## FEDERAL RESERVE statistical release

G. 17 (419)

For release at 9:15 a.m. (EDT)
July 15, 2009

## INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production decreased 0.4 percent in June after having fallen 1.2 percent in May. For the second quarter as a whole, output fell at an annual rate of 11.6 percent, a more moderate contraction than in the first quarter, when output fell 19.1 percent. Manufacturing output moved down 0.6 percent in June, with declines at
(over)

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION: SUMMARY
Seasonally adjusted

## r Revised. p Preliminary.

Note. The statistics in this release cover output, capacity, and capacity utilization in the U.S. industrial sector, which is defined by the Federal Reserve to comprise manufacturing, mining, and electric and gas utilities. Mining is defined as all industries in sector 21 of the North American Industry Classification System (NAICS); electric and gas utilities are those in NAICS sectors 2211 and 2212. Manufacturing comprises NAICS manufacturing industries (sector 31-33) plus the logging industry and the newspaper, periodical, book, and directory publishing industries. Logging and publishing are classified elsewhere in NAICS (under agriculture and information respectively), but historically they were considered to be manufacturing and were included in the industrial sector under the Standard Industrial Classification (SIC) system. In December 2002 the Federal Reserve reclassified all its industrial output data from the SIC system to NAICS.
both durable and nondurable goods producers. Outside of manufacturing, the output of mines fell 0.5 percent in June, and the output of utilities increased 0.8 percent. The rate of capacity utilization for total industry declined in June to 68.0 percent, a level 12.9 percentage points below its average for 1972-2008. Prior to the current recession, the low over the history of this series, which begins in 1967, was 70.9 percent in December 1982.

## Market Groups

The production of consumer goods declined 0.3 percent in June. The output of consumer durables fell 1.0 percent; this index decreased 6.8 percent (annual rate) in the second quarter, a substantially smaller decline than the decrease of 40.7 percent in the first quarter. Within consumer durables, the indexes for automotive products; appliances, furniture, and carpeting; and home electronics all fell in June; the index for miscellaneous durable goods posted a small increase. The output of consumer nondurable goods edged down 0.1 percent: Higher production of energy products was more than offset by widespread declines in the output of other products. For the second quarter as a whole, the output of non-energy nondurable goods decreased 3.4 percent (annual rate) after having fallen 5.6 percent (annual rate) in the first quarter.

The output of business equipment fell 0.8 percent in June. The production of industrial and other equipment and of information processing equipment declined, while the output of transit equipment was unchanged. In the second quarter, industrial and other equipment and information processing equipment both declined at rates similar to those posted in the first quarter. Transit equipment fell in the second quarter after having increased substantially in the first quarter, when the output of aircraft rebounded from a strike. The output of defense and space equipment increased 0.8 percent in June, and the index rose at an annual rate of 2.0 percent for the second quarter as a whole.

The production of construction supplies edged down 0.2 percent in June; this index fell 15.3 percent (annual rate) in the second quarter after having dropped 34.0 percent (annual rate) in the first quarter. The output of business supplies rose 0.1 percent in June but declined 11.3 percent (annual rate) for the second quarter as a whole. The output of materials fell 0.6 percent in June, and each of its major components-durable, nondurable, and energy materials-registered declines. Among durable materials, output dropped for consumer parts and equipment parts, while among nondurables, the indexes for both paper materials and chemical materials decreased.

## Industry Groups

Production in manufacturing fell 0.6 percent in June after having dropped 1.1 percent in May. The factory operating rate declined further in June to a historical low of 64.6 percent; prior to this recession, the low for this series, which begins in 1948, was 68.6 percent in December 1982. For the second quarter as a whole, manufacturing output fell at an annual rate of 10.5 percent, a decline that was about one-half the rate of decrease recorded in the first quarter. Production of durable goods fell 0.7 percent in June: The indexes for machinery; computer and electronic products; electrical equipment, appliances, and components; and motor vehicles and parts all posted decreases of more than 1 percent. Output increased for several industries, most notably for wood products, primary metals, and miscellaneous manufacturing. The gain of 1.7 percent for primary metals follows 10 consecutive monthly decreases for the industry. The output of nondurable goods fell 0.4 percent: Declines in the indexes for food, beverage, and tobacco products; apparel and leather; paper; and chemicals were only partly offset by increases in the indexes for printing and support, petroleum and coal products, and plastics and rubber products.

The index for other manufacturing industries (non-NAICS), which consists of publishing and logging, decreased 0.5 percent in June.

The output of electric and gas utilities increased 0.8 percent in June, and the operating rate for utilities moved up 0.5 percentage point, to 79.7 percent. Mining production fell 0.5 percent, and capacity utilization in this industry edged down to 81.0 percent, a rate 6.6 percentage points below its 1972-2008 average.

Capacity utilization rates in June at industries grouped by stage of process were as follows: At the crude stage, utilization fell 0.6 percentage point, to 77.5 percent, a rate 9.1 percentage points below its 1972-2008 average; at the primary and semifinished stages, utilization increased 0.1 percentage point, to 65.8 percent, a rate 16.2 percentage points below its long-run average; and at the finished stage, utilization decreased 0.4 percentage point, to 66.6 percent, a rate 11.1 percentage points below its long-run average.

## Tables

1. Industrial Production: Market and Industry Group Summary; percent change
2. Industrial Production: Special Aggregates and Selected Detail; percent change

4. Industrial Production: Market and Industry Group Summary; indexes
5. Industrial Production: Special Aggregates and Selected Detail; indexes
6. Diffusion Indexes of Industrial Production
7. Capacity Utilization
8. Industrial Capacity
9. Gross Value of Products and Nonindustrial Supplies
10. Gross-Value-Weighted Industrial Production: Stage-of-Process Groups
11. Historical Statistics: Total Industry
12. Historical Statistics: Manufacturing
13. Historical Statistics: Total Industry Excluding Selected High-Technology Industries
14. Historical Statistics: Manufacturing Excluding Selected High-Technology Industries

Further detail is available on the Board's website (www.federalreserve.gov/releases/G17/).

1. Industrial production, capacity, and utilization

Notes: The shaded areas are periods of business recession as defined by the National Bureau of Economic Research (NBER). The last shaded area begins with the peak as defined by the NBER and ends at the trough of a 3 month moving average of manufacturing IP.

## 2. Industrial production and capacity utilization

Consumer goods

Equipment

Nonindustrial supplies

Industrial materials

Capacity utilization

Notes: The shaded areas are periods of business recession as defined by the National Bureau of Economic Research (NBER). The last shaded area begins with the peak as defined by the NBER and ends at the trough of a 3 month moving average of manufacturing IP.

## 3. Industrial production and capacity utilization, high-technology industries

Notes: High-technology industries are defined as semiconductors and related electronic components (NAICS 334412-9), computers (NAICS 3341), and communications equipment (NAICS 3342).

The shaded areas are periods of business recession as defined by the NBER. The last shaded area begins with the peak as defined by the NBER and ends at the trough of a 3 month moving average of manufacturing IP.

## r Revised. p Preliminary.

NOTE. Under the industry groups, the figures to the right of the series descriptions are 2002 North American Industry Classification System (NAICS) codes. The abbreviation pt denotes part of a NAICS code. Additional industry detail is available on the Board's web site (www.federalreserve.gov/releases/G17). Under market groups, in the products category, miscellaneous consumer nondurables, oil and gas drilling, and manufactured homes are not shown separately; in the nondurable materials category, containers and miscellaneous nondurable materials are not shown separately.

1. The proportion data are estimates of the relative contribution of each series to the growth of total industrial production in the following year.

[^5]
## Explanatory Note

The Industrial Production and Capacity Utilization statistical release, which is published around the middle of the month, reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. More detailed descriptions of industrial production and capacity utilization are available on the Board's website at www.federalreserve.gov/releases/G17. In addition, the website includes files containing data shown in the release, more detailed series that are published in a monthly supplement to the G.17, and historical data. Instructions on searching for and downloading specific series are provided as well. For paid access to the data files through the Department of Commerce's Economic Bulletin Board or World Wide Web site, please call STAT-USA at 1-800-STAT-USA or 202-452-1986. Diskettes containing historical data and the data published in this release also are available from the Board of Governors of the Federal Reserve System, Publications Services, 202-452-3245.

## Industrial Production

Coverage. The industrial production (IP) index measures the real output of the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 2002. Manufacturing consists of those industries included in the North American Industry Classification System (NAICS) definition of manufacturing plus those industries- newspaper, periodical, book, and directory publishing plus logging-that have traditionally been considered to be manufacturing. For the period since 1997, the total IP index has been constructed from 312 individual series based on the 2002 NAICS codes. These individual series are classified in two ways: (1) market groups, and (2) industry groups. Market groups consist of products and materials. Total products are the aggregate of final products, such as consumer goods and equipment, and nonindustrial supplies (which are inputs to nonindustrial sectors). Materials are inputs in the manufacture of products. Major industry groups include three-digit NAICS industries and aggregates of these industries-for example, durable and nondurable manufacturing, mining, and utilities. A complete description of the market and industry structures, including details regarding series classification, relative importance weights, and data sources, is available on the Board's web site (www.federalreserve.gov/releases/G17/About.htm).

Source data. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations and from government agencies; data of this type are used to estimate monthly IP wherever possible and appropriate. Production indexes for a few industries are derived by dividing estimated nominal output (calculated using unit production and unit values or sales) by a corresponding Fisher price index; the most notable of these fall within the high-technology grouping and include computers, communications equipment, and semiconductors. When suitable direct measures of product are not available, estimates of output are based on production-worker hours by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive annual data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. The annual data used in benchmarking the individual IP indexes are constructed from a variety of source data, such as the quinquennial Censuses of Manufactures and Mineral Industries and the Annual Survey of Manufactures, prepared by the Bureau of the Census; the Minerals Yearbook, prepared by the United States Geological Survey of the Department of the Interior; and publications of the Department of Energy.

Aggregation Methodology and Weights. The aggregation method for the IP index is a version of the Fisher-ideal index formula. (For a detailed discussion of the aggregation method, see the Federal Reserve Bulletins of February 1997 and March 2001.) In the IP index, series that measure the output of an individual industry are combined using weights derived from their proportion in the total value-added
output of all industries. The IP index, which extends back to 1919, is built as a chain-type index since 1972. The current formula for the growth in monthly IP (or any of the sub-aggregates) since 1972 is shown below. An output index for month $m$ is denoted by $I_{m}^{A}$ for aggregate A and $I_{m}$ for each of its components. The monthly price measure in the formula $\left(p_{m}\right)$ is interpolated from an annual series of value added divided by the average annual IP index.

$$
\frac{I_{m}^{A}}{I_{m-1}^{A}}=\sqrt{\frac{\sum I_{m} p_{m-1}}{\sum I_{m-1} p_{m-1}} \times \frac{\sum I_{m} p_{m}}{\sum I_{m-1} p_{m}}}
$$

The IP proportions (typically shown in the first column of the relevant tables in the G .17 release) are estimates of the industries' relative contributions to overall growth in the following year. For example, the relative importance weight of the motor vehicles and parts industry is about 8 percent. If output in this industry increased 10 percent in a month, then this gain would boost growth in total IP by $8 / 10$ percentage point $(0.08 \times 10 \%=0.8 \%)$. To assist users with calculations, the Federal Reserve's web site provides supplemental monthly statistics that represent the exact proportionate contribution of a monthly change in a component index to the monthly change in the total index (www.federalreserve.gov/
releases/G17/ipdisk/IPWeightsSa.txt).
Timing. The first estimate of output for a month is published around the 15 th of the following month. The estimate is preliminary (denoted by the superscript " $p$ " in tables) and subject to revision in each of the subsequent five months as new source data become available. (Revised estimates are denoted by the superscript " $r$ " in tables.) For the first estimate of output for a given month, about 72 percent of the source data (in value-added terms) are available; the fraction of available source data increases to 86 percent for estimates in the second month that the estimate is published, 95 percent in the third month, 98 percent in the fourth month, 99 percent in the fifth month, and 99 percent in the sixth month. Data availability by data type in late 2008 is summarized in the table below:

Availability of Monthly IP Data in Publication Window (Percent of value added in 2008)

|  | Month of estimate |  |  |  |  |  |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Type of data | 1st |  | 2nd | 3rd |  |  |  |  |  | 4th | 5th | 6th |
| Physical product | 30 | 44 | 54 | 56 | 57 | 57 |  |  |  |  |  |  |
| Production-worker hours | 42 | 42 | 42 | 42 | 42 | 42 |  |  |  |  |  |  |
| IP data received | 72 | 86 | 95 | 98 | 99 | 99 |  |  |  |  |  |  |
| IP data estimated | 28 | 14 | 5 | 2 | 1 | 1 |  |  |  |  |  |  |

The physical product group includes series based on either monthly or quarterly data. As can be seen in the first row of the table, in the first month, a physical product indicator is available for about half of the series (in terms of value added) that ultimately are based on physical product data ( 30 percent out of a total of 57 percent). Of the 30 percent, about two-thirds ( 19 percent of total IP) include series that are derived from weekly physical product data and for which actual monthly data may lag up to several months. On average, quarterly product data are received for the fourth estimate of industrial production. Specifically, quarterly data are available for the third estimate of the last month of a quarter, the fourth estimate of the second month of a quarter, and the fifth estimate of the first month of a quarter.

Seasonal adjustment. Individual series are seasonally adjusted using Census X-12 ARIMA. For series based on production-worker hours, the current seasonal factors were estimated with data through February 2009; for other series, the factors were estimated with data through at least September 2008. Series are pre-adjusted for the effects of holidays or business cycles when appropriate. For the data since 1972, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

Reliability. The average revision to the level of the total IP index, without regard to sign, between the first and the fourth estimates was 0.26 percent during the 1987-2008 period. The average revision to the percent change in total IP, without regard to sign, from the first to the fourth estimates was 0.21 percentage point during the 1987-2008 period. In most cases (about 85 percent), the direction of the change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

## CAPACITY UTILIZATION

Overyiew. The Federal Reserve Board constructs estimates of capacity and capacity utilization for industries in manufacturing, mining, and electric and gas utilities. For a given industry, the capacity utilization rate is equal to an output index (seasonally adjusted) divided by a capacity index. The Federal Reserve Board's capacity indexes attempt to capture the concept of sustainable maximum output - the greatest level of output a plant can maintain within the framework of a realistic work schedule, after factoring in normal downtime and assuming sufficient availability of inputs to operate the capital in place.

Coverage. Capacity indexes are constructed for 87 detailed industries (69 in manufacturing, 16 in mining, and 2 in utilities), which mostly correspond to industries at the three- and four-digit NAICS level. Estimates of capacity and utilization are available for a variety of groups, including durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Manufacturing consists of those industries included in the North American Industry Classification System (NAICS) definition of manufacturing plus those industries - newspaper, periodical, book, and directory publishing plus logging-that have traditionally been considered to be manufacturing. Also, special aggregates are available, such as high-technology industries and manufacturing excluding high-technology industries.

Source Data. The monthly rates of capacity utilization are designed to be consistent with both the monthly data on production and the periodically available data on capacity and utilization. Because there is no direct monthly information on overall industrial capacity or utilization rates, the Federal Reserve first estimates annual capacity indexes from the source data. Capacity data reported in physical units from government sources (primarily from the U.S. Geological Survey and the Department of Energy's Energy Information Administration) and trade sources are available for portions of several industries in manufacturing (e.g., paper, industrial chemicals, petroleum refining, motor vehicles), as well as for electric utilities and mining; these industries represent about 25 percent of total industrial capacity. When physical product data are unavailable for manufacturing industries, capacity indexes are based on responses to the Bureau of the Census's Quarterly Survey of Plant Capacity (QSPC); these industries account for a bit less than 70 percent of total industry capacity. In the absence of utilization data for a few mining and petroleum series, capacity is based on trends through peaks in production (roughly 5 percent of total industry capacity). A detailed description of the methodology used to construct the capacity indexes is available on the Board's web site
(www.federalreserve.gov/releases/G17/CapNotes.htm).
Aggregation Methodology. Monthly capacity aggregates are calculated in three steps: (1) utilization aggregates are calculated on an annual basis through the most recent full year as capacity-weighted aggregates of individual utilization rates; (2) the annual aggregate capacity is derived from the corresponding production and utilization aggregates; (3) the monthly capacity aggregate is obtained by interpolating the annual capacity aggregate with a Fisher index of its constituent monthly capacity series. Utilization rates for the individual series and aggregates are calculated by dividing the pertinent monthly production index by the related capacity index.

Consistency. A major aim is that the Federal Reserve utilization rates be consistent over time so that, for example, a rate of 85 percent means about the same degree of tightness that it meant in the past. A
major task for the Federal Reserve in developing reasonable and consistent time series of capacity and utilization is dealing with inconsistencies between the movements of the industrial production index and the survey-based utilization rates. The McGraw-Hill/DRI Survey, now discontinued, was the primary source of manufacturing utilization rates for many years. This was a survey of large companies that reported, on average, higher utilization rates than those reported by establishments covered by the Census Bureau's annual Survey of Plant Capacity (the predecessor to the QSPC) for the fourteen years they overlapped. Adjustments have been made to keep the industry utilization rates currently reported by the Federal Reserve roughly in line with rates formerly reported by McGraw-Hill. As a consequence, the rates reported by the Federal Reserve tend to be higher than the rates reported in the QSPC.

Perspective. Over the 1972-2007 period, the average total industry utilization rate is 81.0 percent; for manufacturing, the average factory operating rate has been 79.7 percent. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime. The highs and lows in capacity utilization shown in table 7 are specific to each series and do not all occur in the same month.

## References and Release Dates

References. The release for the annual revision that was published on March 27, 2009 is available on the Board's website (www.federal reserve.gov/releases/g17/revisions/Current/DefaultRev.htm). A more detailed version will be provided in the Federal Reserve Bulletin in the summer of 2009. The annual revision published in March 2008 is described in an article published in the Federal Reserve Bulletin, vol. 94 , pp. A41-A60. A summary of the annual revision that incorporated back to 1972 production and capacity indexes reclassified according to the North American Industry Classification System is available in an article in the Federal Reserve Bulletin, vol. 89 (April 2003), pp.151-176. A description of the aggregation methods for industrial production and capacity utilization is included in an article in the Federal Reserve Bulletin, vol. 83 (February 1997), pp. 67-92. The Federal Reserve methodology for constructing industry-level measures of capital is detailed in "Capital Stock Estimates for Manufacturing Industries: Methods and Data" by Mike Mohr and Charles Gilbert (1996), which can be obtained at: www.federalreserve.gov/releases/g17/CapitalStockDocLatest.pdf.

Industrial Production-1986 Edition contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the Federal Reserve Bulletin (April 1990, June 1990, June 1993, March 1994, January 1995, January 1996, February 1997, February 1998, January 1999, March 2000, March 2001, March 2002, April 2003, Winter 2004, Winter 2005, March 2006, May 2007, August 2008).

## Release Schedule

At 9:15 a.m. on
2009: January 16, February 18, March 16, April 15, May 15, June 16, July 15, August 14, September 16, October 16, November 17, and December 15.
