FEDERAL RESERVE statistical release

G.17 (419)

For release at 9:15 a.m. (EDT) October 17, 2002

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production edged down 0.1 percent in September. Despite the declines in August and September, the index of industrial production was 140.5 percent of the 1992 average, a level still slightly above the June 2002 reading. Average production rose at an annual rate of 3.6 percent between the second and third quarters. Manufacturing output, which fell for the second consecutive month, dropped 0.3 percent in September, but the level of output was 2.5 percent above the December 2001 trough. Production at the nation's mines fell 1.1 percent in September, while the output of utilities rose 2.4 percent. Capacity utilization for total industry was 75.9 percent, a rate that is about the same as in June 2002. Both the capacity utilization rate and the change in overall industrial production were held down 0.1 percentage point by the effects of tropical storms on oil and gas extraction and petroleum refining around the Gulf of Mexico.

Market Groups

A second month of broad declines in consumer durable goods helped push the output of consumer goods down 0.1 percent in September. The index for appliances, furniture, and carpeting fell for a fourth consecutive month to a level near its trough in 2001, and the production of miscellaneous consumer goods contracted for a second month. The output of automotive products eased in both August and September, but together with July's sharp increase, production for the third quarter was up at an annual rate of more than 23 percent. The production of non-energy nondurables was unchanged in September, with higher output levels of clothing and chemical products offset by declines elsewhere. A small decline in the output of paper products ended a four-month series of increases. The index for consumer energy products increased 1.0 percent in September; in recent months this measure has been influenced by large weather-driven swings in the output of electricity for residential use.

The production of business equipment dropped 1.7 percent in September. A key contributor to this decline was a pullback in the production of industrial and other equipment, especially construction and farm machinery. The index for transit equipment was drawn down again last month and has now contracted for five quarters. In September, reduced motor vehicle assemblies for businesses led the decline and were accompanied by the eighteenth consecutive monthly contraction in commercial aircraft production. The output of information processing equipment remained weak in September and was little changed from twelve months ago. The output of defense and space equipment, which has increased more than 7 percent since September 2001, continued its upward climb.

Although the output of construction supplies rose slightly in September, its average in the third quarter was little changed from the second quarter. The production of business supplies also rose slightly in September; most of the increase was attributable to commercial electricity sales. Materials output, which has risen 4.0 percent since September 2001, edged up for a ninth month. Greater output of energy and nondurable materials slightly more than offset a decline in the output of durable materials.

Industry Groups

Manufacturing output declined 0.3 percent in September; the production of durable goods was down, and the production of nondurable goods was unchanged. In the third quarter, manufacturing output rose at an annual rate of 3.3 percent after similarly sized increases in the first and second quarters. The production of durable and nondurable goods also increased in each of the last three quarters. Among durable goods, only the output of furniture and fixtures and aerospace and miscellaneous transportation equipment declined last quarter; both of these industries have been on downward trends for at least six quarters. In contrast, the production of motor vehicles and parts, primary and fabricated metals, and electrical machinery posted sizable gains. Among nondurable goods industries, the output of chemicals and products increased sharply in the third quarter. Production gains in the paper and products, printing and publishing, and rubber and plastics products industries more than offset output decreases in the food and tobacco products, apparel products, and petroleum products industries.

At 74.2 percent in September, the factory operating rate was 6.7 percentage points below its 1967–2001 average. This rate increased 1.7 percentage points between its December 2001 trough and July 2002, but it has fallen in each of the past two months. The utilization rate for primary-processing industries rose marginally in September to its highest level since February 2001, while the rate for advanced-processing industries posted a small decline. The operating rate at mines edged down to 84.4 percent, while the rate at utilities climbed to 88.2 percent.

Revision of Industrial Production and Capacity Utilization

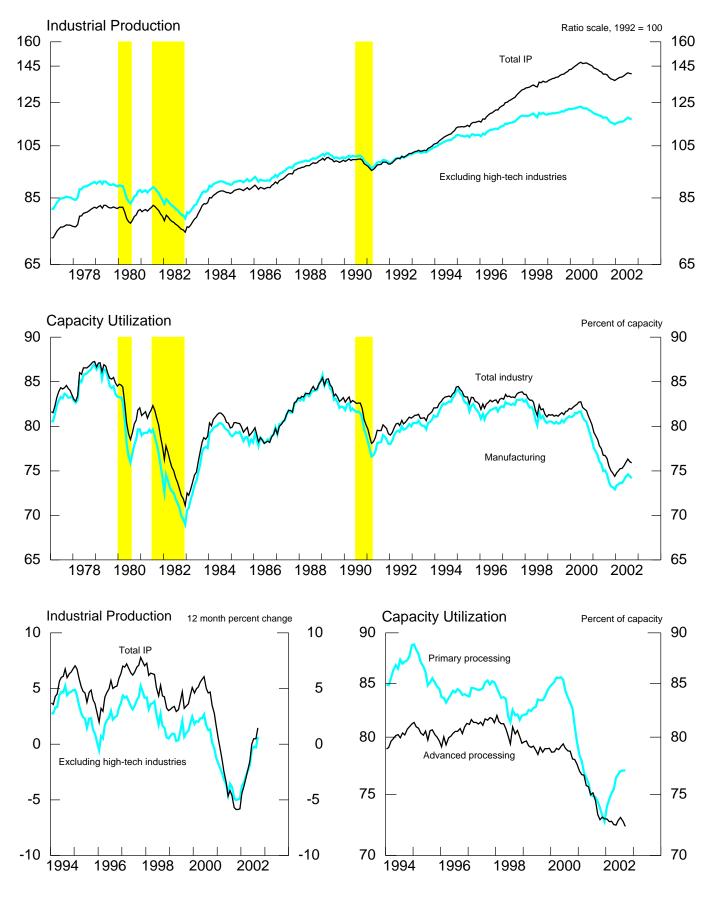

On November 26, the Federal Reserve Board will publish a revision to the index of industrial production (IP), the related measures of capacity and capacity utilization, and the data on industrial use of electric power. The revised estimates will be classified according to the 2002 North American Industrial Classification System (NAICS); previously, the estimates from 1987 forward were classified according to the 1987 Standard Industrial Classification system (SIC). NAICS changes the SIC system's industry composition of manufacturing. To preserve the continuity of the production, capacity, and utilization rate measures featured in the Federal Reserve's G.17 statistical release, portions of SIC 27 (printing and publishing) and SIC 24 (lumber and products) that are not classified in manufacturing under NAICS will continue to be included in the overall IP index and capacity utilization.

The revised production indexes will be based on annual output measures that are constructed by reclassifying the establishments in historical Censuses of Manufactures and Mineral Industries under NAICS; annual output indexes constructed this way will maximize the reliability and historical consistency of the IP industry detail. Data going back to at least 1972 will be restated using NAICS. The monthly indicators used in current IP will be incorporated into the revised IP indexes as far back as the data will allow.

The updated measures will reflect the incorporation of newly available, more comprehensive source data typical of annual revisions. The updating of source data for IP in the 2002 annual revision will include annual data from the 2000 Annual Survey of Manufactures of the Bureau of the Census and from selected editions of its 2000 and 2001 Current Industrial Reports. Annual data from the U.S. Geological Survey regarding metallic and nonmetallic minerals (except fuels) for 2000 and 2001 will also be introduced. The updating will include revisions to the monthly indicator for each industry (either physical product data, production-worker hours, or electric power usage) and revisions to seasonal factors.

Capacity and capacity utilization will be revised to incorporate preliminary data from the 2001 Survey of Plant Capacity of the Bureau of the Census, which covers manufacturing, along with other new data on capacity from the U.S. Geological Survey, the Department of Energy, and other organizations. The statistics on the industrial use of electric power will incorporate additional information received from utilities for the past few years and will include some data from the 2000 Annual Survey of Manufactures.

Once the revision is published, it will be made available on the Board's web site, www.federalreserve.gov/releases/G17. The revised data will also be available through the web site of the Department of Commerce. Further information on these revisions is available from the Board's Industrial Output Section (telephone 202-452-3197).

High-tech industries are defined as semiconductors and related electronic components (SIC 3672-9), computers (SIC 357), and communications equipment (SIC 366). Shaded areas are periods of business recession as defined by the NBER.

 NOTE. Under industry groups, the figures to the right of the series descriptions are 1987 Standard Industrial Classification (SIC) codes. The abbreviation pt denotes part of an SIC code. Additional industry detail is available on the Board's web site (www.federalreserve.gov/releases/G17). Under market groups, in the products category, oil and gas drilling and manufactured homes are not shown separately; in the nondurable materials category, containers and miscellaneous nondurable materials are not shown separately. Under industry groups, in the nondurables category, leather and products (SIC 31) is not shown separately.

 1. The proportion data are estimates of the relative contribution of each series to the growth of total industrial production in the following year. r Revised. p Preliminary.

Note. See notes to table 1. 1. Primary processing consists of textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, stone, clay, and glass products, semiconductors and related electronic components, and motor vehicle parts. 2. Advanced processing consists of foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery except semiconductors and related electronic components, transportation equipment except motor vehicle parts, instruments, and miscellaneous manufactures.

NOTE. See note to table 13.

Explanatory Note

The **Industrial Production and Capacity Utilization** statistical release, which is published around the middle of the month, reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. The release also includes monthly indexes on the use of electric power in manufacturing and mining. Files containing data shown in the release, along with more detailed series that were published in the G.17 prior to February 2001 and historical data for all published series, are available at the Federal Reserve Board web site (www.federalreserve.gov/releases/G17). For paid access to the data files through the Department of Commerce's Economic Bulletin Board or World Wide Web site, please call STAT-USA at 1-800-STAT-USA or 202-452-1986. Diskettes containing historical data and the data published in this release also are available from the Board of Governors of the Federal Reserve System, Publications Services, 202-452-3245.

Industrial Production

Coverage. The industrial production (IP) index measures the real output of the manufacturing, mining, and electric and gas utilities industries; the reference base year for the index is 1992. For the period since 1997, the total IP index has been constructed from 276 individual series based on the 1987 Standard Industrial Classification (SIC) codes. These individual series are classified in two ways: (1) market groups and (2) industry groups. Market groups consist of products and materials. Total products are the aggregate of final products, such as consumer goods and equipment, and intermediate products, which are inputs to nonindustrial sectors. Materials are inputs in the manufacture of products. Major industry groups include two-digit SIC industries and aggregates of these industries-for example, durable and nondurable manufacturing, mining, and utilities. Changes in output for the market and industry groups are summarized in table 1, and the levels of output (in index form) are in table 4. Special aggregates that highlight the relative importance and contributions of several key industries, such as high-technology and motor vehicles, are summarized in tables 2 and 5. A complete description of the market and industry structures, including details regarding series classification, relative importance weights, and data sources, is available on the Board's web site

(www.federalreserve.gov/releases/G17/About.htm).

Source data. On a monthly basis, the individual IP indexes are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations and from government agencies; data of this type are used to estimate monthly IP wherever possible and appropriate. Production indexes for a few industries, the most notable include semiconductors and computers, are derived by calculating a monthly real output index. These indexes are developed from very detailed product data (unit production or sales and unit value). Where suitable data on physical product are not available, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive annual data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. The annual data used to benchmark the individual IP indexes are constructed from various source data, such as the quinquennial Censuses of Manufactures and

Mineral Industries and the *Annual Survey of Manufactures*, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the United States Geological Survey of the Department of the Interior; and publications of the Department of Energy.

Aggregation method and weights. The aggregation method for the current IP index is a version of the Fisher-ideal index formula. The weights used to combine the individual industry output indexes are monthly unit value added measures ("or prices"), which are derived from annual data on industry value added. The formula for the change in monthly IP (or a monthly IP sub–aggregate) is the geometric mean of the change in output computed using current month weights and the change computed using weights for the previous month:

$$\frac{I_m^A}{I_{m-1}^A} = \sqrt{\frac{\sum I_{m} p_{m-1}}{\sum I_{m-1} p_{m-1}}} \times \frac{\sum I_{m} p_m}{\sum I_{m-1} p_m}$$

where I_m is an individual production index for a month and p_m is the unit value added in month m. (For futher discussion and information on the variant of this formula that was used from 1977 to 1992, see the *Federal Reserve Bulletin* article issued in February 1997.)

The Federal Reserve Board web site provides supplemental monthly statistics on the relative importance weights for published IP series: (www.federalreserve.gov/releases/G17/ipdisk/ipweights.sa).These weights are the exact proportionate contribution of a monthly percentage change in a component index to the monthly percentage change in the total index. The weights are computed after IP is derived according to the formula given above and are provided to assist users of the index with calculations and interpretation of current developments. For example, if the relative importance weight of the motor vehicles and parts industry is 5 percent for a month, and if output in this industry increased 10 percent, then the gain in motor vehicle output would boost the change in total IP by $\frac{1}{2}$ percentage point (0.05 x 10% = 0.5%).

In addition, annual IP proportions for the most recent full year (approximately the value added by an industry divided by the total value of all industries in the industrial sector) are typically in the first column of the relevant tables in the G.17 release. These may be used to estimate an industry's relative contribution to overall IP growth in the current year.

Timing. The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in the tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript "r" in the tables.)

Data availability. For the first estimate of output for a given month, about 50 percent of the source data (in value-added terms) are available; the fraction of available source data increases to about 85 percent for the second month that the estimate is published, 95 percent in the third month, and 96 percent in the fourth month. Data availability by data type is summarized in the table below.

Until the source data for a particular series become available for a given month, estimates for the missing observations are based on other available data, such as labor input, recent trends in output and orders, and anecdotal reports from industry sources. After the fourth month that an IP estimate is published, indexes are not revised further until an annual revision or benchmark revision. These historical revisions are typically published in the late fall of each year; the most recent revised source data as well as data from the 1999 *Annual Survey of Manufactures*.

Availability of Monthly IP Data in Publication Window (Percent of value added in 2001)

	Month of estimate									
Type of data	1st	2nd	3rd	4th						
Physical product	24	37	47	48						
Production-worker hours	26	26	26	26						
Electric power use	0	22	22	22						
IP data received	50	85	95	96						
IP data estimated	50	15	5	4						

NOTE—The physical product group includes series based on either monthly or quarterly data. As can be seen in the first line of the table, in the first month, a physical product indicator is available for about half of the series (in terms of value added) that ultimately are based on physical product data (24 percent out of total of 48 percent). Of the 24 percent, about two—thirds (15 percent of total IP) include series that are derived from weekly physical product data and for which actual monthly data may lag up to several months. On average, quarterly product data are received for the third estimate of industrial production. Specifically, quarterly data are available for the second estimate of the last month of a quarter, the third estimate of the second month of a quarter, and the fourth estimate of the first month of a quarter. About 4 percent of the source data for monthly IP—all physical product measures—are available too late for direct inclusion in the current index and are incorporated at the time of an annual historical revision.

Seasonal adjustment. Individual series are seasonally adjusted using the Census X-12 ARIMAprogram. For series based on production-worker hours, the current seasonal factors were estimated with data through October 2001; for other series, the factors were estimated with data through at least June 2001. Series are pre-adjusted for the effects of holidays or the business cycle when appropriate. For the data since 1977, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

Reliability. The average revision to the *level* of the total IP index, without regard to sign, between the first and the fourth estimates was 0.28 percent during the 1987–2001 period. The average revision to the *percent change* in total IP, without regard to sign, from the first to the fourth estimates was 0.22 percentage point during the 1987–2001 period. In most cases (about 84 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percentage changes are calculated from unrounded indexes and may not be the same as changes calculated from the rounded indexes in the release.

Capacity Utilization

Overview. Estimates of capacity and capacity utilization are constructed for industries in manufacturing, mining, and electric and gas utilities. For a given industry, the capacity utilization rate is equal to an output index (seasonally adjusted) divided by a capacity index. The FRB's capacity indexes attempt to capture the concept of *sustainable maximum output*—the greatest level of output a plant can maintain within the framework of a realistic work schedule, after factoring in normal downtime and assuming sufficient availability of inputs to operate the capital in place.

Coverage. Capacity indexes are constructed for 76 detailed industries (56 in manufacturing, 18 in mining, and 2 in utilities), which mostly correspond to industries at the two- and three-digit SIC level. Estimates of capacity and utilization are available for various groups, including primary- and advanced-processing industries within manufacturing, durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Also, special aggregates are available, such as high-tech industries and manufacturing excluding high-tech industries. Component industries of the primary- and advanced-processing groups

within manufacturing are listed in the note in table 2 of the G.17 release.

Source data. The monthly rates of capacity utilization are designed to be consistent with both the monthly data on production and the periodically available data on capacity and utilization. Capacity data reported in physical units from government sources (primarily from the U.S. Geological Survey and the Department of Energy's Energy Information Administration) and trade sources are available for portions of several industries in manufacturing (for example, paper, industrial chemicals, petroleum refining, and motor vehicles), as well as for electric utilities and mining; these industries represent about 15 percent of total industrial capacity. When physical product data are unavailable for manufacturing industries, capacity indexes are based on the Bureau of the Census's Survey of Plant Capacity (SPC); these industries account for a bit more than 80 percent of total industry capacity. In the absence of utilization data for a few mining and petroleum series, capacity is based on trends through peaks in production (roughly 4 percent of total industry capacity). A detailed description of the methodology used to construct the capacity indexes is available on the Board's web site (www.federalreserve.gov/releases/G17/cap_notes.htm).

Aggregation method. Monthly capacity aggregates are calculated in three steps: (1) Utilization aggregates are calculated on an annual basis through the most recent full year as capacity-weighted aggregates of individual utilization rates; (2) The annual aggregate capacity is derived from the corresponding production and utilization aggregates; (3) The monthly capacity aggregate is obtained by interpolating with a Fisher index of its constituent monthly capacity series. Utilization rates for the individual series and aggregates are calculated by dividing the pertinent monthly production index by the related capacity index.

Consistency. The Federal Reserve utilization rates are calculated to be consistent over time so that, for example, a rate of 85 percent represents about the same degree of tightness that it did in the past. A major task for the Federal Reserve in developing reasonable and consistent time series of capacity and utilization is dealing with inconsistencies between the movements of the IP index and the survey-based utilization rates. The McGraw-Hill/DRI Survey, now discontinued, was the primary source of manufacturing utilization rates for many years. This survey of large companies reported, on average, higher utilization rates than those reported by establishments covered by the SPC (currently the primary source of factory operating rates) for the fourteen years the two surveys overlapped. Adjustments have been made to keep the industry utilization rates currently reported by the Federal Reserve roughly in line with rates formerly reported by McGraw-Hill. As a consequence, the rates reported by the Federal Reserve tend to be higher than the rates reported in the SPC.

Perspective. Over the 1967–2001 period, the average total industry utilization rate is 81.9 percent; for manufacturing, the average factory operating rate is 80.9 percent. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: None of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime. The highs and lows in capacity utilization in table 6 of the G.17 release are specific to each series and did not all occur in the same month.

Electric Power

Coverage. Electric power data for sales by utilities to industry users and for electric power produced by cogenerators (manufacturing and mining firms that produce electricity for their own use or to sell to a utility) are generally collected at the three-digit SIC level for mining and manufacturing. Aggregates for two-digit industries—as well as for total mining, durable, nondurable, total manufacturing and total industrial electric power use—are computed. An aggregate showing total industry excluding nuclear nondefense is shown separately because the value-added proportion for the nondefense (part of SIC 2819) in total IP is considerably less than its share of total electric power use. In addition, aggregates for utility sales to industrial users and for industry generation are computed. While only the major aggregates are shown in the release,

data for the two- and three-digit industries are available on the Board's web site (www.federalreserve.gov/releases/G17).

Source data. Electric power data are collected from a sample of utilities and cogenerators covering all twelve Federal Reserve Districts. The primary criterion for inclusion of a utility in the panel is whether the utility provides electric power to industrial customers. A comparison of Federal Reserve kilowatt-hour aggregates to estimates from the 1998 *Annual Survey of Manufactures* suggests the Federal Reserve data cover about 75 percent of the overall sales to manufacturing in that year. The cogeneration panel covers about 50 percent of cogeneration used directly by manufacturers. In order to provide more complete coverage and to correct for any survey shortcomings, the series are benchmarked at the three-digit industry level to the latest available data from the *Annual Survey of Manufactures* and the *Census of Manufactures*.

Methodology. The data we receive from utilities and cogenerators are edited for anomalies and aggregated by weight to the three-digit SIC industry level and above. Where reports are late or unavailable for some reason, responses are estimated.

Seasonal Adjustment. Series are seasonally adjusted at the three-digit SIC level, with seasonally adjusted aggregates typically computed as sums of seasonally adjusted components. The seasonal adjustment procedure (Census's X-12 program) is used without trading-day adjustments because the reporting periods of the various utilities are not the same. A leap-year adjustment is made where appropriate.

Description of Tables.

Table 1 summarizes the latest changes in output for the major market and industry groupings. Fourth-quarter to fourth-quarter changes for the past three years are shown. Output changes expressed at an annual rate for the past four quarters as well as monthly changes for the latest four months are shown. In addition, year-over-year changes are displayed for the latest IP month.

Table 2, which is in the same format as table 1, summarizes the latest changes in output for a special group of aggregates that have been constructed for analytical purposes. The total index is sub-divided into two broad categories: an energy group, which includes consumer energy products, commercial energy products, energy materials, and oil and gas well drilling, and a non-energy group, which includes the remaining portion of the total index. Within the non-energy aggregate, several other analytically useful categories are shown. One of these is a group of high-technology industries, which is composed of semiconductors and related electronic components, and industries that use a large concentration of these parts—computers and communication equipment. Other sub-groups of the market and industry structures excluding this high-technology group and motor vehicles and parts are shown.

Table 3 displays motor vehicle assemblies (seasonally adjusted annual rate) for the latest year, four quarters, and four months. Seasonal factors for auto, light truck, and medium and heavy truck production are available on the Board's web site

(www.federalreserve.gov/releases/G17/mvsf.html). Monthly changes in the IP indexes for the corresponding motor vehicle series will differ slightly from the monthly changes in assemblies, mainly because the IP indexes are built from a weighted (based on relative values) aggregate of the individual models.

Tables 4 and 5 show seasonally adjusted indexes for recent months for the major market and industry groups included on table 1 and the special aggregates displayed on table 2.

Table 6 summarizes the capacity utilization for the major industry groupings as well as for a few special aggregates. In addition to the utilization rates for the most recent four months and four quarters, the average of utilization rates since 1967 and operating rates for relevant cyclical peaks and troughs are shown for each series.

Table 7 summarizes change in capacity. Average rates of change in capacity for selected historical periods and for the most recent four years (on a fourth-quarter to fourth-quarter basis) are shown. In addition, rates of change for capacity on a annual-average basis are shown for the latest four quarters; the rate of change in capacity for the current IP month is shown as well.

Table 8 shows total products expressed in gross values in billions of chained 1996 dollars at an annual rate. Compiling the IP index using gross-value weights facilitates comparison with other dollar-based data. The gross-value system focuses on products that leave the industrial sector and includes both final and intermediate products. The materials consumed in making final and intermediate products are implicitly included in the value weights applied to product series. The gross-product weights are derived from *Census of Manufactures* and *Annual Survey of Manufactures* data.

Table 9 shows diffusion indexes, which are calculated as the percentage of IP series that increased over the relevant span (one, three, or six months) plus one-half of the percentage of series that were unchanged. Because available source data for the current IP month only account for about half of the total index, the diffusion indexes are published with a one-month lag.

Table 10 shows the most recent six months in index form (both seasonally and not seasonally adjusted) of electric power use by industry for the major industry aggregates.

Tables 11–14 display historical seasonally adjusted data for total IP and manufacturing as well as the aggregates excluding high-technology industries. Monthly changes in output as well as indexes for output, utilization, and capacity are shown.

Note: The summary tables in the G17 release do not include all of the publicly available data. The more detailed series for IP, utilization, capacity, and electric power are available at the Board's web site (www.federalreserve.gov/releases/G17/download.html).

References and Release Dates

References. The annual revision published in November 2001 was described in an article published in the *Federal Reserve Bulletin*, vol. 88 (March 2002), pp. 173–187. A description of the aggregation methods for industrial production and capacity utilization is included in an article in the *Federal Reserve Bulletin*, vol. 83 (February 1997), pp. 67–92. The Federal Reserve methodology for constructing industry-level measures of capital is detailed in "Capital Stock Estimates for Manufacturing Industries: Methods and Data" by Mike Mohr and Charles Gilbert (1996), which can be obtained at

www.federalreserve.gov/releases/g17/capital_stock_doc-latest.pdf

Industrial Production—1986 Edition contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the *Federal Reserve Bulletin* (April 1990, June 1990, June 1993, March 1994, January 1995, January 1996, February 1997, February 1998, January 1999, March 2000, March 2001, and March 2002).

Release Schedule

At 9:15 a.m. on

2002: January 16, February 15, March 15, April 16, May 15, June 14, July 16, August 15, September 17, October 17, November 15, and December 17.

2003: January 17, February 14, March 14, April 15, May 15, June 17, July 16, August 15, September 15, October 16, November 14, and December 16.
