earnings on these holdings should be reported as "other noninterest income."

The agencies have seen a number of cases in which institutions have failed to account properly for a type of deferred compensation agreement, commonly referred to as a revenue-neutral plan or an indexed retirement plan. The accounting for such plans is separate and distinct from the accounting for BOLI. However, because many institutions buy BOLI to help offset the cost of providing such deferred compensation, the agencies have issued guidance addressing the accounting requirements for both deferred compensation agreements and BOLI. See the Interagency Advisory on Accounting for Deferred Compensation Agreements and Bank-Owned Life Insurance, dated February 11, 2004, for a complete description, including examples, of the appropriate accounting treatment.

Supervisory Guidance on BOLI

Before entering into a BOLI contract, institutions should have a comprehensive risk-management process for purchasing and holding BOLI. A prudent risk-management process includes—

- effective senior management and board oversight;
- comprehensive policies and procedures, including appropriate limits;
- a thorough pre-purchase analysis of BOLI products; and
- an effective ongoing system of risk assessment, management, monitoring, and internal control processes, including appropriate internal audit and compliance frameworks.

The risks associated with temporary (term) insurance are significantly less than those arising from holdings of permanent insurance. Accordingly, the risk-management process for temporary insurance may take this difference into account and need not be as extensive as the risk-management process for permanent insurance.

Senior Management and Board Oversight

The safe and sound use of BOLI depends on effective senior management and board oversight. Regardless of an institution's financial capacity and risk profile, the board must understand the complex risk characteristics of the institution's insurance holdings and the role this asset is intended to play in the institution's overall business strategy. Although the board may delegate decision-making authority related to purchases of BOLI to senior management, the board remains ultimately responsible for ensuring that the purchase and holding of BOLI is consistent with safe and sound banking practices.

An institution holding life insurance in a manner inconsistent with safe and sound banking practices is subject to supervisory action. Where ineffective controls over BOLI risks exist, or the exposure poses a safety-and-soundness concern, the appropriate agency may take supervisory action against the institution, including requiring the institution to divest affected policies, irrespective of potential tax consequences.

Policies and Procedures

Consistent with prudent risk-management practices, each institution should establish internal policies and procedures governing its BOLI holdings, including guidelines that limit the aggregate CSV of policies from any one insurance company as well as the aggregate CSV of policies from all insurance companies. When establishing these internal CSV limits, an institution should consider its legal lending limit, the capital concentration threshold, and any applicable state restrictions on BOLI holdings.[3] In this regard, given the liquidity, transaction/operational, reputation, and compliance/legal risks associated with BOLI, it is generally not prudent for an institution to hold BOLI with an aggregate CSV that exceeds 25 percent of the institution's capital as measured in accordance with the relevant agency's concentration guidelines.[4] Therefore, the agencies expect an institution that plans to acquire BOLI in an amount that results in an aggregate CSV in excess of 25 percent of capital, or any lower internal limit, to gain prior approval from its board of directors or the appropriate board committee. The agencies particularly expect management to justify that any increase in BOLI resulting in an aggregate CSV above 25 percent of capital does not constitute an imprudent capital concentration. An institution holding BOLI in an amount that approaches or exceeds the 25 percent of capital concentration threshold can expect examiners to more closely scrutinize the risk-management policies and controls associated with the BOLI assets and, where deficient, to require corrective action.

When seeking the board's approval to purchase or increase BOLI, management should inform the board members of the existence of this interagency statement, remind them of the illiquid nature of the insurance asset, advise them of the potential adverse financial impact of early surrender, and identify any other significant risks associated with BOLI. Such risks might include, but are not limited to, the costs associated with changing carriers in the event of a decline in the carrier's creditworthiness and the potential for noncompliance with state insurable interest requirements and federal tax law.

Pre-purchase Analysis

The objective of the pre-purchase analysis is to help ensure that the institution understands the risks, rewards, and unique characteristics of BOLI. The nature and extent of this analysis should be commensurate with the size and complexity of the potential BOLI purchases and should also take into account existing BOLI holdings. A mark of a well-managed institution is the maintenance of adequate records concerning its pre-purchase analyses, usually including documentation of the purpose and amount of insurance needed.

An effective pre-purchase analysis involves the following management actions:

Step 1—Identify the need for insurance and determine the economic benefits and appropriate insurance type. An institution should deter-

3. In July 1999, the OTS adopted a policy that savings associations may not invest more than 25 percent of their total capital in BOLI without first notifying and obtaining authorization from their OTS Regional Office. In order to maintain strong and effective communications with institutions under its supervision, the OTS retains this policy. The other agencies may also institute approval or notification requirements.

4. Each agency's definition of a concentration differs slightly. Institutions should refer to the definition provided by their supervisory agency when measuring the CSV of BOLI as a percentage of capital: OCC Bulletin 95-7 for national banks; FRB *Commercial Bank Examination Manual,* section 2050.1, for state member banks; FDIC *Manual of Examination Policies,* section 11.1, for insured state nonmember banks; and OTS *Thrift Activities Handbook,* section 211, for savings associations.

mine the need for insurance by identifying the specific risk of loss to which it is exposed or the specific costs to be recovered. It is not appropriate to purchase life insurance to recover a loss that the institution has already incurred. An institution's purchase of insurance to indemnify it against a specific risk of loss does not relieve it from other responsibilities related to managing that risk. The type of BOLI product, e.g., general[5] or separate account, and its features should be appropriate to meet the identified needs of the institution. The appendix [appendix A] contains a description of insurance types and design features.

An institution should analyze the cost and benefits of planned BOLI purchases. The analysis should include the anticipated performance of the BOLI policy and an assessment of how the purchase will accomplish the institution's objectives. Before purchasing BOLI, an institution should analyze projected policy values (CSV and death benefits) using multiple illustrations of these projections provided by the carrier, some of which incorporate the institution's own assumptions. An institution should consider using a range of interest-crediting rates and mortality-cost assumptions. In some cases, the net yield (after mortality costs) could be negative, particularly for separate-account products. The potential for unfavorable net yields underscores the importance of carefully evaluating BOLI costs and benefits across multiple scenarios, both currently and into the future.

Step 2—Quantify the amount of insurance appropriate for the institution's objectives. An institution should estimate the size of the employee benefit obligation or the risk of loss to be covered and ensure that the amount of BOLI purchased is not excessive in relation to this estimate and the associated product risks. When using BOLI to recover the cost of providing employee benefits, the estimated present value of the expected future cash flows from BOLI, less the costs of insurance, should not exceed the estimated present value of the expected after-tax employee benefit costs. In situations where an institution purchases BOLI on a group of eligible employees, it may estimate the size of the obligation or the risk of loss for the group on an aggregate basis and compare that to the aggregate amount of insurance to be purchased. This estimate should be based on reasonable financial and actuarial assumptions. State insurable interest laws may further restrict or limit the amount of insurance that may be purchased on a group of employees. Management must be able to support, with objective evidence, the reasonableness of all of the assumptions used in determining the appropriate amount of insurance coverage needed by the institution, including the rationale for its discount rates and cost projections.

Step 3—Assess the vendor's qualifications. When making a decision about vendors, an institution should consider its own knowledge of insurance risks, the vendor's qualifications, and the amount of resources the institution is willing to spend to administer and service the BOLI. Depending on the role of the vendor, the vendor's services can be extensive and may be critical to successful implementation and operation of a BOLI plan, particularly for the more complex separate-account products.

While it is possible to purchase insurance directly from insurance carriers, the vast majority of insurance purchases are made through vendors—either brokers, consultants, or agents. A vendor may design, negotiate, and administer the BOLI policy. An institution should ensure that it understands the product it is purchasing and that it selects a product that best meets its needs. Management, not just the vendor, must demonstrate a familiarity with the technical details of the institution's insurance assets, and be able to explain the reasons for and the risks associated with the product design features they have selected.

An institution that uses a vendor should make appropriate inquiries to satisfy itself about the vendor's ability to honor its long-term commitments, particularly when the vendor is expected to be associated with the institution's insurance program over an extended period of time. The institution should evaluate the adequacy of the vendor's services and its reputation, experience, financial soundness, and commitment to the BOLI product. Vendors typically earn a large portion of their commissions upon the sale of the product, yet they often retain long-term servicing responsibilities for their clients. The vendor's commitment to investing in the operational infrastructure necessary to support BOLI is a key consideration in vendor selection.

5. A general account is a design feature that is generally available to purchasers of whole or universal life insurance whereby the general assets of the insurance company support the policyholder's CSV.

An institution should be aware that the vendor's financial benefit from the sale of insurance may provide the vendor with an incentive to emphasize the benefits of a BOLI purchase to the institution without a commensurate explanation of the associated risks. Therefore, reliance solely upon pre-packaged, vendor-supplied compliance information does *not* demonstrate prudence with respect to the purchase of insurance. An institution should not delegate its selection of product design features to its vendors. An institution that is unable to demonstrate a thorough understanding of BOLI products it has purchased and the associated risks may be subject to supervisory action.

Step 4—Review the characteristics of the available insurance products. There are a few basic types of life insurance products in the marketplace. These products, however, can be combined and modified in many different ways. The resulting final product can be quite complex. Furthermore, certain permanent insurance products have been designed specifically for banks. These products differ from other forms of corporate-owned life insurance (COLI) policies in that the policies designed for banks are generally structured without surrender or front-end sales charges in order to avoid having to report these charges as expenses when initially recording the carrying value. However, BOLI products may have lower net yields than COLI products due to the absence of these charges. An institution should review the characteristics of the various insurance products available, understand the products it is considering purchasing, and select those with the characteristics that best match the institution's objectives, needs, and risk tolerance.

Design features of permanent insurance policies determine (1) whether the policy is a general account, separate account, or hybrid product;[6] (2) whether the insurance contract is a modified endowment contract (MEC) that carries certain tax penalties if surrendered; and (3) the method used to credit earnings to the policy. Some implications of these design features are discussed in more detail in the "Risk Management of BOLI" section of this interagency statement.

When purchasing insurance on a key person or a borrower, management should consider whether the institution's need for the insurance might end before the insured person dies. An institution generally may not hold BOLI on a key person or a borrower once the key person leaves the institution or the borrower has either repaid the loan, or the loan has been charged off. Therefore, the maturity of the term or declining term insurance should be structured to match the expected tenure of the key person or the maturity of the loan, respectively. Permanent insurance generally is not an appropriate form of life insurance under these circumstances.

Step 5—Select the carrier. To achieve the tax benefits of insurance, institutions must hold BOLI policies until the death of the insured. Therefore, carrier selection is one of the most critical decisions in a BOLI purchase and one that can have long-term consequences. While a broker or consultant may assist the institution in evaluating carrier options, the institution alone retains the responsibility for carrier selection. Before purchasing life insurance, an institution should perform a credit analysis on the selected carrier(s) in a manner consistent with safe and sound banking practices for commercial lending. A more complete discussion of the credit-analysis standards is included in the "Credit Risk" section of this interagency statement.

Management should review the product design, pricing, and administrative services of proposed carriers and compare them with the institution's needs. Management should also review the carrier's commitment to the BOLI product, as well as its credit ratings, general reputation, experience in the marketplace, and past performance. Carriers not committed to general-account BOLI products may have an incentive to lower the interest-crediting rate on BOLI over time, reducing the favorable economics of the product. The interest-crediting rate refers to the gross yield on the investment in the insurance policy, that is, the rate at which the cash value increases before considering any deductions for mortality cost, load charges, or other costs that are periodically charged against the policy's cash value. Insurance companies frequently disclose both a current interest-crediting rate and a guaranteed minimum interest-crediting rate. Institutions should be aware that the guaranteed minimum interest-crediting rate may be periodically reset in accordance with the terms of the insurance contract. As a result, the potential exists for a decline in the interest-crediting rate.

6. A hybrid product combines features of both general- and separate-account products.

While institutions can exercise what is known as a 1035 exchange[7] option to change carriers, there are some practical constraints to using this option. First, the institution must have an insurable interest in each individual to be insured under the new carrier's policy. In a 1035 exchange, former employees of the institution may not be eligible for coverage under the new policy because state insurable interest laws may prohibit their eligibility. Second, the original carrier may impose an exchange fee specifically applicable to such 1035 exchanges.

Step 6—Determine the reasonableness of compensation provided to the insured employee if the insurance results in additional compensation. Insurance arrangements that are funded by the institution and that permit the insured officer, director, or employee to designate a beneficiary are a common way to provide additional compensation or other benefits to the insured. Split-dollar life insurance arrangements are often used for this purpose. Before an institution enters into a split-dollar arrangement or otherwise purchases insurance for the benefit of an officer, director, or employee, the institution should identify and quantify its compensation objective and ensure that the arrangement is consistent with that objective. The compensation provided by the split-dollar or other insurance arrangement should be combined with all other compensation provided to the insured to ensure that the insured's total compensation is not excessive. Excessive compensation is considered an unsafe and unsound banking practice. Guidelines for determining excessive compensation can be found in the Interagency Guidelines Establishing Standards for Safety and Soundness.[8]

Because shareholders and their family members who are not officers, directors, or employees of an institution do not provide goods or services to the institution, they should not receive compensation from the institution. This includes compensation in the form of split-dollar life insurance arrangements.

Prior to an institution's purchase of a life insurance policy to be used in a split-dollar life insurance arrangement, the institution and the insured should enter into a written agreement. Written agreements usually describe the rights of the institution, the insured individual, and any other parties (such as trusts or beneficiaries) to the policy's CSV and death benefits. It is important for an institution to be aware that ownership of the policy by the employee, a third party, or a trust (non-institution owner) may not adequately protect the institution's interest in the policy because the institution ordinarily will not have the sole right to borrow against the CSV or to liquidate the policy in the event that funds are needed to provide liquidity to the institution. Moreover, if a non-institution owner borrows heavily against the CSV, an institution's ability to recover its premium payments upon the death of the insured may be impaired.

At a minimum, an institution's economic interest in the policy should be equal to the premiums paid plus a reasonable rate of return, defined as a rate of return that is comparable to returns on investments of similar maturity and credit risk.

Split-dollar life insurance has complex tax and legal consequences. An institution considering entering into a split-dollar life insurance arrangement should consult qualified tax, legal, and insurance advisers.

Step 7—Analyze the associated risks and the ability to monitor and respond to those risks. An institution's pre-purchase analysis should include a thorough evaluation of all significant risks, as well as management's ability to identify, measure, monitor, and control those risks. An explanation of key risks (liquidity, transaction/operational, reputation, credit, interest rate, compliance/legal, and price) is included in the "Risk Management of BOLI" section of this interagency statement.

Step 8—Evaluate the alternatives. Regardless of the purpose of BOLI, a comprehensive pre-purchase analysis will include an analysis of available alternatives. Prior to acquiring BOLI, an institution should thoroughly analyze the risks and benefits, compared to alternative methods for recovering costs associated with the loss of key persons, providing pre- and post-retirement employee benefits, or providing additional employee compensation, as appropriate.

7. A 1035 exchange is a tax-free replacement of an insurance policy for another insurance contract covering the same person in accordance with section 1035 of the Internal Revenue Code.

8. For national banks, appendix A to 12 CFR 30; for state member banks, appendix D-1 to 12 CFR 208; for insured state nonmember banks, appendix A to 12 CFR 364; for savings associations, appendix A to 12 CFR 570.

Step 9—Document the decision. A well-managed institution maintains adequate documentation supporting its comprehensive pre-purchase analysis, including an analysis of both the types and design of products purchased and the overall level of BOLI holdings.

Risk Management of BOLI

Risk assessment and risk management are vital components of an effective BOLI program. In addition to conducting a risk assessment as part of a thorough pre-purchase analysis, monitoring BOLI risks on an ongoing basis is important, especially for an institution whose aggregate BOLI holdings represent a capital concentration. Management of an institution should review the performance of the institution's insurance assets with its board of directors at least annually. More-frequent reviews are appropriate if there are significant anticipated changes to the BOLI program such as additional purchases, a decline in the financial condition of the insurance carrier(s), anticipated policy surrenders, or changes in tax laws or interpretations that could have an impact on the performance of BOLI. This risk-management review should include, but not necessarily be limited to:

- *Comprehensive assessment of the specific risks discussed in this section.*[9]
- *Identification of which employees are, or will be, insured (e.g., vice presidents and above, employees of a certain grade level).* For example, an institution that acquires another institution that owns BOLI may acquire insurance on individuals that it would not insure under its own standards. While the acquiring institution need not correct such exceptions, it is important to know that such exceptions exist.
- *Assessment of death benefit amounts relative to employee salaries.* Such information helps management to assess the reputation and insurable interest risks associated with disproportionately large death benefits.
- *Calculation of the percentage of insured persons still employed by the institution.* Larger institutions often find that their policies insure more former employees than current employees. This information can help the institution assess reputation risk.
- *Evaluation of the material changes to BOLI risk-management policies.*
- *Assessment of the effects of policy exchanges.* Exchanges typically are costly and it is a sound practice to review the costs and benefits of such actions.
- *Analysis of mortality performance and impact on income.* Material gains from death benefits can create reputation risks.
- *Evaluation of material findings from internal and external audits and independent risk-management reviews.*
- *Identification of the reason for, and tax implications of, any policy surrenders.* In some cases, institutions have surrendered BOLI policies and incurred tax liabilities and penalties. Formal assessment of the costs and benefits of a surrender is a useful component of sound corporate governance.
- *Peer analysis of BOLI holdings.* To address reputation risk, an institution should compare its BOLI holdings relative to capital to the holdings of its peers to assess whether it is an outlier.

Liquidity Risk

Liquidity risk is the risk to earnings and capital arising from an institution's inability to meet its obligations when they come due without incurring unacceptable losses. Before purchasing permanent insurance, management should recognize the illiquid nature of the product and ensure that the institution has the long-term financial flexibility to hold the asset in accordance with its expected use. The inability to hold the life insurance until the death(s) of the insured(s) when the death benefits will be collected may compromise the success of the BOLI plan. An institution generally does not receive any cash flow from the insurance until the death benefit is paid. Depending upon the age of the insured population, it is possible that an institution that insures a small number of employees may not recognize any cash flow from the insurance for many years. The illiquid nature of insurance assets, combined with the difficulty of projecting liquidity needs far into the future, is a major reason an institution should keep its BOLI holdings below the agencies' concentration

9. All of the risks discussed in this section are applicable to permanent insurance. In contrast, because temporary insurance does not have a savings component or a CSV, it does not expose an institution to liquidity, interest-rate, or price risk. These risks need not be evaluated in the comprehensive assessment of the risks of temporary insurance.

guidelines. Examiners will consider an institution's BOLI holdings when assessing liquidity and assigning the liquidity component rating.

The purchase of BOLI may negatively affect an institution's liquidity position, both because BOLI is one of the least liquid assets on an institution's balance sheet, and because institutions normally fund BOLI purchases through the sale of liquid assets (e.g., marketable securities). To access the CSV of BOLI, the institution must either surrender or borrow against the policy. In accordance with the policy contract and federal tax laws, the surrender of a policy may subject an institution to surrender charges, tax liabilities for previously untaxed increases in the CSV, and tax penalties. Borrowing against the CSV is disadvantageous in most cases due to limitations on the ability to deduct interest on the borrowing and other possible adverse tax consequences.

A BOLI product qualifying as a modified endowment contract (MEC) for tax purposes has particular liquidity disadvantages. If an institution surrenders a MEC, it will incur a tax liability on the increase in the policy's CSV from earnings on the policy since its inception and may incur an additional tax penalty for early surrender.

In order to avoid such additional tax penalties, an institution may opt to purchase a non-MEC contract. A non-MEC contract permits the policy owner to surrender the policy without incurring the additional tax penalty that, under certain circumstances, applies to MECs. Moreover, depending on the terms of the insurance contract, an institution generally may withdraw up to the basis (that is, the original amount invested) without creating a taxable event. However, a non-MEC policy increases in complexity if it is in the form of a separate account covered by a stable value protection (SVP) contract. An SVP contract protects the policy owner from declines in the value of the assets in the separate account arising from changes in interest rates, thereby mitigating price risk and earnings volatility. An SVP contract is most often used in connection with fixed-income investments. Institutions should recognize that SVP providers often place restrictions on the amount that may be withdrawn from the separate account, thereby reducing the liquidity of the BOLI asset. An institution considering the purchase of a non-MEC for its potential liquidity advantages compared to a MEC also should be aware of contractual provisions, such as 1035 exchange fees and "crawl-out" restrictions,[10] which may limit such advantages.

Transaction/Operational Risk

As it applies to BOLI, transaction/operational risk is the risk to earnings and capital arising from problems caused by the institution's failure to fully understand or to properly implement a transaction. Transaction/operational risk arises due to the variety and complexity of life insurance products, as well as tax and accounting treatments. To help mitigate this risk, management should have a thorough understanding of how the insurance product works and the variables that dictate the product's performance. The variables most likely to affect product performance are the policy's interest-crediting rate, mortality cost, and other expense charges.

Transaction/operational risk is also a function of the type and design features of a life insurance contract. With a general-account product, there are only two parties to the contract: the policy owner and the insurance carrier. With a separate-account product, the insurance carrier has a separate contract with an investment manager. There could also be an SVP provider with whom the carrier has a separate contract.

Transaction/operational risk may also arise as a result of the variety of negotiable features associated with a separate-account product. These include the investment options; the terms, conditions, and cost of SVP; and mortality options. Deferred acquisition costs (DAC) represent the insurance carrier's up-front costs associated with issuing an insurance policy, including taxes and commissions and fees paid to agents for selling the policy. The carrier charges the policyholder for these costs and capitalizes the DAC, including the prepayment of taxes in accordance with federal tax law. As the carrier recovers the DAC in accordance with applicable tax law, it credits the amount to the separate-account policyholder. Once it has been credited to the institution, the DAC is essentially a receivable from the carrier and, therefore, represents a general-account credit exposure.

Separate-account policies have additional transaction risks that can result from accounting requirements. Several institutions have had to

10. A crawl-out restriction limits the amount of CSV eligible for a 1035 exchange or surrender over a period of time.

restate their earnings because of contractual provisions in their policies that were ambiguous with respect to the amount of the CSV available upon surrender of the policy. Because BOLI must be carried at the amount that could be realized under the insurance contract as of the balance-sheet date, if any contractual provision related to costs, charges, or reserves creates uncertainty regarding the realization of a policy's full CSV, the agencies will require an institution to record the BOLI net of those amounts. As part of an effective pre-purchase analysis, an institution should thoroughly review and understand how the accounting rules will apply to the BOLI policy it is considering purchasing.

Tax and Insurable Interest Implications

Before the purchase of BOLI and periodically thereafter, management should also explicitly consider the financial impact (e.g., tax provisions and penalties) of surrendering a policy. Recent adverse press coverage of corporate-owned life insurance (COLI) should serve as a reminder to institutions that the current tax law framework, as it applies to BOLI, is always subject to legislative changes. A tax change that makes future BOLI cash flows subject to income tax, while perhaps deemed unlikely by many institutions, would have a negative impact on the economics of the BOLI holdings. An institution should recognize that earnings from BOLI could make it subject to the alternative minimum tax.

Institutions should also recognize that their actions, subsequent to purchase, could jeopardize the tax-advantaged status of their insurance holdings. The risk that a life insurance policy could be characterized by the Internal Revenue Service (IRS) as an actively managed investment is particularly relevant to separate-account policies. Many larger institutions prefer separate-account products because of perceived lower credit risk and greater transparency (that is, explicit disclosure of costs). Assets held by the insurance company on behalf of the policy owners in the separate account are intended to be beyond the reach of the insurance company's general creditors in the event of insolvency; however, the protected status of separate-account assets is generally untested in the courts. While the separate-account structure helps to mitigate an institution's credit exposure to the insurance carrier, the institution can have no "control" over investment decisions (e.g., timing of investments or credit selection) in the underlying account. Generally, allocating separate-account holdings across various divisions of an insurance company's portfolio does not raise concerns about "control," but other actions that a policy owner takes may be construed as investment control and could jeopardize the tax-advantaged status.

To benefit from the favorable tax treatment of insurance, a BOLI policy must be a valid insurance contract under applicable state law and must qualify under applicable federal law. Institutions must have an insurable interest in the covered employee, as set forth in applicable state laws. Furthermore, the favorable tax-equivalent yields of BOLI result only when an institution generates taxable income. Institutions that have no federal income tax liability receive only the nominal interest-crediting rate as a yield. In such an environment, BOLI loses much of its yield advantage relative to other investment alternatives.

Some institutions seem to have drawn comfort from assurances from insurance carriers that the carrier would waive lack of insurable interest as a defense against paying a claim. While the carrier may indeed make a payment, such payment may not necessarily go to the institution. Such assurances may not be sufficient to satisfy the IRS requirements for a valid insurance contract, nor do they eliminate potential claims from the estate of the insured that might seek to claim insurance proceeds on the basis that the institution lacked an insurable interest.

For example, some institutions have established out-of-state trusts to hold their BOLI assets. While such trusts may have legitimate uses, such as to gain access to an insurance carrier's product, in some cases the purpose is to avoid unfavorable insurable interest laws in the institution's home state and to domicile the policy in a state with more lenient requirements. In some cases, institutions have not made employees aware that they have taken out insurance on their lives.

A recent Fifth Circuit Court of Appeals ruling demonstrates the potential danger of this approach. A Texas employer used a Georgia trust to hold life insurance policies on its employees in Texas, and the trust agreement provided that the insurable interest law of Georgia should apply. In a lawsuit brought by the estate of a deceased employee, the court ignored this provision because the insured employee was not a party to the trust agreement. It then found that the insurable interest law of Texas applied and under that state's law, the employer did not have an insurable interest in the employee. The result was that the employer was not entitled to the insurance death benefits.[11] The outcome in this case suggests that institutions that have used, or are considering using, an out-of-state trust to take advantage of more-favorable insurable interest laws in another state should assess whether they could be vulnerable to a similar legal challenge.

Institutions should have appropriate legal review to help ensure compliance with applicable tax laws and state insurable interest requirements. Institutions that insure employees for excessive amounts may be engaging in impermissible speculation or unsafe and unsound banking practices. The agencies may require institutions to surrender such policies.

Reputation Risk

Reputation risk is the risk to earnings and capital arising from negative publicity regarding an institution's business practices. While this risk arises from virtually all bank products and services, reputation risk is particularly prevalent in BOLI because of the potential perception issues associated with an institution's owning or benefiting from life insurance on employees.

A well-managed institution will take steps to reduce the reputation risk that may arise as a result of its BOLI purchases, including maintaining appropriate documentation evidencing informed consent by the employee, prior to purchasing insurance. Some institutions assert that they make employees aware via employee handbooks, manuals, or newsletters of the possibility that the institution may acquire life insurance on them. Although such disclosure may satisfy state insurance requirements, any approach that does not require formal employee consent may significantly increase an institution's reputation risk.

Some institutions have begun to purchase separate-account, non-MEC product designs in order to address the liquidity concerns with MEC policies. One consequence of this product design choice, however, is that it has become increasingly common for institutions to insure a very large segment of their employee base, including non-officers. Because non-MEC designs have a higher ratio of death benefit to premium dollar invested, some institutions have, therefore, taken out very high death benefit policies on employees, including lower-level employees, further adding to reputation risk and highlighting the importance of obtaining explicit consent.

Credit Risk

Credit risk is the potential impact on earnings and capital arising from an obligor's failure to meet the terms of any contract with the institution or otherwise perform as agreed. All life insurance policyholders are exposed to credit risk. The credit quality of the insurance company and duration of the contract are key variables. With insurance, credit risk arises from the insurance carrier's contractual obligation to pay death benefits upon the death of the insured, and if applicable, from the carrier's obligation to pay the CSV (less any applicable surrender charges) upon the surrender of the policy.

Most BOLI products have very long-term (30- to 40-year) expected time frames for full collection of cash proceeds, i.e., the death benefit. For general-account policies, the CSV is an unsecured, long-term, and nonamortizing obligation of the insurance carrier. Institutions record and carry this claim against the insurance company as an asset.

Before purchasing BOLI, an institution should conduct an independent financial analysis of the insurance company and continue to monitor its condition on an ongoing basis. The institution's credit-risk-management function should participate in the review and approval of insurance carriers. As with lending, the depth and frequency of credit analysis (both initially and on an ongoing basis) should be a function of the relative size and complexity of the transaction and the size of outstanding exposures. Among other things, an institution should consider its legal lending limit, concentration guidelines (generally defined as the aggregate of direct, indirect, and contingent obligations and exposures that exceed 25 percent of the institution's capital), and any applicable state restrictions on BOLI holdings when assessing its broader credit-risk exposure to insurance carriers. To measure

11. Mayo v. Hartford Life Insurance Company, 354 F.3d 400 (5th Cir. 2004).

credit exposures comprehensively, an institution should aggregate its exposures to individual insurance carriers, and the insurance industry as a whole, attributable to both BOLI policies and other credit relationships (e.g., loans and derivatives exposures).

There are product design features of a BOLI policy that can reduce credit risk. As noted earlier, an institution can purchase separate-account products, where the institution assumes the credit risk of the assets held in the separate account, rather than the direct credit risk of the carrier as would be the case in a general-account policy. With separate-account policies, the insurance carrier owns the assets, but maintains the assets beyond the reach of general creditors in the event of the insurer's insolvency. However, even with a separate-account policy, the policy owner incurs some general-account credit-risk exposure to the insurance carrier associated with the carrier's mortality and DAC reserves. Amounts equal to the mortality and DAC reserves are owed to the policyholder and represent general-account obligations of the insurance carrier. In addition, the difference, if any, between the CSV and the minimum guaranteed death benefit would be paid out of the insurance carrier's general account.

A separate-account policy may have a stable value protection (SVP) contract issued by the insurance carrier or by a third party that is intended to protect the policyholder from most declines in fair value of separate-account assets. In general, the provider of an SVP contract agrees to pay any shortfall between the fair value of the separate-account assets when the policy owner surrenders the policy and the cost basis of the separate account to the policy owner. Under most arrangements, the insurance carrier is not responsible for making a payment under the SVP contract if a third-party protection provider fails to make a required payment to it. The SVP contract thus represents an additional source of credit risk for a separate-account product. The policyholder's exposure under an SVP contract is to both the protection provider, which must make any required payment to the insurance carrier, and the carrier, which must remit the payment received from the protection provider to the institution. Because of this exposure, an institution should also evaluate the repayment capacity of the SVP provider.

State insurance regulation governing reserve requirements for insurance carriers, state guaranty funds, and reinsurance arrangements help to reduce direct credit risks from general-account exposures. Further, an institution can use a 1035 exchange to exit a deteriorating credit exposure, although most policies impose fees for the exchange. While credit risk for existing general- and separate-account policies may be low currently, the extremely long-term nature of a BOLI policy underscores the fact that credit risk remains an important risk associated with life insurance products. Strong current credit ratings offer no guarantee of strong credit ratings 20, 30, or 40 years into the future.

Interest-Rate Risk

Interest-rate risk is the risk to earnings and capital arising from movements in interest rates. Due to the interest-rate risk inherent in general-account products, it is particularly important that management fully understand how these products expose the policyholder to interest-rate risk before purchasing the policy. The interest-rate risk associated with these products is primarily a function of the maturities of the assets in the carrier's investment portfolio, which often range from four to eight years. When purchasing a general-account policy, an institution chooses one of a number of interest-crediting options (that is, the method by which the carrier will increase the policy's CSV). Using the "portfolio" crediting rate, the institution will earn a return based upon the existing yield of the carrier's portfolio each year. Using the "new money" crediting rate, the institution earns a return based upon yields available in the market at the time it purchases the policy.

Separate-account products may also expose the institution to interest-rate risk, depending on the types of assets held in the separate account. For example, if the separate-account assets consist solely of U.S. Treasury securities, the institution is exposed to interest-rate risk in the same way as holding U.S. Treasury securities directly in its investment portfolio. However, because the institution cannot control the separate-account assets, it is more difficult for the institution to control this risk. Accordingly, before purchasing a separate-account product, an institution's management should thoroughly review and understand the instruments governing the investment policy and management of the separate account. Management should understand the risk inherent within the separate account and ensure that the risk is appropriate for the institution. The institution also should establish monitoring and reporting systems that will enable management to monitor and respond to interest-rate fluctuations and their effect on separate-account assets.

Compliance/Legal Risk

Compliance/legal risk is the risk to earnings and capital arising from violations of, or nonconformance with, laws, rulings, regulations, prescribed practices, or ethical standards. Failure to comply with applicable laws, rulings, regulations, and prescribed practices could compromise the success of a BOLI program and result in fines or penalties imposed by regulatory authorities or loss of tax benefits. Among the legal and regulatory considerations that an institution should evaluate are compliance with state insurable interest laws, the Employee Retirement Income Security Act of 1974 (ERISA), Federal Reserve Regulations O and W (12 CFR 215 and 223, respectively), the Interagency Guidelines Establishing Standards for Safety and Soundness, the requirements set forth under the "Legal Authority" section of this document, and federal tax regulations applicable to BOLI.

Tax benefits are critical to the success of most BOLI plans. Accordingly, an institution owning separate-account BOLI must implement internal policies and procedures to ensure that it does not take any action that might be interpreted as exercising "control" over separate-account assets. This is especially important for privately placed policies in which the institution is the only policyholder associated with the separate-account assets.

When purchasing BOLI, institutions should be aware that the splitting of commissions between a vendor and the institution's own subsidiary or affiliate insurance agency presents compliance risk. The laws of most states prohibit the payment of inducements or rebates to a person as an incentive for that person to purchase insurance. These laws may also apply to the person receiving the payment. When an insurance vendor splits its commission with an institution's insurance agency that was not otherwise involved in the transaction, such a payment may constitute a prohibited inducement or rebate. Accordingly, an institution should assure itself that this practice is permissible under applicable state law and in compliance with Federal Reserve Regulation W before participating in any such arrangement. Moreover, payments to an affiliate that did not perform services for the institution could also raise other regulatory and supervisory issues.

Due to the significance of the compliance risk, institutions should seek the advice of counsel on these legal and regulatory issues.

Price Risk

Price risk is the risk to earnings and capital arising from changes in the value of portfolios of financial instruments. Accounting rules permit owners of insurance contracts to account for general-account products using an approach that is essentially based on cost plus accrued earnings. However, for separate-account products without SVP, the accounting would largely be based on the fair value of the assets held in the account because this value is the amount that could be realized from the separate account if the policy is surrendered. (See "Accounting Considerations" above.) Typically, the policyholder of separate-account products assumes all price risk associated with the investments within the separate account. Usually, the insurance carrier will provide neither a minimum CSV nor a guaranteed interest-crediting rate for separate-account products. Absent an SVP contract, the amount of price risk generally depends upon the type of assets held in the separate account.

Because the institution does not control the separate-account assets, it is more difficult for it to control the price risk of these assets than if they were directly owned. To address income-statement volatility, an institution may purchase an SVP contract for its separate-account policy. The SVP contract is designed to ensure that the amount that an institution could realize from its separate-account policy, in most circumstances, remains at or above the cost basis of the separate account to the policyholder. Institutions should understand, however, that SVP contracts protect against declines in value attributable to changes in interest rates; they do not cover default risk. Moreover, one purpose of the SVP contract is to reduce volatility in an institution's reported earnings. To realize any economic benefit of the SVP contract, an institution would have to surrender the policy. Since policy surrender is nearly always an uneconomic decision, the SVP contract provides, in a practical sense, accounting benefits only.

Before purchasing a separate-account life insurance product, management should thoroughly review and understand the instruments governing the investment policy and management of the separate account. Management should understand the risk inherent in the separate account and ensure that the risk is appropriate. If the institution does not purchase SVP, management should establish monitoring and reporting systems that will enable it to recognize and respond to price fluctuations in the fair value of separate-account assets.

Under limited circumstances it is legally permissible for an institution to purchase an equity-linked variable life insurance policy if the policy is an effective economic hedge against the institution's equity-linked obligations under employee benefit plans.[12] An effective economic hedge exists when changes in the economic value of the liability or other risk exposure being hedged are matched by counterbalancing changes in the value of the hedging instrument. Such a relationship would exist where the obligation under an institution's deferred compensation plan is based upon the value of a stock market index and the separate account contains a stock mutual fund that mirrors the performance of that index. Institutions need to be aware that this economic hedge may not qualify as a hedge for accounting purposes. Thus, the use of equity-linked variable life insurance policies to economically hedge equity-linked obligations may not have a neutral effect on an institution's reported earnings.

Unlike separate-account holdings of debt securities, SVP contracts on separate-account equity holdings are not common. The economic hedging criteria for equity-linked insurance products lessen the effect of price risk because changes in the amount of the institution's equity-linked liability are required to offset changes in the value of the separate-account assets. If the insurance cannot be characterized as an effective economic hedge, the presence of equity securities in a separate account is impermissible, and the agencies will require institutions to reallocate the assets unless retention of the policy is permitted under federal law.[13]

In addition to the general considerations discussed previously, which are applicable to any separate-account product, an institution should perform further analysis when purchasing a separate-account product involving equity securities. At a minimum, the institution should:

1. Compare the equity-linked liability being hedged (e.g., deferred compensation) and the equity securities in the separate account. Such an analysis considers the correlation between the liability and the equity securities, expected returns for the securities (including standard deviation of returns), and current and projected asset and liability balances.
2. Determine a target range for the hedge effectiveness ratio (e.g., 95 to 105 percent) and establish a method for measuring hedge effectiveness on an ongoing basis. The institution should establish a process for altering the program if hedge effectiveness drops below acceptable levels. Consideration should be given to the potential costs of program changes.
3. Establish a process for analyzing and reporting to management and the board the effect of the hedge on the institution's earnings and capital ratios. The analysis usually considers results both with and without the hedging transaction.

Risk-Based Capital Treatment

If an institution owns a general-account insurance product, it should apply a 100 percent risk weight to its claim on the insurance company for risk-based capital purposes. A BOLI investment in a separate-account insurance product, however, may expose the institution to the market and credit risks associated with the pools of assets in the separate account. The assets in a pool may have different risk weights, similar to the assets held in a mutual fund in which an institution has invested. For risk-based capital purposes, if an institution can demonstrate that the BOLI separate-account policy meets the requirements below, it may choose to "look through" to the underlying assets to determine the risk weight.

12. Insured state banks and state savings associations may make such purchases only if permitted to do so under applicable state law.

13. Insured state banks and state savings associations may request the FDIC's consent to retain the policies, but consent will not be granted if it is determined that retaining the policies presents a significant risk to the appropriate insurance fund.

Criteria for a Look-Through Approach

To qualify for the "look-through" approach, separate-account BOLI assets must be protected from the insurance company's general creditors in the event of the insurer's insolvency. An institution should document its assessment, based upon applicable state insurance laws and other relevant factors, that the separate-account assets would be protected from the carrier's general creditors. If the institution does not have sufficient information to determine that a BOLI separate-account policy qualifies for the look-through approach, the institution must apply the standard risk weight of 100 percent to this asset.

In addition, when an institution has a separate-account policy, the portion of the carrying value of the institution's insurance asset that represents general-account claims on the insurer, such as deferred acquisition costs (DAC) and mortality reserves that are realizable as of the balance-sheet date, and any portion of the carrying value attributable to an SVP contract, are not eligible for the look-through approach. These amounts should be risk-weighted at the 100 percent risk weight applicable to claims on the insurer or the SVP provider, as appropriate.

Look-Through Approaches

When risk-weighting a qualifying separate-account policy, an institution may apply the highest risk weight for an asset permitted in theseparate account, as stated in the investment agreement, to the entire carrying value of the separate-account policy, except for any portions of the carrying value that are general-account claims or are attributable to SVP. In no case, however, may the risk weight for the carrying value of the policy (excluding any general-account and SVP portions) be less than 20 percent.

Alternatively, an institution may use a pro rata approach to risk-weighting the carrying value of a qualifying separate-account policy (excluding any general-account and SVP portions). The pro rata approach is based on the investment limits stated in the investment agreement for each class of assets that can be held in the separate account, with the constraint that the weighted average risk weight may not be less than 20 percent. If the sum of the permitted investments across market sectors in the investment agreement is greater than 100 percent, the institution must use the highest risk weight for the maximum amount permitted in that asset class, and then proceed to the next-highest risk weight until the permitted amounts equal 100 percent.

For example, if a separate-account investment agreement permits a maximum allocation of 60 percent for corporate bonds, 40 percent for U.S. government–sponsored enterprise debt securities, and 60 percent for U.S. Treasury securities, then the institution must risk-weight 60 percent of the carrying value of the separate-account investment (excluding any portion attributable to SVP) at the 100 percent risk weight applicable to corporate bonds and the remaining 40 percent at the 20 percent risk weight for U.S. government–sponsored enterprise debt securities. Because the sum of the permitted allocation for corporate bonds and government-sponsored enterprise debt securities totals 100 percent, the institution cannot use the zero percent risk weight for U.S. Treasury securities. However, if the permitted allocation for U.S. government–sponsored enterprise debt securities was 30 percent rather than 40 percent, the institution could risk-weight the remaining 10 percent of the carrying value of its investment at the zero percent risk weight for U.S. Treasuries.

Regardless of the look-through approach an institution employs, the weighted average risk weight for the separate-account policy (excluding any general-account and SVP portions) may not be less than 20 percent, even if all the assets in the separate account would otherwise qualifyfor a zero percent risk weight. Furthermore, the portion of the carrying value of the separate-account policy that represents general-account claims on the insurer, such as realizable DAC and mortality reserves, and any portion of the carrying value attributable to an SVP contract, should be risk-weighted at the risk weight applicable to the insurer or the SVP provider, as appropriate.

The following example demonstrates the appropriate risk-weight calculations for the pro rata approach, incorporating the components of a BOLI separate-account policy that includes general-account claims on the insurer as well as the investment allocations permitted for different asset classes in the separate-account investment agreement.

Example. The separate-account investment agreement requires the account to hold a minimum of

10 percent in U.S. Treasury obligations. It also imposes a maximum allocation of 50 percent in mortgage-backed securities issued by U.S. government–sponsored enterprises, and a maximum allocation of 50 percent in corporate bonds.

Assume that the portion of the carrying value of the separate-account policy attributable to realizable DAC and mortality reserves equals $10 and that the portion attributable to the SVP totals $10.

Carrying value of separate-account policy	$100.00
Less: Portion attributable to DAC and mortality reserves	10.00
Portion attributable to SVP	10.00
Net carrying value of separate-account policy available for pro rata	$ 80.00
Risk-weight calculation:	
U.S. Treasury @ 10% x $80 = $8 x 0% RW	0.00
Corporate bonds @ 50% x $80 = $40 x 100% RW	$ 40.00
GSE MBS @ 40% x $80 = $32 x 20% RW	6.40
Separate-account risk-weighted assets subject to pro rata	$ 46.40
Add back: DAC and mortality reserves = $10 x 100% RW	$ 10.00
Add back: SVP = $10 x 100% RW	10.00
General-account and SVP risk-weighted assets	$ 20.00
Total BOLI-related risk-weighted assets	$ 66.40

Summary

The purchase of BOLI can be an effective way for institutions to manage exposures arising from commitments to provide employee compensation and pre- and post-retirement benefits. Consistent with safe and sound banking practices, institutions must understand the risks associated with this product and implement a risk-management process that provides for the identification and control of such risks. A sound pre-purchase analysis, meaningful ongoing monitoring program, reliable accounting process, and accurate assessment of risk-based capital requirements are all components of the type of risk-management process the agencies expect institutions to employ.

Where an institution has acquired BOLI in an amount that approaches or exceeds agency concentration levels, examiners will more closely scrutinize the components of the risk-management process and the institution's associated documentation. Where BOLI has been purchased in an impermissible manner, ineffective controls over BOLI risks exist, or a BOLI exposure poses a safety-and-soundness concern, the appropriate agency may take supervisory action, including requiring the institution to divest affected policies, irrespective of tax consequences.

Appendix A—Common Types of Life Insurance

Life insurance can be categorized into two broad types: temporary (also called "term") insurance and permanent insurance. There are numerous variations of these products. However, most life insurance policies fall within one (or a combination) of the following categories.

Temporary (Term) Insurance

Temporary (term) insurance provides life insurance protection for a specified time period. Death benefits are payable only if the insured dies during the specified period. If a loss does not occur during the specified term, the policy lapses and provides no further protection. Term insurance premiums do not have a savings component; thus, term insurance does not create cash surrender value (CSV).

Permanent Insurance

In contrast to term insurance, permanent insurance is intended to provide life insurance protection for the entire life of the insured, and its premium structure includes a savings component. Permanent insurance policy premiums typically have two components: the insurance component (e.g., mortality cost, administrative fees, and sales loads) and the savings component. Mortality cost represents the cost imposed on the policyholder by the insurance company to cover the amount of pure insurance protection for which the insurance company is at risk.

The savings component typically is referred to as CSV. The policyholder may use the CSV to make the minimum premium payments necessary to maintain the death benefit protection and may access the CSV by taking out loans or making partial surrenders. If permanent insurance is surrendered before death, surrender charges may be assessed against the CSV. Generally, surrender charges are assessed if the policy is surrendered within the first 10 to 15 years.

Two broad categories of permanent insurance are:

- *Whole life.* A traditional form of permanent insurance designed so that fixed premiums are paid for the entire life of the insured. Death benefit protection is provided for the entire life of the insured, assuming all premiums are paid.
- *Universal life.* A form of permanent insurance designed to provide flexibility in premium payments and death benefit protection. The policyholder can pay maximum premiums and maintain a very high CSV. Alternatively, the policyholder can make minimal payments in an amount just large enough to cover mortality and other insurance charges.

Purposes for Which Institutions Commonly Purchase Life Insurance

Key person. Institutions often purchase life insurance to protect against the loss of "key persons" whose services are essential to the continuing success of the institution and whose untimely death would be disruptive. For example, an institution may purchase insurance on the life of an employee or director whose death would be of such consequence to the institution as to give it an insurable interest in his or her life. The determination of whether an individual is a key person does not turn on that individual's status as an officer or director, but on the nature of the individual's economic contribution to the institution.

The first step in indemnifying an institution against the loss of a key person is to identify the key person. The next and possibly most difficult step is estimating the insurable value of the key person or the potential loss of income or other value that the institution may incur from the untimely death of that person.

Because the most appropriate method for determining the value of a key person is dependent upon individual circumstances, the agencies have not established a formula or a specific process for estimating the value of a key person. Instead, the agencies expect institutions to consider and analyze all relevant factors and use their judgment to make a decision about the value of key persons.

Key-person life insurance should not be used in place of, and does not diminish the need for, adequate management-succession planning. Indeed, if an institution has an adequate management-succession plan, its reliance on a key person should decline as the person gets closer to retirement.

Financing or cost recovery for benefit plans. Like other businesses, institutions often use life insurance as a financing or cost-recovery vehicle for pre- and post-retirement employee benefits, such as individual or group life insurance, health insurance, dental insurance, vision insurance, tuition reimbursement, deferred compensation, and pension benefits.

Permanent insurance is used for this purpose. In these arrangements, an institution insures the lives of directors or employees in whom it has an insurable interest to reimburse the institution for the cost of employee benefits. The group of insured individuals may be different from the group that receives benefits. The institution's obligation to provide employee benefits is separate and distinct from the purchase of the life insurance. The life insurance purchased by the institution remains an asset even after the employer's relationship with an insured employee is terminated. The employees who receive benefits, whether insured or not, have no ownership interest in the insurance (other than their general claim against the institution's assets arising from the institution's obligation to provide the stated employee benefits).

There are two common methods of financing employee benefits through the purchase of life insurance. The first is the cost-recovery method, which usually involves present-value analysis. Typically, the institution projects the amount of the expected benefits owed to employees and then discounts this amount to determine the present value of the benefits. Then, the institution purchases a sufficient amount of life insurance on the lives of certain employees so that the gain (present value of the life insurance proceeds less the premium payments) from the insurance proceeds reimburses the institution for the benefit payments. Under this method, the institution absorbs the cost of providing the employee benefits and the cost of purchasing the life insurance. The institution holds the life insurance and collects the death benefit to reimburse the institution for the cost of the employee benefits and the insurance.

The second method of financing employee benefits is known as cost offset. With this method, the institution projects the annual employee benefit expense associated with the benefit plan. Then, the institution purchases life insurance on the lives of certain employees. The amount earned on the CSV each year should not exceed the annual benefit expense.

Split-dollar life insurance arrangements. Institutions sometimes use split-dollar life insurance arrangements to provide retirement benefits and death benefits to certain employees as part of their compensation. Under split-dollar arrangements, the employer and the employee share the rights to the policy's CSV and death benefits. The employer and the employee may also share premium payments. If the employer pays the entire premium, the employee may need to recognize taxable income each year in accordance with federal income tax regulations.

Split-dollar arrangements may be structured in a number of ways. The two most common types of split-dollar arrangements are:

- *Endorsement split-dollar.* The employer owns the policy and controls all rights of ownership. The employer provides the employee an endorsement of the portion of the death benefit specified in the plan agreement with the employee. The employee may designate a beneficiary for the designated portion of the death benefit. Under this arrangement, the employer typically holds the policy until the employee's death. At that time, the employee's beneficiary receives the designated portion of the death benefits, and the employer receives the remainder of the death benefits.
- *Collateral-assignment split-dollar.* The employee owns the policy and controls all rights of ownership. Under these arrangements, the employer usually pays the entire premium or a substantial part of the premium. The employee assigns a collateral interest in the policy to the employer that is equal to the employer's interest in the policy. The employer's interest in the policy is set forth in the split-dollar agreement between the employer and the employee. Upon retirement, the employee may have an option to buy the employer's interest in the insurance policy. This transfer of the employer's interest to the employee is typically referred to as a "roll-out." If a "roll-out" is not provided or exercised, the employer does not receive its interest in the policy until the employee's death.

Split-dollar life insurance is a very complex subject that can have unforeseen tax and legal consequences. Internal Revenue Service regulations issued in 2003[14] govern the taxation of split-dollar life insurance arrangements entered into or materially modified after September 17, 2003.[15] These rules provide less favorable tax treatment to split-dollar arrangements than existed previously. Institutions considering entering into a split-dollar life insurance arrangement should consult qualified tax, insurance, and legal advisers.

Life insurance on borrowers. State law generally recognizes that a lender has an insurable interest in the life of a borrower to the extent of the borrower's obligation to the lender. In some states, the lender's insurable interest may equal the borrower's obligation plus the cost of insurance and the time value of money. Institutions are permitted to protect themselves against the

14. 68 *Fed. Reg.* 54336 (Sept. 17, 2003), chiefly codified at 26 CFR 1.61-22 and 1.7872-15.

15. Split-dollar arrangements entered into prior to September 17, 2003, and not materially modified thereafter may be treated differently.

risk of loss from the death of a borrower. This protection may be provided through self-insurance, the purchase of debt-cancellation contracts, or by the purchase of life insurance policies on borrowers.

Institutions can take two approaches in purchasing life insurance on borrowers. First, an institution can purchase life insurance on an individual borrower for the purpose of protecting the institution specifically against loss arising from that borrower's death. Second, an institution may purchase life insurance on borrowers in a homogeneous group of loans employing a cost-recovery technique similar to that used in conjunction with employee benefit plans. Under this method, the institution insures the group of borrowers for the purpose of protecting the institution from loss arising from the death of any borrower in the homogeneous pool. Examples of homogeneous pools of loans include consumer loans that have distinctly similar characteristics, such as automobile loans, credit card loans, and residential real estate mortgages.

When purchasing insurance on an individual borrower, an institution should, given the facts and circumstances known at the time of the insurance purchase, make a reasonable effort to structure the insurance policy in a manner consistent with the expected repayment of the borrower's loan. To accomplish this, management should estimate the risk of loss over the life of the loan and match the anticipated insurance proceeds to the risk of loss. Generally, the risk of loss will be closely related to the outstanding principal of the debt. The insurance policy should be structured so that the expected insurance proceeds never substantially exceed the risk of loss.

When purchasing life insurance on borrowers in a homogeneous pool of loans, an institution's management should, given the facts and circumstances known at the time of the insurance purchase, make a reasonable effort to match the insurance proceeds on an aggregate basis to the total outstanding loan balances. If allowed by state law, institutions may match the insurance proceeds to the outstanding loan balances plus the cost of insurance on either a present-value or future-value basis. This relationship should be maintained throughout the duration of the program.

The purchase of life insurance on a borrower is not an appropriate mechanism for effecting a recovery on an obligation that has been charged off, or is expected to be charged off, for reasons other than the borrower's death. In the case of a charged-off loan, the purchase of life insurance on the borrower does not protect the institution from a risk of loss since the loss has already occurred. Therefore, the institution does not need to purchase insurance. Acquiring insurance that an institution does not need may subject the institution to unwarranted risks, which would be an unsafe and unsound banking practice. In the case of a loan that the institution expects to charge off for reasons other than the borrower's death, the risk of loss is so pronounced that the purchase of life insurance by the institution at that time would be purely speculative and an unsafe and unsound banking practice.

Internal Revenue Code section 264(f) disallows a portion of an institution's interest deduction for debt incurred to purchase life insurance on borrowers. Institutions considering the purchase of insurance on borrowers should consult their tax advisers to determine the economic viability of this strategy.

Life insurance as security for loans. Institutions sometimes take an interest in an existing life insurance policy as security for a loan. Institutions also make loans to individuals to purchase life insurance, taking a security interest in the policy, a practice known as "insurance-premium financing." As with any other type of lending, extensions of credit secured by life insurance should be made on terms that are consistent with safe and sound banking practices. For instance, the borrower should be obligated to repay the loan according to an appropriate amortization schedule.

Generally, an institution may not rely on its security interest in a life insurance policy to extend credit on terms that excuse the borrower from making interest and principal payments during the life of the borrower with the result that the institution is repaid only when the policy matures upon the death of the insured. Lending on such terms is generally speculative and an unsafe and unsound banking practice.

Institutions may acquire ownership of life insurance policies for debts previously contracted (DPC) by invoking their security interest in a policy after a borrower defaults. Consistent with safety and soundness, institutions should use their best efforts to surrender or otherwise dispose of permanent life insurance acquired for DPC at the earliest reasonable opportunity.[16] In

16. The OCC has generally directed national banks to

the case of temporary insurance acquired for DPC, retention until the next renewal date or the next premium date, whichever comes first, will be considered reasonable.

Appendix B—Glossary

Cash surrender value (CSV). The value available to the policyholder if the policy is surrendered. If no loans are outstanding, this amount is generally available in cash. If loans have been made, the amount available upon surrender is equal to the cash surrender value less the outstanding loan (including accrued interest).

Deferred acquisition costs (DAC). DAC represents the insurance carrier's up-front costs associated with issuing an insurance policy, including taxes and commissions and fees paid to agents for selling the policy. The carrier charges the policyholder for these costs. Carriers capitalize DAC and recover them in accordance with applicable tax law. As the carrier recovers DAC, it credits the amount to the policyholder.

Experience-rated pricing. A pricing method that bases prices for insurance products on the actual expenses and claims experience for the pool of individuals being insured.

General account. A design feature that is generally available to purchasers of whole or universal life insurance whereby the general assets of the insurance company support the policy's CSV.

Interest-crediting rate. The gross yield on the investment in the insurance policy, that is, the rate at which the cash value increases before considering any deductions for mortality cost, load charges, or other costs that are periodically charged against the policy's cash value.

There are a number of crediting rates, including "new money" and "portfolio." Using the "portfolio" crediting rate, the institution will earn a return based upon the existing yield of the insurance carrier's portfolio each year. Using the "new money" crediting rate, the institution will earn a return based upon yields available in the market at the time it purchases the policy.

surrender or divest permanent life insurance acquired for DPC within 90 days of obtaining control of the policy.

Modified endowment contract (MEC). Type of policy that is defined in Internal Revenue Code section 7702A. A MEC generally involves the payment of a single premium at the inception of the contract; thus, it fails the so-called seven-pay test set forth in the statute. MECs are denied some of the favorable tax treatment usually accorded to life insurance. For example, most distributions, including loans, are treated as taxable income. An additional 10 percent penalty tax also is imposed on distributions in some circumstances. However, death benefits remain tax-free.

Mortality charge. The pure cost of the life insurance death benefit within a policy. It represents a cost to the purchaser and an income item to the carrier. Mortality charges retained by the insurance carrier are used to pay claims.

Mortality reserve. In separate-account products, the mortality reserve represents funds held by an insurance carrier outside of the separate account to provide for the payment of death benefits.

Non-MEC. An insurance contract that is not categorized as a MEC under Internal Revenue Code section 7702A.

Separate account. A separate account is a design feature that is generally available to purchasers of whole life or universal life whereby the policyholder's CSV is supported by assets segregated from the general assets of the carrier. Under such an arrangement, the policyholder neither owns the underlying separate account nor controls investment decisions (e.g., timing of investments or credit selection) in the underlying separate account that is created by the insurance carrier on its behalf. Nevertheless, the policyholder assumes all investment and price risk.

Seven-pay test. The seven-pay test is a test set forth in Internal Revenue Code section 7702A that determines whether or not a life insurance product is a MEC for federal tax purposes.

Split-dollar life insurance. A split-dollar life insurance arrangement splits the policy's premium and policy benefits between two parties, usually an employer and employee. The two parties may share the premium costs while the policy is in effect, pursuant to a prearranged contractual agreement. At the death of the insured or the termination of the agreement, the parties split the policy benefits or proceeds in accordance with their agreement.

Stable value protection (SVP) contracts. In general, an SVP contract pays the policy owner of a separate account any shortfall between the fair value of the separate-account assets when the policy owner surrenders the policy and the cost basis of the separate account to the policy owner. The cost basis of the separate account typically would take into account the fair value of the assets in the account when the policy was initially purchased, the initial fair value of assets added to the account thereafter, interest credited to the account, the amount of certain redemptions and withdrawals from the account, and credit losses incurred on separate-account assets. Thus, SVP contracts mitigate price risk. SVP contracts are most often used in connection with fixed-income investments.

1035 exchange. A tax-free replacement of an insurance policy for another contract covering the same person(s) in accordance with section 1035 of the Internal Revenue Code.

Variable life insurance. Variable life insurance policies are investment-oriented life insurance policies that provide a return linked to an underlying portfolio of securities. The portfolio typically is a group of mutual funds chosen by the insurer and housed in a separate account, with the policyholder given some discretion in choosing among the available investment options.

Appendix C—Interagency Interpretations of the Interagency Statement on the Purchase and Risk Management of Life Insurance

The federal banking and thrift agencies developed responses to questions regarding the December 7, 2004, Interagency Statement on the Purchase and Risk Management of Life Insurance. A summary of these interpretations is included below to provide clarification on a wide variety of matters pertaining to financial reporting, credit-exposure limits, concentration limits, and the appropriate methodologies to use for calculating the amount of insurance an institution may purchase.

Legal Authority—State and Federal Law

As a general matter, the ability of state-chartered banks to purchase insurance (including equity-linked variable life insurance) is governed by state law. Section 24 of the Federal Deposit Insurance Act (the FDI Act) generally requires insured state-chartered banks to obtain the consent of the Federal Deposit Insurance Corporation (FDIC) before engaging as principal in activities (including making investments) that are not permissible for a national bank. Some state bank regulatory agencies have issued their own BOLI guidance or directives for their respective state-chartered institutions. A state-chartered institution should follow any BOLI guidance or directive issued by its state supervisory authority that is more restrictive than the interagency statement. Generally, if state law or policy is less restrictive than the interagency statement, a state-chartered institution should follow the interagency statement. If federal law is less restrictive than state law, a state-chartered institution should follow the state law.

Permissibility of Equity-Linked Securities in Separate-Account BOLI

The interagency statement states that national banks and federal savings associations may hold equity-linked variable life insurance policies (that is, insurance policies with a return tied to the performance of a portfolio of equity securities held in a separate account of the insurance company) only in very limited circumstances. Similarly, state member banks may also hold equity-linked variable life insurance policies only in very limited circumstances. Because the range of instruments with equity-like characteristics varies significantly, the permissibility of each such instrument must be analyzed on a case-by-case basis. Furthermore, the agencies have significant concerns regarding whether an institution properly understands the complex risk profile that securities with “equity-like” characteristics often present. Some securities, even if legally permissible, may be inappropriate for the vast majority of financial institutions, whether held in an investment portfolio or a separate-account BOLI product. The agencies’ April 1998 Supervisory Policy Statement on Investment Securities and End-User Derivatives

Activities provides guidance on the appropriateness of investments and risk-management expectations.

Senior Management and Board Oversight—Establishing BOLI Concentration Limits

Each institution should establish internal policies and procedures governing its BOLI holdings that limit the aggregate cash surrender value (CSV) of policies from any one insurance company as well as the aggregate CSV of policies from all insurance companies. The interagency statement is not intended to loosen the standards with respect to prior BOLI guidance. The agencies have rigorous expectations regarding the establishment of prudent limits and appropriate board and management oversight of the limit-setting process. Accordingly, exceptions will be subject to increased supervisory attention. The agencies continue to expect institutions to adopt per-carrier limits for BOLI, keeping in mind legal lending limits. Although the federal statutory and regulatory lending limits do not, as a general rule, impose a per-carrier legal constraint on BOLI because BOLI is not a loan, BOLI nevertheless does represent a long-term credit exposure. The agencies expect institutions to manage credit exposures in a prudent manner, irrespective of whether the exposure is subject to a statutory or regulatory limit. If an institution establishes an aggregate limit for BOLI based upon its applicable capital concentration threshold, it would seldom be prudent to have its per-carrier limit equal to the aggregate limit. Apart from credit considerations, it is also important to diversify BOLI exposures in order to control transaction risks that may be associated with an individual carrier's policies.

Per-Carrier Limits

Institutions should establish a per-carrier limit for separate-account policies. Diversification among carriers reduces transaction risks. Institutions should also explicitly consider whether it is appropriate to combine general- and separate-account exposures from the same carrier for purposes of measuring exposure against internal limits. The agencies believe that institutions, based upon their risk tolerance and understanding of insurance risks, should determine for themselves whether to combine such policies. In this regard, the agencies note that separate-account policies also present general-account credit exposures. For example, deferred acquisition costs (DAC) and mortality reserves associated with separate-account policies are general obligations of the insurance carrier. Moreover, when the death of an insured occurs, the difference between the death benefit amount and the cash surrender value comes from the carrier's general account. Finally, the actual credit exposure under a BOLI policy may be many times greater than the carrying value of the policy currently recorded on the institution's balance sheet, given the typical relationship between CSV and policy death benefits. Institutions should keep these factors in mind when evaluating whether and, if so, how to aggregate general- and separate-account exposures for purposes of monitoring compliance with internal limits.

Legal Limits and Concentrations

When establishing internal CSV limits, an institution should consider its legal lending limit, the capital concentration thresholds, and any applicable state restrictions on BOLI holdings. The following are the agencies' capital concentration definitions:

- The FDIC uses 25 percent of tier 1 capital to measure a capital concentration.
- The other agencies use tier 1 capital plus the allowance for loan and lease losses (ALLL).

A state-chartered institution should be guided by the more restrictive of the applicable state and federal limitations and thresholds. For example, if a state defines BOLI as an extension of credit subject to a statutory or regulatory lending limit, or otherwise imposes a per-carrier limit on BOLI, then institutions subject to that state's jurisdiction should ensure that their BOLI exposure to an individual carrier does not exceed the applicable state limit.

Permissibility of Holding Life Insurance on Former Employees and Former Key Persons

A well-managed institution adequately documents the purpose for which it is acquiring BOLI, as part of its pre-purchase analysis. When an institution purchases life insurance on a group of employees (whether it is a group policy or a series of individual policies) as a means to finance or recover the cost of employee benefits, and one or more of the insured employees is no longer employed by the bank, the insurance coverage may be retained by the institution provided—

- the application of the cost-recovery or cost-offset method (see "Quantifying the Amount of Insurance Appropriate for the Institution's Objectives" below) indicates that the amount of insurance held is not in excess of the amount required to recover or offset the cost of the institution's employee benefits,
- the policy is not specifically designated to cover only loss of income to the banking organization that may arise from the death of the employee,
- the coverage continues to qualify as an insurable interest under applicable state law, and
- the insurance asset continues to be a permissible holding under applicable state law for state-chartered institutions.

Additionally, if the policy no longer qualifies as insurance under the applicable state insurable-interest law, the policy may no longer be eligible for favorable tax treatment. These conditions apply to "benefits BOLI" despite the fact that the former employee was a "key person."

This is in contrast to true key-person insurance, in which the institution purchases life insurance on a key person in order to protect itself from financial loss in the event of that person's death. The interagency statement provides that a national bank or federal savings association may be required to surrender or otherwise dispose of key-person life insurance held on an individual who is no longer a key person because the institution will no longer suffer a financial loss from the death of that person. However, when an individual upon whom key-person life insurance has been held is no longer a key person, an institution may be able to recharacterize its objective for the insurance policy as recovery of the cost of providing employee benefits. In such cases, the institution must demonstrate, through appropriate analysis and quantification, that the insurance coverage satisfies the retention conditions, as set forth in the preceding paragraph. For a state-chartered institution, the recharacterization and retention of such key-person life insurance must be permissible under applicable state law. In circumstances where a national bank or federal savings association would be required to surrender or otherwise dispose of key-person life insurance, a state-chartered institution must also surrender or otherwise dispose of a key-person policy unless the retention of the policy is permitted under applicable state law and the institution obtains the FDIC's consent to continue to hold the policy under section 24 or section 28 of the FDI Act, as appropriate.

Quantifying the Amount of Insurance Appropriate for the Institution's Objectives

Institutions are responsible for ensuring that they do not purchase excessive amounts of insurance coverage on their employees relative to salaries paid and the costs of benefits to recover. Examiners will evaluate an institution's BOLI holdings and make a supervisory judgment as to whether insurance amounts on employees are so excessive as to constitute speculation or an unsafe or unsound practice on a case-by-case basis, as they do for other aspects of an institution's operations. Such an evaluation would be based on the totality of the circumstances.

Institutions may use either the cost-recovery or cost-offset method to quantify the amount of insurance permissible for purchase to finance or recover employee benefit costs. When using the cost-offset approach, an institution must ensure that the projected increase in CSV each year over the expected duration of the BOLI is less than or equal to the expected employee benefit expense for that year. When using the cost-recovery method, regardless of an institution's quantification method, management must be able to support, with objective evidence, the reasonableness of all assumptions used in determining the appropriate amount of insurance coverage needed, including the rationale for its discount rates (when the cost-recovery method is used) and cost projections.

Applicability of Prior Guidance for Split-Dollar Arrangements

The pre-purchase analysis guidance in the interagency statement applies to life insurance policies used in split-dollar arrangements that are acquired after December 7, 2004. The guidance concerning the ongoing risk management of life insurance after its purchase applies to life insurance policies, including those used in split-dollar arrangements, regardless of when acquired.

The FDIC's prior guidance on split-dollar arrangements, which was included in supervisory guidance on BOLI that was issued in 1993, has been superseded; until the issuance of the interagency statement, the FDIC had generally followed the Office of the Comptroller of the Currency's prior guidelines from 2000. Otherwise, the prior guidance issued by the agencies on split-dollar life insurance remains in effect. Each agency issued the interagency statement under its own bulletin, letter, or notice. For example, the Federal Reserve Board's issuance of the interagency statement is cross-referenced in SR-04-19, and the prior guidance on split-dollar life insurance arrangements is not superseded.

Accounting Considerations

An institution may purchase multiple permanent insurance policies from the same insurance carrier, with each policy having its own surrender charges. In some cases, the insurance carrier will issue a rider or other contractual provision stating that it will waive the surrender charges if all of the policies are surrendered at the same time. Because it is not known at any balance-sheet date whether one or more of the policies will be surrendered before the deaths of the insureds, the possibility that the institution will surrender all of these policies simultaneously and avoid the surrender charges is a gain contingency. This guidance should be applied to all insurance policies held by an institution regardless of when they were acquired. Therefore, an institution that has purchased BOLI is required to report the CSV on the bank's balance sheet net of the surrender charges (even if the policies have been in force for some time and the institution's auditors have not previously required reporting the CSV net of the surrender charges).

Based on the agencies' review of FASB Technical Bulletin No. 85-4, "Accounting for Purchases of Life Insurance" (TB 85-4), including its appendix, the agencies believe that TB 85-4 is intended to be applied on a policy-by-policy basis. It, therefore, does not permit the aggregation of multiple separate policies for balance-sheet-measurement purposes. Accordingly, the agencies do not intend to defer to institutions or their auditors on this issue. As of the balance-sheet date, an institution should determine the amount that could be realized under each separate insurance policy on a stand-alone basis without regard to the existence of other insurance policies or riders covering multiple policies. If a single insurance policy covers more than one individual, the realizable amount of the entire policy should be determined. A single insurance policy covering multiple individuals should not be subdivided into hypothetical separate policies for each covered individual, even if the carrier reports CSVs for each covered individual.

If a change in an institution's accounting for its holdings of life insurance is necessary for regulatory reporting purposes, the institution should follow Accounting Principles Board Opinion No. 20, "Accounting Changes"(APB 20).[17] APB 20 defines various types of accounting changes and addresses the reporting of corrections of errors in previously issued financial statements. APB 20 states that "[e]rrors in financial statements result from mathematical mistakes, mistakes in the application of accounting principles, or oversight or misuse of facts that existed at the time the financial statements were prepared."

For regulatory reporting purposes, an institution must determine whether the reason for a change in its accounting for its holdings of life insurance meets the APB 20 definition of an accounting error. If the reason for the change meets this definition and the amount is material, the error should be reported as a prior-period adjustment in the institution's regulatory reports. Otherwise, the effect of the correction of the error should be reported in current earnings. If the effect of the correction of the error is material, the institution should also consult with its primary federal regulatory agency to deter-

17. Effective December 15, 2005, APB 20 will be replaced by FASB Statement No. 154, "Accounting Changes and Error Corrections—A replacement of APB Opinion No. 20 and FASB Statement No. 3."

mine whether any previously filed regulatory reports should be amended. For the Call Report, the institution should report the amount of the adjustment in Schedule RI-A, item 2, “Restatements due to corrections of material accounting errors and changes in accounting principles,” with an explanation in Schedule RI-E, item 4. The effect of the correction of the error on income and expenses since the beginning of the period in which the correction of prior-period earnings is reported should be reflected in each affected income and expense account on a year-to-date basis in the Call Report Income Statement (Schedule RI), not as a direct adjustment to retained earnings.

Rate of Return to the Bank in Split-Dollar Insurance Arrangements

The agencies would consider the institution’s economic interest in a split-dollar life insurance arrangement policy, at a minimum, to be a return of the premiums paid plus a reasonable rate of return. The agencies would generally consider a reasonable rate of return to be one that provides the bank a return that is commensurate with alternative investments having similar risk characteristics (including credit quality and term) at the time in which the bank enters into the split-dollar arrangement. The rate of return is to be calculated net of any payments made (or to be made) from insurance proceeds to the employee’s beneficiaries.

The agencies look at the economic value of compensation arrangements when determining the reasonableness of split-dollar compensation, but the agencies do not rely solely on income tax rules for determining this economic value. Other factors that the agencies might consider include, but are not limited to, the benefit of a split-dollar arrangement to the employee as a percentage of salary and the expected length of time until the institution recovers its invested funds.

1. To determine the level and direction of risk that purchases and holdings of life insurance pose to the state member bank, and to recommend corrective action, as appropriate.
2. To perform—
   a. a risk assessment that summarizes the level of inherent risk by risk category, and
   b. an assessment of the adequacy of the board of directors' and management's oversight of the activity, including an assessment of the bank's internal control framework.
3. To ensure that the risk assessment considers a state member bank's purchase and risk management of its—
   a. broad bank-owned life insurance (BOLI) programs, in which life insurance is purchased on a group of employees to offset employee benefit programs and the bank is the beneficiary;
   b. split-dollar insurance arrangements for individual (usually senior-level) bank employees; and
   c. holdings of key-person insurance.
4. Recognizing that management may not be as familiar with insurance products as it is with more-traditional bank products, to adequately identify and assess the risks of BOLI, as well as the risk exposures that may arise from purchases and holdings of life insurance.[1]
5. To apply a forward-looking approach to the review of a bank's purchase and risk management of life insurance, recognizing that the bank may be exposed to increasing operational risks as a result of its large purchases or holdings of this product. These risks may arise from—
   a. separate-account assets that contain holdings of complex equity-linked notes and derivative products;
   b. the growing use of guaranteed minimum death benefits and other complex guarantee structures, which may increase the operational risk to banks purchasing significant amounts of life insurance; and
   c. the potential losses that could result from—
      - inadequate recordkeeping, which may be related to tracking the potentially large variety of contracts and agreements and the potentially large number of insured current and former employees covered by the contracts, and
      - a failure to ensure that contract agreements between the insurance company, the vendor(s), and the employees are properly executed and honored.

1. As noted in more depth in section 4042.1, the December 7, 2004, Interagency Statement on the Purchase and Risk Management of Life Insurance, these risks include operational, liquidity, credit, legal, and reputational risk. Operational risk arises in part from the vast array of new life insurance products and structures being offered and from the complexity of tax considerations related to the products, under various state insurable-interest and federal tax laws.

PRELIMINARY RISK ASSESSMENT

1. Consider the following, among other relevant criteria as appropriate, when determining whether to include the review of bank-owned life insurance (BOLI) in the examination scope:
   a. the volume, growth, and complexity of BOLI purchases and holdings
      - Consider the amount of the bank's BOLI holdings, measured by the total of their cash surrender values (CSVs) as a percentage of capital, and determine whether the resulting percentage is an asset concentration of capital. (For state member banks, the Federal Reserve has defined the capital base for determining this concentration threshold to be a percentage of tier 1 capital plus the allowance for loan and lease losses.) Determine whether the BOLI holdings have grown or declined significantly in recent years, when compared with the BOLI holdings of peer banks (consult the Federal Reserve System's intranet for applicable surveillance and monitoring data).
      - Obtain a breakout of the CSV of BOLI assets, as reported on the bank's balance sheet, including the amounts attributable to split-dollar insurance arrangements, general BOLI plans covering a group of employees to recover the cost of employee compensation and benefit programs, and the amount, if any, attributable to key-person insurance.
      - Obtain a listing of the amount of the bank's reimbursable premium payments under split-dollar life insurance arrangements and the amount receivable for these policies, which is to be booked as "other assets" on the bank's balance sheet.
      - Determine whether a portion of the CSV is in separate-account holdings of a life insurance company. If the bank has separate-account holdings, determine (1) the composition of the underlying separate-account assets and (2) if these assets constitute higher-risk investments, including equity-linked notes, mortgage-backed securities with significant interest-rate risk, or other investments entailing significant market risk.
      - Determine whether any of the life insurance policies are held in out-of-state trusts. If so, ascertain—
        — whether management and the board of directors can demonstrate that they have performed an independent legal analysis to ensure that the legal structure employed does not jeopardize the bank's insurable interest in the insurance policies or its access to the policy proceeds, as applicable; and
        — whether the trust arrangement inappropriately disadvantages the bank (for example, by permitting inappropriate investments or permitting the insured or the beneficiary to borrow against the policy holding in such a way that could jeopardize the bank's ability to recover amounts owed to it under the trust agreement).
   b. BOLI concentrations
      - Determine if there is a CSV concentration of life insurance to one carrier in excess of 25 percent that includes both separate-account and general-account BOLI holdings.
      - Determine if there are any market-risk concentrations within the underlying separate-account assets, including, for example, interest-sensitive fixed-income holdings.
      - Determine if there are any equity-linked notes or direct equity holdings in the separate accounts.
      - Determine if the bank holds any large-exposure life insurance policies on particular individuals. If so, determine if the policies are split-dollar arrangements and, if so—
        — whether the board or a board committee has evaluated the rea-

sonableness of the compensation as part of the employee's overall compensation package, and

— whether the board or a board committee has determined that the overall compensation is appropriate.

c. the appropriateness and recency of materials presented to the bank's board of directors concerning the bank's purchase and risk management of life insurance relative to its insurance purchases and holdings
d. the appropriateness and recency of audits and compliance reviews of the bank's purchases and risk management of life insurance
e. the overall financial condition of the bank, its supervisory rating, and any concerns or potential concerns about its liquidity

2. Depending upon the outcome of the preliminary risk assessment and other relevant factors, consider performing the following examination procedures.

OPERATIONAL-RISK ASSESSMENT

Senior Management and Board Oversight

1. Evaluate whether board and senior management oversight is effective and ensures that the bank's purchases and holdings of BOLI are consistent with safe and sound banking practices.
2. Determine whether the board of directors understands the complex risk characteristics of the bank's insurance holdings and the role of BOLI in the bank's overall business strategy.

Accounting Considerations

3. Determine if the bank's financial and regulatory reporting of its life insurance activities follows applicable generally accepted accounting principles (GAAP), including the following guidance:
   a. *Financial Accounting Standards Board (FASB) Technical Bulletin No. 85-4, "Accounting for Purchases of Life Insurance" (TB 85-4).* Only the amount that can be realized under an insurance contract as of the balance-sheet date (that is, the CSV reported to the bank by the insurance carrier, less any applicable surrender charges not reflected by the insurance carrier in the reported CSV) is reported as an asset. Since there is no right of offset, a BOLI investment is reported as an asset separately from any deferred compensation liability, provided that it was not purchased in connection with a tax-qualified plan.
   b. *Call Report instructions.* The bank is required to report the carrying value of its BOLI holdings (CSV net of applicable surrender charges) as a component of "other assets" and to report the earnings on these holdings as "other noninterest income."
4. Verify that the bank's deferred compensation agreements were accounted for using the guidance in the February 11, 2004, Interagency Advisory on Accounting for Deferred Compensation Agreements and Bank-Owned Life Insurance.
5. Verify that any accounts receivable that represent the bank's reimbursable life insurance premiums paid are recorded as unimpaired account receivables (for example, life insurance policies that are not impaired as a result of declining CSVs backing the obligations or employees borrowing against CSVs). (Impaired amounts should be expensed.)

Policies and Procedures

6. Assess the adequacy of the bank's policies and procedures governing its BOLI purchases and holdings, including its guidelines to limit the aggregate CSV of policies from one insurance company as well as limit the aggregate CSV of policies from all insurance companies.
7. Verify if the bank's board of directors or the board's designated committee approved BOLI purchases in excess of 25 percent of capital or in excess of any lower internal limit. (For state member banks, the Federal Reserve has defined the capital base for determining this concentration threshold to be a percentage of tier 1 capital plus the

allowance for loan and lease losses.)

8. Determine the reasonableness of the bank's internal limits and whether management and the board of directors have considered, before purchasing BOLI, the bank's legal lending limit, its applicable state and federal capital concentration threshold, and any other applicable state restrictions on BOLI.
9. For banks that may have other credit exposures to insurance companies, determine if the bank has considered the credit exposures arising from its BOLI purchases when assessing its overall credit exposure to a carrier and to the insurance industry.
10. Determine whether the bank's management has justified and analyzed the risks associated with a significant increase in the bank's BOLI holdings.
11. Determine if the bank has advised its board of directors of the existence of the December 7, 2004, Interagency Statement on the Purchase and Risk Management of Life Insurance and of the risks associated with BOLI.

Pre-Purchase Analysis

12. Ascertain whether the bank maintains adequate records of its pre-purchase analysis of BOLI.
13. Evaluate whether the bank's board of directors, or a designated board committee, and senior management understand the risks, rewards, and unique characteristics of BOLI.

Need for Insurance, Economic Benefits, and Appropriate Insurance Type

14. Determine whether the bank identified the specific risk of loss to which it is exposed or the specific costs to be recovered by the purchase of life insurance.
15. Determine whether the bank analyzed the costs and benefits of planned BOLI purchases.

Amount of Insurance Appropriate for the Institution's Objectives

16. Find out if the bank estimated the size of its employee benefit obligation or the risk of loss to be covered in order to ensure that the amount of BOLI purchased was not excessive in relation to this estimate and the associated product risks.
17. Determine whether management can support, with objective evidence, the reasonableness of all of the assumptions used in determining the appropriate amount of insurance coverage needed by the bank, including the rationale for its discount rates and cost projections.

Vendor Qualifications

18. Evaluate whether the bank's management assessed its own knowledge of insurance risks, the vendor's qualifications, the amount of resources the bank is willing to spend to administer and service the BOLI, and the vendor's ability to honor the long-term financial commitments associated with BOLI.

Characteristics of Available Insurance Products

19. Evaluate whether the bank's management has reviewed and understands the characteristics of the various life insurance products available and of the products it has acquired.
20. Ascertain if and how the bank's management reviewed and selected the life insurance product characteristics that best matched its objectives, needs, and risk tolerance. Ascertain whether management evaluated and documented, before the bank acquired BOLI, the risks of the variety and complexity of life insurance products considered, how the selected insurance product works, the variables that affect the product's performance, and the applicable tax and accounting treatments.
21. Determine whether the bank's management reviewed and documented its consideration of the types and design features of BOLI. Determine whether management reviewed and documented the negotiable features associated with a separate-account insurance product (for example, its investment options, terms, and conditions; the cost of stable value protection (SVP); deferred acquisition costs (DAC); and mortality options) and with any SVP provider that

may have been separately contracted by the insurance carrier.

22. Verify that the bank's management conducted a thorough review of life insurance policies before acquiring the policies. Ascertain if management determined how the accounting rules would apply to those policies and if it understood any ambiguous contract provisions, such as costs, charges, or reserves, that may affect the amount of a policy's CSV.

Tax and Insurable-Interest Implications

23. For the bank's pre-acquisition review of BOLI and its subsequent BOLI purchases, verify that the bank's management considered and documented its analysis of the financial impact of surrendering a policy (for example, any tax implications).
24. Verify that the bank's management obtained appropriate legal reviews. An appropriate legal review ensures that—
    a. the bank complies with applicable tax and state insurable-interest requirements, and
    b. the bank's insured amounts are *not* excessive (therefore, the bank is not involved in impermissible speculation or unsafe and unsound banking practices).

Carrier Selection

25. Find out if the bank (1) reviewed the BOLI product's design and pricing and the administrative services of the proposed carrier and (2) compared these services with those of other insurance carriers.
26. Ascertain whether the bank's management reviewed the selected carrier's ongoing long-term ability to commit to the BOLI product, as well as its credit ratings, general reputation, experience in the marketplace, and past performance.
27. Determine if the bank performed a credit analysis on the selected BOLI carriers and if the analysis was consistent with safe and sound banking practices for commercial lending.

Split-Dollar or Other Insurance Arrangements That Result in Additional Insured Employee Compensation

28. When a bank acquires insurance that permits a bank officer or employee to designate a beneficiary or provides the officer or employee with additional compensation, determine if the bank identified and quantified its total compensation objective. Determine if the bank ensured (1) that the acquired split-dollar life or other insurance arrangement was consistent with that objective, including when insurance compensation is combined with all other compensation being provided, and (2) that the total compensation was not excessive.
29. Verify that the bank and the insured have entered into a written agreement that specifically states the bank's rights, the insured individual's rights, and the rights of any other parties (trusts or beneficiaries) to the policy's CSV and death benefits.
30. Verify that the bank's shareholders and their family members (who are not bank officers, directors, or employees and who do not provide goods and services to the bank) do not receive compensation in the form of split-dollar life or other insurance coverage benefits.
31. Determine whether the bank's management has assessed the bank's ability to borrow against the CSV of its split-dollar life insurance policies, as well as the ability of other parties (whether an insured officer, employee, or noninstitution owner) to borrow against the policy CSV, without impairing the bank's financial interest in the policy proceeds. Determine also—
    a. if the bank can liquidate the policy in order to meet liquidity needs; or
    b. if the bank effects an early policy surrender (such as might occur if an employee terminates his or her employment), if the surrender would preclude the bank from recovering its premium payments and a market rate of return on the premiums invested.
32. Determine if and how management verified that the bank would be able to recover its premium payments plus a market rate of return on the premiums invested, after the payment of policy proceeds to the employee's beneficiary under the split-dollar arrangement.

Other Elements of Pre-Purchase Analysis

33. Ascertain whether the bank's management thoroughly evaluated all significant risks. Determine whether management has established procedures to identify, measure, monitor, and control those risks.
34. Find out if the bank, before acquiring BOLI, thoroughly analyzed its associated risks and benefits. As appropriate, determine whether the bank compared the risks of BOLI with those of alternative methods for recovering costs associated with the loss of key persons, providing pre- and post-retirement employee benefits, or providing additional employee compensation.

Post-Purchase Analysis

35. Find out if management reviewed at least annually the bank's life insurance purchases and holdings with the bank's board of directors.[1] Ascertain if the review included, at a minimum—
    a. a comprehensive assessment of the specific risks associated with the bank's permanent insurance acquisitions;
    b. an identification of the bank's employees who are or will be insured (for example, vice presidents and above, employees of a certain grade level, etc.);
    c. an assessment of death benefit amounts relative to employee salaries;
    d. a calculation of the percentage of insured persons still employed by the bank;
    e. an evaluation of the material changes to BOLI risk-management policies;
    f. an assessment of the effects of policy exchanges;
    g. an analysis of mortality performance and the impact on income;
    h. an evaluation of material findings from internal and external audits and independent risk-management reviews;
    i. an identification of the reason for, and the tax implications of, any policy surrenders; and
    j. a peer analysis of BOLI holdings.

1. More-frequent reviews should be conducted if significant changes to the BOLI program are anticipated, such as additional purchases, a decline in the financial condition of the insurance carrier(s), anticipated policy surrenders, or changes in tax laws or interpretations that could have an impact on the performance of BOLI.

LIQUIDITY-RISK ASSESSMENT

1. Find out if management, before the bank's purchase of permanent insurance, recognized the illiquid nature of the bank's acquisition of its permanent insurance products. Determine whether management ensured that the bank had the long-term financial flexibility to continue holding the insurance assets for their full term of expected use.
2. Determine if management, before the bank's purchase of permanent insurance, adequately considered the contractual arrangements and product types that limit product liquidity in order to best optimize the value of the bank's insurance assets and their possible future use as liquidity and funding sources. Contract provisions that should be considered include—
    a. 1035 exchange fees and "crawl-out restrictions,"
    b. provisions that would result in the product's categorization for federal tax purposes as a modified endowment contract (MEC) or a non-MEC contract, and
    c. SVP contract provisions that may limit the bank's ability to surrender a policy early or that would increase the cost of an early surrender.

REPUTATION-RISK ASSESSMENT

1. Ascertain whether the bank has taken steps, including obtaining written consent from its insured officers and employees, to reduce its reputation risk that may result from BOLI purchases.
2. Determine if the bank maintains appropriate documentation evidencing that it obtained a formal written consent from its insured officers and employees.
3. Find out what segment of the employee base the bank has insured (i.e., officers or non-officers) and if the bank has taken out very high death benefit policies on employees, including lower-level employees.

CREDIT-RISK ASSESSMENT

1. Determine if the bank's management con-

ducted an independent financial analysis of the insurance carrier before the bank's purchase of a life insurance policy.
   a. Ascertain if management continues to monitor the life insurance company's condition on an ongoing basis.
   b. Verify that the bank's credit-risk management function participated in the review and approval of insurance carriers.
2. Determine whether the bank considered its legal lending limit, its credit concentration guidelines (the aggregate exposures to individual insurance carriers and the life insurance industry, including other bank credit relationships, such as credit exposures involving loans and derivatives), and any state restrictions on BOLI holdings.
3. Determine whether the bank's credit analysis of its BOLI holdings evaluated whether the policies to be acquired were either separate-account or general-account policies.
   a. Find out whether the separate-account policies included an SVP contract to protect the bank (as a policyholder) from declines in the fair value of separate-account assets.
   b. Ascertain if the bank evaluated the insurance carrier's separately contracted SVP provider's repayment capacity.

MARKET-RISK ASSESSMENT

1. Determine whether management fully understood (before the bank purchased its separate-account products)—
   a. how the life insurance products expose the bank to interest-rate risk;
   b. the instruments governing the investment policy, as well as how the separate account is managed;
   c. the inherent risk of a separate account; and
   d. whether the bank's risk from the purchase of separate-account products was appropriate.
2. For general-account products, ascertain if management understands the interest-crediting option the bank chose when purchasing the insurance policy.
3. Find out if the bank has established and if it maintains appropriate monitoring and reporting systems for interest-rate fluctuations and their effect on separate-account assets.
4. Find out if the bank has acquired an SVP contract for its separate-account policy in order to reduce income-statement volatility. (SVP contracts protect against declines in value attributable to changes in interest rates; they do not cover default risk.)
5. If the bank has not purchased an SVP contract, determine if management has established and maintained monitoring and reporting systems that will recognize and respond to price fluctuations in the fair value of separate-account assets.
6. If the bank has purchased an equity-linked variable life insurance policy, determine whether it is characterized as an effective economic hedge against the bank's equity-linked obligations under its employee benefit plans. (An effective hedge exists when changes in the economic value of the liability or other risk exposure being hedged are matched by counterbalancing changes in the value of the hedging instruments. The economic hedging criteria for equity-linked insurance products lessen the effect of price risk because changes in the amount of the equity-linked liability are required to offset changes in the value of the separate-account assets.)
7. If the bank is purchasing or has purchased a separate-account insurance product involving equity securities, determine if the bank's management has performed further analysis that—
   a. compares the equity-linked liability being hedged and the equity securities in the separate account,
   b. determines a target range for the hedge-effectiveness ratio and establishes a method for measuring ongoing hedge effectiveness, and
   c. establishes a process for analyzing and reporting to management and the board of directors the effect of the hedge on the bank's earnings and capital ratios (both with and without the hedging transaction).

COMPLIANCE/LEGAL-RISK ASSESSMENT

1. Determine whether the bank's compliance

and audit functions have evaluated its compliance with applicable state insurable-interest and federal tax laws in order to protect the bank's earnings and capital from the loss of tax benefits or from the imposition of fines or penalties by regulatory authorities for violations of, or noncompliance with, laws, rulings, regulations, prescribed practices, and ethical standards.

2. When the bank owns separate-account BOLI, determine whether the bank has implemented and maintains internal control policies and procedures that adequately ensure that it does not take any action that might be interpreted as exercising "control" over separate-account assets.
3. Determine whether the bank split commissions between a vendor and the bank's own subsidiary or affiliate insurance agency when purchasing life insurance. If so, determine whether the bank's compliance function has assessed the bank's compliance with state and federal securities and insurance laws regarding fee and commission arrangements.
4. Ascertain whether the bank seeks and documents the advice of legal counsel when determining legal and regulatory issues, requirements, and concerns related to its potential purchase or ownership of BOLI.
5. For a general-account insurance product, determine if the bank has assigned a standard risk weight of 100 percent to the general-account asset.
6. For a BOLI separate-account product (when the bank uses the look-through approach to assign risk weights according to the risk-based capital rules)—
   a. review the bank's documentation, and determine if the bank adequately verified that the separate-account BOLI assets are protected from the insurance company's general creditors in the event of the insurance company's insolvency;
   b. determine if the standard risk weight of 100 percent was assigned to the bank's BOLI assets when the bank's documentation is inadequate or does not exist;
   c. verify that a 100 percent risk weight has been assigned to (1) the portion of the bank's insurance asset that represents general-account claims on the insurer (such as DAC and mortality reserves that are realizable on the balance-sheet date) and (2) any portion of the carrying value attributable to an SVP contract (or if the SVP provider is not an insurance company, verify that the correct risk weight has been assigned for that obligor); and
   d. if the bank used a pro rata approach to risk-weighting the carrying value of a qualifying separate-account policy—
      - verify that the risk weight is applied to the separate account based on the most risky portfolio that could be held by the separate account (as stated in the investment agreement), except for any portions of the carrying value that are general-account claims attributable to either DAC or an SVP (which are generally risk-weighted at 100 percent);
      - verify that in no case may the assigned risk weight for the bank's entire separate-account holding be less than 20 percent; and
      - when the sum of the permitted investments across market sectors in the investment agreement is greater than 100 percent, determine if the bank assigned the highest risk weight for the maximum amount permitted in that asset class, and then applied the next-highest risk weights to the other asset classes until the aggregate of the permitted amounts equals 100 percent.

Examiners should use only those internal control questions that are appropriate, given the size, complexity, and growth of a bank's bank-owned life insurance (BOLI) holdings.

PRELIMINARY RISK ASSESSMENT

1. Have the steps for conducting a preliminary risk assessment been followed, as they are set forth in section 4042.3? Have other relevant factors been considered to determine if further examination review may be warranted, in accordance with risk-focused supervision guidelines?
2. What particular factors have been identified to warrant a review of the bank's purchases and risk management of life insurance?

OPERATIONAL-RISK ASSESSMENT

Senior Management and Board of Directors Oversight

1. Has senior management and the board of directors initiated and maintained effective oversight of the bank's BOLI by—
   a. performing a thorough pre-purchase analysis of its risks and rewards and a post-purchase risk assessment?
   b. determining the permissibility of the bank's BOLI purchases and holdings under both the applicable state and federal requirements (whichever requirements are more restrictive)?
   c. determining the types and kinds of risks that are associated with BOLI?
   d. ascertaining and reviewing the safety-and-soundness considerations associated with the bank's BOLI?
   e. understanding the complex risk characteristics of the bank's insurance holdings and what role BOLI is to play in the bank's overall business?
2. Does the bank have a comprehensive risk-management process for purchasing and holding BOLI?

Accounting Considerations

3. When accounting for its holdings of life insurance, did the bank follow the guidance in FASB's Technical Bulletin No. 85-4, "Accounting for Purchases of Life Insurance"? Are the bank's insurance policies reported on its balance sheet on the basis of each policy's cash surrender value (CSV), less any applicable surrender charges that are not reflected in the reported CSV?
4. On the bank's Call Report, did the bank's management —
   a. report the carrying value of its BOLI holdings as an "other asset"?
   b. report the earnings on the bank's holdings as "other noninterest income"?
   c. report the CSV separately, as required if the CSV amount exceeded the reporting threshold?
   d. expense only the noninvestment portion of the premium, in the case of bank-owned policies?
   e. expense the premium for employee-owned insurance purchased by the bank and record a receivable in "other assets" for any portion of the premium to be reimbursed to the bank under a contractual agreement?
5. Were the bank's deferred compensation agreements accounted for using the guidance in the February 11, 2004, Interagency Advisory on Accounting for Deferred Compensation Agreements and Bank-Owned Life Insurance?

Policies and Procedures

6. Does the bank have comprehensive policies and procedures, including guidelines, that limit the aggregate CSV of policies from any one insurance company, as well as the aggregate CSV of policies from all insurance companies?
   a. Does the board of directors or a designated board committee require senior management to provide adequate and appropriate justification for establishing or revising internal CSV limits on the amount of BOLI the bank holds? Does

this justification take into account the bank's legal lending limits, its capital and credit concentration threshold, and any applicable laws and regulations?

b. Is written justification required when the amount of the bank's BOLI holdings approaches or exceeds 25 percent of the bank's capital (tier 1 capital plus the allowance for loan and lease losses)? Does the board of directors or a board committee approve this justification?

Pre-Purchase Analysis

7. Did the bank's management perform a written pre-purchase analysis of its BOLI products?
8. Did management identify the bank's need for BOLI, the appropriate type of insurance to be acquired, and the economic benefits to be derived from the purchase of BOLI? Did this analysis accomplish the following:
   a. identify the specific risk of loss to be covered by the insurance, or the costs the insurance is supposed to cover?
   b. determine what type BOLI (for example, general- or separate-account) and what BOLI features are needed, before acquiring the product?
   c. evaluate the permissibility and market risk of any underlying separate-account asset holdings, if separate-account BOLI is held?
   d. analyze projected policy values (CSV and death benefits) using various interest-crediting rates and mortality cost assumptions?
   e. estimate the size of the employee benefit obligation or the risk of loss to be covered? Did management ensure that the amount of BOLI coverage was appropriate for the bank's objectives and that BOLI was not excessive in relation to this estimate and the associated product risks?
   f. review the range of assumptions? Was management able to justify the assumptions with objective evidence, and deem them reasonable in view of previous and expected market conditions?
   g. assess whether the present value of the BOLI's expected future cash flows (net of the costs of the insurance) is less than the estimated present value of the expected after-tax employee benefit costs, when the bank uses BOLI to recover the costs of providing employee benefits?
9. Did the bank's management —
   a. review and assess its own knowledge of insurance risks, the vendor's qualifications, and the amount of the bank's resources that will be needed to administer and service the BOLI?
   b. demonstrate its familiarity with the technical details of the bank's insurance assets, and is management able to explain the reasons for and the risks associated with the product design features that have been selected?
   c. make appropriate inquiries to determine whether the vendor has the financial ability to honor its long-term commitments over an extended period of time?
   d. assure itself of the vendor's commitment to investing in the operational infrastructure that is necessary to support the BOLI?
   e. undertake its own independent review and not rely solely on prepackaged, vendor-supplied compliance information (such reliance is a potential cause for supervisory action)?
   f. properly evaluate the characteristics of the available insurance products against the bank's objectives, needs, and risk tolerance?
   g. determine if the bank's need for insurance on key persons or on a borrower's loan resulted in a matching of the maturity of the term or declining term insurance to the key person's expected tenure or the maturity of the borrower's loan?
   h. conduct a review of the insurance carrier that included—
      - a credit analysis of the potential insurance carrier (the analysis should have been performed in a manner consistent with safe and sound banking practices for commercial lending)?
      - a review of the bank's needs and a comparison of those needs with the proposed carrier's product design, pricing, and administrative services?
      - a review of the insurance carrier's commitment to the BOLI product, as well as the carrier's general reputation, experience in the marketplace, and past performance?

   i. determine whether the total amount of compensation and insurance to be provided to an employee is excessive, if the purchased BOLI will result in the payment of additional compensation?
   j. analyze the associated significant credit risks and the bank's ability to monitor and respond to those risks?
   k. as appropriate, analyze the risks and benefits of BOLI, compared with other available methods for recovering costs associated with the loss of key persons, providing pre- and post-retirement employee benefits, or providing additional employee compensation?
   l. sufficiently document its comprehensive pre-purchase analysis (including its analysis of both the types and product designs of purchased BOLI and the bank's overall level of BOLI holdings)?

Post-Purchase Analysis

10. Do management and the board of directors annually review the performance of the bank's insurance assets? Does the annual review include—
   a. a comprehensive assessment of the specific risks associated with permanent insurance acquisitions?
   b. an identification of employees who are or will be insured (e.g., vice presidents and above, employees of a certain grade level)?
   c. an assessment of death benefit amounts relative to employee salaries?
   d. a calculation of the percentage of insured persons still employed by the institution?
   e. an evaluation of the material changes to BOLI risk-management policies?
   f. an assessment of the effects of policy exchanges?
   g. an analysis of mortality performance and the impact on income?
   h. an evaluation of material findings from internal and external audits and independent risk-management reviews?
   i. an identification of the reason for and the tax implications of any policy surrenders?
   j. a peer analysis of BOLI holdings?

Tax and Insurable-Interest Implications

11. Has the bank's management explicitly considered the financial impact (for example, the tax provisions and penalties) of surrendering a BOLI policy?
12. Does the bank's management have or has it obtained appropriate legal review to ensure that it will be in compliance with applicable tax and state insurable-interest requirements? Is management aware of the relevant tax features of the insurance assets, including whether the bank's purchase would—
   a. make the bank subject to the alternative minimum tax?
   b. jeopardize the tax-advantaged status of the bank's insurance holdings?
   c. qualify (under applicable state law) an insurable ownership interest in the BOLI policy covering the bank's officers or its employees (including any applicable state law pertaining to the insured's consent and the amounts of allowable insurance coverage for an employee)?
13. Did the bank establish an out-of-state trust to hold its BOLI assets, and, if so, has the bank adequately assessed its insurable interest, given the arrangement?

LIQUIDITY-RISK ASSESSMENT

1. Has the bank's management fully recognized and considered the illiquid nature of the BOLI to be acquired? (An institution's BOLI holdings should be considered when assessing liquidity and assigning the component rating for liquidity.)
2. Did management determine if the bank has the long-term financial flexibility to hold the insurance asset for the full term of its expected use?

REPUTATION-RISK ASSESSMENT

1. Has the bank's management implemented procedures to ensure that the bank maintains appropriate documentation that evidences employees' informed consent for the bank's purchase of insurance on their lives? Do these procedures ensure that the bank

obtains employees' explicit consent before purchasing the insurance?

2. Has the bank obtained insurance products that insure large segments of its employee base (including the bank's non-officers)? Do these policies provide very high death benefits on employees, possibly causing the bank to be exposed to increased reputation risk if explicit consent was not obtained from the employees?

CREDIT-RISK ASSESSMENT

1. Did the bank's management conduct an independent financial analysis of the insurance carrier before purchasing the life insurance policy?
   a. Does management continue to monitor the life insurance company's financial condition on an ongoing basis?
   b. Did the bank's credit-risk management function participate in the review and approval of insurance carriers?
2. When establishing exposure limits for aggregate BOLI holdings and exposures to individual carriers, did the bank's management consider—
   a. the bank's legal lending limit?
   b. the applicable state and federal credit concentration exposure guidelines?
   c. the aggregate CSV exposures as a percentage of the bank's capital?
3. Has the bank's credit-risk management process taken into account credit exposures arising from both BOLI holdings and other credit exposures (loans, derivatives, and other insurance products) when measuring exposures to individual carriers?
4. Did the bank's credit analysis of its BOLI holdings consider whether the policies to be acquired were separate-account or general-account policies?
   a. For the separate-account policies, did the credit review include a risk analysis of the underlying separate-account assets?
   b. For separate-account policies that include a stable value protection (SVP) contract, has the repayment capacity of the insurance carrier's separately contracted SVP providers been evaluated?

MARKET-RISK ASSESSMENT

1. Did management adequately assess the interest-rate risk exposure of BOLI before purchasing the products for separate-account and general-account assets?
2. Has the bank's management reviewed, and does it understand the instruments governing the separate-account investment policy and its management?
   a. Does the bank's management understand the risk inherent within the separate account?
   b. Has the bank's management determined if the risk is appropriate?
3. Have monitoring and reporting systems been established that will enable the bank's management to monitor, measure, and appropriately manage interest-rate risk exposure from BOLI holdings when assessing the bank's overall sensitivity to interest-rate risk?

COMPLIANCE/LEGAL-RISK ASSESSMENT

1. Has the bank's audit and/or compliance function reviewed the bank's legal and regulatory requirements as they pertain to life insurance holdings? Did the review consider—
   a. state insurable-interest laws?
   b. the Employee Retirement Income Security Act of 1974 (ERISA)?
   c. the Federal Reserve Board's Regulation W (12 CFR 223)?
   d. applicable federal prohibitions on insider loans, including the Federal Reserve Board's Regulation O, that may apply to split-dollar life insurance arrangements?
   e. the interagency guidelines for establishing standards for safety and soundness?[1]
   f. other state and federal regulations applicable to BOLI?
2. To ensure that the life insurance qualifies for its tax-advantaged status, has the bank's management implemented and maintained internal policies and procedures to ensure that "control" will not be exercised over any of the separate-account assets, espe-

1. For state member banks, see 12 CFR 208, appendix D-1.

cially those involving privately placed policies?

3. Does the bank's board of directors, its designated board committee, and its management seek the assistance of legal counsel when determining the legal and regulatory issues related to the acquisition and holding of life insurance policies?
4. Has management thoroughly reviewed, and does it understand, the instruments governing the investment policy and the management of a separate account, before purchasing a separate-account policy?
5. If the bank has not purchased SVP for a separate-account BOLI policy, has management established the appropriate monitoring and reporting systems that will enable it to recognize and respond to price fluctuations in the fair value of the separate-account assets?
6. When the bank considers or purchases a separate-account BOLI product involving equity securities, does it analyze the equity securities? Does this analysis—
   a. compare the specific equity-linked liability being hedged against the securities held in a separate account?
   b. establish a target ratio for hedge effectiveness, as well as a method for measuring hedge effectiveness on an ongoing basis?
   c. establish a process for analyzing and reporting to the board of directors, its designated committee, and senior management the effect of the hedge on the bank's earnings and capital ratios (this analysis should include a consideration of the results both with and without the hedging transaction)?
7. When reporting its risk-based capital, has the bank ensured that it accurately calculates and reports its risk-weighted assets for BOLI holdings according to the risk-based capital guidelines and the December 7, 2004, Interagency Statement on the Purchase and Risk Management of Life Insurance (see section 4042.1 and SR-04-19 and its attachment)?
   a. For a general-account insurance product, has the bank applied a standard risk weight of 100 percent to the general-account asset?
   b. When the bank has applied a look-through approach for separate-account holdings—
      - has management determined if BOLI assets would be protected from the insurance company's general creditors in the event of its insolvency? Has the bank documented its assessment that BOLI assets are protected?
      - has the portion of the carrying value of the separate-account policy (that reflects the amounts attributable to the insurer's DAC and mortality reserves, and any other portion that is attributable to the carrying value of an SVP contract) been risk-weighted using the 100 percent risk weight applicable to the insurer's general-account obligations? Or, if the SVP provider is not an insurance company, has the portion of the carrying value been risk-weighted as appropriate for that obligor?
8. When the bank has used a pro rata approach to risk-weighting the carrying value of a qualifying separate-account policy, did it use the appropriate procedures, as outlined in the December 7, 2004, Interagency Statement on the Purchase and Risk Management of Life Insurance (see section 4042.1 and SR-04-19 and its attachment)?
   a. Has the bank ensured that its assigned aggregate risk weight for all separate-account BOLI holdings will be 20 percent or more?
   b. When the sum of the permitted investments across market sectors in the investment agreement is greater than 100 percent, was the highest risk weight applied for the maximum amount permitted in that asset class, and was the next-highest risk weight then applied until the cumulative permitted amounts equal 100 percent?

Banking organizations have long been engaged in the sale of insurance products and annuities, although these activities historically have been subject to several restrictions. For example, until recently, national banks could sell most types of insurance, but only through an agency located in a small town. Bank holding companies also were permitted to engage in only limited insurance agency activities under the Bank Holding Company Act. State-chartered banks, on the other hand, generally have been permitted to engage in insurance sales activities as agents to the extent permitted by state law.

The Gramm-Leach-Bliley Act of 1999 (the GLB Act), however, authorized national banks and state-chartered member banks to sell all types of insurance products through a financial subsidiary. *The GLB Act generally did not change the powers of banks to sell insurance directly.* As a result of the GLB Act and marketplace developments, many banking organizations are increasing the range and volume of their insurance and annuities sales activities. To the extent permitted by applicable law, banking organizations may conduct insurance and annuity sales activities through a variety of structures and delivery channels, including ownership of an insurance underwriter or an insurance agency or broker, the employment by a bank of licensed agents, a joint marketing arrangement with a producer,[1] independent agents located at a bank's office, direct mail, telemarketing, and Internet marketing.

A banking organization may also conduct insurance or annuity sales activities through a managing general agent (MGA). An MGA is a wholesaler of insurance products and services to insurance agents. The MGA has a contractual agreement with an insurance carrier to assume functions for the carrier, which may include marketing, accounting, data processing, policy recordkeeping, and monitoring or processing claims. The MGA may rely on various local agents or agencies to sell the carrier's products. Most states require an MGA to be licensed.

OVERVIEW AND SCOPE

The following guidance pertains to state member banks that are either directly or indirectly engaged in the sale of insurance or annuity products. Examiner guidance on performing appropriate risk assessments of a state member bank's insurance and annuity sales activities is included.[2] Additionally, guidance is provided for examining a state member bank's compliance with the consumer protection rules relating to insurance and annuities sales activities that are contained in the Board's December 2000 revisions to Regulation H (subpart H) (12 CFR 208.81–86), ''Consumer Protection in Sales of Insurance'' (CPSI). Subpart H, which became effective on October 1, 2001, implements the consumer protection requirements of the GLB Act, which are codified at 12 USC 1831x. (See 65 *Fed. Reg.* 75841, December 4, 2000.) The regulation applies not only to the sale of insurance products or annuities by the bank, but also to activities of any person engaged in insurance product or annuity sales on behalf of the bank, as discussed in this guidance. The guidance is generally not applicable to debt-cancellation contracts and debt-suspension agreements, unless these products are considered to be insurance products by the state in which the sales activities are conducted.

The GLB Act permits state member banks that are not authorized by applicable state law to sell insurance directly to do so through a financial subsidiary.[3] A financial subsidiary engaged in insurance sales may be located wherever state

1. The term ''producer'' refers broadly to persons, partnerships, associations, limited liability corporations, etc., that hold a license to sell or solicit contracts of insurance to the public. Insurance agents and agencies are producers who, through a written contractual arrangement known as a direct appointment, represent one or more insurance underwriters. Independent agents and agencies are those producers that sell products underwritten by one or more insurance underwriters. Captive agents and agencies represent a specific underwriter and sell only its products. Brokers are producers that represent the purchaser of insurance and obtain bids from competing underwriters on behalf of their clients. State insurance laws and regulations often distinguish between an insurance agent and a broker; in practice, the terms are often used interchangeably.

2. The term ''risk assessment'' denotes the work product described in SR-97-24, ''Risk-Focused Framework for Supervision of Large Complex Institutions,'' and entails an analysis of (1) the level of inherent risk by type of risk (operational, legal, market, liquidity, credit, and reputation risk) for a business line or business function, (2) the adequacy of management controls over that business line or business function, and (3) the direction of the risk (increasing, decreasing, or stable).

3. Rules pertaining to state member bank financial subsid-

law permits the establishment and operation of an insurance agency. Such subsidiaries, however, would be subject to state licensing and other requirements.

The Federal Reserve is responsible for evaluating the consolidated risk profile of a state member bank. This reponsibility includes determining the risks posed to the state member bank from the insurance and annuity sales activities it conducts directly or indirectly, as well as determining the effectiveness of the bank's risk-management systems. However, the GLB Act also established a regulatory framework that is designed to ensure that the Federal Reserve coordinates with, and relies to the extent possible on information from, the state insurance authorities when it is supervising the insurance activities a state member bank conducts through a functionally regulated subsidiary.

Consistent with the Federal Reserve's risk-focused framework for supervising banking organizations, resources allocated to the review of insurance sales activities should be commensurate with the significance of the activities and the risk they pose to the bank. The scope of the review depends on the significance of the activity to the state member bank and the extent to which the bank is directly involved in the activity. Examiner judgment is required to tailor the reviews, as appropriate, on the basis of the legal, organizational, and risk-management structure of the state member bank's insurance and annuity sales activities and on other relevant factors.[4]

SUPERVISORY APPROACH FOR THE REVIEW OF INSURANCE AND ANNUITY SALES ACTIVITIES

Supervisory Objective

The primary objective for the review of a state member bank's insurance and annuity sales activities is to determine the level and direction of risk such activities pose to the state member bank. The review includes insurance and annuity sales activities the state member bank conducts directly (by or in conjunction with a subsidiary or affiliate) or through a third-party arrangement. Primary risks that may arise from insurance sales activities include operational, legal, and reputational risk. If the state member bank does not adequately manage these risks, they could have an adverse impact on its earnings and capital. The examiner should produce (1) a risk assessment that summarizes the level of inherent risk to the state member bank by risk category and (2) an assessment of the adequacy of board of directors' and management oversight of the insurance and annuity sales activities, including their internal control framework. For those state member banks selling insurance or annuity products, or that enter into arrangements under which another party sells insurance or annuity products at the bank's offices or on behalf of the bank, a second objective of the review is to determine the bank's compliance with the consumer protection provisions of the GLB Act and the CPSI regulation.

State Regulation of Insurance Activities

Historically, insurance activities have primarily been regulated by the states. In 1945, Congress passed the McCarran-Ferguson Act, which granted states the power to regulate most aspects of the insurance business. The McCarran-Ferguson Act states that "no act of Congress shall be construed to invalidate, impair, or supersede any law enacted by any state for the purpose of regulating the business of insurance, or which imposes a fee or tax upon such business, unless such Act specifically relates to the business of insurance" (15 USC 1012(b)).

State regulation of insurance producers is centered on the protection of the consumer and consists primarily of licensing and continuing education requirements for producers. A producer generally must obtain a license from each state in which it sells insurance and for each product sold. Each state in which a producer sells insurance has regulatory authority over the producer's activities in the state.

The GLB Act does include several provisions that are designed to keep states from (1) unfairly regulating a bank to prevent it from engaging in

iaries are found in the Board's Regulation H (12 CFR 208.71–77).

4. See SR-02-01, "Revisions to Bank Holding Company Supervision Procedures for Organizations with Total Consolidated Assets of $5 Billion or Less," and section 1000.1 for a discussion of the Federal Reserve's risk-focused examinations and the risk-focused supervision program for community banking organizations. See also SR-97-24 and SR-97-25.

authorized insurance activities or (2) otherwise discriminating against banks engaged in insurance activities. These provisions are complex and beyond the scope of this guidance. However, the GLB Act generally does not prohibit a state from requiring a bank or bank employee engaged in insurance sales, solicitation, or cross-marketing activities to be licensed within the state.

State insurance regulatory authorities do not conduct routine, periodic examinations of an insurance producer. A state examination of an insurance producer is generally conducted only on an ad hoc basis and is primarily based on the volume and severity of consumer complaints. The state examination may also be based in part on the producer's market share and on previous examination findings. Additionally, a review of a producer would typically not assess its financial condition.

A state's market conduct examination of *insurance sales practices* is focused at the insurance-underwriter level.[5] The insurance underwriter is generally held accountable for compliance with state insurance laws to protect the consumer from the unfair sales practices of any producer that markets the insurance underwriter's products. Market conduct examinations of an insurance underwriter may potentially uncover a concern about a particular producer, such as a bank-affiliated producer.[6] However, in the past, a state insurance regulatory authority has not typically examined a producer unless the producer is owned by the insurance underwriter.

Generally, market conduct examinations include reviews of the insurance underwriters' complaint handling, producer licensing, policyholder service, and marketing and sales practices. Typically, a state authority will direct a corrective action for insurance sales activity at the underwriter. The states generally have specific guidance for their market conduct examinations of life, health, and property/casualty[7] lines of business—guidance that corresponds to regulations related to advertising, misrepresentations, and disclosures for these different business lines. The reports of examination issued by the state insurance departments are usually available to the public.

Because the underwriter, not the producer, is liable to the insured, the failure of an insurance producer generally would not result in financial loss to consumers or state guarantee funds. Consequently, there are no regulatory capital requirements for insurance producers, nor do states require regulatory reporting of financial statement data on insurance producers. While the underwriter is ultimately liable to the insured, in some instances, a producer and its owner may be held liable for misrepresentations, as well as for violations of laws and regulations.

Functional Regulation

Under the GLB Act, banking supervisors' reviews of insurance or securities activities conducted in a bank's functionally regulated subsidiary are not to be extensions of more traditional bank-like supervision. Rather, to the extent possible, bank supervisors are to rely on the functional regulators to appropriately supervise the insurance and securities activities of a functionally regulated subsidiary. A functionally regulated subsidiary includes any subsidiary of a bank that (1) is engaged in insurance activities and subject to supervision by a state insurance regulator or (2) is registered as a broker-dealer with the Securities and Exchange Commission. The GLB Act does *not* limit the Federal Reserve's supervisory authority with respect to a *bank* or the insurance activities conducted by a bank. The functional regulators for insurance sales activities, including the activities of insurance producers, consist of the insurance departments in each of the 50 states, the District of Columbia, Puerto Rico, the U.S. Virgin Islands, American Samoa, and Guam.

5. Generally, market conduct reviews of *insurance underwriters* are conducted on an ad hoc basis, triggered primarily by the volume and severity of consumer complaints, and are based on the underwriter's market share or on previous examination findings. In some states, however, market conduct reviews of insurance underwriters are conducted on a periodic, three- to five-year schedule.

6. The terms "insurance underwriter," "insurer," "insurance carrier," and "insurance company" are industry terms that apply similarly to the party to an insurance arrangement who undertakes to indemnify for losses, that is, the party that assumes the principal risk under the contract.

7. Property insurance indemnifies a person who has an interest in a physical property for loss of the property or the loss of its income-producing abilities. Casualty insurance is primarily concerned with the legal liability for losses caused by injury to persons or damage to the property of others. It may also include such diverse forms of insurance as crime insurance, boiler and machinery insurance, and aviation insurance. Many casualty insurers also underwrite surety bonds.

The GLB Act places certain limits on the ability of the Federal Reserve to examine, obtain reports from, or take enforcement action against a functionally regulated nondepository subsidiary of a state member bank. For purposes of these limitations, a subsidiary licensed by a state insurance department to conduct insurance sales activities is considered functionally regulated only with respect to its insurance activities and any activities incidental to these activities.[8]

The GLB Act indicates that the Federal Reserve must rely, to the fullest extent possible, on information obtained by the appropriate state insurance authority of a nondepository insurance agency subsidiary of a state member bank. In addition, the Federal Reserve may examine a functionally regulated subsidiary of a state member bank only in the following situations:

- The Federal Reserve has reasonable cause to believe that the subsidiary is engaged in activities that pose a material risk to an affiliated depository institution, as determined by the responsible Reserve Bank and Board staff.
- After reviewing relevant information (including information obtained from the appropriate functional regulator), it is determined that an examination is necessary to adequately understand and assess the banking organization's systems for monitoring and controlling the financial and operational risks that may pose a threat to the safety and soundness of an affiliated depository institution.
- On the basis of reports and other available information (including information obtained from the appropriate functional regulator), there is reasonable cause to believe that the subsidiary is not in compliance with a federal law that the Federal Reserve has specific jurisdiction to enforce with respect to the subsidiary (including limits relating to transactions with affiliated depository institutions), and the Federal Reserve cannot assess such compliance by examining the state member bank or other affiliated depository institution.

Other similar restrictions limit the ability of the Federal Reserve to obtain a report directly from, or take enforcement action against, a functionally regulated nonbank subsidiary of a state member bank. These GLB Act limitations do *not* apply to a state member bank even if the state member bank is itself licensed by a state insurance regulatory authority to conduct insurance sales activities.

Staff who are conducting reviews of state member bank insurance or annuity sales activities should be thoroughly familiar with SR-00-13, which provides guidance on reviews of functionally regulated state member bank subsidiaries. Reserve Bank staff may conduct an examination of a functionally regulated subsidiary, or request a specialized report from a functionally regulated subsidiary, only after obtaining approvals from the appropriate staff of the Board's Division of Banking Supervision and Regulation.

When preparing or updating the risk assessment of a state member bank's insurance or annuity sales activities, Federal Reserve staff, when appropriate, should coordinate their activities with the appropriate state insurance authorities. The Federal Reserve's supervision of state member banks engaged in insurance sales activities is not intended to replace or duplicate the regulation of insurance activities by the appropriate state insurance authorities.

Information Sharing with the Functional Regulator

The Federal Reserve and the National Association of Insurance Commissioners (NAIC) approved a model memorandum of understanding (MOU) on the sharing of confidential information between the Federal Reserve and individual state insurance departments.[9] The Board also approved the delegation of authority to the Board's general counsel to execute agreements with individual states, based on this MOU. Examiners should follow required Board administrative procedures before sharing any confidential information with a state insurance regulator. (These procedures generally require Federal Reserve staff to identify and forward to Board staff for review any confidential information that may be appropriate to share with the applicable

8. For example, if a state member bank subsidiary engages in mortgage lending and is also licensed as an insurance agency, it would be considered a functionally regulated subsidiary only to the extent of its insurance sales activities.

9. The NAIC is the organization of insurance regulators from the 50 states, the District of Columbia, and the four U. S. territories. The NAIC provides a forum for the development of uniform policy among the states and territories. The NAIC is not a governmental or regulatory body.

state insurance regulator concerning insurance sales activities conducted by state member banks.) The Board's Division of Consumer and Community Affairs CP Letter 2001-11 outlines the procedures for sharing consumer complaint information with state insurance regulators.

STATUTORY AND REGULATORY REQUIREMENTS AND POLICY GUIDANCE

Privacy Rule and the Fair Credit Reporting Act

State member banks that sell insurance to consumers must comply with the privacy provisions under title V of the GLB Act (12 USC 6801–6809), as implemented by the Board's Regulation P (12 CFR 216) (the privacy rule). Functionally regulated state member bank nonbank insurance agency subsidiaries are not covered by the Federal Reserve's privacy rule; however, they must comply with the privacy regulations (if any) issued by their relevant state insurance regulator.

The privacy rule regulates a state member bank's treatment of nonpublic personal information about a "consumer," an individual who obtains a financial product or service (such as insurance) from the institution for personal, family, or household purposes. The privacy rule generally requires a bank to provide a notice to each of its customers that describes its privacy policies and practices no later than when the bank establishes a business relationship with the customer. The privacy rule also generally prohibits a bank from disclosing any nonpublic personal information about a consumer to any nonaffiliated third party, unless the bank first provides to the consumer a privacy notice and a reasonable opportunity to prevent (or "opt out" of) the disclosure, and the consumer does not opt out. The privacy rule permits a financial institution to provide a joint notice with one or more of its affiliates or other financial institutions, as identified in the privacy notice itself, provided that the notice is accurate with respect to the institution and the other institutions.

While the privacy rule applies to the sharing of nonpublic personal information by a bank with nonaffiliated third parties, the sharing of certain consumer information with affiliates or nonaffiliates may be subject to the Fair Credit Reporting Act (FCRA) as well. For example, under the FCRA, if a bank wants to share with its insurance subsidiary information from a credit report or from a consumer application for credit (such as the consumer's assets, income, or marital status), the bank must first notify the consumer about the intended sharing and give the consumer an opportunity to opt out. The same rules would apply to an insurance company that wants to share information from credit reports or from applications for insurance with an affiliate or a third party.

Anti-Tying Prohibitions

Federal law (section 106(b) of the BHC Act Amendments of 1970 (12 USC 1972(b))) generally prohibits a bank from requiring that a customer purchase a product or service from the bank or an affiliate as a prerequisite to obtaining another product or service (or a discount on the other product or service) from the bank. This prohibition applies whether the customer is retail or institutional, or whether the transaction is on bank premises or off premises. For example, a state member bank may not require that a customer purchase insurance from the bank or a subsidiary or affiliate of the bank in order to obtain a loan from the bank (or a reduced interest rate on the loan).[10]

Policy Statement on Income from Sale of Credit Life Insurance

The Federal Reserve Board's Policy Statement on Income from Sale of Credit Life Insurance (see the *Federal Reserve Regulatory Service* at 3-1556) sets forth the principles and standards that apply to a bank's sales of credit life insurance and the limitations that apply to the receipt of income from those sales by certain individuals and entities associated with the bank. See also the examination procedures related to this policy statement in section 2130.3.

10. See section 2040.1 and "Tie-In Considerations of the BHC Act," section 3500.0, of the *Bank Holding Company Supervision Manual.*

RISK-MANAGEMENT PROGRAM

Elements of a Sound Insurance or Annuity Sales Program

A state member bank engaged in insurance or annuity sales activities should—

- conduct insurance sales programs in a safe and sound manner;
- have appropriate written policies and procedures in place that are commensurate with the volume and complexity of its insurance sales activities;
- obtain its board of directors' approval of the scope of the insurance and annuity sales program and of written policies and procedures for the program;
- effectively oversee the sales program activities, including third-party arrangements;
- have an effective, independent internal audit and compliance program;
- appropriately train and supervise the employees conducting insurance and annuity sales activities;
- take reasonable precautions to ensure that disclosures to customers for insurance and annuity sales and solicitations are complete and accurate and are in compliance with applicable laws and regulations;
- ensure compliance with all applicable federal, state, or other jurisdiction regulations, including compliance with sections 23A and 23B of the Federal Reserve Act as that act applies to affiliate transactions; and
- have controls in place to ensure accurate and timely financial reporting.

Every state member bank conducting insurance or annuity sales activities should have appropriate, board-approved policies, procedures, and controls in place to monitor and ensure that it complies with both federal and state regulatory requirements. Consistent with the principle of functional regulation, the Federal Reserve will rely primarily on the appropriate state insurance authorities to monitor and enforce compliance with applicable state insurance laws and regulations, including state consumer protection laws and regulations governing insurance sales.

Sales Practices and Handling of Customer Complaints

Every state member bank engaged in insurance or annuity sales activities should have board-approved policies and procedures for handling customer complaints related to these sales. The customer complaint process should provide for the recording and tracking of all complaints and require periodic reviews of complaints by compliance personnel. A state member bank's board of directors and senior management should also review complaints if the complaints involve significant compliance issues that may pose a risk to the state member bank.

Third-Party Arrangements

State member banks, to the extent permitted by applicable law, may enter into agreements with third parties, including unaffiliated agents or agencies, to sell insurance or annuities or provide expertise and services that otherwise would have to be developed in-house. Many banks hire third parties to assist in establishing an insurance program or to train their own insurance staff. A bank may also find it advantageous to offer more specialized insurance products through a third-party arrangement.

A state member bank's management should conduct a comprehensive review of an unaffiliated third party before entering into any arrangement to conduct insurance or annuity sales with the third party. The review should include an assessment of the third party's financial condition, management experience, reputation, and ability to fulfill its contractual obligations to the state member bank, which includes compliance with applicable consumer protection laws and regulations.

The state member bank's board of directors or its designated committee should approve any agreements with third parties. Agreements should outline the duties and responsibilities of each party; describe the third-party activities permitted on the institution's premises; address the sharing or use of confidential customer information; and define the terms for use of the state member bank's office space, equipment, and personnel. If an arrangement includes dual employees (for example, bank employees who are also employed by an independent third party), the agreement must provide for written employment contracts that specify the duties of these employees and their compensation arrangements.

In addition, a third-party agreement should specify that the third party will comply with all applicable laws and regulations and will conduct its activities in a manner consistent with the CPSI regulation, if applicable. The agreement should authorize the banking organization to monitor the third party's compliance with its agreement, as well as authorize the bank to have access to third-party records considered necessary to evaluate compliance. A state member bank that contracts with a functionally regulated third party should obtain from and review, as appropriate, any relevant, publicly available regulatory reports of examination of the third party.[11] Finally, the agreement should provide for indemnification of the institution by the unaffiliated third party for any losses caused by the conduct of the third party's employees in connection with its sales activities.

The state member bank is responsible for ensuring that any third party or dual employee selling insurance at or on behalf of the bank is appropriately trained either by the bank or the third party with respect to compliance with the minimum disclosures and other requirements of the CPSI regulation and applicable state regulations. The banking organization should obtain and review copies of third-party training and compliance materials to monitor the third party's performance of its disclosure and training obligations.

Designation, Training, and Supervision of Personnel

A state member bank hiring personnel to sell insurance or annuities should investigate the backgrounds of the prospective employees. When a candidate for employment has previous insurance industry experience, the state member bank should have procedures to determine whether the individual has been the subject of any disciplinary actions by state insurance regulators.[12]

11. The reports of examination issued by state insurance regulators are generally public documents. Many states do not conduct periodic examinations of insurance sales activities.

12. Information from the states on the issuance and termination of producer licenses and on producers' compliance with continuing education requirements is available from the NAIC database known as the National Insurance Producer Registry (NIPR).

The state member bank should require its own insurance or annuity sales personnel or third-party sales personnel selling at or on behalf of the bank to receive appropriate training and licensing. Training should cover appropriate policies and procedures for the bank's sales of insurance and annuity products. Personnel who are referring potential or established customers to a licensed insurance producer should also be trained to ensure that referrals are made in conformance with the CPSI regulation, if applicable. The training should also include procedures and guidance to ensure that an unlicensed or referring individual cannot be deemed to be acting as an insurance agent that is subject to licensing requirements.

When insurance or annuities are sold by a state member bank or third parties at an office of, or on behalf of, the organization, the institution should have policies and procedures to designate, by title or name, the individuals responsible for supervising insurance sales activities, as well as for supervising the referral activities of bank employees not authorized to sell these products. A state member bank also should designate supervisory personnel responsible for monitoring compliance with any third-party agreement, as well as with the CPSI regulation, if applicable.

Compliance

State member banks should have policies and procedures to ensure that insurance or annuity sales activities are conducted in compliance with applicable laws and regulations (including the CPSI regulation for sales conducted by or on behalf of the state member bank) and the institution's internal policies and procedures. Compliance procedures should identify any potential conflicts of interest and how such conflicts should be addressed. For example, sales-compensation programs should be conducted in a manner that would not expose the bank to undue legal or reputation risks. The compliance procedures should also provide for a system to monitor customer complaints and their resolution. Where applicable, compliance procedures also should call for verification that third-party sales are being conducted in a manner consistent with the governing agreement with the banking organization.

The compliance function should be conducted independently of the insurance and annuity product sales and management activities. Compliance personnel should determine the scope and frequency of their reviews, and findings of compliance reviews should be reported directly to the state member bank's board of directors or to its designated board committee.

RISK ASSESSMENT OF INSURANCE AND ANNUITY SALES ACTIVITIES

A risk assessment of insurance activities may be accomplished in the course of conducting a regularly scheduled state member bank examination or as a targeted review. The purpose of preparing the risk assessment is to determine the level and direction of risk to the bank arising from its insurance and annuity sales activities. Risks to state member banks engaged in insurance and annuity sales programs consist primarily of legal, reputational, and operational risk, all of which may lead to financial loss. After completing the risk assessment, if material concerns remain, the Board's Division of Banking Supervision and Regulation staff should be consulted for further guidance.

Legal and reputational risk may arise from a variety of sources, such as fraud; noncompliance with statutory or regulatory requirements, including those pertaining to the handling of premiums collected on behalf of the underwriter; claims processing; insurance and annuity sales practices; and the handling of ''errors and omissions'' claims.[13] Other sources of legal and reputational risk may arise from failing to safeguard nonpublic customer information, a high volume of customer complaints, or public regulatory sanctions against a producer.

Legal and reputational risks may also arise from an agent's obligation to provide a customer with products that are suited to the customer's particular needs and are priced and sold in accordance with state regulations. Additionally, an agent or agency may be liable for failing to carry out the appropriate paperwork to bind a policy that it has sold to a customer, or for making an error in binding the policy. State insurance departments generally are permitted by law to suspend or revoke a producer's license and assess monetary penalties against a producer if warranted.

Operational risk may arise from errors in processing sales-related information or from a lack of appropriate controls over systems or staff responsible for carrying out the insurance or annuity sales activities. Additionally, state member banks that have recently commenced insurance or annuity sales activities, or that are expanding their insurance or annuity sales business, also are exposed to risk arising from inadequate strategic and financial planning associated with the activities, which could result in financial loss. Examiners should be attuned to risks that may arise from inadequate controls over insurance activities, a rapid expansion of the insurance or annuity sales programs offered by the state member bank, the introduction of new products or delivery channels, and legal and regulatory developments.

Operational risk may arise from inadequate premium-payment procedures and trust-account-balance administration by an agency. When the insurance agency bills the insured, the agent must comply with requirements for forwarding the payments to the insurer and for safekeeping the funds. Inadequate internal controls over this activity may result in the inappropriate use of these funds by the agent or agency. The state member bank should ensure that appropriate controls are in place to verify that all funds that are owed to the insurer or the insured are identified in the trust account and that the account is in balance.

When conducting a risk assessment, the examiner should first obtain relevant information to determine the existence and scale of insurance or annuity sales activity. Such information is available in the state member bank's Uniform Bank Performance Report (UBPR) and in other System reports on insurance activities. Relevant reports, including applicable balance sheets and income statements for the insurance and annuity sales activities, may also be obtained from the state member bank. When preparing a risk assessment for an insurance or annuity sales activity that is conducted by a functionally regulated nonbank subsidiary of a state member bank, examiners should rely, to the fullest extent possible, on information available from the state member bank and the appropriate state insurance regulator for the subsidiary. If information that is needed to assess the risk cannot be obtained from the state member bank or the

13. Errors and omissions insurance indemnifies the insured against loss sustained because of an error or oversight by the insured. For instance, an insurance agency generally purchases this type of coverage to protect itself against such things as failing to issue a policy.

applicable functional regulator, the examiner should consult with the appropriate designated Board staff. Requests should not be made directly to a functionally regulated nonbank insurance and annuity sales subsidiary of a state member bank without first obtaining approval from the appropriate Board staff.

CONSUMER PROTECTION IN SALES OF INSURANCE RULES

Overview of the CPSI Regulation

The CPSI regulation is applicable to all insured depository institutions.[14] The regulation, however, generally does not apply to nonbank affiliates or subsidiaries of a state member bank unless the company engages in the retail sale of insurance products or annuities at an office of, or on behalf of, an insured depository institution. Interpretations of the regulation issued by the federal banking agencies are found in appendix A of this section. Federal Reserve examiners are responsible for reviewing state member banks' compliance with the regulation.

The regulation applies to the retail sale of insurance products and annuities by banks or by any other person at an office of a bank, or acting on behalf of a bank. For purposes of the CPSI regulation, "office" means the premises of the bank where retail deposits are accepted. The regulation applies only to the retail sale of insurance or annuity products—that is, when the insurance is sold or marketed to an individual primarily for personal, family, or household purposes.

Misrepresentations Prohibited

The regulation prohibits a bank or other covered person from engaging in any practice or using any advertisement at any office of, or on behalf of, the bank or a subsidiary of the bank if the practice or advertisement could mislead any person or otherwise cause a reasonable person to erroneously believe—

- that the insurance product or annuity is backed by the federal government or the bank or is insured by the Federal Deposit Insurance Corporation (FDIC);
- that an insurance product or annuity does not have investment risk, including the potential that principal may be lost and the product may decline in value, when in fact the product or annuity does have such risks; or
- in the case of a bank or subsidiary of the bank at which insurance products or annuities are sold or offered for sale, that (1) the bank may condition approval of an extension of credit to a consumer by the bank or subsidiary on the purchase of an insurance product or annuity from the bank or a subsidiary of the bank, and (2) the consumer is not free to purchase the insurance product or annuity from another source.

The regulation also incorporates the anti-tying provisions of section 106(b) of the Bank Holding Company Act Amendments of 1970 (12 USC 1972). Additionally, banks are prohibited from selling life or health insurance products if the status of the applicant or insured as a victim of domestic violence or as a provider of services to domestic violence victims is considered as a factor in decision making on the product, except as expressly authorized by state law.

Insurance Disclosures

The CPSI regulation also requires that a bank or a person selling insurance at an office of, or on behalf of, a bank make the following affirmative disclosures (to the extent accurate), both orally and in writing, before the completion of the initial sale of an insurance product or an annuity to a consumer. However, sales by mail or, if the consumer consents, via electronic media (such as the Internet) do not require oral disclosure.

- The insurance product or annuity is not a deposit or other obligation of, or guaranteed by, the bank or an affiliate of the bank.
- The insurance product or annuity is not insured by the FDIC or any other U.S. government agency, the bank, or (if applicable) an affiliate of the bank.
- The insurance product or annuity, if applicable, has investment risk, including the possible loss of value.

14. The CPSI regulation applies to all federally insured depository institutions, including all federally chartered U.S. branches and state-chartered insured U.S. branches of foreign banking organizations.

For telephone sales, written disclosures must be mailed within three business days. The above disclosures must be included in advertisements and promotional materials for insurance products and annuities, unless the advertisements or promotional materials are of a general nature and describe or list the nature of services or products offered by the bank. Disclosures must be conspicuous and readily understandable.

Credit Disclosures

When an application for credit is made in connection with the solicitation, offer, or sale of an insurance product or annuity, the consumer must be notified that the bank may not condition the extension of credit on either (1) the consumer's purchase of an insurance product or annuity from the bank or any of its affiliates or (2) the consumer's agreement not to obtain, or a prohibition on the consumer from obtaining, an insurance product or annuity from an unaffiliated entity. These disclosures must be made both orally and in writing; however, applications taken by mail or, if the consumer consents, via electronic media, do not require oral disclosure. For telephone applications, the written disclosure must be mailed within three business days. The disclosures must be conspicuous and readily understandable.

Consumer Acknowledgment

The bank must obtain written or electronic acknowledgments of the consumer's receipt of the disclosures described above at the time they are made or at the completion of the initial purchase. For telephone sales, the bank must receive an oral acknowledgment and make a reasonable effort to obtain a subsequent written or electronic acknowledgment.

Location

Insurance and annuity sales activities must take place, to the extent practicable, in an area physically segregated from one where retail deposits are routinely accepted from the general public (such as teller windows). The bank must clearly identify and delineate areas where insurance and annuity sales activities occur.

Referrals

Any person who accepts deposits from the public in an area where deposits are routinely accepted may refer a consumer to a qualified person who sells insurance products or annuities only if the person making the referral receives no more than a one-time, nominal fee of a fixed dollar amount for the referral. The amount of the referral fee may *not* depend on whether a sale results from the referral.

Qualifications

A bank may not permit any person to sell or offer insurance products or annuities at its office or on its behalf, unless that person is at all times properly qualified and licensed under applicable state law for the specific products being sold or recommended.

Relationship of the CPSI Regulation to State Regulation

The GLB Act contains a legal framework for determining the effect of the CPSI regulation on state laws governing the sale of insurance, including state consumer protection standards. In general, if a state has legal requirements that are inconsistent with, or contrary to, the CPSI regulation, initially the federal regulation does not apply in the state. However, the federal banking agencies may, after consulting with the state involved, decide to preempt any inconsistent or contrary state laws if the agencies find that the CPSI regulation provides greater protections than the state laws. It is not expected that there will be significant conflict between state and federal laws in this area. If the consumer protection laws of a particular state appear to be inconsistent with and less stringent (that is, provide less consumer protection) than the CPSI regulation, examiners should inform the staff of the Board's Division of Banking Supervision and Regulation.

Relationship to Federal Reserve Guidance on the Sale of Nondeposit Investment Products

When a bank sells insurance products or annuities that also are securities (such as variable life insurance annuities), it must conform with the applicable Federal Reserve and interagency guidance pertaining to a bank's retail sales of nondeposit investment products (NDIPs).[15] If the CPSI regulation and the guidance pertaining to NDIPs conflict, the CPSI regulation prevails.

Examining a State Member Bank for Compliance with the CPSI Regulation

Examinations for compliance with the CPSI regulation should be conducted consistent with the risk-focused supervisory approach when a state member bank sells insurance products or annuities directly, or when a third party sells insurance or annuities at or on behalf of, a state member bank. To the extent practicable, the examiner should conduct the review at the state member bank. In certain instances, however, the examiner's review at the state member bank may identify potential supervisory concerns about the state member bank's compliance with the CPSI regulation as it pertains to insurance or annuities sales conducted by a functionally regulated nonbank affiliate or subsidiary of the state member bank that is selling insurance products or annuities at or on behalf of the state member bank.

If the examiner determines that an on-site review of a functionally regulated nonbank affiliate or subsidiary of the state member bank is appropriate to adequately assess the state member bank's compliance with the CPSI regulation, the examiner should discuss the situation with staff of the Board's Division of Banking Supervision and Regulation. The approval of the Division of Banking Supervision and Regulation's officer that is responsible for the supervisory policy and examination guidance pertaining to insurance and annuity sales activities should be obtained before examining or requesting any information directly from a functionally regulated nonbank affiliate or subsidiary of the state member bank that is selling insurance or annuity products at or on behalf of the state member bank.

The examination guidelines described in section 4043.3 apply to retail sales, solicitations, advertisements, or offers of insurance products and annuities by any state member bank or any other person that is engaged in such activities at an office of the bank or on behalf of the state member bank. For purposes of the CPSI regulation, activities "on behalf of a state member bank" include activities in which a person, whether at an office of the bank or at another location, sells, solicits, advertises, or offers an insurance product or annuity and in which at least one of the following applies:

- The person represents to a consumer that the sale, solicitation, advertisement, or offer of any insurance product or annuity is by or on behalf of the bank.
- The bank refers a consumer to a seller of insurance products or annuities, and the bank has a contractual arrangement to receive commissions or fees derived from the sale of an insurance product or annuity resulting from the bank's referral.
- Documents evidencing the sale, solicitation, advertising, or offer of an insurance product or annuity identify or refer to the bank.

APPENDIX A—JOINT INTERPRETATIONS OF THE CONSUMER PROTECTION IN SALES OF INSURANCE REGULATION

In response to a banking association's inquiries, the federal banking agencies jointly issued interpretations regarding the Consumer Protection in Sales of Insurance (CPSI) regulation.[1] A joint statement, issued on August 17, 2001, contains responses to a set of questions relating to disclosure and acknowledgment, the scope of applicability of the regulation, and compliance. Additionally, a February 28, 2003, joint statement responded to a request to clarify whether the disclosure requirements apply to renewals of pre-existing insurance policies sold before Octo-

15. Interagency Statement on Retail Sales of Nondeposit Investment Products, February 17, 1994. See SR-94-11.

1. These letters, issued jointly by the Board of Governors of the Federal Reserve System, the Office of the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the Office of Thrift Supervision, may be accessed on these agencies' web sites.

ber 1, 2001, the effective date of the regulation. The issues raised and the banking agencies' responses are summarized below.

Disclosures

Credit Disclosures

A bank or other person who engages in insurance sales activities at an office of, or on behalf of, a bank (''a covered person'') must make the credit disclosures set forth in the regulation if a consumer is solicited to purchase insurance while the consumer's loan application is pending. A consumer's application for credit is still ''pending'' for purposes of the regulation if the depository institution has approved the consumer's loan application but not yet notified the consumer. Until the consumer is notified of the loan approval, the covered person must provide the credit disclosures if the consumer is solicited, offered, or sold insurance.

Disclosures for Sales by Mail and Telephone

The regulation requires a covered person to provide oral disclosures and to obtain an oral acknowledgment of these disclosures when sales activities are conducted by telephone. This requirement applies regardless of whether the consumer will also receive and acknowledge written disclosures in person, through the mail, or electronically.

Use of Short-Form Insurance Disclosures

There is no short form for the credit disclosures. A depository institution, however, may use the short-form insurance disclosures set forth below in visual media (such as television broadcasting, ATM screens, billboards, signs, posters, and written advertisements and promotional materials):

- NOT A DEPOSIT
- NOT FDIC-INSURED
- NOT INSURED BY ANY FEDERAL GOVERNMENT AGENCY
- NOT GUARANTEED BY THE BANK
- MAY GO DOWN IN VALUE

Acknowledgment of Disclosures

Reasonable efforts to obtain written acknowledgment. The banking agencies have not prescribed any steps that must be taken for a depository institution's efforts to obtain a written acknowledgment to be deemed ''reasonable'' in a transaction conducted by telephone. Examples of reasonable efforts, however, include—

- providing the consumer with a return-addressed envelope or similar means to facilitate the consumer's return of the written acknowledgment,
- making a follow-up phone call or contact,
- sending a second mailing, or
- similar actions.

The covered person should (1) maintain documentation that the written disclosures and the request for written acknowledgment of those disclosures were mailed to the consumer and (2) should record his or her efforts to obtain the signed acknowledgment. The ''reasonable efforts'' policy exception for telephone sales does not apply to other types of transactions, such as mail solicitations, in which a covered person must obtain from the consumer a written (in electronic or paper form) acknowledgment.

Appropriate form or format for acknowledgment provided electronically. Electronic acknowledgments are not required to be in a specific format but must be consistent with the provisions of the CPSI regulation applicable to consumer acknowledgments. That is, the electronic acknowledgment must establish that the consumer has acknowledged receipt of the credit and insurance disclosures, as applicable.

Retention of acknowledgments by an insurance company. If an insurance company provides the disclosures and obtains the acknowledgment on behalf of a depository institution, the insurance company may retain the acknowledgment. The depository institution is responsible for ensuring that sales made ''on behalf of'' the depository institution are in compliance with the CPSI regulation. An insurance company may maintain documentation showing compliance with the CPSI regulation, but the depository institution should have access to such records and the records should be readily available for review by examiners.

Form of written acknowledgment. There is no prescribed form for the written acknowledgment. The regulation requires, however, that a covered person obtain the consumer's acknowledgment of receipt of the complete insurance and credit disclosures.

Timing of acknowledgment receipt. A covered person must obtain the consumer's acknowledgment either at the time a consumer receives disclosures or at the time of the initial purchase of an insurance product.

Oral acknowledgment of oral disclosure. The CPSI regulation does not prescribe any specific wording for an oral acknowledgment. However, if a covered person has made the insurance and credit disclosures orally, an affirmative response to the question "Do you acknowledge that you received this disclosure?" is acceptable.

Scope of the CPSI Regulation

Applicability to Private Mortgage Insurance

Depending on the nature of a depository institution's involvement in an insurance sales transaction, the CPSI regulation may cover sales of private mortgage insurance. If the depository institution itself purchases the insurance to protect its interest in mortgage loans it has issued and merely passes the costs of the insurance on to the mortgage borrowers, the transaction is not covered by the regulation. If, however, a consumer has the option of purchasing the private mortgage insurance and (1) the depository institution offers the private mortgage insurance to a consumer or (2) any other person offers the private mortgage insurance to a consumer at an office of a depository institution, or on behalf of a depository institution, the transaction would be covered by the regulation.

Applicability to Federal Crop Insurance

The CPSI regulation does not apply to federal crop insurance that is sold for commercial or business purposes. However, if the crop insurance is purchased by an individual primarily for family, personal, or household purposes, it would be covered.

Solicitations and Applications Distributed Before, but Returned After, the Effective Date of the CPSI Regulation

Direct-mail solicitations and "take-one" applications that are distributed on or after October 1, 2001, must comply with the CPSI regulation. If a consumer seeks to purchase insurance after the effective date of the regulation in response to a solicitation or advertisement that was distributed *before* that date, the depository institution would be in compliance with the regulation if the institution provides the consumer, before the initial sale, with the disclosures required by the regulation. These disclosures must be both written and oral, except that oral disclosures are not required if the consumer mails in the application.

Renewals of Insurance

Renewals of insurance are not subject to the disclosure requirements (see "Disclosures" above) but are subject to other requirements of the CPSI regulation. A "renewal" of insurance means continuation of coverage involving the same type of insurance for a consumer as issued by the same carrier. A renewal need not be on the same terms and conditions as the original policy, provided that the renewal does not involve a different type of insurance and the consumer has previously received the disclosures required by the regulation at the time of the initial sale. An upgrade in coverage at a time when a policy is not up for renewal would be treated as a renewal, provided that the solicitation and sale of the upgrade does not involve a different type of insurance and the consumer has previously received the disclosures required by the regulation at the initial sale.

Disclosures Required with Renewals of Insurance Coverage

The banking agencies' interpretations clarified that the CPSI regulation does not *mandate* disclosures for renewals of policies sold before October 1, 2001. Accordingly, the regulation does not require the disclosures to be furnished at the time of renewal of a policy, including a pre-existing policy. However, renewals are subject to the other provisions of the regulation. Moreover, the banking agencies would expect that, consistent with applicable safety-and-soundness requirements, depository institutions would take reasonable steps to avoid customer confusion in connection with renewals of pre-existing policies.

"On-Behalf-of" Test and Use of Corporate Name or Logo

Under the CPSI regulation, an affiliate of a bank is not considered to be acting "on behalf of" a bank simply because the affiliate's marketing or other materials use a corporate name or logo that is common to the bank and the affiliate. In general, this exclusion applies even if a bank and its parent holding company have a similar, but not identical, name. For example, if the names of all of the affiliates of a bank holding company share the words "First National," an affiliate would not be considered to be engaged in an activity "on behalf of" an affiliated bank simply by using the terms "First National" as part of a corporate logo or identity. The affiliate would, however, be considered to be acting "on behalf of" an affiliated bank if the name of the bank (for example, "First National Bank") appears in a document as the seller, solicitor, advertiser, or offeror of insurance. A transaction also would be covered if it occurs on the premises of a depository institution or if one of the other prongs of the "on-behalf-of" test is met.

Compliance

Appropriate Documentation of an Oral Disclosure or Oral Acknowledgment

There is no specific documentation requirement for oral disclosures or acknowledgments. However, other applicable regulatory reporting standards would apply. Appropriate documentation of an oral disclosure would clearly show that the covered person made the credit and insurance disclosures to a consumer. Similarly, appropriate documentation of an oral acknowledgment would clearly show that the consumer acknowledged receiving the credit and insurance disclosures. For example, a tape recording of the conversation (where permitted by applicable laws) in which the covered person made the oral disclosures and received the oral acknowledgment would be acceptable. Another example would be a contemporaneous checklist completed by the covered person to indicate that he or she made the oral disclosures and received the oral acknowledgment. A contemporaneous note to the consumer's file would also be adequate. The documentation should be maintained in the consumer's file so that it is accessible to examiners.

Setting for Insurance Sales

A depository institution must identify the areas where insurance sales occur and must clearly delineate and distinguish those areas from areas where the depository institution's retail deposit-taking activities occur. Although the banking agencies did not define how depository institutions could "clearly delineate and distinguish" insurance areas, signage or other means may be used.

APPENDIX B—GLOSSARY

For additional definitions of insurance terms, see section 4040.1.

Accident and health insurance. A type of coverage that pays benefits in case of sickness, accidental injury, or accidental death. This coverage may provide for loss of income when the insured is disabled and provides reimbursement for medical expenses when the insured is ill. The insurance can provide for debt payment if it is taken out in conjunction with a loan. (See *Credit life insurance.*)

Actuary. A professional whose function is to calculate statistically various estimates for the field of insurance, including the estimated risk of loss on an insurable interest and the appropriate level for premiums and reserves.

Admitted insurer. An insurance company licensed by a state insurance department to underwrite insurance products in that state.

Agency contract (or agreement). An agreement that establishes the contractual relationship between an agent and an insurer.

Agent. A licensed insurance company representative under contract to one or more insurance companies. Depending on the line of insurance represented, an agent's power may include soliciting, advertising, and selling insurance; collecting premiums; claims processing; and effecting insurance coverage on behalf of an insurance underwriter. Agents are generally compensated by commissions on policies sold, although some may receive salaries.

- *Captive or exclusive agent.* An agent who represents a single insurer.
- *General agent.* An agent who is contractually awarded a specific geographic territory for an individual insurance company. They are responsible for building their own agency and usually represent only one insurer. Unlike exclusive agents, who usually receive a salary in addition to commissions, general agents are typically compensated on a commission basis only.
- *Independent agent.* An agent who is under contractual agreements with at least two different insurers. Typically, all of the independent agent's compensation originates from commissions.

Aggregate excess-of-loss reinsurance. A form of ''excess-of-loss'' reinsurance that indemnifies the ceding company against the amount by which all of the ceding company's losses incurred during a specific period (usually 12 months) exceed either (1) a predetermined dollar amount or (2) a percentage of the company's subject premiums. This type of contract is also commonly referred to as *stop-loss reinsurance* or *excess-of-loss ratio reinsurance.*

Allied lines. Various insurance coverages for additional types of losses and against losses by additional perils. The coverages are closely associated with and usually sold with fire insurance. Examples include coverage against loss by perils other than fire, coverage for sprinkler-leakage damage, and business-interruption coverage.

Annuity. A contract that provides for a series of payments payable over an individual's life span or other term, on the basis of an initial lump-sum contribution or series of payments made by the annuitant into the annuity during the accumulation phase of the contract.

- *Fixed-annuity contracts* provide for payments to annuitants at fixed, guaranteed minimum rates of interests.
- *Variable-annuity contracts* provide for payments based on the performance of annuity investments. Variable-annuity contracts are usually sold based on a series of payments and offer a range of investment or funding options, such as stocks, bonds, and money market fund investments. The annuity principal and the investment return are not guaranteed as they depend on the performance of the underlying funding option.

Annuity payments may commence with the execution of the annuity contract (*immediate annuity*) or may be deferred until some future date (*deferred annuity*).

Assigned risk. A risk that is not usually acceptable to insurers and is therefore assigned to a group of insurers who are required to share in the premium income and losses, in accordance with state requirements, in order for the insurer to sell insurance in the state.

Assignment. The legal transfer of one person's interest in an insurance policy to another person or business.

Bank-owned life insurance (BOLI). Life insurance purchased and owned by a bank to fund its exposure arising from employee compensation and benefit programs. In a typical BOLI program, a bank insures a group of employees; pays the life insurance policy premiums; owns the cash values of the policies, which are booked on the bank's balance sheet as ''other assets''; and is the beneficiary of the policies upon the death of any insured employee or former employee. (See SR-04-19 and section 4042.1.)

Beneficiary. The person or entity named in an insurance policy as the recipient of insurance proceeds upon the policyholder's death or when an endorsement matures. A revocable beneficiary can be changed by the policyholder at any time. An irrevocable beneficiary can be changed by the policyholder only with the written permission of the beneficiary.

Binder. A written or oral agreement, typically issued by an insurer, agent, or broker for property and casualty insurance, to indicate acceptance of a person's application for insurance and to provide interim coverage pending the insurance company's issuance of a binding policy.

Blanket bond. Coverage for an employer for loss incurred as a result of employee dishonesty.

Boiler and machinery insurance. Insurance against the sudden and accidental breakdown of boilers, machinery, and electrical equipment, including coverage for damage to the equipment and property damage, including the property of others. Coverage can be extended to cover consequential losses, including loss from interruption of business.

Broker. A person who represents the insurance buyer in the purchase of insurance. Brokers do not have the power to bind an insurance company to an insurance contract. Once a contract is accepted, the broker is compensated for the transaction through a commission from the insurance company. An individual may be licensed as both a broker and an agent.

Bulk reinsurance. A transaction sometimes defined by statute as any quota-share, surplus aid, or portfolio reinsurance agreement through which an insurer assumes all or a substantial portion of the liability of the reinsured company.

Captive insurer. An insurance company established by a parent firm to insure or reinsure its own risks or the risks of affiliated companies. A captive may also underwrite insurable risks of unaffiliated companies, typically the risks of its customers or employees. A captive insurer may underwrite credit life or private mortgage insurance (third-party risks) related to its lending activities.

Cash surrender value of life insurance. The amount of cash available to a life insurance policyholder upon the voluntary termination of a life insurance policy before it becomes payable by death or maturity.

Casualty insurance. Coverage for the liability arising from third-party claims against the insured for negligent acts or omissions causing bodily injury or property damage.

Cede. To transfer to a reinsurer all or part of the insurance or reinsurance risk underwritten by an insurance company.

Ceding commission. The fee paid to a reinsurance company for assuming the risk of a primary insurance company.

Ceding company (also cedant, reinsured, reassured). The insurer that transfers all or part of the insurance or reinsurance risk it has underwritten to another insurer or reinsurer via a reinsurance agreement.

Cession. The amount of insurance risk transferred to the reinsurer by the ceding company.

Churning. The illegal practice wherein a customer is persuaded to unnecessarily cancel one insurance policy in favor of buying a purportedly superior policy, often using the cash surrender value of the existing policy to pay the early premiums of the new policy. In such a transaction, the salesperson benefits from the additional commission awarded for booking a new policy.

Claim. A request for payment of a loss under the terms of a policy. Claims are payable in the manner suited to the insured risk. Life, property, casualty, health, and liability claims generally are paid in a lump sum after the loss is incurred. Disability and loss-of-time claims are paid periodically during the period of disability or through a discounted lump-sum payment.

Coinsurance. A provision in property and casualty insurance that requires the insured to maintain a specified amount of insurance based on the value of the property insured. Coinsurance clauses are also found in health insurance and require the insured to share a percentage of the loss.

Combination-plan reinsurance. A reinsurance agreement that combines the excess-of-loss and the quota-share forms of coverage within one contract, with the reinsurance premium established as a fixed percentage of the ceding company's subject premium. After deducting the excess recovery on any one loss for one risk, the reinsurer indemnifies the ceding company on the basis of a fixed quota-share percentage. If a loss does not exceed the excess-of-loss retention level, only the quota-share coverage applies.

Commission. The remuneration paid by insurance carriers to insurance agents and brokers for the sale of insurance and annuity products.

Comprehensive personal liability insurance. A type of insurance that reimburses the policyholder if he or she becomes liable to pay money for damage or injury he or she has caused to others. This coverage does not include automobile liability but does include almost every activity of the policyholder, except business operations.

Contractholder. The person, entity, or group to whom an annuity is issued.

Credit for reinsurance. A statutory accounting procedure, set forth under state insurance regulations, that permits a ceding company to treat amounts due from reinsurers as assets, or as offsets to liabilities, on the basis of the reinsurer's status.

Credit life insurance. A term insurance product issued on the life of a debtor that is tied to repayment of a specific loan or indebtedness. Proceeds of a credit life insurance policy are used to extinguish remaining indebtedness at the time of the borrower's death. The term is applied broadly to other forms of credit-related insurance that provide for debt satisfaction in the event of a borrower's disability, accident or illness, and unemployment. Credit life insurance has historically been among the most common bank insurance products.

Credit score. A number that is based on an analysis of an individual's credit history and that insurers may consider as an indicator of risk for purposes of underwriting insurance. Where not prohibited by state law, insurers may consider a person's credit history when underwriting personal lines.

Debt-cancellation contract/debt-suspension agreement. A loan term or contract between a lender and borrower whereby, for a fee, the lender agrees to cancel or suspend payment on the borrower's loan in the event of the borrowers's death, serious injury, unemployment, or other specified events. The Office of the Comptroller of the Currency considers these products to be banking products. State law determines whether these products are bank or insurance products for state-chartered banks and insurance companies.

Deductible. The amount a policyholder agrees to pay toward the total amount of insurance loss. The deductible may apply to each claim for a loss occurrence, such as each automobile accident, or to all claims made during a specified period, as with health insurance.

Directors and officers liability insurance. Liability insurance covering a corporation's obligation to reimburse its directors or officers for claims made against them for alleged wrongful acts. It also provides direct coverage for company directors and officers themselves in instances when corporate indemnification is not available.

Direct premiums written. Premiums received by an underwriter for all policies written during a given time period by the insurer, excluding those received through reinsurance assumed.

Direct writer. An insurance company that deals directly with the insured through a salaried representative, as opposed to those insurers that use agents. This term also refers to insurers that operate through exclusive agents. In reinsurance, a direct writer is the company that originally underwrites the insurance policies ceded.

Disability income insurance. An insurance product that provides income payment to the insured when his or her income is interrupted or terminated because of illness or accident.

Endowment insurance. A type of life insurance contract under which the insured receives the face value of the policy if he or she survives the endowment period. Otherwise, the beneficiary receives the face value of the policy upon the death of the insured.

Errors and omissions (E&O) liability insurance. Professional liability insurance that covers negligent acts or omissions resulting in loss. Insurance agents are continually exposed to the claim that inadequate or inappropriate coverage was recommended, resulting in a lack of coverage for losses incurred. The agent or the carrier may be responsible for coverage for legitimate claims.

Excess-of-loss reinsurance. A form of reinsurance whereby an insurer pays the amount of each claim for each risk up to a limit determined in advance, and the reinsurer pays the amount of the claim above that limit up to a specific sum. It includes various types of reinsurance, such as catastrophe reinsurance, per-risk reinsurance, per-occurrence reinsurance, and aggregate excess-of-loss reinsurance.

Excess-per-risk reinsurance. A form of excess-of-loss reinsurance that, subject to a specified limit, indemnifies the ceding company against the amount of loss in excess of a specified retention for each risk involved in each occurrence.

Excess and surplus lines. Property/casualty coverage that is unavailable from insurers licensed by the state (admitted insurers) and must be purchased from a nonadmitted underwriter.

Exposure. The aggregate of all policyholder limits of liability arising from policies written.

Face amount. The amount stated on the face of the insurance policy to be paid, depending on the type of coverage, upon death or maturity. It does not include dividend additions or additional amounts payable under accidental death or other special provisions.

Facultative reinsurance. Reinsurance of individual risks by offer and acceptance wherein the reinsurer retains the faculty to accept or reject each risk offered by the ceding company.

Facultative treaty. A reinsurance contract under which the ceding company has the option to cede and the reinsurer has the option to accept or decline classified risks of a specific business line. The contract merely reflects how individual facultative reinsurance shall be handled.

Financial guarantee insurance. Financial guarantee insurance is provided for a wide array of financial risks. Typically, coverage is provided for the fulfillment of a specific financial obligation originated in a business transaction. The insurer, in effect, is lending the debtor its own credit rating to enhance the debtor's creditworthiness.

Financial strength rating. Opinion as to an insurance company's ability to meet its senior policyholder obligations and claims. For many years, the principal rating agency for property and casualty insurers and life insurers has been A.M. Best. Other rating agencies, such as Fitch, Moody's, Standard and Poor's, and Weiss, also rate insurers.

Fixed annuity. See *Annuity.*

Flood insurance. A special insurance policy to protect against the risk of loss or damage to property caused by flooding. Regular homeowners' policies do not pay for damages caused by flooding.

General liability insurance. A broad commercial policy that covers all business liability exposures, such as product liability, completed operations, premises and operations, independent contractors, and other exposures that are not specifically excluded.

Gross premiums written. Total premiums for insurance written during a given period, before deduction for reinsurance ceded.

Group insurance. Insurance coverage typically issued to an employer under a master policy for the benefit of employees. The insurer usually does not condition coverage of the people that make up the group upon satisfactory medical examinations or other requirements. The individual members of the group hold certificates as evidence of their insurance.

Health insurance. An insurance product that provides benefits for medical expenses incurred as a result of sickness or accident, as well as income payments to replace lost income when the insured is unable to work because of illness, accident, or disability. This product may be in the form of traditional indemnity insurance or managed-care plans and may be underwritten on an individual or group basis.

Incurred but not reported (IBNR). The loss-reserve value established by insurance and reinsurance companies in recognition of their liability for future payments on losses that have occurred but have not yet been reported to them. This definition is often erroneously expanded to include adverse loss development on reported claims. The term *incurred but not enough reported (IBNER)* is being increasingly used to reflect more accurately the adverse development on inadequately reserved reported claims.

Inland marine insurance. A broad field of insurance that covers cargo being shipped by air, truck, or rail. It includes coverage for most property involved in transporting cargo as well as for bridges, tunnels, and communications systems.

Key person life insurance. Life insurance designed to cover the key employees of an employer. It may be written on a group- or an individual-policy basis.

Lapse. The termination or discontinuance of a policy resulting from the insured's failure to pay the premium due.

Liability insurance. Protects policyholders from financial loss due to liability resulting from injuries to other persons or damage to their property.

Lines. A term used in insurance to denote insurance business lines, as in "commercial lines" and "personal lines."

Long-term care insurance. Health insurance designed to supplement the cost of nursing home care or other care facilities in the event of a long-term illness or permanent disability or incapacity.

Managing general agent. A managing general agent (MGA) is a wholesaler of insurance products and services to insurance agents. An MGA receives contractual authority from an insurer to assume many of the insurance company's functions. The MGA may provide insurance products to the public through local insurance agents as well as provide services to an insurance company, including marketing, accounting, data processing, policy maintenance, and claims-monitoring and -processing services. Many insurance companies prefer the MGA distribution and management system for their insurance products because it avoids the high cost of establishing branch offices. Most states require that an MGA be licensed.

Manuscript policy. A policy written to include specific coverage or conditions not provided in a standard policy.

Morbidity. The incidence and severity of illness and disease in a defined class of insured persons.

Mortality. The rate at which members of a group die in a specified period of time or die from a specific illness.

Mortgage guarantee insurance. A product that insures lenders against nonpayment by borrowers. The policies are issued for a specified time period. Lenders who finance more than 80 percent of the property's fair value generally require such insurance.

Mortgage insurance. Life insurance that pays the balance of a mortgage even if the borrower dies. Coverage typically is in the form of term life insurance, with the coverage declining as the debt is paid off.

Multiperil insurance. An insurance contract providing coverage against many perils, usually combining liability and physical damage coverage.

Net premiums written. The amount of gross premiums written, after deduction for premiums ceded to reinsurers.

Ninety-day loss rule. A state requirement for an insurer to establish a loss provision for reinsurance recoverables over 90 days past due.

Obligatory treaty. A reinsurance contract under which business must be ceded in accordance with contract terms and must be accepted by the reinsurer.

Policyholder. The person or entity who owns an insurance policy. This is usually the insured person, but it may also be a relative of the insured, a partnership, or a corporation.

Premium. The payment, or one of the periodic payments, a policyholder agrees to make for insurance coverage.

Private mortgage insurance (PMI). Coverage for a mortgage lender against losses due to a collateral shortfall on a defaulted residential real estate loan. Most banks require borrowers to take out a PMI policy if a downpayment of less than 20 percent of a home's value is made at the time the loan is originated. PMI does not directly benefit a borrower, although its existence provides the opportunity to purchase a home to many people who otherwise would not qualify for a loan.

Producer. A person licensed to sell, solicit, or negotiate insurance.

Professional designations and organizations. Three of the most common insurance professional designations are chartered life underwriter (CLU), chartered property casualty underwriter (CPCU), and chartered financial consultant (ChFC). Insurance agents also join professional organizations such as the American Society of Chartered Life Underwriters, the International Association of Financial Planning, the National Association of Life Underwriters, the National Association of Health Underwriters, the American Council of Life Insurance, the Life Insurance Marketing and Research Association, the Life Underwriter Training Council, and the Million Dollar Round Table.

Pro rata reinsurance. A generic term describing all forms of "quota-share" and "surplus reinsurance," in which the reinsurer shares a pro rata portion of the losses and premiums of the ceding company.

Property insurance. Coverage for physical damage or destruction of real property (buildings, fixtures, and permanently attached equipment) and personal property (movable items that are not attached to land) that occurs during the policy period as a result of, for example, fire, windstorm, explosion, or vandalism.

Protected cell. A structure available to captive insurers underwriting risks of unaffiliated companies whereby the assets associated with the self-insurance program of one organization are segregated to provide legal-recourse protection from creditors of protected cells providing insurance coverage to other organizations.

Quota-share reinsurance. A form of pro rata reinsurance indemnifying the ceding company for a fixed percent of loss on each risk covered in the contract in consideration of the same percentage of the premium paid to the ceding company.

Rebating. Directly or indirectly giving or offering to give any portion of the premium or any other consideration to an insurance buyer as an inducement to purchase or renew the insurance. Rebates are forbidden under most state insurance codes.

Reinsurance. Insurance placed by an underwriter (the ceding company or reinsured) in another company to transfer or reduce the amount of the risk assumed under the original insurance policy (or group of policies).

Reinsurance premium. The consideration paid by a ceding company to a reinsurer for the coverage provided by the reinsurer.

Residual market. Also known as the shared market, it covers applications for insurance that were rejected by underwriters in the voluntary market that is covered by agency direct-marketing systems, perhaps because of high loss experience by the insured party. The residual market includes government insurance programs, specialty pools, and shared market mechanisms such as assigned-risk plans.

Retrocession. A reinsurance transaction whereby a reinsurer (the retrocedant) cedes all or part of the reinsurance risks it has assumed to another reinsurer (the retrocessionaire).

Retrospective rating. An insurance plan in which the current year's premium is based on the insured's own loss experience for that same period, subject to a maximum and minimum.

Rider. A written attachment, also known as an endorsement, to an insurance policy that changes the original policy to meet specific requirements, such as increasing or decreasing benefits or providing coverage for specific property items beyond that provided for under the insurance company's standard contract terms.

Self-insured retention (SIR). The percentage of a risk or potential loss assumed by an insured, whether in the form of a deductible, self-insurance, or no insurance at all.

Separate accounts. Certain life insurance assets and related liabilities that are segregated and maintained to meet specific investment objectives of contract holders, particularly those assets and liabilities associated with pension plans and variable products offered by life insurers, wherein the customer and not the insurer retains most of the investment and interest-rate risk.

Split-dollar life insurance. An arrangement that typically involves an agreement between an employer and an employee whereby the premium payment, cash values, policy ownership, and death benefits may be split. There are many variations of split-dollar arrangements, including arrangements in which a trust is created to facilitate estate planning. Split-dollar life insurance is designed to serve as a supplemental benefit to a particular company executive. The arrangement typically involves the payment of the insurance premium by the employer, with the death benefit accruing to the employee.

Subrogation. An insurance carrier may reserve the "right of subrogation" in the event of a loss. This means that the company may choose to take action to recover the amount of a claim paid to a covered insured if a third party caused the loss. After expenses, the amount recovered must be divided proportionately with the insured to cover any deductible for which the insured was responsible.

Term life insurance. An insurance product that provides, for a specified period of time, death coverage only. Typically, it has no savings component and, therefore, no cash value. Because term insurance provides only mortality protection, it generally provides the most coverage per premium dollar. Most term life insurance policies are renewable for one or more time periods up to a stipulated maximum age; however, premiums generally increase with the age of the policyholder.

Title insurance. Insurance that protects banks and mortgagees against unknown encumbrances against real estate by indemnifying the mortgagor and property owner in the event that clear ownership of the property is clouded by the discovery of faults in the title. Title insurance policies may be issued to either the mortgagor or the mortgagee or both. Title insurance is written largely only by companies specializing in this class of insurance.

Treaty reinsurance. A reinsurance contract under which the reinsured company agrees to cede, and the reinsurer agrees to assume, risks of a particular class or classes of business.

Twisting. In insurance, twisting involves making misrepresentations to a policyholder to induce the policyholder to terminate one policy and take out another policy with another company, when it is not to the insured's benefit. Twisting is a violation of the Unfair Trade Practices Act. Twisting is similar to the "churning" concept in securities sales, and it results in increased commissions for the inducing agent.

Umbrella liability insurance. This type of liability insurance provides excess liability protection over the "underlying" liability insurance coverage to supplement underlying policies that have been reduced or exhausted by loss.

Underwriting. The process by which a company determines whether it can accept an application for insurance and by which it may charge an appropriate premium for those applications selected. For example, the underwriting process for life insurance classifies applicants by identifying such characteristics as age, sex, health, and occupation.

Unearned reinsurance premium. The part of the reinsurance premium that is applicable to the unexpired portion of the policies reinsured.

Universal life insurance. A form of permanent insurance designed to provide flexibility in premium payments and death benefit protection. The policyholder can pay maximum premiums and maintain a high cash surrender value. Alternatively, the policyholder can make minimal payments in an amount only large enough to cover mortality and other expense charges.

Variable annuity. See *Annuity.*

Variable life insurance. A form of whole life, or universal life, insurance in which the policyholder's cash value is invested in "separate accounts" of the insurer. These accounts are segregated from the insurance carrier's other asset holdings. Such separate account investments are generally not available to a carrier's general creditors in the event of the carrier's insolvency. The policyholder assumes the investment and price risk. Because variable life policies have investment features, life insurance agents selling these policies must be registered representatives of a broker-dealer licensed by the Financial Industry Regulatory Authority and registered with the Securities and Exchange Commission.

Vendors' single-interest insurance. A form of force-placed insurance that is typically purchased by the bank to protect against loss or damage to loan collateral in which the bank has a security interest. The bank passes its expense for this insurance on to the consumer who has either refused or is unable to obtain property insurance.

Viatical settlement. The cashing in of a life insurance policy at a discount from face amount by policyholders who are often terminally ill and need the money for medical care. The purchaser becomes the policyholder as well as the beneficiary and assumes the premium payments of the policy.

Whole life insurance. A fixed-rate insurance product, with premiums and death benefits guaranteed over the duration of the policy. There is a cash value (essentially a savings account) that accrues to the policyholder tax deferred. A policyholder receives the cash value in lieu of death benefits if the policy matures or lapses before the insured's death. A policyholder also may borrow against the policy's accumulated cash value or use it to pay future premiums. For most whole life insurance policies, premiums are constant for the life of the insured's contract.

Insurance Sales Activities and Consumer Protection in Sales of Insurance

Examination Objectives

Effective date November 2003

Section 4043.2

1. To understand the volume and complexity of the state member bank's insurance or annuity program and insurance sales strategy.
2. To assess the financial results of the insurance and annuity sales activity compared with planned results.
3. To determine if the state member bank's insurance and annuity sales activities are effectively integrated into the risk-management, audit, and compliance functions and if the control environment is adequate.
4. To assess the adequacy of the state member bank's controls to ensure compliance with the applicable state and federal laws and regulations.
5. To assess the state member bank's level and direction of operational, legal, and reputational risks from the insurance or annuity sales activity.

The following objectives apply if insurance products or annuities are sold by a bank or another person at an office of, or on behalf of, the bank.

6. To assess the adequacy of the state member bank's oversight program for ensuring compliance with the Consumer Protection in Sales of Insurance (CPSI) regulation. (See section 4043.1.)
7. To assess the effectiveness of the state member bank's audit and compliance programs for the CPSI regulation.
8. To assess the state member bank's current compliance with the CPSI regulation.
9. To obtain commitments for corrective action when the state member bank is in violation of the CPSI regulation or when applicable policies, procedures, practices, or management oversight to protect against violations is deficient.

Insurance Sales Activities and Consumer Protection in Sales of Insurance

Examination Procedures

Effective date November 2003

Section 4043.3

RISK ASSESSMENT OF INSURANCE AND ANNUITY SALES ACTIVITIES

The examiner should consider the following procedures, as appropriate, when conducting a risk assessment to determine the level and direction of risk exposure to the state member bank that is attributable to insurance or annuity sales activity. If there are specific areas of concern, the examiner should focus primarily on those areas.

1. *Scope of activities and strategies.* Assess the significance and complexity of the insurance or annuity sales program.
   a. Obtain a general overview of the scope of the state member bank's insurance or annuity sales activities and any anticipated or recent change in or expansion of such activities.
   b. Determine the state member bank's strategy for insurance or annuity sales, including strategies for cross-selling and referrals of insurance and banking products. Determine the institution's experience with any cross-marketing programs for both insurance business generated by the bank and bank business generated by insurance producers.
   c. Obtain two years' worth of income statements, balance sheets, and budget documents for the agency's activities. Compare the expected budget items with their actual results.
   d. Determine the volume and type of insurance or annuity products and services sold or solicited.
   e. Determine what other related services the state member bank provides in connection with its insurance or annuity sales activities, such as providing risk-management services to clients seeking advice on appropriate insurance coverages, claims processing, and other activities.
2. *Insurance sales products and concentrations.*
   a. Determine the composition of sales—
      - by line of business, such as property/casualty insurance, life insurance including annuities, and health insurance;
      - by the proportion of sales to commercial and retail customers; and
      - by the portion of sales that is credit related, such as credit life and credit health insurance.
   b. Determine any sales concentrations to particular entities, industries, or bank customers.
   c. Note any concentrations to large commercial accounts.
   d. Determine what insurance services are provided to the bank, its employees, and bank affiliates.
3. *Legal-entity and risk-management structure for insurance or annuity sales.*
   a. Obtain an organizational chart for the legal-entity and risk-management structure for the insurance or annuity sales activities.
   b. Determine—
      - whether the insurance or annuity sales activity is conducted in an affiliated producer, by the bank itself, through another distribution arrangement, or by a combination of these arrangements;
      - the names of any affiliated insurance agencies and the states where the affiliated insurance agencies are licensed;
      - the locations outside of the United States where insurance or annuities are sold or solicited; and
      - if any subsidiary agency operates as a financial subsidiary under the Gramm-Leach-Bliley Act.
   c. Determine if the insurance or annuity producer is acting as a managing general agent (MGA).[1] If so, determine—
      - the scope of the MGA activities;
      - the state member bank management's assessment of the risk associated with the MGA activity; and

1. MGAs do not assume underwriting risk. Through contractual arrangements with an insurer, MGAs have the authority to write policies on behalf of the insurer in certain instances, thereby binding the insurer to the policy. Certain minimum provisions governing MGA agreements are delineated in the applicable National Association of Insurance Commissioners (NAIC) model law.

- what risk controls are in place to protect the state member bank from potential loss that may arise from the MGA's activities, such as loss arising from legal liability.

4. *Strategic and financial plans.* Assess management controls over the insurance and annuity sales activities.
   a. Ascertain the state member bank management's strategic and financial plans and goals for the insurance or annuity sales activity.
   b. Review the state member bank's due-diligence process for acquiring and pricing agencies, if applicable.
   c. Review the state member bank's financial budgets and forecasts for the activity, particularly plans for new products, marketing strategies and marketing arrangements, and the rate of actual and expected growth for the activity.
   d. Determine the cause for significant deviations from the plan.
   e. Determine if any agency acquired by the state member bank is providing the expected return on investment and if the agency's revenues are covering the debt servicing associated with the purchase, if applicable.
5. *Review of board and committee records and reports.*
   a. Review the reports of any significant state member bank oversight committees, including relevant board of directors and board committee minutes and risk-management reports.
   b. Determine if the board of directors, a board committee, or senior management of the state member bank reviews reports pertaining to consumer complaints and complaint resolution, information pertaining to litigation and associated losses, and performance compared with the organization's plan for the insurance and annuity sales activities.
6. *Policies and procedures.*
   a. Determine—
      - the adequacy of the state member bank's policies and procedures for conducting and monitoring insurance or annuity sales activities, including those policies designed to ensure adherence with federal and state laws and regulations pertaining to consumer protection;
      - whether there are appropriate policies and procedures for the handling of customer funds collected on behalf of the underwriter; accurate and timely financial reporting; complaint monitoring and resolution; effective system security and disaster-recovery plans; and policy-exception tracking and reporting; and
      - if the board of directors or its designated committee has formally approved the policies.
   b. Obtain a detailed balance sheet for agency subsidiaries, and determine if the assets held by insurance or annuity agency subsidiaries of the state member bank are all bank-eligible investments.
   c. Determine the independence of the state member bank's audit program applicable to the insurance and annuity sales activity. Determine if the audit program's scope, frequency, and resources are commensurate with the insurance or annuity sales activities conducted.
   d. Determine how the state member bank selects insurance underwriters with whom to do business, as well as how the state member bank monitors the continuing performance of the underwriters.
   e. Determine the adequacy of the oversight of the bank's board of directors over the insurance management team's qualifications, the training and licensing of personnel, and general compliance with state insurance regulations.
   f. Review the internal controls of the state member bank related to third-party arrangements, including arrangements for sales, processing, and auditing of insurance or annuity sales activities.
7. *Claims, litigation, and functional regulatory supervision.* Assess legal and reputational risk.
   a. Identify any significant litigation against the state member bank arising from its insurance or annuity sales activity and the likely impact of the litigation on the state member bank.
   b. Obtain the insurance agency's errors and omissions claims records for the past several years, including a listing of claims it has made and the amount of claims, the claim status, and the amount of claim payments.
   c. Review the state member bank's policies

and procedures for tracking and resolving claims. Determine if they appear adequate and if they are adhered to.

d. Determine if the applicable functional regulator has any outstanding supervisory issues with the insurance agency.

8. *Consumer complaints.*
   a. Determine if bank managagement has policies and procedures in place to assess whether consumer complaints received are likely to expose the state member bank to regulatory action, litigation, reputational damage, or other significant risk.
   b. Obtain applicable consumer complaint files, and evaluate internal control procedures to ensure the complaints are being adequately addressed.
9. *Audit and compliance functions.*
   a. Determine the date of the most recent review of the insurance or annuity sales activities by the audit and compliance functions.
   b. Determine the adequacy of the state member bank's management policies and procedures for ensuring that any deficiencies noted in such reviews are corrected, and ascertain whether any such deficiencies are being adequately addressed.[2]
10. *Insurance underwriter oversight of agent/agency activities.*
    a. Determine if there are adequate policies and procedures to review and resolve any issues or concerns raised by an insurance underwriter regarding the producers used by, or affiliated with, the state member bank.[3]
    b. Determine whether any of the insurance underwriters conducted a periodic review of the producers that they engaged to sell insurance.
11. *State supervisory insurance authorities.*
    a. During discussions with state member bank management, determine whether state insurance regulators have raised any issues or concerns in correspondence or reports.
    b. Consult with the state insurance regulators, as appropriate, to determine any significant supervisory issues, actions, or investigations. (For multistate agencies, contacts with states may be prioritized on the basis of the location of the agency's head office or by a determination of the significance of sales by state. Both financial examinations and market conduct examinations conducted by the state insurance departments are targeted at insurance underwriters, not agencies. Therefore, information available from the states pertaining to agencies may be very limited.)
12. *Operational risk assessment.* Ascertain from the state member bank's management whether there are—
    a. any significant operational problems or concerns relating to insurance or annuity sales activities;
    b. policies and procedures in place to ensure accurate and timely reporting to the state member bank's management of insurance or annuity sales activity plans, financial results, and significant consumer complaints or lawsuits or compliance issues, such as errors and omissions claims;[4]
    c. appropriate policies and procedures at the state member bank to ensure accurate reporting of insurance or annuity sales activity on Federal Reserve regulatory reports (Determine from applicable Board or Reserve Bank contacts if there are any outstanding issues with respect to potential reporting errors on submitted Federal Reserve reports, bank call reports, or other applicable reports. If so, seek resolution of the issues.); and
    d. adequate disaster-recovery plans and procedures to protect the state member bank from loss of data related to insurance or annuity sales activities.

2. Enforcement of the privacy provisions of the Gramm-Leach-Bliley Act as they relate to state member banks is the responsibility of the Board's Division of Consumer and Community Affairs. However, enforcement of the privacy provisions of the GLB Act with respect to the insurance activities of nondepository subsidiaries of a state member bank is the responsibility of the state insurance regulators.

3. Insurance underwriters generally have procedures to determine whether individual producers affiliated with agencies are selling the underwriters' products in conformance with applicable laws and regulations. The findings and conclusions of these reviews should be available to the state member bank's management.

4. Errors and omissions insurance should be in place to protect the state member bank against loss sustained because of an error or oversight, such as failure to issue an insurance policy. A tracking system to monitor errors and omission claims should be in place and monitored by the state member bank, as appropriate. See section 4040.1, "Management of Insurable Risks."

CONSUMER PROTECTION IN SALES OF INSURANCE REGULATION

The following procedures should be risk-focused in accordance with the Federal Reserve's risk-focused framework for supervising banking organizations. The procedures should be carried out as necessary to adequately assess the state member bank's compliance with the Consumer Protection in Sales of Insurance (CPSI) regulation.

1. Determine the role of the state member bank's board of directors and management in ensuring compliance with the CPSI regulation and applicable state consumer regulations.
2. Evaluate the management information system (MIS) reports the state member bank's board or designated committee rely on to monitor compliance with the consumer regulations and to track complaints and complaint resolution.
3. Review the state member bank's policies and procedures to ensure they are consistent with the CPSI regulation, and conduct transaction testing, as necessary, in the following areas.[5]
   a. disclosures, advertising, and promotional materials
   b. consumer acknowledgments
   c. physical separation from areas of deposit-taking activities
   d. qualifications and licensing for insurance personnel
   e. compliance programs and internal audits
   f. hiring, training, and supervision of insurance or annuity sales personnel employed directly by the bank, or of third parties selling insurance or annuity products at a state member bank office or on behalf of the state member bank
   g. compensation practices and training for personnel making referrals
4. If a third party sells insurance or annuities at the state member bank's offices, or on behalf of the bank, review the state member bank's policies and procedures for ensuring that the third party complies with the CPSI regulation and other relevant policies and procedures of the bank.
5. Review the bank's process for identifying and resolving consumer complaints related to the sale of insurance products and annuities.
6. Obtain and review the record of consumer complaints related to the CPSI regulation. (These records are available from the Board's Division of Consumer and Community Affairs database. See CP letter 2001-11.)
7. Include examination findings, as appropriate, in the commercial bank examination report or in other communications to the bank, as appropriate, that pertain to safety-and-soundness reviews of the bank.

5. If the examiner determines that transaction testing of a functionally regulated nonbank affiliate of the state member bank is appropriate in order to determine the state member bank's compliance with the CPSI regulation, the examiner should first consult with and obtain approval from appropriate staff of the Board's Division of Banking Supervision and Regulation.

RISK ASSESSMENT OF INSURANCE AND ANNUITY SALES ACTIVITIES

Program Management

1. Does the state member bank have a comprehensive program to ensure that its insurance and annuity sales activities are conducted in a safe and sound manner?
2. Does the state member bank have appropriate written policies and procedures commensurate with the volume and complexity of the insurance or annuity sales activities?
3. Has bank management obtained the approval of the bank's board of directors for the program scope and the associated policies and procedures?
4. Have reasonable precautions been taken to ensure that disclosures to customers for insurance or annuity sales and solicitations are complete and accurate, and are in compliance with applicable laws and regulations?
5. Does the state member bank effectively oversee the insurance or annuity sales activities, including those involving third parties?
6. Does the state member bank have an effective independent internal audit and compliance program in place to monitor retail sales of insurance or annuity products?
7. Does the bank appropriately train and supervise employees conducting insurance or annuity sales activities?

Management Information Systems

8. Does the state member bank's insurance program management plan establish the appropriate management information systems (MIS) necessary for the board of directors to properly oversee the bank's insurance or annuity sales activities?
9. Does MIS provide sufficient information to allow for the evaluation and measurement of the effect of actions taken to identify, track, and resolve any issues relative to compliance with the Consumer Protection in Sales of Insurance (CPSI) regulation?
10. Does MIS include sales volumes and trends, profitability, policy exceptions and associated controls, customer complaints, and other information providing evidence of compliance with laws and established policies?

Compliance Programs and Internal Audits

11. Are there policies and procedures in place to ensure that insurance or annuity sales activities are conducted in compliance with applicable laws and regulations?
12. Do compliance procedures identify potential conflicts of interest and how such conflicts should be addressed?
13. Do the compliance procedures provide a system to monitor customer complaints and track their resolution?
14. When applicable, do compliance procedures call for verification that third-party sales are being conducted in a manner consistent with the agreement governing the third party's arrangement with the state member bank?
15. Is the compliance function conducted independently of the insurance or annuity sales and management activities?
16. Do compliance personnel determine the scope and frequency of the insurance-product review?
17. Are findings of insurance or annuity sales activity compliance reviews periodically reported directly to the state member bank's board of directors or a designated committee thereof?

CONSUMER PROTECTION IN SALES OF INSURANCE REGULATION

If applicable, review the state member bank's internal controls, policies, practices, and procedures for retail insurance or annuity sales activities conducted by the bank on bank premises or on behalf of the bank. The bank's program management for such activities should be well documented and should include appropriate personnel training, as well as compliance and audit-function coverage of all efforts to ensure compliance with the provisions of the Board's CPSI regulation.

Advertising and Promotional Materials

1. Do advertising materials associated with the insurance or annuity sales program create an erroneous belief that—
   a. an insurance product or annuity sold or offered for sale by the state member bank, or on behalf of the bank, is backed by the federal government or the bank, or that the product is insured by the FDIC?
   b. an insurance product or annuity that involves investment risk does not, in fact, have investment risk, including the potential that principal may be lost and the product may decline in value?
2. Does a review of advertising for insurance products or annuities sold or offered for sale create an erroneous impression that—
   a. the state member bank or an affiliate or subsidiary may condition the grant of an extension of credit to a consumer on the purchase of an insurance product or annuity by the consumer from the bank or an affiliate or subsidiary of the bank?
   b. the consumer is not free to purchase an insurance product or annuity from another source?

Disclosures

3. In connection with the initial purchase of an insurance product or annuity by a consumer, does the initial disclosure to the consumer, except to the extent the disclosure would not be accurate, state that—
   a. the insurance product or annuity is not a deposit or other obligation of, or is not guaranteed by, the state member bank or an affiliate of the bank?
   b. the insurance product or annuity is not insured by the FDIC or any other agency of the United States, the state member bank, or (if applicable) an affiliate of the bank?
   c. in the case of an insurance product or annuity that involves an investment risk, there is risk associated with the product, including the possible loss of value?
4. In the case of an application for credit, in connection with which an insurance product or annuity is solicited, offered, or sold, is a disclosure made that the state member bank may not condition an extension of credit on either—
   a. the consumer's purchase of an insurance product or annuity from the bank or any of its affiliates?
   b. the consumer's agreement not to obtain, or a prohibition on the consumer's obtaining, an insurance product or annuity from an unaffiliated entity?
5. Are the disclosures under question 3 above provided orally and in writing before the completion of the initial face-to-face sale of an insurance product or annuity to a consumer?
6. Are the disclosures under question 4 above made orally and in writing at the time the consumer applies in a face-to-face interaction for an extension of credit in connection with which insurance is solicited, offered, or sold?
7. If a sale of an insurance product or annuity is conducted by telephone, are the disclosures under question 3 above provided in writing, by mail, within three business days?
8. If an application for credit is by telephone, are the disclosures under question 4 above provided by mail to the consumer within three business days?
9. Are the disclosures under questions 3 and 4 above provided through electronic media, instead of on paper, only if the consumer affirmatively consents to receiving the disclosures electronically, and only if the disclosures are provided in a format that the consumer may retain or obtain later?
10. Are disclosures made through electronic media, for which paper or oral disclosures are not required, presented in a meaningful form and format?
11. Are disclosures conspicuous, simple, direct, readily understandable, and designed to call attention to the nature and significance of the information provided?
12. Are required disclosures presented in a meaningful form and format?

Consumer Acknowledgment

13. At the time a consumer receives the required disclosures, or at the time of the consumer's initial purchase of an insurance product or annuity, is a written acknowledgment from the consumer that affirms receipt of the disclosures obtained?
14. If the required disclosures are provided in connection with a transaction that is conducted by telephone—
    a. has an oral acknowledgment of receipt of the disclosures been obtained, and is sufficient documentation maintained to show that the acknowledgment was given?
    b. have reasonable efforts to obtain a written acknowledgment from the consumer been made?

Physical Separation from Deposit Activities

15. Does the state member bank, to the extent practicable—
    a. keep the area where the bank conducts transactions involving the retail sale of insurance products or annuities physically segregated from the areas where retail deposits are routinely accepted from the general public?
    b. identify the areas where insurance product or annuity sales activities occur?
    c. clearly delineate and distinguish insurance and annuity sales areas from the areas where the bank's retail deposit-taking activities occur?

Qualifications and Licensing

16. Does the state member bank permit any person to sell, or offer for sale, any insurance product or annuity in any part of its office, or on its behalf, only if the person is at all times appropriately qualified and licensed under applicable state insurance licensing standards for the specific products being sold or recommended?

Hiring, Training, and Supervision

17. Have background investigations of prospective employees that will sell insurance products or annuities been completed?
18. When a candidate for employment has previous insurance experience, has a review to determine whether the individual has been the subject of any disciplinary actions by state insurance regulators been completed?
19. Do all insurance or annuity sales personnel, or third-party sales personnel conducting sales activities at or on behalf of the state member bank, receive appropriate training and continue to meet licensing requirements?
20. Does training address policies and procedures for sales of insurance and annuity products, and does it cover personnel making referrals to a licensed insurance producer?
21. Does training ensure that personnel making referrals about insurance products or annuities are properly handling all inquiries so as not to be deemed to be acting as unlicensed insurance agents or registered (or equivalently trained) securities sales representatives (for insurance products that are also securities) if they are not qualified?
22. When insurance products or annuities are sold by the state member bank or third parties at an office of, or on behalf of, the organization, does the institution have policies and procedures to designate, by title or name, the individuals responsible for supervising insurance sales activities, as well as the referral activities of bank employees not authorized to sell these products?
23. Does the bank designate supervisory personnel responsible for monitoring compliance with any third-party agreement, as well as with the CPSI regulation?

Referrals

24. Are fees paid to nonlicensed personnel who are making referrals to qualified insurance or annuity salespersons limited to a one-time, nominal fee of a fixed dollar amount for each referral, and is the fee unrelated to whether the referral results in a sales transaction?

Third-Party Agreements

25. Does the state member bank's management conduct a comprehensive review of a third party before entering into any arrangement to conduct insurance or annuity sales activities through the third party?
26. Does the review include an assessment of the third party's financial condition, management experience, reputation, and ability to fulfill its contractual obligations to the bank, including compliance with applicable consumer protection laws and regulation?
27. Does the board of directors or a designated committee thereof approve any agreement with the third party?
28. Does the agreement outline the duties and responsibilities of each party; describe the third-party activities permitted on the institution's premises; address the sharing or use of confidential customer information; and define the terms for use of the bank's office space, equipment, and personnel?
29. Does the third-party agreement specify that the third party will comply with all applicable laws and regulations and will conduct its activities in a manner consistent with the CPSI regulation, if applicable?
30. Does the agreement authorize the bank to monitor a third party's compliance with the agreement, as well as to have access to third-party records considered necessary to evaluate compliance?
31. Does the agreement provide for indemnification of the institution by the third party for any losses caused by the conduct of the third party's employees in connection with its insurance or annuity sales activities?
32. If an arrangement includes dual employees, does the agreement provide for written employment contracts that specify the duties of these employees and their compensation arrangements?
33. If the state member bank contracts with a functionally regulated third party, does the bank obtain, as appropriate, any relevant regulatory reports of examination of the third party?
34. How does the state member bank ensure that a third party selling insurance or annuity products at or on behalf of the bank complies with all applicable regulations, including the CPSI regulation?
35. How does the state member bank ensure that any third party or dual employee selling insurance or annuity products at or on behalf of the bank is appropriately trained to comply with the minimum disclosures and other requirements of the Board's CPSI regulation and applicable state regulations?
36. Does the bank obtain and review copies of third-party training and compliance materials to monitor the third party's performance regarding its disclosure and training obligations?

Consumer Complaints

37. Does the state member bank have policies and procedures for handling customer complaints related to insurance and annuity sales?
38. Does the customer complaint process provide for the recording and tracking of all complaints?
39. Does the state member bank require periodic reviews of complaints by compliance personnel? Is a review by the state member bank's board and senior management required for significant compliance issues that may pose risk to the state member bank?

INTRODUCTION

Banks routinely rely on third parties for a range of products, services, and other activities. The use of third parties can offer banks efficient access to technologies, human capital, delivery channels, products, services, and markets. As a result, the numbers and types of banks' third-party relationships have increased over time. The use of third parties, especially those utilizing new technologies, may present elevated risks to a bank and its customers, including operational, compliance, and strategic risks. Therefore, when a bank uses a third party, the bank needs a strong risk-management process to ensure that the third party conducts its activities in a safe-and-sound manner and in compliance with applicable laws and regulations. Such laws and regulations include those designed to protect consumers (i.e., fair lending laws and prohibitions against unfair, deceptive, or abusive acts or practices) and those addressing financial crimes.

The purpose of this manual section is to provide a summary of *Interagency Guidance on Third-Party Relationships* (interagency guidance) issued by the Federal Reserve, Federal Deposit Insurance Corporation, and Office of the Comptroller of the Currency (collectively, the agencies) on managing risks associated with third-party relationships. For the complete guidance see SR-23-4, "Interagency Guidance on Third-Party Relationships: Risk Management."[1]

INTERAGENCY GUIDANCE ON MANAGING RISKS ASSOCIATED WITH THIRD-PARTY RELATIONSHIPS

Overview

The agencies issued the interagency guidance to assist banks in identifying and managing risks associated with third-party relationships and in complying with applicable laws and regulations.[2] Furthermore, the interagency guidance offers the agencies' views on sound risk-management principles for supervised institutions when developing and implementing risk-management practices for all stages in the life cycle of third-party relationships. In the end, a bank's third-party risk management should reflect the level of risk, complexity, and size of the bank and the nature of its third-party relationship.

Applicability of the Guidance

The interagency guidance is relevant to institutions supervised by the agencies. For the Federal Reserve, this primarily includes state member banks, bank holding companies, savings and loan holding companies, U.S. branches and agencies of foreign banking organizations, and Edge Act and agreement corporations.

The interagency guidance addresses any business arrangement between a bank and a third-party entity, by contract or otherwise. A "business arrangement" is another term for "third-party relationship," including

- outsourced services,
- independent consultants,
- referral arrangements,
- merchant payment processing services,
- services provided by affiliates and subsidiaries, and
- joint ventures.

Risk Management

As a third-party relationship presents a varying level of risk, a bank's risk-management practices should include

- analyzing the risks associated with each third-party relationship;
- tailoring risk-management practices, commensurate with the bank's size, complexity, and risk profile as well as the nature of the third-party relationship;

1. See also 88 Fed. Reg. 37,920 (June 9, 2023).
2. These include the "Interagency Guidelines Establishing Standards for Safety and Soundness," and the "Interagency Guidelines Establishing Information Security Standards," which were adopted pursuant to the procedures of section 39 of the Federal Deposit Insurance Act and section 505 of the Graham Leach Bliley Act, respectively. See 12 CFR pt. 208, appendices D-1 and D-2.

- maintaining a complete inventory of its third-party relationships;
- periodically conducting risk assessments for each third-party relationship and determining whether risks have changed over time and risk-management practices need to be updated; and
- engaging in more rigorous oversight and management of third-party relationships that support higher-risk activities, including the bank's critical activities.

Critical Activities

Critical activities will depend upon a bank's risk profile and business operations. Characteristics of critical activities may include those activities that could

- cause a bank to face significant risk if the third party fails to meet expectations;
- have significant customer impacts; or
- have a significant impact on a bank's financial condition or operations.

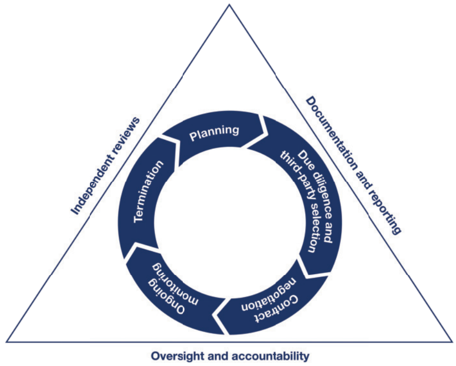
A bank should identify its critical activities and third-party relationships that support these activities. Some banks may assign a criticality or risk level to each third-party relationship, whereas others identify critical activities and those third parties that support such activities.

Third-Party Relationship Life Cycle

Effective third-party risk management generally follows a continuous life cycle for third-party relationships. The stages of the risk-management life cycle of third-party relationships are shown in figure 1 and detailed below. The interagency guidance includes examples of risk-management practices that a bank may find helpful in the development and maintenance of its risk-management process. However, these examples may not apply to all banks' third-party relationships.

Bank staff with the requisite knowledge and skills should appropriately implement each stage of the risk-management life cycle. A bank may involve experts across disciplines, such as compliance, risk, or technology as well as legal counsel, and may engage external support when helpful to supplement the qualifications and technical expertise of in-house staff.[3]

Figure 1. The risk-management life cycle of third-party relationships



Planning

As part of sound risk management, effective planning allows a bank to evaluate and consider its approach for managing risks before entering into a third-party relationship. Certain third parties, such as those that support a bank's higher-risk activities, including critical activities, typically warrant a greater degree of planning and consideration. For example, when critical activities are involved, plans may be presented to and approved by a bank's board of directors (or a designated board committee).

Due Diligence and Third-Party Selection

Conducting due diligence on third parties before selecting and entering into third-party relationships is an important part of sound risk management. Due diligence includes assessing the third party's ability to perform the activity as expected, adhere to a bank's policies related to the activity, comply with all applicable laws and regulations, and conduct the activity in a safe and sound manner. The due diligence process provides

- management with the information needed about potential third parties to determine if a

3. When a bank uses a third-party assessment service or utility, it has a business arrangement with that entity. Therefore, the arrangement should be incorporated into the bank's third-party risk-management processes.

relationship would help achieve a bank's strategic and financial goals; and
- the bank with the information needed to evaluate whether it can appropriately identify, monitor, and control risks associated with the particular third-party relationship.

Relying solely on experience with or prior knowledge of a third party is not an adequate proxy for performing appropriate due diligence, as the scope and degree of due diligence should be commensurate with the level of risk and complexity of the third-party relationship.[4]

Contract Negotiation

When evaluating whether to enter into a relationship with a third party, a bank typically determines whether a written contract is needed, and if the proposed contract can meet its business goals and risk-management needs. After such determination, a bank typically negotiates contract provisions that will facilitate effective risk management and oversight and that specify the expectations and obligations of both the bank and the third party. A bank may tailor the level of detail and comprehensiveness of such contract provisions based on the risk and complexity posed by the particular third-party relationship.

Ongoing Monitoring

Ongoing monitoring enables a bank to (1) confirm the quality and sustainability of a third party's controls and ability to meet contractual obligations; (2) escalate significant issues or concerns, such as material or repeat audit findings, deterioration in financial condition, security breaches, data loss, service interruptions, compliance lapses, or other indicators of increased risk; and (3) respond to such significant issues or concerns when identified.

Typical monitoring activities include:

1. Reviewing reports regarding the third party's performance and the effectiveness;
2. Periodically visiting and meeting with third-party representatives; and
3. Regularly testing a bank's controls that manage risks from its third-party relationships.

Table 1 provides information on a bank's risk management of third-party relationships, focusing on due diligence, contract negotiations, and ongoing monitoring considerations.

Termination

A bank may terminate a relationship for various reasons, such as expiration or breach of the contract; the third party's failure to comply with applicable laws or regulations; or a desire to seek an alternate third party, bring the activity in-house, or discontinue the activity. In terminating a relationship, bank management should consider whether the activities will be transitioned to another third party, brought in-house, or discontinued. Depending on the degree of risk and complexity of the third-party relationship, a bank typically considers various factors to facilitate termination such as

- transitioning services and activities.
- costs and fees associated with termination.
- managing risks associated
  - — with data retention and destruction;
  - — information system connections and access control, or other control concerns;
  - — handling of joint intellectual property; and
  - — with the termination of services including any impact on customers and the necessary action to address the third party's inability to perform in accordance with service expectations.

Governance

Oversight and Accountability

Proper oversight and accountability in the third-party risk-management process aid a bank in minimizing adverse financial, operational, or other consequences. A bank's board of directors has ultimate responsibility for providing oversight for third-party risk management and holding bank management accountable. The board also provides clear guidance regarding acceptable risk appetite, approves appropriate policies, and ensures that appropriate procedures and

4. For more background information, see *Community Bank Access to Innovation Through Partnerships* (September 2021) and *Interagency Due Diligence Guide for Community Banks* (August 2021).

practices have been established. In turn, bank management is responsible for developing and implementing third-party risk-management policies, procedures, and practices, commensurate with the bank's risk appetite and the level of risk and complexity of its third-party relationships. Table 2 highlights the typical roles and responsibilities of a bank's board and management in the third-party risk-management process.

Independent Reviews

Periodic independent reviews of third-party relationships allow a bank to assess the adequacy of its risk-management processes over third-party activities. Such reviews typically consider whether

- the third-party relationships align with the bank's business strategy, and with internal policies, procedures, and standards;
- risks of third-party relationships are identified, measured, monitored, and controlled;
- the bank's processes and controls are designed and operating adequately;
- the bank's staff with appropriate expertise are engaged to perform risk-management activities throughout the third-party risk-management life cycle; and
- conflicts of interest or appearances of conflicts of interest are avoided or eliminated when a bank selects a third party and as part of its oversight process for monitoring the activities of third parties.

The results of independent reviews may aid a bank in determining whether and how to adjust its third-party risk-management process, including its policies, reporting, resources, expertise, and controls. Furthermore, bank management should respond promptly and thoroughly to issues or concerns identified and escalate them to the bank's board of directors, as appropriate.

Documentation and Reporting

Documentation and reporting are key elements of a bank's risk-management process for overseeing third-party risk activities and the activities of specific third-party relationships throughout the life cycle of that relationship. The extent of documentation and reporting will depend on the complexity of a bank's third-party relationships. The following are examples of processes that support effective documentation and internal reporting:

- a current inventory of all third-party relationships (and, as appropriate, related subcontractors) that clearly identifies higher-risk and critical activities;
- planning and risk assessments related to the use of third parties;
- due diligence results and recommendations;
- executed contracts;
- results of independent reviews;
- remediation plans and related reports addressing the quality and sustainability of the third party's controls;
- risk and performance reports required and received from the third party as part of ongoing monitoring;
- if applicable, reports related to customer complaints and inquiry monitoring, and any subsequent remediation reports;
- reports from third parties of service disruptions, security breaches, or other events that pose, or may pose, a material risk to the bank; and
- periodic reporting to the board of directors (including, as applicable, dependency on a single provider for multiple activities).

Supervisory Review of Third-Party Relationships

The Federal Reserve reviews its supervised institutions' risk management of third-party relationships as part of its supervisory processes, tailored to the institution's asset size and complexity. Supervisory reviews will evaluate risks and the effectiveness of risk management to determine whether activities are conducted in a safe-and-sound manner and in compliance with applicable laws and regulations.

In evaluating a bank's third-party risk management, examiners consider whether the bank engages in a diverse set of third-party relationships, recognizing that not all third-party risk relationships present the same risks, and that a bank accordingly tailors its practices to the risks. Thus, the scope of the supervisory review depends on the degree of risk and the complexity associated with a bank's activities and third-party relationships. When reviewing third-party risk-management processes, examiners typically conduct the following activities, among others:

- assess the ability of the bank's management to oversee and manage the bank's third-party relationships;
- assess the impact of third-party relationships on the bank's risk profile and key aspects of financial and operational performance, including compliance with applicable laws and regulations;
- perform transaction testing or review results of testing to evaluate third-party activities and assess compliance with applicable laws and regulations;
- highlight and discuss any material risks and deficiencies in the bank's risk-management process with senior management and the board of directors, as appropriate;
- review the bank's plans for appropriate and sustainable remediation of any deficiencies, particularly those associated with the oversight of third parties that involve critical activities; and
- consider supervisory findings when assigning the components of the applicable rating system and highlight any material risks and deficiencies in the report of examination or supervisory letter.

When circumstances warrant, the Federal Reserve may use its legal authority to examine functions or operations that a third party performs on behalf of a bank. Such examinations may evaluate the third party's ability to fulfill its obligations in a safe-and-sound manner and comply with applicable laws and regulations, including those designed to protect customers and to provide fair access to financial services. The Federal Reserve may pursue corrective measures, including enforcement actions, when necessary to address violations of laws and regulations or unsafe or unsound banking practices by the bank or its third party.

Table 1. Bank risk management of third-party relationships

Risk-management theme	**Due diligence considerations** *The bank should consider the third party's…*	**Contract considerations** *Effective contracts typically discuss…*	**Ongoing monitoring** *The bank should assess…*
Strategies and goals	• Current and proposed strategic business arrangements. • Service philosophies, quality initiatives, and employment policies and practices.	• The nature and scope of the business arrangement. • The activities the third party will perform. • Ancillary services, such as software, technology support, maintenance, and customer service. • Terms governing the use of the bank's information, facilities, personnel, systems, intellectual property, and equipment as well as the bank's or customers' information. • All costs and compensation arrangements.	Changes to the third party's business strategy that may pose new or increased risks or impact the third party's ability to meet contractual obligations.
Legal and regulatory compliance	• Ownership structure. • Whether the third party is subject to sanctions. • Expertise, processes, and controls to enable the bank to comply with applicable laws and regulations. • Responsiveness to issues. • Process to mitigate, areas of potential consumer harm.	The obligations of the third party and the bank to comply with applicable laws and regulations.	The third party's ongoing compliance with applicable laws and regulations and its performance as measured against contractual obligations.
Financial condition	• Audited financial statements, annual reports, and filings with the U.S. Securities and Exchange Commission.	The type and frequency of reports to be received from the third party, including performance reports, financial reports, security reports, and control assessments.	Changes in the third party's financial condition, including its financial obligations to others.
Business experience	• Depth of resources (including staffing). • Previous experience. • History of addressing customer complaints.	The terms governing the use of the bank's personnel. If dual employees will be used, it may also be helpful to specify their responsibilities and reporting lines.	Changes in the third party's key personnel involved in the activity.

Risk-management theme	**Due diligence considerations** *The bank should consider the third party's…*	**Contract considerations** *Effective contracts typically discuss…*	**Ongoing monitoring** *The bank should assess…*
Qualifications and backgrounds of key personnel and other human resources considerations	• Background checks on the third party's key personnel and contractors. • Ability to identify and remove employees failing to meet suitability requirements. • Succession and redundancy planning.	Performance measures that do not incentivize imprudent performance or behavior, such as encouraging processing volume or speed without regard for accuracy, compliance requirements, or adverse effects on the bank or customer.	Training provided to employees of the bank and the third party.
Risk management	• Policies, processes, and internal controls. • Alignment with applicable policies and expectations of the bank surrounding the activity. • Audit assessments, including independent testing and objective reporting of results and findings. • System and Organization Control (SOC) reports.	Provisions for periodic, independent audits of the third party and its relevant subcontractors, consistent with the risk and complexity of the third-party relationship.	Relevant audits, testing results, and other reports that address whether the third party remains capable of managing risks and meeting contractual obligations and regulatory requirements.
Information security	• Information security program and determine whether there are any gaps that present risk. • Experience in identifying, assessing, and mitigating, known and emerging threats and vulnerabilities.	When and how the third party will disclose, in a timely manner, information security breaches or unauthorized intrusions.	The third party's response to changing threats, new vulnerabilities, and incidents impacting the activity, including any resulting adjustments to the third party's operations or controls.
Management information systems	• Ability to identify gaps in service-level expectations, business process and management, and interoperability issues. • Processes for maintaining timely and accurate inventories of its technology and its contractor(s).	• Prohibitions on the use and disclosure of bank and customer information by a third party and its subcontractors, except as necessary to provide the contracted activities or comply with legal requirements. • Obligations for retention and provision of timely, accurate, and comprehensive information.	The third party's ability to maintain the confidentiality, availability, and integrity of the bank's systems, information, and data, as well as customer data, where applicable.

Risk-management theme	**Due diligence considerations** *The bank should consider the third party's…*	**Contract considerations** *Effective contracts typically discuss…*	**Ongoing monitoring** *The bank should assess…*
Operational resilience	• Results from operational resilience and business continuity testing and performance during actual disruptions. • Telecommunications redundancy and resilience plans. • Preparations for threats and vulnerabilities, such as natural disasters, pandemics, distributed denial of service attacks, or other intentional or unintentional events.	The continuation of the activity in the event of problems affecting the third party's operations, including degradations or interruptions in delivery.	The third party's response to incidents, business continuity and resumption plans, and testing results to evaluate the third party's ability to respond to and recover from service disruptions or degradations.
Incident reporting and management processes	Documented processes, timelines, and accountability for identifying, reporting, investigating, and escalating incidents.	Whether the bank or the third party is responsible for responding to customer complaints or inquiries.	The volume, nature, and trends of customer inquiries and complaints, the adequacy of the third party's responses (if responsible for handling customer inquiries or complaints), and any resulting remediation.
Physical security	Physical and environmental controls to protect the safety and security of people, facilities, technology systems, and data, as applicable.	The terms governing the use of the bank's facilities, personnel, systems, and equipment.	*See ongoing monitoring for "Operational resilience" above.*
Reliance on subcontractors	Ability to identify, manage, and mitigate risks associated with subcontracting, including how the third party selects and oversees its subcontractors and ensures that its subcontractors implement effective controls.	When and how the third party should notify the bank of its use or intent to use a subcontractor and whether specific subcontractors are prohibited by the bank.	The third party's reliance on, exposure to, and use of subcontractors, the location of subcontractors (and any related data), and the third party's own risk-management processes for monitoring subcontractors.

Risk-management theme	**Due diligence considerations** *The bank should consider the third party's…*	**Contract considerations** *Effective contracts typically discuss…*	**Ongoing monitoring** *The bank should assess…*
Insurance coverage	Insurance policies and the extent to which potential losses are mitigated, including losses posed by the third party to the bank.	• Specified types and amounts of insurance (including, if appropriate, naming the bank as insured or additional insured). • Notifications to the bank of material changes to coverage. • Expectations for evidence of coverage, as appropriate.	Changes to, or lapses in, the third party's insurance coverage.
Contractual agreements with other parties	Legally binding arrangements with subcontractors or other parties to determine whether such arrangements may create or transfer risks to the bank or its customers.	• Indemnification clauses specifying the extent to which the bank will be held liable for claims or be reimbursed for damages based on the failure of the third party or its subcontractor to perform. • The dispute resolution process to resolve problems between the bank and the third party in an expeditious manner, and whether the third party should continue to provide activities to the bank during the dispute resolution period. • The extent to which the third party has the right to use the bank's information, technology, and intellectual property, such as the bank's name, logo, trademark, and copyrighted material.	Changes to the third party's agreements with other entities that may pose new or increased risks or impact the third party's ability to meet contractual obligations.

Table 2. Third-party risk-management responsibilities for a bank's board of directors and management

Board of directors (or a designated board committee)	Bank management
• Assessing whether third-party relationships are managed in a manner consistent with the bank's strategic goals and risk appetite and in compliance with applicable laws and regulations • Assessing whether there is appropriate periodic reporting on third-party relationships to monitor third-party relationships and these activities • Determining whether management has taken appropriate actions to remedy performance issues and address changing risks or material issues	• Integrating third-party risk management with the bank's overall risk-management processes • Directing the planning, due diligence, and ongoing monitoring of third-party activities • Reporting periodically on third-party activities to the board (or designated board committee) • Providing that contracts with third parties are appropriately reviewed, approved, and executed • Establishing appropriate organizational structures and staffing to oversee third-party activities • Implementing and maintaining an appropriate system of internal controls to manage risks associated with third-party relationships • Assessing whether the bank's compliance management system is appropriate given the nature, size, complexity, and scope of its third-party relationships • Determining whether the bank has appropriate access to data and information from its third parties • Escalating significant issues to the board and monitoring any resulting remediation, including actions taken by the third party • Appropriately terminating business arrangements with third parties

LITIGATION AND OTHER LEGAL MATTERS

Events or conditions arising from litigation,[1] claims, and assessments are matters within the direct knowledge and, often, control of bank management. Accordingly, management is the primary source of information about these matters.[2] Examiners ordinarily do not possess legal skills and therefore cannot make legal judgments on such information.[3] Examiners should request that bank management send a letter of inquiry to those attorneys with whom it has consulted on litigation, claims, and assessments. The letter of inquiry is the examiner's primary means of corroborating information furnished by management.

When requesting these inquiries, examiners should consider the scope of counsel's involvement with the bank. Banks may engage a number of law firms, so examiners should have the bank direct requests to both general counsel and counsel whose service is limited to particular matters. Ordinarily, inquiries should be made of all outside counsel.

In certain instances, however, examiners may be reasonably certain that some of the bank's counsels are handling only routine matters that ultimately will not have a significant effect on the bank's financial condition. In these cases, the examiner-in-charge may decide not to send letters of inquiry to those counsels.

Requests for corroboration from legal counsel should ask for information about litigation, impending litigation, claims, and contingent liabilities. For the purposes of these requests, the terms impending litigation and contingent liabilities have the following meanings:

1. Legal risk arises from the potential that unenforceable contracts, lawsuits, or adverse judgments can disrupt or otherwise negatively affect the operations or condition of a financial institution.
2. In limited circumstances, a bank director who is not an officer of the bank may have direct knowledge and control of legal information, usually when the director's primary occupation is as an attorney. Management in these rare instances may have limited knowledge and control of legal information.
3. Appropriate examination staff should notify the enforcement section of Board Legal of any investigations or other legal actions being conducted by governmental regulators or criminal prosecutors against the bank when such information is ascertained during the examination process.

- *Impending litigation.* Litigation threatened against the bank by a third party but not formally commenced.
- *Contingent liabilities.* Matters other than litigation or claims, which available information indicates have at least a reasonable possibility of impairing assets or increasing liabilities. Contingent liabilities should include unasserted claims or assessments.

A letter of inquiry should ask for a response both as of the examination date and as of the date of counsel's response. That date of response should be as close to the completion of the examination as practicable, yet should allow sufficient time for evaluation of responses and follow-up of nonreplies. In some cases, the examiner may wish to obtain an interim response (in addition to a final response) so that a timely preliminary evaluation of material legal matters may be made. Letters of inquiry should be sent early enough to allow them to circulate within the law firm because several attorneys may be considering legal matters for the bank. Before completing the examination, examiners should request that appropriate bank officials contact counsel who have not responded to the initial letter of inquiry.

If examination staff have reason to believe that there may be subsequent developments, the examiner should contact bank management again before submitting the report of examination. If bank management is uncooperative or regarded as incapable of supervising matters concerning litigation, or if other sensitivities mandate circumvention of bank management, then examiners should bring the matter to the attention of Federal Reserve Bank management for further communications with the bank's management and counsel, which could include direct contact with bank counsel.

EXAMINATION-RELATED SUBSEQUENT EVENTS

As a practical matter, the examination, and therefore the report of examination, is as of a stated date. However, events or transactions sometimes occur, subsequent to the date of examination, but before the date the report of examination is submitted to the Reserve Bank, that may have a significant effect on the soundness of a bank. Such events and transactions are referred to as "subsequent events" and may be of two types.

One type includes those events or transactions that provide additional evidence about conditions that existed at the examination date. Examples of this type are the bankruptcy of a significant borrower or the resolution of outstanding litigation.

The second type includes those events that provide evidence about conditions that did not exist at the date of examination but that arose subsequently. An example of that type of event would be new litigation arising subsequent to the examination date but before submission of the examination report.

All information that becomes available before the submission of the report of examination should be used by examiners in the evaluation of the bank. Accordingly, all events or transactions that either significantly affect or have the potential to significantly affect the soundness of the bank should be reflected in the report of examination, regardless of whether they occurred before or subsequent to the examination date.

Litigation and Other Legal Matters, and Examination-Related Subsequent Events

Examination Objectives

Effective date October 2018

Section 4070.2

1. To determine whether any events or transactions have occurred subsequent to the examination date that have had or may have a significant impact on the present or future soundness of the bank or on the conclusions expressed in the report of examination.
2. To determine the adequacy of risk management practices surrounding litigation and other legal matters.
3. To determine the effect of legal counsel's evaluation of litigation, impending litigation, claims, and contingent liabilities on the examiner's overall conclusion regarding the soundness of the bank.

Litigation and Other Legal Matters, and Examination-Related Subsequent Events
Examination Procedures
Effective date October 2018

Section 4070.3

1. Read minutes of all meetings of stockholders, directors, and appropriate committees (investment, loans, etc.).
   a. Ascertain from officials of the bank whether minutes of all such meetings subsequent to the examination date are set forth in the minute book.
   b. As to meetings for which minutes have not been prepared at the date of the review, inquire directly of persons present at the meetings and, preferably, of the person charged with the responsibility of preparing the minutes, concerning matters dealt with at such meetings.
2. If specific violations of law or areas of weakness have been reported to management earlier in the examination, determine the extent to which management has proceeded toward corrective action.
3. Obtain from the bank officer responsible for legal matters a listing of impending or threatened litigation. For each item, the following information should be included:
   a. nature of the litigation
   b. progress of case to date
   c. how management is responding or intends to respond to the litigation
   d. an evaluation of the likelihood of an unfavorable outcome and an estimate, if one can be made, of the amount or range of potential loss
4. Obtain from the bank officer responsible for legal matters a listing of unasserted claims or assessments management considers will probably be asserted and which, if asserted, would have at least a reasonable possibility of an unfavorable outcome. For each item, the following information should be included:
   a. nature of the matter
   b. how management intends to respond if the claim is asserted
   c. possible exposure if the claim is asserted
5. Obtain from management a listing of attorneys and legal firms to whom litigation and related matters have been referred. Also, obtain a listing of any litigation noted in the newest review done by internal or external auditors from the examiner assigned internal control, and determine that corrections have been accomplished.
6. Review bills supporting major charges to the general ledger expenses account(s) for legal services as a test of the completeness of the list supplied by the bank.
7. Request that management incorporate information obtained in above steps in a letter to the bank's legal counsel for corroboration.
8. Evaluate management's listing of litigation, unasserted claims and assessments, and counsel's replies for the effect on the financial condition of the bank, giving appropriate consideration to any insurance coverage.
9. Obtain and review copies of any subsequent interim financial statements. Examples of such statements are—
   a. published reports sent to shareholders or others;
   b. reports submitted to the board of directors by internal auditors, external auditors, or management;
   c. statements of condition; and
   d. income statements.
      - Inquire as to whether interim statements obtained were prepared on the same basis as that used for the statements as of the examination date. If not, request proper adjustments to the interim statements.
      - Compare the interim financial statements, especially income statements, with similar statements for the corresponding period in the prior year and to budgets, profit plans, etc., for the current period, if such are available.
      - Obtain from management satisfactory explanations for any unusual items or significant fluctuations noted.
10. Make inquiries of and hold discussions with officers and other executives who have responsibility for the following matters:
    a. changes in credit lines or transactions with officers, directors, controlling shareholders, affiliated bank holding companies, affiliates of an affiliated holding company, or their interests
    b. changes in significant accounting policies
    c. changes in senior officers
    d. any event or combination of events which

have had or could have a material adverse effect on the bank's financial condition, including liquidity, or results of operation, such as the default of a bond issue in which the bank has substantial holdings or the filing of bankruptcy by a major borrower

e. commencement or discontinuance of services not requiring prior approval
f. execution of significant contracts, such as for employment, leases, pension, or other fringe benefit programs
g. significant new contingent liabilities or commitments other than those referred to above
h. significant changes in assets which may not be evident from the review of subsequent interim financial statements, such as a shift in the amount of loans or investments in special categories, or unusal adjustments made in or after the subsequent interim financial statements reviewed in connection with the previous procedure

11. Distribute information obtained in the previous steps to the appropriate examiners. Notify the enforcement section of Board Legal of any investigations or other legal actions being conducted by governmental regulators or criminal prosecutors against the bank when such information is ascertained during the examination process
12. Make additional inquiries or perform such procedures as considered necessary and appropriate to dispose of questions that arose in the course of the preceding procedures, inquiries, and discussions.
13. If, as a result of performing the above procedures, information is obtained that has a significant impact on the evaluation of the soundness of the bank, extend the appropriate examination procedures so that sufficient evidence is reviewed and documented in the workpapers to support the conclusions reached.
14. Prepare comments for the examination report on any events or transaction noted which may have a material effect on the soundness of the bank.
15. Update the workpapers with any information that will facilitate future examinations.

Internal Control and Audit Function, Oversight, and Outsourcing

Effective date April 2013

Section 4500.1

This section sets forth the principal aspects of effective internal control and audit and discusses some pertinent points relative to the internal control questionnaires (ICQs). It assists the examiner in understanding and evaluating the objectives of and the work performed by internal and external auditors. It also sets forth the general criteria the examiner should consider to determine if the work of internal and external auditors can be relied on in the performance of the examination. To the extent that audit records can be relied on, they should be used to complete the ICQs implemented during the examination. In most cases, only those questions not fully supported by audit records would require the examiner to perform a detailed review of the area in question.

Effective internal control is a foundation for the safe and sound operation of a financial institution. The board of directors and senior managers of an institution are responsible for ensuring that the system of internal control is effective. Their responsibility *cannot* be delegated to others within or outside the organization. An internal audit function is an important element of an effective system of internal control. When properly structured and conducted, internal audit provides directors and senior management with vital information about the condition of the system of internal control, and it identifies weaknesses so that management can take prompt, remedial action. Examiners are to review an institution's internal audit function and recommend improvements if needed. In addition, under the Interagency Guidelines Establishing Standards for Safety and Soundness,[1] pursuant to section 39 of the Federal Deposit Insurance Act (FDI Act) (12 USC 1831p-1), each institution is required to have an internal audit function that is appropriate to its size and the nature and scope of its activities.

In summary, internal control is a process designed to provide reasonable assurance that the institution will achieve the following objectives: efficient and effective operations, including safeguarding of assets; reliable financial reporting; and compliance with applicable laws and regulations. Internal control consists of five components that are a part of the management process: control environment, risk assessment, control activities, information and communication, and monitoring activities. The effective functioning of these components, which is brought about by an institution's board of directors, management, and other personnel, is essential to achieving the internal control objectives. This description of internal control is consistent with the Committee of Sponsoring Organizations of the Treadway Commission (COSO) report *Internal Control—Integrated Framework.* In addition, under the COSO framework, financial reporting is defined in terms of published financial statements, which, for these purposes, encompass financial statements prepared in accordance with generally accepted accounting principles and regulatory reports (such as the Reports of Condition and Income). Institutions are encouraged to evaluate their internal control against the COSO framework.

This section includes the March 17, 2003, "Interagency Policy Statement on the Internal Audit Function and Its Outsourcing." In addition, that policy statement is immediately followed by a January 23, 2013, "Federal Reserve Supplemental Policy Statement on the Internal Audit Function and Its Outsourcing," which supplements the 2003 guidance.

AUDIT COMMITTEE OVERSIGHT

Internal and external auditors will not feel free to assess the bank's operations if their independence is compromised. This can sometimes happen when internal and external auditors report solely to senior management instead of to the board of directors.

The independence of internal and external auditors is increased when they report to an independent audit committee (one made up of external directors who are not members of the bank's management). The auditors' independence is enhanced when the audit committee takes an active role in approving the internal and external audit scope and plan.

The role of the independent audit committee is important. The audit committee's duties may include (1) overseeing the internal audit function; (2) approving or recommending the appointment of external auditors and the scope

1. For state member banks, see appendix D-1 to 12 CFR 208.

of external audits and other services; (3) providing the opportunity for auditors to meet and discuss findings apart from management; (4) reviewing with management and external auditors the year-end financial statements; and (5) meeting with regulatory authorities.

Public Company Accounting Oversight Board

The Sarbanes-Oxley Act of 2002 (the act) became law on July 30, 2002 (Pub. L. No. 107-204). The act addresses weaknesses in corporate governance and the accounting and auditing professions and includes provisions addressing audits, financial reporting and disclosure, conflicts of interest, and corporate governance at publicly owned companies. The act, among other things, requires public companies to have an audit committee made entirely of independent directors. Publicly owned banking organizations that are listed on the New York Stock Exchange (NYSE) and Nasdaq must also comply with those exchanges' listing requirements, which include audit committee requirements.

The act also established a Public Company Accounting Oversight Board (PCAOB) that has the authority to set and enforce auditing, attestation, quality-control, and ethics (including independence) standards for auditors of public companies (subject to Securities and Exchange Commission (SEC) review). (See SR-02-20.) Accounting firms that conduct audits of public companies (registered accounting firms) must register with the PCAOB and be subject to its supervision. The PCAOB is also empowered to inspect the auditing operations of public accounting firms that audit public companies as well as impose disciplinary and remedial sanctions for violations of its rules, securities laws, and professional auditing and accounting standards. (See www.pcaobus.org.)

Nonpublic banking organizations are encouraged to periodically review their policies and procedures relating to corporate-governance and auditing matters. This review should ensure that such policies and procedures are consistent with applicable law, regulations, and supervisory guidance and remain appropriate in light of the organization's size, operations, and resources. Furthermore, a banking organization's policies and procedures for corporate governance, internal controls, and auditing will be assessed during the supervisory process, and supervisory action may be taken if there are deficiencies or weaknesses in these areas that are inconsistent with sound corporate-governance practices or safety-and-soundness considerations.

DISCIPLINARY ACTIONS AGAINST ACCOUNTANTS AND ACCOUNTING FIRMS PERFORMING CERTAIN AUDIT SERVICES

Section 36 of the Federal Deposit Insurance Act (the FDI Act) authorizes the federal bank and thrift regulatory agencies (the agencies)[2] to take disciplinary actions against independent public accountants and accounting firms that perform audit services covered by the act's provisions. Section 36, as implemented by part 363 of the FDIC's rules (12 CFR 363), requires that each federally insured depository institution with total assets of $500 million or more obtain an audit of its financial statements and a management report. Institutions with assets of $1 billion or more must provide an attestation on management's assertions concerning internal controls over financial reporting that is performed by an independent public accountant (the accountant). The respective insured depository institution must include the accountant's audit and attestation reports in its annual report, as required. See the section on "Legal Requirements Affecting Banks and the Audit Function."

The agencies amended their rules, pursuant to section 36, that set forth the practices and procedures to implement their authority to remove, suspend, or debar, for good cause,[3] an accountant or firm from performing audit and attestation services for insured depository institutions with assets of $500 million or more.[4] Immediate suspensions are permitted in limited circum-

2. The Board of Governors of the Federal Reserve System, the Office of the Comptroller of the Currency, and the Federal Deposit Insurance Corporation. The Board approved its rules on August 6, 2003 (press release of August 8, 2003). The rules became effective October 1, 2003. They were later revised as of July 20, 2009.

3. The rules provide that certain violations of law, negligent conduct, reckless violations of professional standards, or lack of qualifications to perform auditing services may be considered good cause.

4. See the Federal Reserve's rules on disciplinary actions against public accountants and accounting firms at 12 CFR 263.94 and 12 CFR 263, subpart J.

stances. Also, an accountant or accounting firm is prohibited from performing audit services for the covered institution if an authorized agency has taken such a disciplinary action against the accountant or firm, or if the SEC or the PCAOB has taken certain disciplinary action against the accountant or firm.

The amended rules reflect the agencies' increasing concern about the quality of audits and internal controls for financial reporting at insured depository institutions. The rules emphasize the importance of maintaining high quality in the audits of federally insured depository institutions' financial position and in the attestations of management assessments.

OBJECTIVES OF INTERNAL CONTROL

In general, good internal control exists when no one is in a position to make significant errors or perpetrate significant irregularities without timely detection. Therefore, a system of internal control should include those procedures necessary to ensure timely detection of failure of accountability, and such procedures should be performed by competent persons who have no incompatible duties. The following standards are encompassed within the description of internal control:

Existence of procedures. Existence of prescribed internal control procedures is necessary but not sufficient for effective internal control. Prescribed procedures that are not actually performed do nothing to establish control. Consequently, the examiner must give thoughtful attention not only to the prescribed set of procedures but also to the practices actually followed. This attention can be accomplished through inquiry, observation, testing, or a combination thereof.

Competent performance. For internal control to be effective, the required procedures must be performed by competent persons. Evaluation of competence undoubtedly requires some degree of subjective judgment because attributes such as intelligence, knowledge, and attitude are relevant. Thus, the examiner should be alert for indications that employees have failed so substantially to perform their duties that a serious question is raised concerning their abilities.

Independent performance. If employees who have access to assets also have access to the related accounting records or perform related review operations (or immediately supervise the activities of other employees who maintain the records or perform the review operations), they may be able to both perpetrate and conceal defalcations. Therefore, duties concerned with the custody of assets are incompatible with recordkeeping duties for those assets, and duties concerned with the performance of activities are incompatible with the authorization or review of those activities.

In judging the independence of a person, the examiner must avoid looking at that person as an individual and presuming the way in which that individual would respond in a given situation. For example, an individual may be the sole check signer and an assistant may prepare monthly bank reconcilement. If the assistant appears to be a competent person, it may seem that an independent reconcilement would be performed and anything amiss would be reported. Such judgments are potentially erroneous. There exist no established tests by which the psychological and economic independence of an individual in a given situation can be judged. The position must be evaluated, not the person. If the position in which the person acts is not an independent one in itself, then the work should not be presumed to be independent, regardless of the apparent competence of the person in question. In the example cited above, the function performed by the assistant should be viewed as if it were performed by the supervisor. Hence, incompatible duties are present in that situation.

PROCEDURES FOR COMPLETING ICQs

The implementation of selected ICQs and the evaluation of internal audit activities provide a basis for determining the adequacy of the bank's control environment. To reach conclusions required by the questionnaires, the examiner assigned to review a given internal control routine or area of bank operations should use any source of information necessary to ensure a full understanding of the prescribed system, including any potential weaknesses. Only when the examiner completely understands the bank's system can an assessment and evaluation be made of the effects of internal controls on the examination.

To reach conclusions concerning a specific section of an ICQ, the examiner should document and review the bank's operating systems and procedures by consulting all available sources of information and discussing them with appropriate bank personnel. Sources of information might include organization charts, procedural manuals, operating instructions, job specifications, directives to employees, and other similar sources of information. Also, the examiner should not overlook potential sources such as job descriptions, flow charts, and other documentation in the internal audit workpapers. A primary objective in the review of the system is to efficiently reach a conclusion about the overall adequacy of existing controls. Any existing source of information that will enable the examiner to quickly gain an understanding of the procedures in effect should be used in order to minimize the time required to formulate the conclusions. The review should be documented in an organized manner through the use of narrative descriptions, flow charts, or other diagrams. If a system is properly documented, the documentation will provide a ready reference for any examiner performing work in the area, and it often may be carried forward for future examinations, which will save time.

Although narrative descriptions can often provide an adequate explanation of systems of internal control, especially in less complex situations, they may have certain drawbacks, such as the following:

- They may be cumbersome and too lengthy.
- They may be unclear or poorly written.
- Related points may be difficult to integrate.
- Annual changes may be awkward to record.

To overcome these problems, the examiner should consider using flow charts, which reduce narrative descriptions to a picture. Flow charts often reduce a complex situation to an easily understandable sequence of interrelated steps.

In obtaining and substantiating the answers to the questions in the ICQ, the examiner should develop a plan to obtain the necessary information efficiently. Such a plan would normally avoid a direct question-and-answer session with bank officers. A suggested approach to completion of the ICQ is to—

- become familiar with the ICQ,
- review related internal audit procedures, reports, and responses,
- review any written documentation of a bank's system of controls,
- find out what the department does and what the functions of personnel within the department are through conversations with appropriate individuals, and
- answer as many individual questions as possible from information gained in the preceding steps and fill in the remaining questions by direct inquiry.

An effective way to begin an on-site review of internal control is to identify the various key functions applicable to the area under review. For each position identified, the following questions should then be asked:

- Is this a critical position? That is, can a person in this position either make a significant error that will affect the recording of transactions or perpetrate material irregularities of some type?
- If an error is made or an irregularity is perpetrated, what is the probability that normal routines will disclose it on a timely basis? That is, what controls exist that would prevent or detect significant errors or the perpetration of significant irregularities?
- What are the specific opportunities open to the individual to conceal any irregularity, and are there any mitigating controls that will reduce or eliminate these opportunities?

Although all employees within an organization may be subject to control, not all have financial responsibilities that can influence the accuracy of the accounting and financial records or have access to assets. The examiner should be primarily concerned with those positions that have the ability to influence the records and that have access to assets. Once those positions have been identified, the examiners must exercise their professional knowledge of bank operations to visualize the possibilities open to any person holding a particular position. The question is not whether the individual is honest, but rather whether situations exist that might permit an error to be concealed. By directing attention to such situations, an examiner will also consider situations that may permit unintentional errors to remain undetected.

The evaluation of internal control should include consideration of other existing accounting and administrative controls or other circumstances that might counteract or mitigate an apparent weakness or impair an established control. Controls that mitigate an apparent weakness may be a formal part of the bank's operating system, such as budget procedures that include a careful comparison of budgeted and actual amounts by competent management personnel. Mitigating controls also may be informal. For example, in small banks, management may be sufficiently involved in daily operations to know the purpose and reasonableness of all expense disbursements. That knowledge, coupled with the responsibility for signing checks, may make irregularities by nonmanagement personnel unlikely, even if disbursements are otherwise under the control of only one person.

When reviewing internal controls, an essential part of the examination is being alert to indications that adverse circumstances may exist. Adverse circumstances may lead employees or officers into courses of action they normally would not pursue. An adverse circumstance to which the examiner should be especially alert exists when the personal financial interests of key officers or employees depend directly on operating results or financial condition. Although the review of internal control does not place the examiner in the role of an investigator or detective, an alert attitude toward possible conflicts of interest should be maintained throughout the examination. Also, offices staffed by members of the same family, branches completely dominated by a strong personality, or departments in which supervisors rely unduly on their assis-tants require special alertness on the part of the examiner. Those circumstances and other similar ones should be considered in preparing the ICQ. It is not the formality of the particular factor that is of importance but rather its effect on the overall operation under review. Circumstances that may affect answers to the basic questions should be noted along with conclusions concerning their effect on the examination.

The ICQs were designed so that answers could be substantiated by (1) inquiry to bank personnel, (2) observation, or (3) testing. However, certain questions are marked with an asterisk to indicate that they require substantiation through observation or testing. Those questions are deemed so critical that substantiation by inquiry is not sufficient. For those questions substantiated through testing, the nature and extent of the test performed should be indicated adjacent to the applicable step in the ICQ.

The examiner should be alert for deviations by bank personnel from established policies, practices, and procedures. This applies not only to questions marked with an asterisk but also to every question in the ICQ. Examples of such deviations include situations when (1) instructions and directives are frequently not revised to reflect current practices, (2) employees find shortcuts for performing their tasks, (3) changes in organization and activities may influence operating procedures in unexpected ways, or (4) employees' duties may be rotated in ways that have not been previously considered. These and other circumstances may serve to modify or otherwise change prescribed procedures, thus giving the examiner an inadequate basis for evaluating internal control.

Sometimes, when a substantial portion of the accounting work is accomplished by computer, the procedures are so different from conventional accounting methods that the principles discussed here seem inapplicable. Care should be taken to resist drawing this conclusion. This discussion of internal control and its evaluation is purposely stated in terms sufficiently general to apply to any system. Perpetration of defalcations requires direct or indirect access to appropriate documents or accounting records. As such, perpetration requires the involvement of people and, under any system, computerized or not, there will be persons who have access to assets and records. Those with access may include computer operators, programmers, and their supervisors and other related personnel.

The final question in each section of the ICQ requires a composite evaluation of existing internal controls in the applicable area of the bank. The examiner should base that evaluation on answers to the preceding questions within the section, the review and observation of the systems and controls within the bank, and discussion with appropriate bank personnel.

The composite evaluation does, however, require some degree of subjective judgment. The examiner should use all information available to formulate an overall evaluation, fully realizing that a high degree of professional judgment is required.

Applying the ICQ to Different Situations

The ICQs are general enough to apply to a wide range of systems, so not all sections or questions will apply to every situation, depending on factors such as bank size, complexity and type of operations, and organizational structure. When completing the ICQs, the examiner should include a brief comment stating the reason a section or question is not applicable to the specific situation.

For large banking institutions or when multiple locations of a bank are being examined, it may be necessary to design supplements to the ICQs to adequately review all phases of the bank's operations and related internal controls. Because certain functions described in this manual may be performed by several departments in some banks, it also may be necessary to redesign a particular section of the ICQ so that each department receives appropriate consideration. Conversely, functions described in several different sections of this handbook may be performed in a single department in smaller banks. If the ICQ is adapted to fit a specific situation, care should be taken to ensure that its scope and intent are not modified. That requires professional judgment in interpreting and expanding the generalized material. Any such modifications should be completely documented and filed in the workpapers.

LEGAL REQUIREMENTS AFFECTING BANKS AND THE AUDIT FUNCTION

The Federal Deposit Insurance Corporation Improvement Act of 1991 amended section 36 of the FDI Act (12 USC 1831m). Since then, the FDIC has made various revisions to its rules at Part 363 (12 CFR 363) and guidelines. When specific reports are required to be submitted to the FDIC to comply with the provisions of compliance with Part 363, the institution must also submit the report to the appropriate federal banking agency and any appropriate state supervisor.

For the purposes of determining the applicability of this rule, an institution should use total assets as reported on its most recent Report of Condition (the Call Report), the date that coincides with the end of the preceding fiscal year. If the fiscal year ends on a date other than the end of a calendar quarter, the institution is to use the Call Report for the quarter end immediately preceding the end of the fiscal year.

Institutions with $500 Million or More in Total Assets

The regulations require these institutions to file two copies of their annual reports with the FDIC, as well as with the appropriate federal banking agency and the appropriate state supervisory agency, that must include the following:

- Audited comparative annual financial statements;
- The independent public accountant's report on the audited financial statements;
- A management report (comprising its statements and assessments) that is signed by the chief executive officer and chief accounting or chief financial officer. The report should include:
  - — A statement of management's responsibilities for:
    - preparing the annual financial statements;
    - establishing and maintaining an adequate internal control structure and procedures over financial reporting;
    - complying with designated safety-and-soundness laws and regulations pertaining to insider loans and dividend restrictions; and
  - — An assessment by management of:
    - compliance with the designated safety-and-soundness laws and regulations pertaining to insider loans and dividend restrictions during the year, which must state management's conclusions regarding compliance and disclose any noncompliance with these laws and regulations.[5] (See SR-13-11.)

If the institution is a public company or a subsidiary of a public company that would be subject to the provisions of section 404 of the Sarbanes-Oxley Act (Section 404), it must comply with the requirement to file other reports issued by the independent accountant as set forth in section 363.4(c) (12 CFR 363.4(c)). The

5. See appendix B of 12 CFR part 363 for further details and illustrative examples of the appropriate wording for the management report.

institutions must provide a copy of the independent accountant's report to the FDIC on the audit of internal control over financial reporting that is required by section 404 with the FDIC within 15 days after receipt. The institutions also are encouraged to submit a copy of management's section 404 report on internal control over financial reporting together with the independent public accountant's internal control report.

Institutions with $1 Billion or More in Total Assets

Section 36 of the FDI Act and Part 363 of the FDIC's regulations required insured depository institutions with a least $1 billion in total assets to file two copies of additional reports that must include the following:

- Assessments by management of the effectiveness of the institution's internal control structure and procedures over financial reporting as of the end of the fiscal year (12 USC 1831m(b)(2)(B)(i); and
- The independent public accountant's attestation report—the independent public accountant is to examine, attest to, and report separately in an attestation report, on the assertions by management's concerning the institution's internal control structure and procedures for financial reporting (12 USC 1831m(c)). This includes the Call Report and the FR Y-9C report. The attestation is to be made in accordance with generally accepted standards for attestation engagements.

Other Requirements—Institutions with $500 Million or More in Total Assets

Financial reporting encompasses, for the purposes of Part 363, both financial statements prepared in accordance with generally accepted accounting principles and those prepared for regulatory reporting purposes. Each institution is to have an independent public accountant perform an audit who reports on the institution's annual financial statements in accordance with generally accepted auditing standards and section 37 of the FDI Act (12 USC 1831n). The scope of the audit engagement must be sufficient to permit the accountant to determine and report whether the financial statements are presented fairly and in accordance with generally accepted accounting principles. The audit is to be performed using procedures that will objectively determine the accuracy of management's assertions on compliance with safety-and-soundness laws and regulations (12 USC 1831m (b)(2)(A)(iii)).

In addition, each institution is required to file a copy of any management letter, qualification, or any other report issued by its independent public accountant with the FDIC within 15 days of receipt of such letter or report. See section 363.4(c) (12 CFR 363.4(c)).

Each institution is required to establish an audit committee of its board of directors. The duties of the audit committee include reviewing with management and the independent public accountant the basis for, and the results of, the annual independent audit reports and the institution's respective reporting requirements. Each institution with total assets of $1 billion or more, as of the beginning of the fiscal year, is required to have an audit committee, the members of which must be outside directors who are independent of the institution's management. Institutions with total assets of $500 million, but less than $1 billion or more, as of the beginning of the fiscal year, must have an audit committee, the members of which are outside directors, the majority of whom must be independent of the institution's management.

Reporting Requirements for Subsidiaries of Holding Companies

Under the FDIC rules, an insured depository institution that is a subsidiary of a holding company may file its audited financial statements at the holding company level (top-tier or mid-tier) if the holding company has total insured depository institution assets comprising 75 percent or more of the holding company's consolidated assets as of the beginning of the fiscal year. Furthermore, in accordance with 12 CFR part 363, the other reporting requirements can be satisfied at the holding company level if the holding company provides services and functions comparable to the insured depository institution, and the insured depository subsidiary (a) has less than $5 billion in total assets or (b) has a CAMELS composite rating of "1" or "2" when its total assets are $5 billion or more.

In order to facilitate effective and prudential supervision of the holding company, a holding company that has institutions subject to the FDIC rules must submit one copy of the required reports to the appropriate Federal Reserve Bank regardless of whether or not the holding company submitted these reports on a consolidated basis for its insured depository subsidiaries, and regardless of the charter of the insured depository subsidiary under the holding company. Refer to SR letter 94-3, "Supervisory Guidance on the Implementation of Section 112 of the FDIC Improvement Act," for further guidance on this filing requirement. (See SR-13-11.)

Required Management Report Signatures

As specified in 12 CFR part 363, an insured depository institution and holding company must adhere to the following signature requirements:

- If the audited financial statements and the management report requirements are satisfied entirely at the insured depository institution level, the management report must be signed by the CEO, as well as the CAO or CFO, at the insured depository institution level.
- If the audited financial statements and the management report requirements are satisfied entirely at the holding company level, the management report must be signed by the CEO, as well as the CAO or CFO, at the holding company level.
- If the audited financial statement requirements are satisfied at the holding company level and the management report requirement is satisfied at the insured depository institution level or one or more component requirements are satisfied at the holding company and the remaining component requirements are satisfied at the insured depository institution level, the management report must be signed by the CEO, as well as the CAO or CFO, of both the holding company and the insured depository institution.

INTERAGENCY POLICY STATEMENT ON THE INTERNAL AUDIT FUNCTION AND ITS OUTSOURCING

The Federal Reserve and other federal banking agencies[6] (the agencies) adopted on March 17, 2003, an interagency policy statement addressing the internal audit function and its outsourcing. The policy statement revises and replaces the former 1997 policy statement and incorporates recent developments in internal auditing. In addition, the revised policy incorporates guidance on the independence of accountants who provide institutions with both internal and external audit services in light of the Sarbanes-Oxley Act of 2002 (the act) and associated SEC rules.

The act prohibits an accounting firm from acting as the external auditor of a public company during the same period that the firm provides internal audit services to the company. The policy statement discusses the applicability of this prohibition to institutions that are public companies, to insured depository institutions with assets of $500 million or more that are subject to the annual audit and reporting requirements of section 36 of the FDI Act, and to nonpublic institutions that are not subject to section 36.

The statement recognizes that many institutions have engaged independent public accounting firms and other outside professionals (outsourcing vendors) to perform work that traditionally has been done by internal auditors. These arrangements are often called "internal audit outsourcing," "internal audit assistance," "audit co-sourcing," and "extended audit services" (hereafter collectively referred to as outsourcing). Typical outsourcing arrangements are more fully described below.

Outsourcing may be beneficial to an institution if it is properly structured, carefully conducted, and prudently managed. However, the structure, scope, and management of some internal audit outsourcing arrangements may not contribute to the institution's safety and soundness. Furthermore, arrangements with outsourcing vendors should not leave directors and senior management with the erroneous impression that they have been relieved of their responsibility for maintaining an effective system of internal control and for overseeing the internal audit function.

6. The Board of Governors of the Federal Reserve System, the Federal Deposit Insurance Corporation, and the Office of the Comptroller of the Currency.

Internal Audit Function (Part I)

Board and Senior Management Responsibilities

The board of directors and senior management are responsible for having an effective system of internal control and an effective internal audit function in place at their institution. They are also responsible for ensuring that the importance of internal control is understood and respected throughout the institution. This overall responsibility cannot be delegated to anyone else. They may, however, delegate the design, implementation, and monitoring of specific internal controls to lower-level management and delegate the testing and assessment of internal controls to others. Accordingly, directors and senior management should have reasonable assurance that the system of internal control prevents or detects significant inaccurate, incomplete, or unauthorized transactions; deficiencies in the safeguarding of assets; unreliable financial reporting (which includes regulatory reporting); and deviations from laws, regulations, and the institution's policies.[7]

Some institutions have chosen to rely on so-called management self-assessments or control self-assessments, wherein business-line managers and their staff evaluate the performance of internal controls within their purview. Such reviews help to underscore management's responsibility for internal control, but they are not impartial. Directors and members of senior management who rely too much on these reviews may not learn of control weaknesses until they have become costly problems, particularly if directors are not intimately familiar with the institution's operations. Therefore, institutions generally should also have their internal controls tested and evaluated by units without business-line responsibilities, such as internal audit groups.

Directors should be confident that the internal audit function addresses the risks of and meets the demands posed by the institution's current and planned activities. To accomplish this objective, directors should consider whether their institution's internal audit activities are conducted in accordance with professional standards, such as the Institute of Internal Auditors' (IIA) *Standards for the Professional Practice of Internal Auditing*. These standards address independence, professional proficiency, scope of work, performance of audit work, management of internal audit, and quality-assurance reviews. Furthermore, directors and senior management should ensure that the following matters are reflected in their institution's internal audit function.

Structure. Careful thought should be given to the placement of the audit function in the institution's management structure. The internal audit function should be positioned so that the board has confidence that the internal audit function will perform its duties with impartiality and not be unduly influenced by managers of day-to-day operations. The audit committee,[8] using objective criteria it has established, should oversee the internal audit function and evaluate its performance.[9] The audit committee should assign responsibility for the internal audit function to a member of management (that is, the manager of internal audit or internal audit manager) who understands the function and has no responsibility for operating the system of internal control. The ideal organizational arrange-

7. As noted above, under section 36 of the FDI Act, as implemented by part 363 of the FDIC's regulations (12 CFR 363), FDIC-insured depository institutions with total assets of $500 million or more must submit an annual management report signed by the chief executive officer (CEO) and chief accounting or chief financial officer. This report must contain (1) a statement of management's responsibilities for preparing the institution's annual financial statements, for establishing and maintaining an adequate internal control structure and procedures for financial reporting, and for complying with designated laws and regulations relating to safety and soundness, including management's assessment of the institution's compliance with those laws and regulations, and (2) for an institution with total assets of $1 billion or more at the beginning of the institution's most recent fiscal year, an assessment by management of the effectiveness of such internal control structure and procedures as of the end of such fiscal year. (See 12 CFR 363.2(b) and 70 *Fed. Reg.* 71,232, Nov. 28, 2005.)

8. Depository institutions subject to section 36 of the FDI Act and part 363 of the FDIC's regulations must maintain independent audit committees (i.e., consisting of directors who are not members of management). Consistent with the 1999 Interagency Policy Statement on External Auditing Programs of Banks and Savings Associations, the agencies also encourage the board of directors of each depository institution that is not otherwise required to do so to establish an audit committee consisting entirely of outside directors. Where the term *audit committee* is used in this policy statement, the board of directors may fulfill the audit committee responsibilities if the institution is not subject to an audit committee requirement. See *Fed. Reg.,* September 28, 1999 (64 FR 52,319).

9. For example, the performance criteria could include the timeliness of each completed audit, a comparison of overall performance to plan, and other measures.

ment is for this manager to report directly and solely to the audit committee regarding both audit issues and administrative matters, for example, resources, budget, appraisals, and compensation. Institutions are encouraged to consider the IIA's *Practice Advisory 2060-2: Relationship with the Audit Committee,* which provides more guidance on the roles and relationships between the audit committee and the internal audit manager.

Many institutions place the manager of internal audit under a dual reporting arrangement: the manager is functionally accountable to the audit committee on issues discovered by the internal audit function, while reporting to another senior manager on administrative matters. Under a dual reporting relationship, the board should consider the potential for diminished objectivity on the part of the internal audit manager with respect to audits concerning the executive to whom he or she reports. For example, a manager of internal audit who reports to the chief financial officer (CFO) for performance appraisal, salary, and approval of department budgets may approach audits of the accounting and treasury operations controlled by the CFO with less objectivity than if the manager were to report to the chief executive officer. Thus, the chief financial officer, controller, or other similar officer should ideally be excluded from overseeing the internal audit activities even in a dual role. The objectivity and organizational stature of the internal audit function are best served under such a dual arrangement if the internal audit manager reports administratively to the CEO.

Some institutions seek to coordinate the internal audit function with several risk-monitoring functions (for example, loan-review, market-risk-assessment, and legal compliance departments) by establishing an administrative arrangement under one senior executive. Coordination of these other monitoring activities with the internal audit function can facilitate the reporting of material risk and control issues to the audit committee, increase the overall effectiveness of these monitoring functions, better utilize available resources, and enhance the institution's ability to comprehensively manage risk. Such an administrative reporting relationship should be designed so as to not interfere with or hinder the manager of internal audit's functional reporting to and ability to directly communicate with the institution's audit committee. In addition, the audit committee should ensure that efforts to coordinate these monitoring functions do not result in the manager of internal audit conducting control activities nor diminish his or her independence with respect to the other risk-monitoring functions. Furthermore, the internal audit manager should have the ability to independently audit these other monitoring functions.

In structuring the reporting hierarchy, the board should weigh the risk of diminished independence against the benefit of reduced administrative burden in adopting a dual reporting organizational structure. The audit committee should document its consideration of this risk and mitigating controls. The IIA's *Practice Advisory 1110-2: Chief Audit Executive Reporting Lines* provides additional guidance regarding functional and administrative reporting lines.

Management, staffing, and audit quality. In managing the internal audit function, the manager of internal audit is responsible for control risk assessments, audit plans, audit programs, and audit reports.

- A control risk assessment (or risk-assessment methodology) documents the internal auditor's understanding of the institution's significant business activities and their associated risks. These assessments typically analyze the risks inherent in a given business line, the mitigating control processes, and the resulting residual risk exposure of the institution. They should be updated regularly to reflect changes to the system of internal control or work processes and to incorporate new lines of business.
- An internal audit plan is based on the control risk assessment and typically includes a summary of key internal controls within each significant business activity, the timing and frequency of planned internal audit work, and a resource budget.
- An internal audit program describes the objectives of the audit work and lists the procedures that will be performed during each internal audit review.
- An audit report generally presents the purpose, scope, and results of the audit, including findings, conclusions, and recommendations. Workpapers that document the work performed and support the audit report should be maintained.

Ideally, the internal audit function's only role should be to independently and objectively evaluate and report on the effectiveness of an institution's risk-management, control, and governance processes. Internal auditors increasingly have taken a consulting role within institutions on new products and services and on mergers, acquisitions, and other corporate reorganizations. This role typically includes helping design controls and participating in the implementation of changes to the institution's control activities. The audit committee, in its oversight of the internal audit staff, should ensure that the function's consulting activities do not interfere or conflict with the objectivity it should have with respect to monitoring the institution's system of internal control. In order to maintain its independence, the internal audit function should not assume a business-line management role over control activities, such as approving or implementing operating policies or procedures, including those it has helped design in connection with its consulting activities. The agencies encourage internal auditors to follow the IIA's standards, including guidance related to the internal audit function acting in an advisory capacity.

The internal audit function should be competently supervised and staffed by people with sufficient expertise and resources to identify the risks inherent in the institution's operations and assess whether internal controls are effective. The manager of internal audit should oversee the staff assigned to perform the internal audit work and should establish policies and procedures to guide the audit staff. The form and content of these policies and procedures should be consistent with the size and complexity of the department and the institution. Many policies and procedures may be communicated informally in small internal audit departments, while larger departments would normally require more formal and comprehensive written guidance.

Scope. The frequency and extent of internal audit review and testing should be consistent with the nature, complexity, and risk of the institution's on- and off-balance-sheet activities. At least annually, the audit committee should review and approve internal audit's control risk assessment and the scope of the audit plan, including how much the manager relies on the work of an outsourcing vendor. It should also periodically review internal audit's adherence to the audit plan. The audit committee should consider requests for expansion of basic internal audit work when significant issues arise or when significant changes occur in the institution's environment, structure, activities, risk exposures, or systems.[10]

Communication. To properly carry out their responsibility for internal control, directors and senior management should foster forthright communications and critical examination of issues to better understand the importance and severity of internal control weaknesses identified by the internal auditor and operating management's solutions to these weaknesses. Internal auditors should report internal control deficiencies to the appropriate level of management as soon as they are identified. Significant matters should be promptly reported directly to the board of directors (or its audit committee) and senior management. In periodic meetings with management and the manager of internal audit, the audit committee should assess whether management is expeditiously resolving internal control weaknesses and other exceptions. Moreover, the audit committee should give the manager of internal audit the opportunity to discuss his or her findings without management being present.

Furthermore, each audit committee should establish and maintain procedures for employees of their institution to confidentially and anonymously submit concerns to the committee about questionable accounting, internal accounting control, or auditing matters.[11] In addition, the audit committee should set up procedures for the timely investigation of complaints received and the retention for a reasonable time period of documentation concerning the complaint and its subsequent resolution.

Contingency planning. As with any other function, the institution should have a contingency plan to mitigate any significant discontinuity in audit coverage, particularly for high-risk areas. Lack of contingency planning for continuing internal audit coverage may increase the institution's level of operational risk.

10. Major changes in an institution's environment and conditions may compel changes to the internal control system and also warrant additional internal audit work. These changes include (1) new management; (2) areas or activities experiencing rapid growth or rapid decline; (3) new lines of business, products, or technologies or disposals thereof; (4) corporate restructurings, mergers, and acquisitions; and (5) an expansion or acquisition of foreign operations (including the impact of changes in the related economic and regulatory environments).

11. When the board of directors fulfills the audit committee responsibilities, the procedures should provide for the submission of employee concerns to an outside director.

Small Financial Institution's Internal Audit Function

An effective system of internal control and an independent internal audit function form the foundation for safe and sound operations, regardless of an institution's size. Each institution should have an internal audit function that is appropriate to its size and the nature and scope of its activities. The procedures assigned to this function should include adequate testing and review of internal controls and information systems.

It is the responsibility of the audit committee and management to carefully consider the extent of auditing that will effectively monitor the internal control system, after taking into account the internal audit function's costs and benefits. For institutions that are large or have complex operations, the benefits derived from a full-time manager of internal audit or an auditing staff likely outweigh the cost. For small institutions with few employees and less complex operations, however, these costs may outweigh the benefits. Nevertheless, a small institution without an internal auditor can ensure that it maintains an objective internal audit function by implementing a comprehensive set of independent reviews of significant internal controls. The key characteristic of such reviews is that the persons directing and/or performing the review of internal controls are *not* also responsible for managing or operating those controls. A person who is competent in evaluating a system of internal control should design the review procedures and arrange for their implementation. The person responsible for reviewing the system of internal control should report findings directly to the audit committee. The audit committee should evaluate the findings and ensure that senior management has or will take appropriate action to correct the control deficiencies.

Internal Audit Outsourcing Arrangements (Part II)

Examples of Internal Audit Outsourcing Arrangements

An outsourcing arrangement is a contract between an institution and an outsourcing vendor to provide internal audit services. Outsourcing arrangements take many forms and are used by institutions of all sizes. Some institutions consider entering into these arrangements to enhance the quality of their control environment by obtaining the services of a vendor with the knowledge and skills to critically assess, and recommend improvements to, their internal control systems. The internal audit services under contract can be limited to helping internal audit staff in an assignment for which they lack expertise. Such an arrangement is typically under the control of the institution's manager of internal audit, and the outsourcing vendor reports to him or her. Institutions often use outsourcing vendors for audits of areas requiring more technical expertise, such as electronic data processing and capital-markets activities. Such uses are often referred to as "internal audit assistance" or "audit co-sourcing."

Some outsourcing arrangements may require an outsourcing vendor to perform virtually all the procedures or tests of the system of internal control. Under such an arrangement, a designated manager of internal audit oversees the activities of the outsourcing vendor and typically is supported by internal audit staff. The outsourcing vendor may assist the audit staff in determining risks to be reviewed and may recommend testing procedures, but the internal audit manager is responsible for approving the audit scope, plan, and procedures to be performed. Furthermore, the internal audit manager is responsible for the results of the outsourced audit work, including findings, conclusions, and recommendations. The outsourcing vendor may report these results jointly with the internal audit manager to the audit committee.

Additional Considerations for Internal Audit Outsourcing Arrangements

Even when outsourcing vendors provide internal audit services, the board of directors and senior management of an institution are responsible for ensuring that both the system of internal control and the internal audit function operate effectively. In any outsourced internal audit arrangement, the institution's board of directors and senior management must maintain ownership of the internal audit function and provide active oversight of outsourced activities. When negotiating the outsourcing arrangement with an outsourcing vendor, an institution should carefully consider its current and anticipated business risks in setting each party's internal audit responsibilities. The outsourcing arrangement should not increase the risk that a breakdown of internal control will go undetected.

To clearly distinguish its duties from those of the outsourcing vendor, the institution should have a written contract, often taking the form of an engagement letter.[12] Contracts between the institution and the vendor typically include provisions that—

- define the expectations and responsibilities under the contract for both parties;
- set the scope and frequency of, and the fees to be paid for, the work to be performed by the vendor;
- set the responsibilities for providing and receiving information, such as the type and frequency of reporting to senior management and directors about the status of contract work;
- establish the process for changing the terms of the service contract, especially for expansion of audit work if significant issues are found, and stipulations for default and termination of the contract;
- state that internal audit reports are the property of the institution, that the institution will be provided with any copies of the related workpapers it deems necessary, and that employees authorized by the institution will have reasonable and timely access to the workpapers prepared by the outsourcing vendor;
- specify the locations of internal audit reports and the related workpapers;
- specify the period of time (for example, seven years) that vendors must maintain the workpapers;[13]
- state that outsourced internal audit services provided by the vendor are subject to regulatory review and that examiners will be granted full and timely access to the internal audit reports and related workpapers prepared by the outsourcing vendor;
- prescribe a process (arbitration, mediation, or other means) for resolving disputes and for determining who bears the cost of consequential damages arising from errors, omissions, and negligence; and
- state that the outsourcing vendor will not perform management functions, make management decisions, or act or appear to act in a capacity equivalent to that of a member of management or an employee and, if applicable, will comply with AICPA, U.S. Securities and Exchange Commission (SEC), PCAOB, or regulatory independence guidance.

Vendor competence. Before entering an outsourcing arrangement, the institution should perform due diligence to satisfy itself that the outsourcing vendor has sufficient staff qualified to perform the contracted work. The staff's qualifications may be demonstrated, for example, through prior experience with financial institutions. Because the outsourcing arrangement is a personal-services contract, the institution's internal audit manager should have confidence in the competence of the staff assigned by the outsourcing vendor and receive timely notice of key staffing changes. Throughout the outsourcing arrangement, management should ensure that the outsourcing vendor maintains sufficient expertise to effectively perform its contractual obligations.

Management of the outsourced internal audit function. Directors and senior management should ensure that the outsourced internal audit function is competently managed. For example, larger institutions should employ sufficient competent staff members in the internal audit department to assist the manager of internal audit in overseeing the outsourcing vendor. Small institutions that do not employ a full-time audit manager should appoint a competent employee who ideally has no managerial responsibility for the areas being audited to oversee the outsourcing vendor's performance under the contract. This person should report directly to the audit committee for purposes of communicating internal audit issues.

Communication when an outsourced internal audit function exists. Communication between the internal audit function and the audit committee and senior management should not

12. The engagement-letter provisions described are comparable to those outlined by the American Institute of Certified Public Accountants (AICPA) for financial statement audits. (See AICPA Professional Standards, AU section 310.) These provisions are consistent with the provisions customarily included in contracts for other outsourcing arrangements, such as those involving data processing and information technology. Therefore, the federal banking agencies consider these provisions to be usual and customary business practices.

13. If the workpapers are in electronic format, contracts often call for the vendor to maintain proprietary software that enables the bank and examiners to access the electronic workpapers for a specified time period.

diminish because the institution engages an outsourcing vendor. All work by the outsourcing vendor should be well documented and all findings of control weaknesses should be promptly reported to the institution's manager of internal audit. Decisions not to report the outsourcing vendor's findings to directors and senior management should be the mutual decision of the internal audit manager and the outsourcing vendor. In deciding what issues should be brought to the board's attention, the concept of "materiality," as the term is used in financial statement audits, is generally not a good indicator of which control weakness to report. For example, when evaluating an institution's compliance with laws and regulations, any exception may be important.

Contingency planning to ensure continuity of outsourced audit coverage. When an institution enters into an outsourcing arrangement (or significantly changes the mix of internal and external resources used by internal audit), it may increase its operational risk. Because the arrangement may be terminated suddenly, the institution should have a contingency plan to mitigate any significant discontinuity in audit coverage, particularly for high-risk areas.

Independence of the Independent Public Accountant (Part III)

The following discussion applies only when a financial institution is considering using a public accountant to provide both external audit and internal audit services to the institution.

When one accounting firm performs both the external audit and the outsourced internal audit function, the firm risks compromising its independence. These concerns arise because, rather than having two separate functions, this outsourcing arrangement places the independent public accounting firm in the position of appearing to audit, or actually auditing, its own work. For example, in auditing an institution's financial statements, the accounting firm will consider the extent to which it may rely on the internal control system, including the internal audit function, in designing audit procedures.

Applicability of the SEC's Auditor Independence Requirements

Institutions that are public companies. To strengthen auditor independence, Congress passed the Sarbanes-Oxley Act of 2002 (the act). Title II of the act applies to any public company—that is, any company that has a class of securities registered with the SEC or the appropriate federal banking agency under section 12 of the Securities Exchange Act of 1934 or that is required to file reports with the SEC under section 15(d) of that act.[14] The act prohibits an accounting firm from acting as the external auditor of a public company during the same period that the firm provides internal audit outsourcing services to the company.[15] In addition, if a public company's external auditor will be providing auditing services and permissible nonaudit services, such as tax services, the company's audit committee must preapprove each of these services.

According to the SEC's final rules (effective May 6, 2003) implementing the act's nonaudit-service prohibitions and audit committee preapproval requirements, an accountant is not independent if, at any point during the audit and professional engagement period, the accountant provides internal audit outsourcing or other prohibited nonaudit services to the public company audit client. The SEC's final rules generally become effective on May 6, 2003, although there is a one-year transition period if the accountant is performing prohibited nonaudit services and external audit services for a public

14. 15 USC 78*l* and 78o(d).

15. In addition to prohibiting internal audit outsourcing, the Sarbanes-Oxley Act (15 USC 78j-1) also identifies other nonaudit services that an external auditor is prohibited from providing to a public company whose financial statements it audits. The legislative history of the act indicates that three broad principles should be considered when determining whether an auditor should be prohibited from providing a nonaudit service to an audit client. These principles are that an auditor should not (1) audit his or her own work, (2) perform management functions for the client, or (3) serve in an advocacy role for the client. To do so would impair the auditor's independence. Based on these three broad principles, the other nonaudit services that an auditor is prohibited from providing to a public company audit client include bookkeeping or other services related to the client's accounting records or financial statements; financial information systems design and implementation; appraisal or valuation services, fairness opinions, or contribution-in-kind reports; actuarial services; management or human resources functions; broker or dealer, investment adviser, or investment banking services; legal services and expert services unrelated to the audit; and any other service determined to be impermissible by the PCAOB.

company pursuant to a contract in existence on May 6, 2003. The services provided during this transition period must not have impaired the auditor's independence under the preexisting independence requirements of the SEC, the Independence Standards Board, and the AICPA. Although the SEC's pre-Sarbanes-Oxley independence requirements (issued in November 2000, effective August 2002) did not prohibit the outsourcing of internal audit services to a public company's independent public accountant, they did place conditions and limitations on internal audit outsourcing.

Depository institutions subject to the annual audit and reporting requirements of section 36 of the FDI Act. Under section 36, as implemented by part 363 of the FDIC's regulations, each FDIC-insured depository institution with total assets of $500 million or more is required to have an annual audit performed by an independent public accountant.[16] The part 363 guidelines address the qualifications of an independent public accountant engaged by such an institution by stating that "[t]he independent public accountant should also be in compliance with the AICPA's *Code of Professional Conduct* and meet the independence requirements and interpretations of the SEC and its staff."[17]

Thus, the guidelines provide for each FDIC-insured depository institution with $500 million or more in total assets, whether or not it is a public company, and its external auditor to comply with the SEC's auditor independence requirements that are in effect during the period covered by the audit. These requirements include the nonaudit-service prohibitions and audit committee preapproval requirements implemented by the SEC's January 2003 auditor independence rules once these rule come into effect.[18]

Institutions not subject to section 36 of the FDI Act that are neither public companies nor subsidiaries of public companies. The agencies have long encouraged each institution not subject to section 36 of the FDI Act that is neither a public company nor a subsidiary of a public company[19] to have its financial statements audited by an independent public accountant.[20] The agencies also encourage each such institution to follow the internal audit outsourcing prohibition in the Sarbanes-Oxley Act, as discussed above for institutions that are public companies.

As previously mentioned, some institutions seek to enhance the quality of their control environment by obtaining the services of an outsourcing vendor who can critically assess their internal control system and recommend improvements. The agencies believe that a small nonpublic institution with less complex operations and limited staff can, in certain circumstances, use the same accounting firm to perform both an external audit and some or all of the institution's internal audit activities. These circumstances include, but are not limited to, situations in which—

- splitting the audit activities poses significant costs or burden;
- persons with the appropriate specialized knowledge and skills are difficult to locate and obtain;
- the institution is closely held and investors are not solely reliant on the audited financial statements to understand the financial position and performance of the institution; and
- the outsourced internal audit services are limited in either scope or frequency.

In circumstances such as these, the agencies view an internal audit outsourcing arrangement between a small nonpublic institution and its external auditor as not being inconsistent with their safety-and-soundness objectives for the institution.

16. 12 CFR 363.3(a). (See FDIC Financial Institutions Letter FIL-17-2003 (Corporate Governance, Audits, and Reporting Requirements), attachment II, March 5, 2003.)

17. Appendix A to part 363, Guidelines and Interpretations, paragraph 14, Independence.

18. If a depository institution subject to section 36 and part 363 satisfies the annual independent audit requirement by relying on the independent audit of its parent holding company, once the SEC's January 2003 regulations prohibiting an external auditor from performing internal audit outsourcing services for an audit client take effect May 6, 2003, or May 6, 2004, depending on the circumstances, the holding company's external auditor cannot perform internal audit outsourcing work for that holding company or the subsidiary institution.

19. FDIC-insured depository institutions with less than $500 million in total assets are not subject to section 36 of the FDI Act. Section 36 does not apply directly to holding companies but provides that, for an insured depository institution that is a subsidiary of a holding company, the audited financial statements requirement and certain of the statute's other requirements may be satisfied by the holding company.

20. See, for example, the 1999 Interagency Policy Statement on External Auditing Programs of Banks and Savings Institutions.

When a small nonpublic institution decides to hire the same firm to perform internal and external audit work, the audit committee and the external auditor should pay particular attention to preserving the independence of both the internal and external audit functions. Furthermore, the audit committee should document both that it has preapproved the internal audit outsourcing to its external auditor and has considered the independence issues associated with this arrangement.[21] In this regard, the audit committee should consider the independence standards described in parts I and II of the policy statement, the AICPA guidance discussed below, and the broad principles that the auditor should not perform management functions or serve in an advocacy role for the client.

Accordingly, the agencies will not consider an auditor who performs internal audit outsourcing services for a small nonpublic audit client to be independent unless the institution and its auditor have adequately addressed the associated independence issues. In addition, the institution's board of directors and management must retain ownership of and accountability for the internal audit function and provide active oversight of the outsourced internal audit relationship.

A small nonpublic institution may be required by another law or regulation, an order, or another supervisory action to have its financial statements audited by an independent public accountant. In this situation, if warranted for safety-and-soundness reasons, the institution's primary federal regulator may require that the institution and its independent public accountant comply with the auditor-independence requirements of the act.[22]

AICPA guidance. As noted above, the independent public accountant for a depository institution subject to section 36 of the FDI Act also should be in compliance with the AICPA's *Code of Professional Conduct.* This code includes professional ethics standards, rules, and interpretations that are binding on all certified public accountants (CPAs) who are members of the AICPA in order for the member to remain in good standing. Therefore, this code applies to each member CPA who provides audit services to an institution, regardless of whether the institution is subject to section 36 or is a public company.

The AICPA has issued guidance indicating that a member CPA would be deemed not independent of his or her client when the CPA acts or appears to act in a capacity equivalent to a member of the client's management or as a client employee. The AICPA's guidance includes illustrations of activities that would be considered to compromise a CPA's independence. Among these are activities that involve the CPA authorizing, executing, or consummating transactions or otherwise exercising authority on behalf of the client. For additional details, refer to Interpretation 101-3, Performance of Other Services, and Interpretation 101-13, Extended Audit Services, in the AICPA's *Code of Professional Conduct*.

Examination Guidance (Part IV)

Review of the Internal Audit Function and Outsourcing Arrangements

Examiners should have full and timely access to an institution's internal audit resources, including personnel, workpapers, risk assessments, work plans, programs, reports, and budgets. A delay may require examiners to widen the scope of their examination work and may subject the institution to follow-up supervisory actions.

Examiners should assess the quality and scope of an institution's internal audit function, regardless of whether it is performed by the institution's employees or by an outsourcing vendor. Specifically, examiners should consider whether—

- the internal audit function's control risk assessment, audit plans, and audit programs are appropriate for the institution's activities;
- the internal audit activities have been adjusted for significant changes in the institution's environment, structure, activities, risk exposures, or systems;
- the internal audit activities are consistent with the long-range goals and strategic direction of the institution and are responsive to its internal control needs;
- the audit committee promotes the internal audit manager's impartiality and indepen-

21. If a small nonpublic institution is considering having its external auditor perform other nonaudit services, its audit committee may wish to discuss the implications of the performance of these services on the auditor's independence.

22. 15 USC 78j-1.

dence by having him or her directly report audit findings to it;
- the internal audit manager is placed in the management structure in such a way that the independence of the function is not impaired;
- the institution has promptly responded to significant identified internal control weaknesses;
- the internal audit function is adequately managed to ensure that audit plans are met, programs are carried out, and the results of audits are promptly communicated to senior management and members of the audit committee and board of directors;
- workpapers adequately document the internal audit work performed and support the audit reports;
- management and the board of directors use reasonable standards, such as the IIA's *Standards for the Professional Practice of Internal Auditing*, when assessing the performance of internal audit; and
- the audit function provides high-quality advice and counsel to management and the board of directors on current developments in risk management, internal control, and regulatory compliance.

The examiner should assess the competence of the institution's internal audit staff and management by considering the education, professional background, and experience of the principal internal auditors. In addition, when reviewing outsourcing arrangements, examiners should determine whether—

- the arrangement maintains or improves the quality of the internal audit function and the institution's internal control;
- key employees of the institution and the outsourcing vendor clearly understand the lines of communication and how any internal control problems or other matters noted by the outsourcing vendor are to be addressed;
- the scope of the outsourced work is revised appropriately when the institution's environment, structure, activities, risk exposures, or systems change significantly;
- the directors have ensured that the outsourced internal audit activities are effectively managed by the institution;
- the arrangement with the outsourcing vendor satisfies the independence standards described in this policy statement and thereby preserves the independence of the internal audit function, whether or not the vendor is also the institution's independent public accountant; and
- the institution has performed sufficient due diligence to satisfy itself of the vendor's competence before entering into the outsourcing arrangement and has adequate procedures for ensuring that the vendor maintains sufficient expertise to perform effectively throughout the arrangement.

Examination concerns about the adequacy of the internal audit function. If the examiner concludes that the institution's internal audit function, whether or not it is outsourced, does not sufficiently meet the institution's internal audit needs; does not satisfy the Interagency Guidelines Establishing Standards for Safety and Soundness, if applicable; or is otherwise inadequate, he or she should determine whether the scope of the examination should be adjusted. The examiner should also discuss his or her concerns with the internal audit manager or other person responsible for reviewing the system of internal control. If these discussions do not resolve the examiner's concerns, he or she should bring these matters to the attention of senior management and the board of directors or audit committee. If the examiner finds material weaknesses in the internal audit function or the internal control system, he or she should discuss them with appropriate agency staff in order to determine the appropriate actions the agency should take to ensure that the institution corrects the deficiencies. These actions may include formal and informal enforcement actions.

The institution's management and composite ratings should reflect the examiner's conclusions regarding the institution's internal audit function. The report of examination should contain comments concerning the adequacy of this function, significant issues or concerns, and recommended corrective actions.

Concerns about the independence of the outsourcing vendor. An examiner's initial review of an internal audit outsourcing arrangement, including the actions of the outsourcing vendor, may raise questions about the institution's and its vendor's adherence to the independence standards described in parts I and II of the policy statement, whether or not the vendor is an accounting firm, and in part III if the vendor provides both external and internal audit services to the institution. In such cases, the examiner first should ask the institution and the outsourcing vendor how the audit committee determined that the vendor was independent. If the vendor is an accounting firm, the audit committee should be asked to demonstrate how it assessed that the arrangement has not compromised applicable SEC, PCAOB, AICPA, or other regulatory standards concerning auditor independence. If the examiner's concerns are not adequately addressed, the examiner should discuss the matter with appropriate agency staff prior to taking any further action.

If the agency staff concurs that the independence of the external auditor or other vendor appears to be compromised, the examiner will discuss his or her findings and the actions the agency may take with the institution's senior management, board of directors (or audit committee), and the external auditor or other vendor. In addition, the agency may refer the external auditor to the state board of accountancy, the AICPA, the SEC, the PCAOB, or other authorities for possible violations of applicable independence standards. Moreover, the agency may conclude that the institution's external auditing program is inadequate and that it does not comply with auditing and reporting requirements, including sections 36 and 39 of the FDI Act and related guidance and regulations, if applicable. *Issued jointly by the Board, FDIC, OCC, and OTS on March 17, 2003.*

SUPPLEMENTAL POLICY STATEMENT ON THE INTERNAL AUDIT FUNCTION AND ITS OUTSOURCING

The Federal Reserve issued this January 23, 2013, policy statement to supplement the guidance in the 2003 "Interagency Policy Statement on the Internal Audit Function and Its Outsourcing" (referred to as the 2003 Policy Statement).[23] Federal Reserve staff has identified areas for improving regulated institutions' internal audit functions. This supplemental policy statement addresses the characteristics, governance, and operational effectiveness of an institution's internal audit function. Further, this statement reflects certain changes in banking regulations that have occurred since the issuance of the 2003 Policy Statement. The Federal Reserve is providing this supplemental guidance to enhance regulated institutions' internal audit practices and to encourage them to adopt professional audit standards and other authoritative guidance, including those issued by the Institute of Internal Auditors (IIA).[24]

This supplemental statement applies to supervised institutions with greater than $10 billion in total consolidated assets, including state member banks, domestic bank and savings and loan holding companies, and U.S. operations of foreign banking organizations.[25] This supplemental guidance is also consistent with the objectives of the Federal Reserve's consolidated supervision framework for large financial institutions with total consolidated assets of $50 billion or more, which promotes an independent internal audit function as an essential element for enhancing the resiliency of supervised institutions.[26]

Overview—Assessment of the Effectiveness of the Internal Audit Function

The degree to which an institution implements the internal audit practices outlined in this policy statement will be considered in the Federal Reserve's supervisory assessment of the effectiveness of an institution's internal audit function as well as its safety and soundness and compliance with consumer laws and regulations. Moreover, the overall effectiveness of an institution's internal audit function will influence the ability of the Federal Reserve to rely upon the work of an institution's internal audit function.

This supplemental policy statement builds upon the 2003 Policy Statement, which remains in effect, and follows the same organizational structure, with a new section entitled "Enhanced

SUPPLEMENTAL POLICY GUIDANCE

Enhanced Internal Audit Practices

An institution's internal audit function should incorporate the following enhanced practices into their overall processes:

Risk Analysis

Internal audit should analyze the effectiveness of all critical risk-management functions both with respect to individual risk dimensions (for example, credit risk), and an institution's overall risk-management function. The analysis should focus on the nature and extent of monitoring compliance with established policies and processes and applicable laws and regulations within the institution as well as whether monitoring processes are appropriate for the institution's business activities and the associated risks.

Thematic Control Issues

Internal audit should identify thematic macro control issues as part of its risk-assessment processes and determine the overall impact of such issues on the institution's risk profile. Additional audit coverage would be expected in business activities that present the highest risk to the institution. Internal audit coverage should reflect the identification of thematic macro control issues across the firm in all auditable areas. Internal audit should communicate thematic macro control issues to senior management and the audit committee.

In addition, internal audit should identify patterns of thematic macro control issues, determine whether additional audit coverage is required, communicate such control deficiencies to senior management and the audit committee, and ensure management establishes effective remediation mechanisms.

Challenging Management and Policy

Internal audit should challenge management to adopt appropriate policies and procedures and effective controls. If policies, procedures, and internal controls are ineffective or insufficient in a particular line of business or activity, internal audit should report specific deficiencies to senior management and the audit committee with recommended remediation. Such recommendations may include restricting business activity in affected lines of business until effective policies, procedures, and controls are designed and implemented. Internal audit should monitor management's corrective action and conduct a follow-up review to confirm that the recommendations of both internal audit and the audit committee have been addressed.

Infrastructure

When an institution designs and implements infrastructure enhancements, internal audit should review significant changes and notify management of potential internal control issues. In particular, internal audit should ensure that existing, effective internal controls (for example, software applications and management information system reporting) are not rendered ineffective as a result of infrastructure changes unless those controls are compensated for by other improvements to internal controls.

Risk Tolerance

Internal audit should understand risks faced by the institution and confirm that the board of directors and senior management are actively involved in setting and monitoring compliance with the institution's risk tolerance limits. Internal audit should evaluate the reasonableness of established limits and perform sufficient testing to ensure that management is operating within these limits and other restrictions.

Governance and Strategic Objectives

Internal audit should evaluate governance at all management levels within the institution, including at the senior management level, and within all significant business lines. Internal audit should also evaluate the adequacy and effectiveness of controls to respond to risks within the organization's governance, operations, and information systems in achieving the organization's strategic objectives. Any concerns should be communicated by internal audit to the board of directors and senior management.

Internal Audit Function *(Part I of the 2003 Policy Statement)*

The primary objectives of the internal audit function are to examine, evaluate, and perform an independent assessment of the institution's internal control system, and report findings back to senior management and the institution's audit committee. An effective internal audit function within a financial institution is a vital means for an institution's board of directors to maintain the quality of the internal control environment and risk-management systems.

The guidance set forth in this section supplements the existing guidance in the 2003 Policy Statement by strongly encouraging internal auditors to adhere to professional standards, such as the IIA guidance. Furthermore, this section clarifies certain aspects of the IIA guidance and provides practices intended to increase the safety and soundness of institutions.

Attributes of Internal Audit

Independence. Internal audit is an independent function that supports the organization's business objectives and evaluates the effectiveness of risk management, control, and governance processes. The 2003 Policy Statement addressed the structure of an internal audit function, noting that it should be positioned so that an institution's board of directors has confidence that the internal audit function can be impartial and not unduly influenced by managers of day-to-day operations. Thus, the member of management responsible for the internal audit function (hereafter referred to as the chief audit executive or CAE)[27] should have no responsibility for operating the system of internal control and should report functionally to the audit committee. A reporting arrangement may be used in which the CAE is functionally accountable and reports directly to the audit committee on internal audit matters (that is, the audit plan, audit findings, and the CAE's job performance and compensation) and reports administratively to another senior member of management who is not responsible for operational activities reviewed by internal audit. When there is an administrative reporting of the CAE to another member of senior management, the objectivity of internal audit is served best when the CAE reports administratively to the chief executive officer (CEO).

If the CAE reports administratively to someone other than the CEO, the audit committee should document its rationale for this reporting structure, including mitigating controls available for situations that could adversely impact the objectivity of the CAE. In such instances, the audit committee should periodically (at least annually) evaluate whether the CAE is impartial and not unduly influenced by the administrative reporting line arrangement. Further, conflicts of interest for the CAE and all other audit staff should be monitored at least annually with appropriate restrictions placed on auditing areas where conflicts may occur.

For foreign banking organizations (FBOs), the internal audit function for the U.S. operations of an FBO should have appropriate independent oversight for the total assets of U.S. operations.[28] When there is a resident U.S. audit function, the CAE of the U.S. audit function should report directly to senior officials of the internal audit department at the head office such as the global CAE. If the FBO has separate U.S. subsidiaries, oversight may be provided by a U.S. based audit committee that meets U.S. public company standards for independence or by the foreign parent company's internal audit function.

Professional competence and staffing. Internal audit staff should have the requisite collective

27. More recently, this title is used to refer to the person in charge of the internal audit function. An institution may not have a person at the management level of CAE and instead may have an internal audit manager.

28. This is defined as the combined total assets of U.S. operations, net of all intercompany assets and claims on U.S.-domiciled affiliates.

skill levels to audit all areas of the institution. Therefore, auditors should have a wide range of business knowledge, demonstrated through years of audit and industry-specific experience, educational background, professional certifications, training programs, committee participation, professional associations, and job rotational assignments. Internal audit should assign staff to audit assignments based on areas of expertise and, when feasible, rotate staff within the audit function.

Internal audit management should perform knowledge-gap assessments at least annually to evaluate whether current staff members have the knowledge and skills commensurate with the institution's strategy and operations. Management feedback surveys and internal or external quality assurance findings are useful tools to identify and assess knowledge gaps. Any identified knowledge gaps should be filled and may be addressed through targeted staff hires, training, business line rotation programs, and outsourcing arrangements. The internal audit function should have an effective staff training program to advance professional development and should have a process to evaluate and monitor the quality and appropriateness of training provided to each auditor. Internal auditors generally receive a minimum of forty hours of training in a given year.

Objectivity and ethics. Internal auditors should be objective, which means performing assignments free from bias and interference. A major characteristic of objectivity is that the CAE and all internal audit professional staff avoid any conflicts of interest.[29] For their first year in the internal audit function, internally recruited internal auditors should not audit activities for which they were previously responsible. Moreover, compensation schemes should not provide incentives for internal auditors to act contrary to the attributes and objectives of the internal audit function.[30] While an internal auditor may recommend internal control standards or review management's procedures before implementation, objectivity requires that the internal auditor not be responsible for the design, installation, procedures development, or operations of the institution's internal control systems.

An institution's internal audit function should have a code of ethics that emphasizes the principles of objectivity, competence, confidentiality, and integrity, consistent with professional internal audit guidance such as the code of ethics established by the IIA.

Internal audit charter. Each institution should have an internal audit charter that describes the purpose, authority, and responsibility of the internal audit function. An audit charter should include the following critical components:

- The objectives and scope of the internal audit function;
- The internal audit function's management reporting position within the organization, as well as its authority and responsibilities;
- The responsibility and accountability of the CAE; and
- The internal audit function's responsibility to evaluate the effectiveness of the institution's risk management, internal controls, and governance processes.

The charter should be approved by the audit committee of the institution's board of directors. The charter should provide the internal audit function with the authorization to access the institution's records, personnel, and physical properties relevant to the performance of internal audit procedures, including the authority to examine any activities or entities. Periodically, the CAE should evaluate whether the charter continues to be adequate, requesting the approval of the audit committee for any revisions. The charter should define the criteria for when and how the internal audit function may outsource some of its work to external experts.

Corporate Governance Considerations

Board of directors and senior management responsibilities. The board of directors and senior management are responsible for ensuring that the institution has an effective system of internal controls. As indicated in the 2003 Policy Statement, this responsibility cannot be delegated to others within the institution or to external parties. Further, the board of directors and senior management are responsible for ensuring that internal controls are operating effectively.

29. IIA standards define conflict of interest as a situation in which an internal auditor, who is in a position of trust, has a competing professional or personal interest. Such competing interests can make it difficult for the individual to fulfill his or her duties impartially.

30. IIA standards have additional examples of "conflict of interest" for consideration.

Audit committee responsibilities. An institution's audit committee is responsible for establishing an appropriate internal audit function and ensuring that it operates adequately and effectively. The audit committee should be confident that the internal audit function addresses the risks and meets the demands posed by the institution's current and planned activities. Moreover, the audit committee is expected to retain oversight responsibility for any aspects of the internal audit function that are outsourced to a third party.

The audit committee should provide oversight to the internal audit function. Audit committee meetings should be on a frequency that facilitates this oversight and generally should be held four times a year at a minimum, with additional meetings held by audit committees of larger financial institutions. Annually, the audit committee should review and approve internal audit's charter, budget and staffing levels, and the audit plan and overall risk-assessment methodology. The committee approves the CAE's hiring, annual performance evaluation, and compensation.

The audit committee and its chairperson should have ongoing interaction with the CAE separate from formally scheduled meetings to remain current on any internal audit department, organizational, or industry concerns. In addition, the audit committee should have executive sessions with the CAE without members of senior management present as needed.

The audit committee should receive appropriate levels of management information to fulfill its oversight responsibilities. At a minimum, the audit committee should receive the following data with respect to internal audit:

- Audit results with a focus on areas rated less than satisfactory;
- Audit plan completion status and compliance with report issuance timeframes;
- Audit plan changes, including the rationale for significant changes;
- Audit issue information, including aging, past-due status, root-cause analysis, and thematic trends;
- Information on higher-risk issues indicating the potential impact, root cause, and remediation status;
- Results of internal and external quality assurance reviews;
- Information on significant industry and institution trends in risks and controls;
- Reporting of significant changes in audit staffing levels;
- Significant changes in internal audit processes, including a periodic review of key internal audit policies and procedures;
- Budgeted audit hours versus actual audit hours;
- Information on major projects; and
- Opinion on the adequacy of risk-management processes, including effectiveness of management's self-assessment and remediation of identified issues (at least annually).

Role of the chief audit executive. In addition to communicating and reporting to the audit committee on audit-related matters, the CAE is responsible for developing and maintaining a quality assurance and improvement program that covers all aspects of internal audit activity, and for continuously monitoring the effectiveness of the audit function. The CAE and/or senior staff should effectively manage and monitor all aspects of audit work on an ongoing basis, including any audit work that is outsourced.[31]

The Adequacy of the Internal Audit Function's Processes

Internal audit should have an understanding of the institution's strategy and operating processes as well as the potential impact of current market and macroeconomic conditions on the financial institution. Internal audit's risk-assessment methodology is an integral part of the evaluation of overall policies, procedures, and controls at the institution and the development of a plan to test those processes.

Audit methodology. Internal audit should ensure that it has a well-developed risk-assessment methodology that drives its risk-assessment process. The methodology should include an analysis of cross-institutional risk and thematic control issues and address its processes and procedures for evaluating the effectiveness of risk management, control, and governance processes. The methodology should also address the role of continuous monitoring in determining and evaluating risk, as well as internal

31. The ongoing review of audit work should include risk assessments of audit entities and elements, scope documents, audit programs, detailed audit procedures and steps (including sampling methodologies), audit work papers, audit findings, and monitoring of the timely and effective resolution of audit issues.

audit's process for incorporating other risk identification techniques that the institution's management utilizes such as a risk and control self-assessment (RCSA). The components of an effective methodology should support the internal audit function's assessment of the control environment, beginning with an evaluation of the audit universe.

Audit universe. Internal audit should have effective processes to identify all auditable entities within the audit universe. The number of auditable entities will depend upon whether entities are captured at individual department levels or at other aggregated organizational levels. Internal audit should use its knowledge of the institution to determine whether it has identified all auditable entities and may use the general ledger, cost centers, new product approval processes, organization charts, department listings, knowledge of the institution's products and services, major operating and application systems, significant laws and regulations, or other data. The audit universe should be documented and reviewed periodically as significant organizational changes occur or at least during the annual audit planning process.

Internal audit risk assessment. A risk assessment should document the internal audit staff's understanding of the institution's significant business activities and the associated risks. These assessments typically analyze the risks inherent in a given business line or process, the mitigating control processes, and the resulting residual risk exposure to the institution.

A comprehensive risk assessment should effectively analyze the key risks (and the critical risk-management functions) within the institution and prioritize audit entities within the audit universe. The risk-assessment process should be well documented and dynamic, reflecting changes to the system of internal controls, infrastructure, work processes, and new or changed business lines or laws and regulations. The risk assessments should also consider thematic control issues, risk tolerance, and governance within the institution. Risk assessments should be revised in light of changing market conditions or laws and regulations and updated during the year as changes are identified in the business activities of the institution or observed in the markets in which the institution operates, but no less than annually. When the risk assessment indicates a change in risk, the audit plan should be reviewed to determine whether the planned audit coverage should be increased or decreased to address the revised assessment of risk.

Risk assessments should be formally documented and supported with written analysis of the risks.[32] There should be risk assessments for critical risk-management functions within the institution. Risk assessments may be quantitative or qualitative and may include factors such as the date of the last audit, prior audit results, the impact and likelihood of an event occurring, and the status of external vendor relationships. A management RCSA, if performed, may be considered by the internal audit function in developing its independent risk assessment. The internal audit risk assessment should also include a specific rationale for the overall auditable entity risk score. The overall disposition of the risk assessment should be summarized with consideration given to key performance or risk indicators and prior audit results. A high-level summary or discussion of the risk-assessment results should be provided to the audit committee and include the most significant risks facing the institution as well as how these risks have been addressed in the internal audit plan.

Internal audit plan. Internal audit should develop and periodically revise its comprehensive audit plan and ensure that audit coverage for all identified, auditable entities within the audit universe is appropriate for the size and complexity of the institution's activities. This should be accomplished either through a multiyear plan approach, with the plan revised annually, or through an approach that utilizes a framework to evaluate risks annually focusing on the most significant risks. In the latter approach, there should be a mechanism in place to identify when a significant risk will not be audited in the specified timeframe and a requirement to notify the audit committee and seek its approval of any exception to the framework. Generally, common practice for institutions with defined audit cycles is to follow either a three- or four-year audit cycle; high-risk areas should be audited at least every twelve to eighteen months.[33]

32. For example, risks include credit, market, operational, liquidity, compliance, IT, fraud, political, legal, regulatory, strategic, and reputational.

33. Regardless of the institution's practice, particular care should be taken to ensure that higher-risk elements are reviewed with an appropriate frequency, and not obscured due to their inclusion in a lower risk-rated audit entity.

The internal audit plan should consider the risk assessment and internal audit's approach to audit coverage should be appropriate based on the risk assessment. An effective plan covers individual business areas and risk disciplines as well as cross-functional and cross-institutional areas.

The audit planning process should be dynamic, allowing for change when necessary. The process should include a process for modifying the internal audit plan to incorporate significant changes that are identified either through continuous monitoring or during an audit. Any significant changes should be clearly documented and included in quarterly communications to the audit committee. Critical data to be reported to the audit committee should include deferred or cancelled audits rated high-risk and other significant additions or deletions. Significant changes to audit budgets and timeliness for the completion of audits should be reported to the audit committee with documented rationale.

Internal audit continuous monitoring. Internal audit is encouraged to utilize formal continuous monitoring practices as part of the function's risk-assessment processes to support adjustments to the audit plan or universe as they occur. Continuous monitoring can be conducted by an assigned group or individual internal auditors. An effective continuous monitoring process should include written standards to ensure consistent application of processes throughout the organization.

Continuous monitoring results should be documented through a combination of metrics, management reporting, periodic audit summaries, and updated risk assessments to substantiate that the process is operating as designed. Critical issues identified through the monitoring process should be communicated to the audit committee. Computer-assisted auditing techniques are useful tools to highlight issues that warrant further consideration within a continuous monitoring process.

Internal Audit Performance and Monitoring Processes

Performance. Detailed guidance related to the performance of an internal audit should be documented in the audit manual[34] and work programs to ensure that audit execution is consistent across the audit function. Internal audit policies and procedures should be designed to ensure that audits are executed in a high-quality manner, their results are appropriately communicated, and issues are monitored and appropriately resolved. In performing internal audit work, an institution should consider the following.

- *Internal audit scope:* During the audit planning process, internal audit should analyze the auditable entity's specific risks, mitigating controls, and level of residual risk. The information gathered during the audit planning phase should be used to determine the scope and specific audit steps that should be performed to test the adequacy of the design and operating effectiveness of control processes.

- *Internal audit work papers:* Work papers document the work performed, observations and analyses made, and support for the conclusions and audit results. The work papers should contain sufficient information regarding any scope or audit program modifications and waiver of issues not included in the final report. Work papers also should document the specific sampling methodology, including minimum sample sizes, and the rationale for such methodology. The work papers should contain information that reflects all phases of the audit process including planning, fieldwork, reporting, and issues tracking and follow-up. On an ongoing basis, a comprehensive supervisory review should be performed on all audit work, including any outsourced internal audit procedures.[35]

- *Audit report:* Internal audit should have effective processes to ensure that issues are communicated throughout the institution and audit issues are addressed in a timely manner. The audit report should include an executive summary that describes the auditable area, audit's conclusions, the rationale for those conclusions, and key issues. Most audit reports also include management's action plans to address

34. To facilitate effective, efficient, and consistent practice within the internal audit department, an institution should develop an audit manual that includes comprehensive policies and procedures and is made available to all internal audit staff. The manual should be updated as needed.

35. An experienced audit manager should perform this review.

audit findings. To ensure that identified issues are addressed in a timely manner, reports should be issued to affected business areas, senior management, and the audit committee within an appropriate timeframe after the completion of field work. Compliance with issuance timeframes should be monitored and reported periodically to the audit committee. At a minimum, internal audit should ensure that management considers the level and significance of the risk when assigning resources to address and remediate issues. Management should appropriately document the action plans either within the audit report or separately.

- *Internal audit issues tracking:* Internal audit should have effective processes in place to track and monitor open audit issues and to follow-up on such issues. The timely remediation of open audit issues is an essential component of an organization's risk reduction efforts. Internal audit and the responsible management should discuss and agree to an appropriate resolution date, based on the level of work necessary to complete remediation processes. When an issue owner indicates that work to close an issue is completed, the internal audit function should perform validation work prior to closing the issue. The level of validation necessary may vary based on the issue's risk level. For higher-risk issues, internal audit should perform and document substantive testing to validate that the issue has been resolved. Issues should be tested over an appropriate period of time to ensure the sustainability of the remediation.

Retrospective review processes. When an adverse event occurs at an institution (for example, fraud or a significant loss), management should conduct a post-mortem and "lessons learned" analysis. In these situations, internal audit should ensure that such a review takes place and appropriate action is taken to remediate identified issues. The internal audit function should evaluate management's analysis of the reasons for the event and whether the adverse event was the result of a control breakdown or failure, and identify the measures that should be put in place to prevent a similar event from occurring in the future. In certain situations, the internal audit function should conduct its own post-mortem and a "lessons learned" analysis outlining the remediation procedures necessary to detect, correct, and/or prevent future internal control breakdowns (including improvements in internal audit processes).

Quality assurance and improvement program. A well-designed, comprehensive quality assurance program should ensure that internal audit activities conform to the IIA's professional standards and the institution's internal audit policies and procedures. The program should include both internal and external quality assessments.

The internal audit function should develop and document its internal assessment program to promote and assess the quality and consistency of audit work across all audit groups with respect to policies, procedures, audit performance, and work papers. The quality assurance review should be performed by someone independent of the audit work being reviewed. Conclusions reached and recommendations for appropriate improvement in internal audit process or staff training should be implemented by the CAE through the quality assurance and improvement program. Action plan progress should be monitored and subsequently closed after a period of sustainability. Each institution should conduct an internal quality assessment annually and the CAE should report the results and status of internal assessments to senior management and the audit committee at least annually.

The IIA recommends that an external quality assessment of internal audit be performed by a qualified independent party at least once every five years. The review should address compliance with the IIA's definition of internal auditing, code of ethics, and standards, as well as with the internal audit function's charter, policies and procedures, and any applicable legislative and regulatory requirements. The CAE should communicate the results, planned actions, and status of remediation efforts to senior management and the audit committee.

Internal Audit Outsourcing Arrangements *(Part II of the 2003 Policy Statement)*

As stated in the 2003 Policy Statement, an institution's board of directors and senior management are charged with the overall responsibility for maintaining an effective system of internal controls. Responsibility for maintaining an effective system of internal controls cannot be delegated to a third party. An institution that chooses to outsource audit work should ensure that the audit committee maintains ownership of the internal audit function. The institution's audit committee and CAE should provide active and effective oversight of outsourced activities. Institutions should carefully consider the oversight responsibilities that are consequential to these types of arrangements in determining appropriate staffing levels.

To distinguish its duties from those of the outsourcing vendor, the institution should have a written contract, which may take the form of an engagement letter or similar services agreement. Contracts between the institution and the vendor should include a provision stating that work papers and any related non-public confidential information and personal information must be handled by the vendor in accordance with applicable laws and regulations. An institution should periodically confirm that the vendor continues to comply with the agreed-upon confidentiality requirements, especially for long-term contracts. The audit committee should approve all significant aspects of outsourcing arrangements and should receive information on audit deficiencies in a manner consistent with that provided by the in-house audit department.

Vendor Competence

An institution should have appropriate policies and procedures governing the selection and oversight of internal audit vendors, including whether to continue with an existing outsourced arrangement. The audit committee and the CAE are responsible for the selection and retention of internal audit vendors and should be aware of factors that may impact vendors' competence and ability to deliver high-quality audit services.

Contingency Planning

An institution's contingency plan should take into consideration the extent to which the institution relies upon outsourcing arrangements. When an institution relies significantly on the resources of an internal audit service provider, the institution should have contingency procedures for managing temporary or permanent disruptions in the service in order to ensure that the internal audit function can meet its intended objectives.

Quality of Audit Work

The quality of audit work performed by the vendor should be consistent with the institution's standards of work expected to be performed by an in-house internal audit department. Further, information supplied by the vendor should provide the board of directors, its audit committee, and senior management with an accurate report on the control environment, including any changes necessary to enhance controls.

Independence Guidance for the Independent Public Accountant *(Part III of the 2003 Policy Statement)*

The following discussion supplements the discussion in Part III of the 2003 Policy Statement and addresses additional requirements regarding auditor independence for depository institutions subject to section 36 of the FDI Act (as amended in 2009).

Depository Institutions Subject to the Annual Audit and Reporting Requirements of Section 36 of the FDI Act

The July 2009 amendments to section 36 of the FDI Act (applicable to insured depository institutions with total assets of $500 million or more) require an institution's external auditor to follow the more restrictive of the independence rules issued by the AICPA, SEC, and PCAOB. In March 2003, the SEC prohibited a registered public accounting firm that is responsible for furnishing an opinion on the consolidated or separate financial statements of an audit client from providing internal audit services to that same client.[36] Therefore, by following the more restrictive independence rules, a depository institution's external auditor is precluded from performing internal audit services, either on a

36. See SEC final rule, "Strengthening the Commission's Requirements Regarding Auditor Independence," at 17 CFR parts 210, 240, 249 and 274.

co-sourced or an outsourced basis, even if the institution is not a public company.

Examination Guidance *(Part IV of the 2003 Policy Statement)*

The following discussion supplements the existing guidance in Part IV of the 2003 Policy Statement on examination guidance and discusses the overall effectiveness of an institution's internal audit function and the examiner's reliance on internal audit.

Determining the Overall Effectiveness of Internal Audit

An effective internal audit function is a vehicle to advance an institution's safety and soundness and compliance with consumer laws and regulations and is therefore considered as part of the supervisory review process. Federal Reserve examiners will make an overall determination as to whether the internal audit function and its processes are effective or ineffective and whether examiners can potentially rely upon internal audit's work as part of the supervisory review process. If internal audit's overall processes are deemed effective, examiners may be able to rely on the work performed by internal audit depending on the nature and risk of the functions subject to examination.

The supervisory assessment of internal audit and its effectiveness will consider an institution's application of the 2003 Policy Statement and this supplemental guidance. An institution's internal audit function generally would be considered effective if the institution's internal audit function structure and practices are consistent with the 2003 Policy Statement and this guidance.

Conversely, an institution's internal audit function that does not follow the enhanced practices and supplemental guidance outlined in this policy letter generally will be considered ineffective. In such a case, examiners will not rely on the institution's internal audit function.
