FEDERAL RESERVE statistical release

G.17 (419)

For release at 9:15 a.m. (EDT) October 14, 2005

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production dropped 1.3 percent in September, as Hurricanes Katrina and Rita and a strike at a major aircraft producer significantly reduced output. At 118.0 percent of its 1997 average, output in September was 2.0 percent above its year-earlier level; for the third quarter as a whole, production rose 1.3 percent at an annual rate. For September, manufacturing output decreased 0.5 percent; for the quarter, it increased 2.3 percent at an annual rate. The output of mining, which includes many industries that were hit hard by storms, declined 9.1 percent in September and fell 16.5 percent at an annual rate for the third quarter. Production at utilities declined 0.9 percent in September, but output

(over)

r Revised. p Preliminary.

NOTE- The statistics in this release cover output, capacity, and capacity utilization in the industrial sector, which the Federal Reserve defines as manufacturing, mining, and electric and gas utilities. Manufacturing comprises those industries included in the North American Industry Classification System, or NAICS, definition of manufacturing *plus* the logging and newspaper, periodical, book and directory publishing industries that have traditionally been considered manufacturing and included in the industrial sector.

for the third quarter rose at an annual rate of 10.7 percent. Capacity utilization for total industry dropped 1.2 percentage points, to 78.6 percent, a rate that is 0.6 percentage point above its year-earlier level but 2.4 percentage points below its 1972-2004 average.

In September, storm-related production declines are estimated to have held down the change in total industrial production about 1.7 percentage points; in August, storm-related losses reduced the change in total industrial production nearly 0.4 percentage point. Oil and gas extraction and petroleum refining suffered because of the storms, which contributed importantly to a decrease of 5 percent in production by the energy sector in September. The largest effect of the storms outside the energy sector was in the manufacture of industrial chemicals. The strike in the aircraft industry reduced the change in total industrial output almost 0.5 percentage point.

Market Groups

The output of consumer goods rose 0.2 percent in September; for the third quarter this index advanced at an annual rate of 3.4 percent. The production of durable goods increased 1.8 percent in September, and all major categories posted gains. The output of automotive products rose 2.4 percent, and for the third quarter, it increased at an annual rate of 18.6 percent. The indexes for home electronics; appliances, furniture, and carpeting; and miscellaneous goods also rose in September. The output of consumer nondurable goods decreased 0.4 percent, for its third consecutive monthly decline; however, this index increased at an annual rate of 0.6 percent in the third quarter. The production of non-energy nondurable consumer goods was unchanged in September. The output of foods and tobacco rose 0.1 percent, and the production of consumer chemical products increased 0.3 percent. However, the index for paper products declined for a fourth consecutive month. Hurricane-related shutdowns contributed to a drop of 2.2 percent in the output of consumer energy products in September.

The index for business equipment declined 3.7 percent in September; the aircraft manufacturing strike was largely responsible for a drop of 24.3 percent in the production of transit equipment. The output of information processing equipment advanced 2.2 percent; for the third quarter, this index moved up at an annual rate of 23.4 percent. The production of industrial and other equipment rose 0.4 percent for the month and at an annual rate of 7.2 percent for the quarter. The production of defense and space equipment fell 3.4 percent in September, mainly as a result of storm-related effects on shipbuilding. The index for construction supplies increased 0.2 percent, but the output of business supplies declined 0.5 percent.

The output of materials fell 2.1 percent in September; the output of non-energy materials slipped 0.2 percent, and the production of energy materials dropped 6.8 percent. Among non-energy materials, output rose for all major categories of durable goods materials, and output fell for all major categories of nondurable materials. Storm-related disruptions contributed to the decreases in the output of energy materials and the output of chemical materials (a major category within nondurable materials).

Industry Groups

Manufacturing output fell 0.5 percent in September. The production of durables edged down 0.1 percent but increased at an annual rate of 7.6 percent in the third quarter. Gains in durables were widespread in September, with the only notable exception being the strike-affected aerospace and miscellaneous transportation equipment category. The output of primary metals advanced 1.7 percent and increased at an annual rate of 3.6 percent in the third quarter after two quarters of decline. The production of computer and electronic products accelerated in the third quarter and was led by gains in the communications equipment industry. The production of motor vehicles and parts advanced 2.2 percent in September and rose at an annual rate of 12.5 percent in the third quarter after having declined in the second quarter. Fabricated metal products; machinery; electrical equipment, appliances, and components; furniture and related products; and miscellaneous manufacturing also posted solid gains in output for the quarter. The production of nondurables decreased 1.2 percent in September. Hurricane-related shutdowns in the Gulf Coast region contributed to a drop of 3.3 percent in the production of chemicals and a decrease of 6.4 percent in the output of petroleum and coal products. Most other major nondurable goods industries posted small gains; however, the output of plastics and rubber products climbed 1.8 percent, and the production of paper declined for a third consecutive month. The output of non-NAICS

manufacturing industries (publishing and logging) together declined 0.5 percent. Capacity utilization in manufacturing fell to 77.9 percent, a level 1.1 percentage points above that of September 2004.

The output at mines dropped 9.1 percent in September, a decrease driven by curtailments in the extraction of oil and gas in the Gulf of Mexico. Capacity utilization in mining fell to 79.1 percent. The output at utilities declined 0.9 percent, and the industry operating rate declined to 86.3 percent.

For industries by stage of process, capacity utilization at the crude stage sank 7.6 percentage points, to 77.6 percent; at the primary and semifinished stages, it declined 0.2 percentage point, to 80.2 percent; and at the finished stage, it fell 0.6 percentage point, to 77.6 percent.

Calculation of Hurricane Effects

Government and industry sources were used to measure the impact of Hurricanes Katrina and Rita on industrial production. Losses in the extraction of oil and gas are based on shut-in resources in the Gulf of Mexico reported by the Mineral Management Survey of the U.S. Department of the Interior. Information from the U.S. Department of Energy on production curtailments was used to estimate the impact of the storms on petroleum refining. Effects in the chemicals industry are based on detailed product data from an industry source. Outside of these industries, lost output is assumed to be proportional to U.S. Census Bureau measures of industry employment counts for counties declared eligible for disaster assistance by the Federal Emergency Management Agency.

Revision of Industrial Production and Capacity Utilization

The Federal Reserve Board plans to issue its annual revision to the index of industrial production (IP) and the related measures of capacity and capacity utilization on November 7, 2005. The production indexes will be revised throughout to reflect a new comparison base year of 2002. The revised IP indexes will incorporate data from the 2003 Annual Survey of Manufactures and from selected editions of the 2003 and 2004 Current Industrial Reports, all from the Census Bureau. Annual data from the Geological Survey regarding metallic and nonmetallic minerals (except fuels) for 2003 and 2004 will also be introduced. The updating will include revisions to the monthly indicator for each industry (either product data or input data) and revisions to seasonal factors.

Capacity and capacity utilization will be revised to incorporate preliminary data from the Census Bureau's 2004 Survey of Plant Capacity, which covers manufacturing, along with new data on capacity from the U.S. Geological Survey, the Department of Energy, and other organizations.

Once published, the revision will be available on the Board's website at www.federalreserve.gov/releases/G17. The revised data will also be available on the website of the U.S. Department of Commerce. Further information on these revisions is available from the Board's Industrial Output Section (telephone 202-452-3197).

1. Industrial production, capacity, and utilization

Notes: The shaded areas are periods of business recession as defined by the National Bureau of Economic Research (NBER). See note on cover page.

2. Industrial production and capacity utilization

3. Industrial production and capacity utilization, high-technology industries

Notes: High-technology industries are defined as semiconductors and related electronic components (NAICS 334412-9), computers (NAICS 3341),and communications equipment (NAICS 3342). The shaded areas are periods of business recession as defined by the NBER.

r Revised. p Preliminary. NOTE. Under industry groups, the figures to the right of the series descriptions are 2002 North American Industry Classification System (NAICS) codes. The abbreviation pt denotes part of an NAICS code. Additional industry detail is available on the Board's web site (www.federalreserve.gov/releases/G17). Under market groups, in the products category, miscellaneous consumer nondurables, oil and gas drilling, and manufactured homes are not shown separately; in the nondurable materials category, containers and miscellaneous nondurable materials are not shown separately. 1. The proportion data are estimates of the relative contribution of each series to the growth of total industrial production in the following year.

 Quarterly changes are at annual rates. Annual changes are calculated from annual averages.
 NOTE. Selected high-technology industries are computers, communications equipment, and semiconductors and related electronic components.

EXPLANATORY NOTE

The Industrial Production and Capacity Utilization statistical release, which is published around the middle of the month, reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. The release also includes monthly indexes on the use of electric power in manufacturing and mining. More detailed descriptions of industrial production, capacity utilization, and electric power are available at www.federalreserve.gov/releases/G17 at the Board's World Wide Web site. In addition, files containing data shown in the release, more detailed series that were published in the G.17 prior to December 2000, and historical data are available at the Board's Web site. Instructions for searching for and downloading specific series are provided as well. For paid access to the data files through the Department of Commerce's Economic Bulletin Board or World Wide Web site, please call STAT-USA at 1-800-STAT-USA or 202-452-1986. Diskettes containing historical data and the data published in this release also are available from the Board of Governors of the Federal Reserve System, Publications Services, 202-452-3245.

INDUSTRIAL PRODUCTION

Coverage. The industrial production (IP) index measures the real output of the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 1997. Manufacturing consists of those industries included in the North American Industry Classification System, or NAICS, definition of manufacturing plus those industries-logging and newspaper, periodical, book and directory publishing-that have traditionally been considered to be manufacturing and included in the industrial sector. For the period since 1997, the total IP index has been constructed from 300 individual series based on the 2002 North American Industrial Classification System (NAICS) codes. These individual series are classified in two ways: (1) market groups, and (2) industry groups. Market groups consist of products and materials. Total products are the aggregate of final products, such as consumer goods and equipment, and nonindustrial supplies (which are inputs to nonindustrial sectors). Materials are inputs in the manufacture of products. Major industry groups include three-digit NAICS industries and aggregates of these industries-for example, durable and nondurable manufacturing, mining, and utilities. A complete description of the market and industry structures, including details regarding series classification, relative importance weights, and data sources, is available on the Board's web site (www.federalreserve.gov/releases/G17/About.html). Changes in output for the market and industry groups are summarized in table 1 and the levels of output (in index form) are shown in table 4. Special aggregates, that highlight the relative importance and contributions of several key industries, such as high-technology and motor vehicles, are summarized in tables 2 and 5. For a detailed description of the contents of the statistical tables, see below.

Source data. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations and from government agencies; data of this type are used to estimate monthly IP wherever possible and appropriate. Production indexes for a few industries are derived by dividing estimated nominal output (calculated using unit production or sales and unit values) by a corresponding Fisher price index; the most notable of these fall within the high-technology grouping and include computers, communications equipment, and semiconductors. When suitable data on physical product are not available, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive annual data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. The annual data used in benchmarking the individual IP indexes are constructed from a variety of source data, such as the quinquennial Censuses of Manufactures and Mineral Industries and the

Annual Survey of Manufactures, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the United States Geological Survey of the Department of the Interior; and publications of the Department of Energy.

Aggregation Methodology and Weights. The aggregation method for the IP index is a version of the Fisher-ideal index formula. (For a detailed discussion of the aggregation method, see *Federal Reserve Bulletin* February 1997 and March 2001.) In the IP index, series that measure the output of an individual industry are combined using weights derived from their proportion in the total value-added output of all industries. The IP index, which extends back to 1919, is built as a chain-type index since 1972. The current formula for the growth in monthly IP (or any of the sub-aggregates) since 1972 is the geometric mean of the change in output (*I*), and, as can be seen below, is computed using the unit value added estimate for the current month (p_m) and the estimate for previous month:

$$\frac{I_{m}^{A}}{I_{m-1}^{A}} = \sqrt{\frac{\sum I_{m} P_{m-1}}{\sum I_{m-1} P_{m-1}}} \times \frac{\sum I_{m} P_{m}}{\sum I_{m-1} P_{m}}$$

The IP proportions (typically shown in the first column of the relevant tables in the G.17 release) are estimates of the industries' relative contributions to overall growth in the following year. For example, the relative importance weight of the motor vehicles and parts industry is about 5 percent. If output in this industry increased 10 percent in a month, then this gain would boost growth in total IP by $\frac{1}{2}$ percentage point (0.05 x 10% = 0.5%). To assist users with calculations, the Federal Reserve's web site provides supplemental monthly statistics that represent the exact proportionate contribution of a monthly change in a component index to the monthly change in the total index (www.federalreserve.gov/ releases/G17/ipdisk/ipweights.sa).

Timing. The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript "r" in tables.) For the first estimate of output for a given month, about 59 percent of the source data increases to about 86 percent for estimates in the second month that the estimate is published, 96 percent in the third month, and 96 percent in the fourth month. Data availability by data type is summarized in the table below:

Availability of Monthly IP Data in Publication Window (Percent of value added in 2004)

| | Month of estimate | | | | | | | | |
|-------------------------|-------------------|-----|-----|-----|--|--|--|--|--|
| Type of data | 1st | 2nd | 3rd | 4th | | | | | |
| Physical product | 24 | 40 | 50 | 50 | | | | | |
| Production-worker hours | 35 | 35 | 35 | 35 | | | | | |
| Electric power use | 0 | 11 | 11 | 11 | | | | | |
| IP data received | 59 | 86 | 96 | 96 | | | | | |
| IP data estimated | 41 | 14 | 4 | 4 | | | | | |

NOTE—The physical product group includes series based on either monthly or quarterly data. As can be seen in the first line of the table, in the first month, a physical product indicator is available for about half of the series (in terms of value added) that ultimately are based on physical product data (24 percent out of total of 59 percent). Of the 24 percent, about five-sixths (20 percent of total IP) include series that are derived from weekly physical product data and for which actual monthly data may lag up to several months. On average, quarterly product data are received for the third estimate of industrial production. Specifically, quarterly data are available for the second estimate of the last month of a quarter, the third estimate of the second month of a quarter, and the fourth estimate of the first month of a quarter. About 4 percent of the source data for monthly IP—all physical product measures—are available too late for direct inclusion in the current index and are incorporated at the time of an annual historical revision. Seasonal adjustment. Individual series are seasonally adjusted using Census X-12 ARIMA. For series based on production-worker hours, the current seasonal factors were estimated with data through September 2004; for other series, the factors were estimated with data through at least June 2004. Series are pre-adjusted for the effects of holidays or the business cycle when appropriate. For the data since 1972, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

Reliability. The average revision to the *level* of the total IP index, without regard to sign, between the first and the fourth estimates was 0.27 percent during the 1987-2004 period. The average revision to the *percent change* in total IP, without regard to sign, from the first to the fourth estimates was 0.21 percentage point during the 1987-2004 period. In most cases (about 85 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

CAPACITY UTILIZATION

Overview. The Federal Reserve Board constructs estimates of capacity and capacity utilization for industries in manufacturing, mining, and electric and gas utilities. For a given industry, the capacity utilization rate is equal to an output index (seasonally adjusted) divided by a capacity index. The Federal Reserve Board's capacity indexes attempt to capture the concept of *sustainable maximum output*—the greatest level of output a plant can maintain within the framework of a realistic work schedule, after factoring in normal downtime and assuming sufficient availability of inputs to operate the capital in place.

Coverage. Capacity indexes are constructed for 85 detailed industries (67 in manufacturing, 16 in mining, and 2 in utilities), which mostly correspond to industries at the three- and four-digit NAICS level. Estimates of capacity and utilization are available for a variety of groups, including durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Manufacturing consists of those industries included in the North American Industry Classification System, or NAICS, definition of manufacturing *plus* those industries—logging and newspaper, periodical, book and directory publishing—that have traditionally been considered to be manufacturing and included in the industrial sector. Also, special aggregates are available, such as high-tech industries and manufacturing excluding high-tech industries.

Source Data. The monthly rates of capacity utilization are designed to be consistent with both the monthly data on production and the periodically available data on capacity and utilization. Because there is no direct monthly information on overall industrial capacity or utilization rates, the Federal Reserve first estimates annual capacity indexes from the source data. Capacity data reported in physical units from government sources (primarily from the U.S. Geological Survey and the Department of Energy's Energy Information Administration) and trade sources are available for portions of several industries in manufacturing (e.g., paper, industrial chemicals, petroleum refining, motor vehicles), as well as for electric utilities and mining; these industries represent about 20 percent of total industrial capacity. When physical product data are unavailable for manufacturing industries, capacity indexes are based on responses to the Bureau of the Census's Survey of Plant Capacity (SPC); these industries account for a bit less than 75 percent of total industry capacity. In the absence of utilization data for a few mining and petroleum series, capacity is based on trends through peaks in production (roughly 5 percent of total industry capacity). A detailed description of the methodology used to construct the capacity indexes is available on the Board's web site (www.federalreserve.gov/releases/G17/cap_notes.html).

Aggregation Methodology. Monthly capacity aggregates are calculated in three steps: (1) utilization aggregates are calculated on an annual basis through the most recent full year as capacity-weighted aggregates of individual utilization rates; (2) the annual aggregate capacity is derived from the corresponding production and utilization aggregates; (3) the monthly capacity aggregate is obtained by interpolating with a Fisher index of its constituent monthly capacity series. Utilization rates for the individual series and aggregates are calculated by dividing the pertinent monthly production index by the related capacity index.

Consistency. A major aim is that the Federal Reserve utilization rates be consistent over time so that, for example, a rate of 85 percent means about the same degree of tightness that it meant in the past. A major task for the Federal Reserve in developing reasonable and consistent time series of capacity and utilization is dealing with inconsistencies between the movements of the industrial production index and the survey-based utilization rates. The McGraw-Hill/DRI Survey, now discontinued, was the primary source of manufacturing utilization rates for many years. This was a survey of large companies that reported, on average, higher utilization rates than those reported by establishments covered by the SPC (currently the primary source of factory operating rates) for the fourteen years they overlapped. Adjustments have been made to keep the industry utilization rates currently reported by the Federal Reserve roughly in line with rates formerly reported by McGraw-Hill. As a consequence, the rates reported by the Federal Reserve tend to be higher than the rates reported in the SPC.

Perspective. Over the 1972-2004 period, the average total industry utilization rate is 81.0 percent; for manufacturing, the average factory operating rate has been 79.8 percent. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime. The highs and lows in capacity utilization shown in table 7 are specific to each series and do not all occur in the same month.

ELECTRIC POWER

Coverage. Electric power data for sales by utilities to industry users and for electric power produced by cogenerators (manufacturing and mining firms that produce electricity for their own use or to sell to a utility) are generally collected at the 4-digit NAICS and 3-digit SIC level for mining and manufacturing. Aggregates for 3-digit industries, as well as for total mining, durable, nondurable, total manufacturing and total industrial electric power use, are computed. Manufacturing consists of those industries included in the North American Industry Classification System, or NAICS, definition of manufacturing plus those industries-logging and newspaper, periodical, book and directory publishing-that have traditionally been considered to be manufacturing and included in the industrial sector. An aggregate showing total industry excluding nuclear nondefense is shown separately because the value-added proportion for the nondefense nuclear material series (part of NAICS 3251) in total IP is considerably less than its share of total electric power use. In addition, aggregates for utility sales to industrial users and industry generation are computed. While only the major aggregates are shown in the release, data for the 3- and 4-digit industries are available on the Board's web site (www.federalreserve.gov/releases/G17).

Source Data. Electric power data are collected from a sample of utilities and cogenerators covering all twelve Federal Reserve Districts. The primary criterion for inclusion of a utility in the panel is whether the utility provides electric power to industrial customers. A comparison of Federal Reserve kilowatt-hour aggregates to estimates from the 1997 *Census of Manufactures* (the most recent available) and recent reporting panel statistics suggests the Federal Reserve data cover about 50 percent of the overall sales to manufacturing in that year. The cogeneration panel covers about 50 percent of cogeneration used directly by manufacturers. In order to provide more complete coverage and correct for any shortcomings of the survey, the series are benchmarked at the 4-digit industry level to the latest available data from the *Annual Survey of Manufactures* and the *Census of Manufactures*.

Methodology. The data we receive from utilities and cogenerators are edited for anomalies and aggregated, using self weights, to the 4-digit NAICS industry levels and above. Where reports are late or unavailable for some reason, responses are estimated.

Seasonal Adjustment. Series are seasonally adjusted at the 4-digit NAICS level, with seasonally-adjusted aggregates typically computed as sums of seasonally adjusted components. The seasonal adjustment procedure (Census X-12 program) is used without trading-day

adjustments because the reporting periods of the various utilities are not the same. A leap year adjustment is also made where appropriate.

REFERENCES AND RELEASE DATES

References. The annual revision published in December 2004 is described in an article published in the *Federal Reserve Bulletin*, vol. 91 (Winter 2005), pp. 9-25. A description of the aggregation methods for industrial production and capacity utilization is included in an article in the *Federal Reserve Bulletin*, vol. 83 (February 1997), pp. 67-92. The Federal Reserve methodology for constructing industry-level measures of capital is detailed in "Capital Stock Estimates for Manufacturing Industries: Methods and Data" by Mike Mohr and Charles Gilbert (1996), which can be obtained at:

www.federalreserve.gov/releases/g17/capital_stock_doc-latest.pdf.

Industrial Production—1986 Edition contains a more detailed description of the other methods used to compile the industrial production index, plus

a history of its development, a glossary of terms, and a bibliography. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the *Federal Reserve Bulletin* (April 1990, June 1990, June 1993, March 1994, January 1995, January 1996, February 1997, February 1998, January 1999, March 2000, March 2001, March 2002, April 2003, Winter 2004).

Release Schedule

At 9:15 a.m. on

2005: January 14, February 16, March 16, April 15, May 17, June 15, July 15, August 16, September 14, October 14, November 17, and December 15.

2006: January 17, February 15, March 17, April 14, May 16, June 15, July 17, August 16, September 15, October 17, November 16, and December 15.
