

FEDERAL RESERVE statistical release

G.17 (419)

For release at 9:15 a.m. (EDT)
August 17, 1999

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production, which had risen only 0.2 percent in May and 0.1 percent in June, increased 0.7 percent in July. Because of high temperatures and the heavy use of air conditioning, electric utility output rose more than 3 percent; manufacturing output increased 0.6 percent, and mining output, 0.8 percent. At 135.1 percent of its 1992 average, industrial production in July was 3.6 percent higher than in July 1998. The rate of capacity utilization for total industry rose 0.4 percentage point, to 80.7 percent, 1.4 percentage points below its 1967–98 average.

Market Groups

The output of consumer goods edged up 0.1 percent for a third consecutive month. Because of a dip in motor vehicle assemblies, the output of consumer durable goods fell back 1.1 percent in July after solid increases earlier. The production of automotive products dropped 4.3 percent; it had increased more than 6 percent from March to June. The production of other durable consumer goods advanced 1.6 percent after having changed little in both May and June; a rebound in the output of appliances along with further strength in home computing equipment and room air conditioners

(over)

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION: SUMMARY

Seasonally adjusted

Industrial Production	Index, 1992=100				Percent change				July 98 to July 99

accounted for the gain. The production of nondurable consumer goods, which had been weak in earlier months, rose 0.4 percent. A small increase in the production of non-energy products was accompanied by a rebound in the production of energy goods as residential sales of electricity jumped. Although the output of consumer nondurable goods increased, it remained 2.2 percent below its level of July 1998.

After having eased 0.5 percent in June, the output of business equipment rebounded 0.8 percent in July. The output of industrial equipment was up noticeably, reversing part of the cumulative losses over the preceding two months. The production of information processing equipment, which advanced 2.1 percent in July, has risen 16.2 percent over the past twelve months. The output of transit equipment and of other equipment declined again. Within these groups, the production of farm machinery and commercial aircraft weakened further; assemblies of light business vehicles fell back, but assemblies of medium and heavy trucks advanced more than 1 percent. The output of defense and space equipment, which had fallen 1 percent in June, edged up 0.2 percent.

The production of construction supplies, which dipped in June, bounced back in July, continuing the strong performance that has been evident since late 1997. The output of materials increased 1.1 percent. The output of durable goods materials, which accounts for more than half of total materials in terms of value added, rose 1.3 percent, nearly double the increase in June; all the major groups within this category posted sizable gains. The output of energy materials rose 1.9 percent, while the production of nondurable goods materials edged down.

Industry Groups

Manufacturing output advanced 0.6 percent in July after it had edged up 0.1 percent in June. Excluding motor vehicles and parts, the gain in July was 0.8 percent. Production of both durables and nondurables picked up. The 0.8 percent gain in the output of durables once again was led by significant advances at makers of high-technology equipment and parts; however, the production of motor vehicles and parts fell 2 percent, reversing its increase in June. The production indexes for furniture and fixtures; for stone, clay, and glass products; and for fabricated metal products all increased 1 percent in July. Among nondurables, rebounds in the production of petroleum products, rubber and plastics products, and apparel products were partly offset by declines in the leather, paper, and foods industries.

The factory operating rate rose 0.3 percentage point in July, to 79.7 percent, with increases in both advanced- and primary-processing industries. Capacity utilization in primary-processing industries rose 0.5 percentage point, to 83.0 percent, its highest level since January, while utilization in advanced-processing industries rose 0.2 percentage point, to 78.6 percent.

The operating rate at electric utilities, which rose 3 percentage points, to 97.6 percent, reflected both the higher use of air conditioning during the heat wave and the reluctance of some utilities in recent years to add capacity in a more competitive environment. The operating rate for mining rose 0.5 percentage point, to 81.6 percent, a level well below its long-run average. Some recovery in oil and gas well drilling and an increase in coal mining contributed to the increase.

Revision of Industrial Production and Capacity Utilization

In November the Federal Reserve will publish revisions to its measures of industrial production (IP), capacity, capacity utilization, and industrial use of electric power. The revisions will begin with 1992 and will incorporate updated source data for more recent years.

This regular updating of source data for IP will include some annual data from the Bureau of the Census's 1997 Census of Manufactures and from selected editions of its 1998 Current Industrial Reports. Annual data from the U. S. Geological Survey on metallic and nonmetallic minerals (except fuels) for 1997 and 1998 will also be introduced. The updating will also include revisions to the monthly indicator for each industry (either physical product data, production-worker hours, or electric power usage) and revised seasonal factors. In addition, the revision will introduce improved measures of production for selected series.

Capacity and capacity utilization will be revised to incorporate preliminary data from the 1998 Survey of Plant Capacity of the Bureau of the Census. The statistics on the industrial use of electric power will incorporate additional information received from utilities for the past few years and may include some data from the 1997 Census of Manufactures.

Once the revision is published, it will also be made available on the Board's web site, <http://www.federalreserve.gov/releases/g17>, and on diskettes from Publications Services (telephone 202-452-3245). The revised data will also be available through the web site and Economic Bulletin Board of the Department of Commerce. Further information on these revisions is available from the Board's Industrial Output Section (telephone 202-452-3197).

1. The IP proportion data are estimates of the industries' relative contributions to overall IP growth in the following year.

2. Semiconductors include related electronic components.

3. Millions of units at an annual rate.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

Table 2B
INDUSTRIAL PRODUCTION: INDUSTRY GROUPS

Percent change

1. Series begins in 1977.

2. Semiconductors include related electronic components.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastic products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

Explanatory Note

The statistical release of **Industrial Production and Capacity Utilization** reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. The release also includes monthly indexes on the use of electric power in manufacturing and mining. Files containing data in the release and historical data are available under statistical releases at <http://www.federalreserve.gov>, the Board's World Wide Web site. For paid access to these files through the Department of Commerce's Economic Bulletin Board or World Wide Web site, please call STAT-USA at 1-800-STAT-USA or (202) 452-1986. Diskettes containing historical data and the data published in this release are available from the Board of Governors of the Federal Reserve System, Publications Services, (202) 452-3245.

Industrial Production

Coverage. The industrial production (IP) index measures output in the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 1992. For the period since 1992, the total IP index has been constructed from 267 individual series based on the 1987 Standard Industrial Classification (SIC). These individual series are classified in two ways: (1) market groups (shown in table 1), such as consumer goods, equipment, intermediate products, and materials; and (2) industry groups (shown in tables 2 and 6), such as two-digit SIC industries and major aggregates of these industries—for example, durable and nondurable manufacturing, mining, and utilities.

Market groups. For purposes of analysis, the individual IP series are grouped into final products, intermediate products, and materials. Final products are assumed to be purchased by consumers, businesses, or government for final use. Intermediate products are expected to become inputs in nonindustrial sectors, such as construction, agriculture, and services. Materials are industrial output requiring further processing within the industrial sector. Total products comprise final and intermediate products, and final products are divided into consumer goods and equipment.

Timing. The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript "r" in tables.) After the fourth month, indexes are not revised further until the time of an annual revision or a benchmark revision. The last three benchmark revisions were published in 1990, 1985, and 1976.

Source data. In annual or benchmark revisions, the individual IP indexes are constructed from a variety of source data, such as the quinquennial *Censuses of Manufactures and Mineral Industries* and the *Annual Survey of Manufactures*, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the Department of the Interior; and publications of the Department of Energy. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations as well as from government agencies including those listed above; data of this type are used to estimate monthly IP where possible and appropriate. When suitable data on physical product are unavailable, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. Especially for the first and second estimates for a given month, the available source data are limited and subject to revision.

Weights. In the index, series that measure the output of an individual industry are weighted according to their proportion in the total value-added output of all industries. The industrial production index, which extends back to 1919, is built as an annually weighted chain-type index since 1977. The components of IP are combined using estimates of value added per unit of output. For months from January to June, the weights are drawn from the year containing the month being estimated and the preceding year; for months from July to December, the weights are drawn from the current and following year. The IP proportions shown in column 1 of tables 1A, 2A, and 6 are estimates of the industries' relative contributions to overall growth in the following year. For example, a 1 percent increase in durable goods manufacturing in 1997 would account for an increase in total IP of nearly 1/2 percent.

Seasonal adjustment. Individual series are seasonally adjusted by the X-11 ARIMA method, developed at Statistics Canada. For series based on production-worker hours, the current seasonal factors were estimated with data through October 1998; for other series, the factors were estimated with data through at least June 1998. Series are preadjusted for the effects of holidays or the business cycle where appropriate. For the data since 1977, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

Reliability. The average revision to the *level* of the total IP index, without regard to sign, between the first and the fourth estimates was 0.28 percent during the 1987–97 period. The average revision to the *percent change* in total IP, without regard to sign,

from the first to the fourth estimates was 0.21 percentage point during the 1987–97 period. In most cases (about 83 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

Capacity Utilization

Definition. Capacity utilization is calculated for the manufacturing, mining, and electric and gas utilities industries. For a given industry, the utilization rate is equal to an output index divided by a capacity index. Output is measured by seasonally adjusted indexes of industrial production. The capacity indexes attempt to capture the concept of sustainable practical capacity, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work schedule, taking account of normal downtime, and assuming sufficient availability of inputs to operate the machinery and equipment in place. The 76 individual capacity indexes are based on a variety of data, including capacity data measured in physical units compiled by trade associations, surveys of utilization rates and investment, and estimates of growth of the capital input.

Groups. Estimates of capacity and utilization are available for a variety of groups, including primary and advanced processing industries within manufacturing, durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Component industries of the primary and advanced processing groups within manufacturing are listed in the note on tables 2 and 3 of the release.

Weights. Although each utilization rate is the result of dividing an IP series by a corresponding capacity index, aggregate utilization rates are equivalent to combinations of individual utilization rates aggregated with proportions that reflect current capacity levels of output valued in current-period value added per unit of actual output. The implied proportions of individual industry operating rates in the rate for total industry for the most recent year are shown in the first column of table 3.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime.

Electric Power

Data on electric power (expressed in kilowatt hours) are collected by the Federal Reserve District Banks from electric utilities and also from manufacturing and mining establishments that generate electric power for their own use (cogenerators). The indexes of power use shown in table 9 are sums of kilowatt hours used by an industry or industry group expressed as a percentage of that industry's or group's usage in 1992. The first column of the table shows, for reference, electric power use in billions of kilowatt hours as reported by manufacturing and mining industries in the 1992 censuses of those industries. The supplementary group, "Total, less nuclear nondefense," is shown separately because the value-added proportion for the nondefense nuclear material series (part of SIC 2819) in total IP is considerably smaller than its share of total electric power use. Excluding this component from total power use facilitates comparisons with total IP.

References

The annual revision published on November 24, 1998 is described more completely in the *Federal Reserve Bulletin*, vol.85 (January 1999).

A description of the aggregation methods for industrial production and capacity utilization is included in an article in the *Federal Reserve Bulletin*, vol. 83 (February 1997), pp. 67–92. *Industrial Production—1986 Edition* contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. To obtain *Industrial Production—1986 Edition* (\$9.00 per copy), write to Board of Governors of the Federal Reserve System, Publications Services, Washington, DC 20551. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the *Federal Reserve Bulletin* (April 1990, June 1990, June 1993, March 1994, January 1995, and January 1996, February 1997, February 1998, January 1999). The basic methodology used to estimate capacity and utilization is discussed in the June 1990 *Federal Reserve Bulletin*.

Release Schedule for 1999 and 2000

At 9:15 a.m. on:

1999: January 15, February 17, March 16, April 16, May 14, June 16, July 16, August 17, September 16, October 15, November 16, and December 15

2000: January 14, February 15, March 15, April 14, May 15, June 15, July 14, August 15, September 15, October 17, November 15, and December 15
